Re: Hearing Examiner File Nos. LUCE-86-004 and LUCE-86-005; Appeals by Children's Orthopedic Hospital and Airlift Northwest, et al., from an Order and Notice of Violation of DCLU

Dear Ms. Cloud:

This letter follows up on your order of March 27, 1990 requesting that we provide an update on the status of this matter by March 29, 1991. My understanding is that the final environmental impact statement is to be published within the next 60 days. After the final environmental impact statement is published, further proceedings on the council conditional use permit request by Children's Hospital and Medical Center for the establishment of a helistop would be taken as required by ordinance.

Should you have any questions, please do not hesitate to contact me.

Very truly yours,

NOTICE OF VIOLATION

of Land Use Code

Seattle Municipal Code - Title 23

August 30, 1985
File No. Z853959
Page 1

Trevman Katz, Chief Executive Officer
Childrens Orthopedic Hospital
4800 Sand Point Way Northeast
Seattle, Washington 98105

Michael Copass, Medical Director
Airlift Northwest
325 - 9th Avenue
Seattle, Washington 98104

Subject: Premises known as 4800 Sandpoint Way Northeast
legally described as:

That portion of the West half of the Southeast quarter of the Southwest Quarter of Section 10, Township 25 North, Range 4 East, W. M., in King County, Washington, described as follows:

Beginning on the Easterly line of said subdivision at a point 658.20 feet Northerly of the Southeast corner thereof; thence West 271.44 feet, more or less, to the Northerly production of the Westerly line of Block 1, of Gwinn's Laurelhurst Manor Addition according to Plat recorded in Volume 41 of Plats Page 27, in King County, Washington; thence North 0'26'19" East along the Northerly production of said Westerly line to the Southeasterly line of Sand Point Way; thence Northeasterly along said Southeasterly line of East 50th Street; thence Easterly along said Southerly line to the Easterly line of said subdivision thence Southerly along said Easterly line 630 feet, more or less, to the point of beginning.

PARCEL B

The West 5.00 feet of the Northeast quarter of the Southeast quarter of the Southwest Quarter of Section 10, Township 25 North, Ranger 4 East, W. M., in King County, Washington, except the North 30.00 feet thereof, and the South 25 thereof;

PARCEL C

Blocks 1, 2, 3, 4, 5, and 6 of Gwinn's Laurelhurst Manor addition to Plat recorded in Volume 41 of Plats, Page 27, in King County, Washington except Lot 12 in said Block 6;

PARCEL D

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Those portions of 42nd Avenue Northeast, 43rd Avenue Northeast, 44th Avenue Northeast and East 47th Street, vacated under Ordinance No. 76010 of the City of Seattle.

Subject to:

Right of the public to make neccesary slopes for cuts or fills upon said premises in the reasonable original grading of streets, avenues, alleys and roads, as dedicated in the Plat.

Also subject to:

Right to make necessary slopes for cuts of fills over the Northerly 558 feet of said Parcel as granted to the City of Seattle by Deed recorded under Auditor's File No. 2553722.

Also subject to:

Right of the public to use that portion of Lot 9 and 10, Block 4, of Gwinn's Laurelhurst Manor addition, lying within boundaries of East 47th Street.

As a result of a recent inspection, notice is hereby given that the subject property and/or person(s) responsible for that property are in violation of the Seattle Land Use Code, Section(s) 23.40.02C, 23.48.05A and 23.90.02B. CORRECTIVE ACTION BY THE DESIGNATED PERSON(S) IS REQUIRED NO LATER THAN SEPTEMBER 19, 1985.

The specific violation and corrections are as follows:

USING OR PERMITTING THE USE OF THE PREMISES AS A LANDING PAD FOR HELICOPTERS, IMMEDIATELY DISCONTINUE THE USE OF A HELICOPTER PAD.OR OBTAIN A PERMIT FOR SUCH USE.

The following paragraphs provide information on complying with this violation notice and procedures for appealing our determination. If you have questions, please call the inspector whose signature appears on the last page at 625-2271.

1. The Land Use Code provides that any party affected by a Notice of Violation may request a hearing before a Department Hearing Officer for reconsideration of this notice. Any affected party who decides to request a hearing should be aware that reconsideration hearings are very limited in scope. The Hearing Officer merely has the authority to review the facts of the case and determine whether there is a violation of the Zoning or Land Use Code. Although the Hearing Officer can extend the compliance date for a short period of time, the Hearing Officer CANNOT AUTHORIZE A VIOLATION TO CONTINUE.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. The request for reconsideration must be in writing, and filed with the Director no later than twenty (20) days following service of this notice, and contain the following:

   (a) A brief statement as to how the appellant is significantly affected by or interested in the reconsideration.

   (b) A brief statement containing explicit exceptions and objections with regard to the Notice of Violation.

   (c) The requested relief from the notice such as withdrawal or modification.

   (d) The signature, mailing address and telephone number of the appellant. In the event there are numerous appellants, the request for reconsideration shall designate the single representative to be contacted.

   NOTE: Requests for extension of the compliance date do not require a hearing. See Item 5.

3. If no request for reconsideration is received, the notice shall become a final order of the Director. A copy of the final order will be filed with the Department of Records and Elections of King County.

4. Any actions involving construction, demolition, or change of use are regulated by City Codes and Ordinance, and must be covered by the proper permits. Information on permits may be obtained at the Application Intake Center on the 5th Floor of the Municipal Building, or by calling 625-2293. Please bring this document with you when applying for any permits.

5. The date set for compliance with a final order takes precedence over work completion dates specified in any permit(s) and will be subordinante only to written extensions of the order. REQUESTS FOR EXTENSIONS MUST BE RECEIVED IN WRITING NOT LATER THAN FIFTEEN (15) DAYS PRIOR TO THE DATE SET FOR COMPLIANCE.

6. Any person failing to comply with a final order within the time specified shall be subject to a cumulative penalty as provided by law.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

An inspection will be made on approximately the date set for compliance to determine if the corrections have been made. If you have questions, or have completed the work and desire an inspection prior to the reinspection date, please call the undersigned inspector at 625-2271.

Sincerely,

BEATRICE FARRAR RYAN
Interim Director

HAND DELIVERED

Ms. Beatrice Farrar Ryan
Interim Director
Department of Construction and Land Use
400 Seattle Municipal Building
600 Fourth Avenue
Seattle, Washington 98104

Re: File Number: Z853959; Request for Reconsideration of Notice of Code Violation

Dear Ms. Ryan:

We represent Children's Orthopedic Hospital Medical Center ("COHMC") which received on September 2, 1985, a Notice of Violation of Land Use Code. The Notice states that the hospital is in violation of the Land Use Code for "using or permitting the use of the premises as a landing pad for helicopters . . . ." The notice does not indicate the facts upon which this allegation is based. It indicates that this activity is in violation of the following code sections: 23.40.02C[sic]; 23.48.05A[sic]; and, 23.90.02B[sic].

Seattle Municipal Code Section 23.40.020C identifies the elements which must be proven in order to obtain a variance. Seattle Municipal Code Section 23.48.005 states that a helistop is a council conditional use in the major institution classification. Seattle Municipal Code Section 23.90.002B states:

> It is a violation of this Land Use Code to use or cause to be used any structure or land or to construct, locate or cause to be constructed or located any structure within the City of Seattle in any manner that is not permitted by the terms of any permit or authorization issued pursuant to this Land Use Code . . .

The first two cited code sections suggest that the alleged violation relates to an impermissible structure. The language in the notice suggests that the violation relates to an unauthorized use under Seattle Municipal Code Section 23.90.002.

APPELLANTS' INTEREST IN RECONSIDERATION

COHMC is the owner of the land described in the notice. It in no way has caused helicopters to use this land as a landing pad. Application of the terms of this notice would wrongfully subject COHMC to penalties in the event of any similar occurances in the future.

OBJECTIONS TO NOTICE

Seattle Municipal Code Section 23.40.020C does not apply because there is no "structure" at issue.

Seattle Municipal Code Section 23.48.005A does not apply because COHMC does not have a "helistop" on the premises. This term is defined at 24.08.090 as "an area on a roof or on the ground used by helicopters . . . for the purpose of picking up or discharging passengers or cargo. . . ." There is no such designated area on the subject land. Helicopter landings have been so rare that it is impossible to identify "an area on . . . the ground used by helicopters . . . for the purpose of picking up or discharging passengers or cargo . . ."

Seattle Municipal Code Section 23.90.002B has not been violated by COHMC because it did not use its land or cause it to be used in an impermissible manner. Seattle Municipal Code Section 23.90.002B states that a violation occurs only if a person or entity used land in an impermissible manner or causes land to be so used. It cannot be shown that COHMC is responsible for any helicopter landings.

Furthermore, the rare instances of helicopters landing on the subject property have occurred only on the occasion of direct and immediate life threatening emergencies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

REQUESTED RELIEF

COHMC respectfully requests that the notice and determination of code violation be withdrawn.

Very truly yours,

DAVIS, WRIGHT, TODD, RIESE & JONES

AVAILABILITY OF FINAL ENVIRONMENTAL IMPACT STATEMENT

A Final Environmental Impact Statement (FEIS) on the project described below is available for public review. The lead agency is the Seattle Department of Construction and Land Use (DCLU).

Project number and name: 8405870 Children's Hospital and Medical Center Helistop
Address and zone: 4800 Sand Point Way NE I-4/I-2/SF
Project description: Council Land Use Action to allow an emergency helistop facility accessory to a major institution (Children's Hospital and Medical Center).

INFORMATION AVAILABLE

A copy of the Final EIS is available for public review at the Downtown Seattle Public Library, 1000 Fourth Avenue; the Governmental Research Assistance Library, Seattle Municipal Building; Northeast Branch, 6804 35th Avenue N.E.; University Branch, 5009 Roosevelt Way N.E.; and University of Washington Suzallo and Health Sciences Libraries. Additional information about the project and a limited number of copies of the Final EIS are available through the Master Use Permit Information and Notification Center, 408 Seattle Municipal Building (684-8467).

The DCLU Director will issue a decision on the adequacy of the Final EIS and a recommendation on whether to grant, condition or deny the project described above no sooner than seven days after publication of the Final EIS. The final decision on the proposal will be made by the Seattle City Council. Notice of the Director's recommendation will be mailed to interested parties. If you wish to receive a copy of the notice, please telephone the Master Use Permit Information Center at 684-8467.

Beatrice Farrer Ryan, Interim Director
Charles Royer, Mayor

MASTER USE PERMIT

January 13 1986

NOTICE OF DECISION (DECLARATION OF SIGNIFICANCE & SCOPING)

The Director of the Department of Construction and Land Use has reviewed the Master Use Permit application described below and has issued a Declaration of Significance (DS) on this project.
The public is invited to identify specific significant environmental impacts and issues which should be addressed in the Environmental Impact Statement.
If an EIS is prepared, you will be notified of the time, date and place of the public hearing.

Comments on the scope of the Environmental Impact Statement are to be sent to the following address by FEBRUARY 03, 1986 :

Director
Department of Construction and Land Use
Room 400 Municipal Building
Seattle, Washington 98104

The Declaration of Significance is a part of the file on this matter and is available for public viewing in Room 408 of the Seattle Municipal Building

810 - 3rd Ave. # 754
Seattle, WA Zip: 98104

Comments/corrections from:
✓ Zoning
___ Land Use Review
___ Land Use Intake

Land Use File

PLAN STATUS:
___ Plans will continue routing
___ Project/plans are on hold, pending resolution of the corrections listed below.

Reviewed by: Roberta Baker
Date: 1/10/92

NOTE: If necessary, meetings with plans examiners to discuss corrections or other code matters may be made by **APPOINTMENT ONLY.** Call **684-8875** for Zoning and LU Review, **684-8850** for LU Intake between **10:30 am and 4:30 pm.** Itemized written response to corrections is helpful. Minor corrections may be made in ink on the original blueprints. Major corrections must be submitted on new prints. Please incorporate the new print sheets into each plan set and return the original replaced prints in separate sets. (These must be marked **VOID**). Return plans to the Plans Routing Center, Room 503, Municipal Building.

* Please dimension the new parking areas — stall width, stall depth & parking aisle. At least 1/3 (35%) of the new stalls need to be small (7'-6" x 15'-0") and at least 35% need to be large stalls (8'-6" x 19'-0"). The rest of the stalls can be small, medium or large — the parking aisle differs for each stall size.

Please dimension the site plan, and feel free to call me if you have any questions.

Please Note: If you fail to submit the information required in the corrections listed above, within 90 days from the date of this correction sheet, your application will be canceled. This means that you will have to make a new application if you wish to proceed with the project.

NOTICE TO THE APPLICANT: The Department of Construction and Land Use cannot guarantee any specific time frame for project review. The applicant shall determine applicability of and compliance with all relevant codes. DCLU permit action is based upon information supplied by the applicant. The Department reserves the right to require additional information. Field revisions on issued permits may be required if errors or omissions are discovered.

Construction or substantial progress toward construction of a project for which a Master Use Permit or construction permit has been granted must be undertaken prior to the expiration date. Extension of the construction permit without penalty may be granted if application is made within the 30 days prior to the date of expiration. Additional fees will be assessed to reinstate an expired permit.

Not valid unless signed by the DIRECTOR OF THE DEPARTMENT OF CONSTRUCTION AND LAND USE. Starting construction without a building permit is punishable by fine and/or imprisonment. All work shall be done in accordance with the permit and approved plans. Call for inspection before placing any concrete or installing any piling on private property. Phone 684-8900.

I certify that I have read the above notice, and that to the best of my knowledge the information which I have provided is complete and accurate.

Inspection Phone 684-8900

POST THIS SIDE OUT

Permit No. _____ Project No. _____

_____
Property Address

TO THE CONTRACTOR/OWNER:

1. This card must be posted in a conspicuous place on the premises.
2. Call DCLU Inspection Division (684-8900) for all of the applicable inspections:
   a. pre-construction conference
   b. foundation (setbacks, reinforcing steel, soil bearing, foundation drainage)
   c. fireplace and chimney reinforcing steel
   d. concrete & masonry reinforcing steel
   e. glu-lams, wood trusses
   f. diaphragm nailing (walls, floors, roofs, including connections
   g. framing
   h. insulation
   i. stucco lath & gypsum board nailing
   j. mechanical HVAC
   k. final inspection

   Inspections will be made on the same working day if you call between 7:30 and 8:30 a.m. Inspections will be made on the next working day for calls received after 8:30 a.m. on our 24-hour recorder at 684-8900.

   Please clarify which inspections are required before proceeding with your project. If you have any questions, call the building inspector at 684-8950 between 7:30 and 9:00 a.m., or leave a message after 9:00 a.m.

   When special inspection is required, notify inspection agency specified on approved plan 24 hours in advance. If special inspection is required, you must receive approval from building inspector prior to the start of construction.
3. PROPERTY LINES MUST BE ESTABLISHED BY SURVEY STAKES PRIOR TO FOUNDATION INSPECTION.
4. This permit does not cover sewer, drainage and street use, plumbing, electrical, furnace, boiler, elevator, Fire Department, public right-of-way shoring, or sign permits. If any of these permits are required, you will need to apply for them separately from this permit. Additional permits may also be required for work covered by this permit.
5. The requirements for all permits related to this permit (including but not limited to plumbing, electrical, Master Use, drainage and street use permits) shall be completed prior to final inspection.
6. Premises must not be occupied until final inspection is made and approval granted by the Seattle Department of Construction and Land Use.
7. FINAL INSPECTION IS REQUIRED ON ALL PERMITS.

INSPECTION REPORTING

DCLU inspectors will provide a copy of all inspection reports to you. These reports should be clipped to your permit or kept where they can be conveniently referenced.

The following signature boxes are for inspectors other than DCLU building inspectors. These are included here for your convenience; if you get signatures from the other inspectors as shown below, it will speed up the approval of your construction project.

PRIOR TO FOUNDATION APPROVAL

When your permit requires special inspection for soil bearing capacity by a soils engineer, the building inspector will require verification of the soils engineer approval prior to the foundation pour. If the soils engineer does not leave a report at the site, their signature in this box is sufficient for the building inspector.

Soil Bearing (identify area)	Approved by	Date

PRIOR TO FINAL BUILDING APPROVAL

The following sign-offs may be necessary prior to the final approval of the building permit or a Certificate of Occupancy. To speed up your approval, we recommend that you get the inspectors to sign below when they have given final approval of their portions of the work. This will help you and the building inspector make sure that all approvals are received in a timely manner.

FIRE DEPT. approved by / date	ELECTRICAL approved by / date	MECHANICAL approved by / date
PLUMBING approved by / date	ELEVATOR approved by / date	ENGINEERING street use approved by / date
BOILER approved by / date	LANDSCAPING approved by / date	side sewer approved by / date

Re: Council Conditional Use Application (Helistop at Graves Field)

Dear Mr. McLerran:

In response to your January 30, 1991, letter to me and Tallman Trask III, Children's Hospital and Medical Center is submitting an application for a Council Conditional Use Permit for a helistop at Graves Field.

We are submitting this application as a way to implement the "preferred alternative" now proposed by CHMC. This alternative would provide for the majority of emergency helicopter flights to land at Graves Field and the remainder to land on Children's campus at the site proposed in our current Conditional Use application with the City. We believe that the preferred alternative will accomplish Children's objectives and mitigate adverse impacts on the community.

This application is submitted for a helistop at Graves Field to be operated in conjunction with the helistop on the main campus. The improved helistop at Graves Field is not intended to serve all emergency flights for patients destined to Children's.

I noted in your letter that you determined that the University of Washington's use of Graves Field as a helistop is considered grandfathered since this site has been used for many years by the UW. As you know, this site has also been used for many years for the landing of helicopters with patients destined for Children's Hospital. We also believe that use of the Graves Field site by helicopters with Children's patients is grandfathered. By submitting this application for Graves Field, Children's or patients bound for Children's do not intend to waive whatever rights we would have to continue landing at Graves Field (and the main campus) without any additional permits.

DEPARTMENT OF CONSTRUCTION AND LAND USE
DEC 13 1991

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We look forward to working with the City in the review of this application. We understand from your staff that the existing EIS for this project issued in April, 1991, will be used to support the review of this Council Conditional Use Permit application. We have, therefore, not submitted a new environmental checklist.

This proposal for a helistop at Graves Field has also been reviewed by the University of Washington and we have their permission to apply for a helistop at this location. We submit this application with the understanding that our application does not waive the University's right to use the existing helistop for its patients.

The helistop has been designed by the firm of Mills, John & Rigdon Architects; Mr. Sigmund A. Brudevold is the project manager. Suzanne Petersen, Director of Government Affairs, is the Children's Hospital contact person for this application (526-2530).

Thank you for your consideration of this request.

Sincerely yours,

Treuman Katz
President and CEO

Dear Mr. Trask and Mr. Katz:

In an effort to resolve the outstanding issues regarding the possibility of permitting use of an existing helistop at Graves Field for both the University of Washington (UW) and Children's Hospital Medical Center (CHMC) helicopter landings, I have met with my staff several times and have consulted with the City's Law Department. We have developed a proposed solution which I hope will be satisfactory to all parties.

As you know, we are faced with a code issue which has hindered our ability to move forward on a permit decision for CHMC's proposed helistop. The preferred alternative now proposed by CHMC would have the majority of flights landing at Graves Field, which is within the UW's campus. The site has historically been used periodically by the University as a landing site for helicopters transporting injured persons. Although the new Major Institution Code does not require CHMC to include CHMC's use of Graves Field helistop in the CHMC master plan because the site is more than 1/2 mile from the hospital campus, the Major Institutions code does not explicitly provide that one institution may apply for such a new facility on another institution's campus. We understand that the UW does not want to apply for the CHMC facility because of the controversy which has been associated with the hospital's on-site proposal.

Regarding the UW's concerns that its helicopter flights not be subject to the permitting process, I believe that the UW use of the site should be considered grandfathered since this site has been used for many years as a helistop. No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

additional permitting of the UW's existing use at this location would be necessary. The Final GPDP and EIS includes discussion of the helistop, its continuous use by the UW and its intended future use by CHMC, referring to the pending parallel review process for CHMC's use of the site.

If the helistop at Graves Field is an existing use for the University of Washington, the Children's flights may be added in much the same way as other medical facilities at the University are available to Children's patients. Because the number of flights will increase substantially beyond the UW's historic use, we will require that the Children's use of the helistop be allowed only through the Conditional Use process. In the event the Council Conditional Use for Children's destined flights at Graves Field is not approved, no Children's landings would be allowed, but the grandfathered UW usage would not be affected. Prior to publishing a decision on the Children's flights, Children's must apply for a permit at Graves Field.

This solution relies on the cooperation of both institutions in arriving at a mutually beneficial result. CHMC would be able to apply for what it has identified as the preferred site for the majority of its proposed helicopter landings, and the UW use of the site would be recognized and grandfathered without formally going through the permit process. I trust that you will agree with this approach and work together with us to resolve this complex issue. I would like to move as quickly as possible for a decision on the Children's helicopter flights as the issue has lingered unresolved for an embarrassingly extended period.

I hope this proposed solution addresses the concerns of Children's Hospital and the University of Washington. If there are any questions, please contact me at 684-8899 or Senior Land Use Specialist John Doan at 684-8875.

Sincerely,

Dennis J. McLerran

Re: 4800 Sand Point Way N.E.
(MUP #8405870)

Suzanne Peterson, Director
Governmental Relations
Children's Hospital and Medical Center
4800 Sand Point Way N.E.
P.O. Box C5371
Seattle, Washington 98105

Dear Ms. Peterson:

This is in regard to the permit application for a helistop on the Children's Hospital Campus.

At application for your permit, $272.50 was paid to cover the environmental review. The Permit Fee Ordinance establishes that the fee for an Environmental Impact Statement is a function of the project's construction value. The helistop proposal is unusual because it has no valuation for fee calculation purposes. The fee ordinance provides that special fees shall be assessed to recover city costs where the valuation or other methodology normally used (to determine costs) does not reflect actual costs. In conformance with this, we will be charging you the hourly fee of $71.00 per hour for the time spent on the EIS.

Because we are informing you of this at this late date, you will only be responsible for the environmental review costs incurred after January 1, 1989. Payment of these fees and those owing as a result of the Council Conditional Use will be due prior to our publication of a decision. The Conditional Use charges through 1988 are approximately $7,500.00.

This information is being provided to help you plan for the resolution of this issue. If you have any questions, please do not hesitate to call me at 684-8875.

Sincerely,

DENNIS McLERRAN
Director

Summary Report of Safety Review
Proposed Kitchen Garden Helistop
Children's Hospital & Medical Center
Seattle, Washington

RECEIVED
MAY 05 1989

Introduction

This report is based on an analysis of current and proposed helistops serving the Children's Hospital & Medical Center to determine their suitability from a flight safety perspective. It is based on an extensive site visit and discussions with personnel involved in all aspects of the aeromedical operation at Children's.

Key Findings

The proposed Kitchen Garden helistop site offers numerous advantages in terms of safety and efficiency over the other sites under consideration (the existing Children's Hospital landing site and the Intramural Field site).

As currently designed, the Kitchen Garden site would provide increased safety over the landing area at the hospital's current site. It would allow for full compliance with the Federal Aviation Administration Advisory Circular #150/5390-2, which provides guidelines for helistop design, a claim that cannot be made for any of the other sites' configurations. It would provide:

> Greater clearances for the takeoff and landing area which would improve the ability of the pilot to locate and identify the touchdown area earlier in the approach sequence;
>
> Increased maneuverability for the helicopter to provide a greater range of approach and departure possibilities as well as fly-away capability in the event of an aborted approach to the hospital;
>
> A better and safer parking area; and
>
> An improved area of security which provides the pilot with the knowledge that the chance of unforeseen and unplanned events (arising from unauthorized access to aircraft) would be minimal.

The Kitchen Garden site also provides an improvement over every other site (except for the existing Children's Hospital site) in its proximity to the emergency room. (While emergency room proximity is not directly related to flight safety it does affect patient health. FAA Advisory Circular #150/5390-2 stresses the importance of proximity as a consideration in heliport design.) And when compared to the existing site, the Kitchen Garden

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

proposal offers a significant improvement in safety, especially for night operations.

Additional Factors Analyzed

The review of the proposed Kitchen Garden site also addressed specific safety and related issues concerning:

Obstructions at or near the site

"Tight turns" that may be necessary in approaching the site

Execution of downwind landings

Safety and noise abatement

Protocols for coordinating the operations of two aircraft approaching the landing site without established communications

Means by which established flight paths can be monitored

Obstructions At or Near the Site

There are no existing obstructions associated with the design for the Kitchen Garden site that cannot be dealt with in a properly designed and constructed helistop. Items that should be addressed include:

Removal of trees, as well as bushes and shrubs at the immediate site to provide a clear area and to avoid penetration of the imaginary approach and departure surface. The exact number of plants to be removed will depend on the final elevation of the helicopter landing site.

Removal or topping of one or two trees located northeast of the site if alternate approach and departure paths will be used in that direction. This too is dependent on the elevation of the landing site.

Installation of obstruction marking or lighting for the boiler stacks on the north side of the hospital

Possible repositioning of one or two street lights located to the north of the site. This will depend on the exact elevation of the helistop and the flight path of the helicopter. This is dependent on the elevation of the landing site.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

None of these items are considered significant impediments to locating the helistop.

Safety Implications of Planned Approach Procedure

The so-called "tight turn" approach to the Kitchen Garden site described by Mr. Gene Hill, Chief Pilot for Hospital Air Transport, is a modified version of a normal approach procedure. It would require that normal care and precaution be exercised by the pilot.

(Normal procedures at an airport require the aircraft to enter a downwind leg at 1000 feet, parallel and opposite to the direction of landing. Once abeam the intended touchdown area a descent is initiated. The descent is continued through two 90 degree turns to arrive on a final approach course aligned with the runway.

The Kitchen Garden approach modifies this. The "downwind" leg is not parallel and opposite, but is slightly turned toward the final approach course. This more or less combines the "downwind" and crosswind" legs and requires a continuous turn of more than 90 degrees to align on the final course.

A helicopter provides greater flexibility than a fixed wing aircraft with respect to agility and maneuverability. This is especially apparent at slower air speeds. This difference means that what might be unsafe for a fixed wing aircraft would be perfectly safe and reasonable for a helicopter. Because of the greater maneuverability of a helicopter, a normal approach pattern is seldom used even at airports without noise abatement procedures. A modified approach procedure is used much more by helicopters than is a normal approach pattern.)

Implications of Downwind Landings

It is not possible to make a generalized statement about downwind landings other than they can be executed safely, depending on numerous variables. The two most important factors are wind speed and the amount of available power for the aircraft. The greater the wind speed, the more difficult the landing. Available aircraft power is a function of aircraft type, weight, altitude and temperature, among other components.

Given a choice, pilots normally will land into the wind. Second choice is a cross wind landing. The last choice is a downwind landing, which is used only if it can be determined by the pilot that there is an adequate margin of safety to execute the maneuver. The determination to make a downwind landing must made by the individual pilot at the controls using good judgment.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Safety and Noise Abatement

Air safety and noise abatement procedures are not mutually exclusive.

The approach and departure procedures for Children's Hospital incorporate guidelines that minimize noise impact and risk to all areas along the route of flight. The procedures affect the route of flight, altitude and airspeed of Airlift Northwest helicopters.

The route of flight determined by the approach and departure procedures require the aircraft to operate, as far as practicable, over interstate highways, arterials and bodies of water. Safety is not compromised by this procedure and, in some respects, may be enhanced by providing pilots with easily recognizable routes into and out of the hospital.

The altitude restriction for the noise abatement procedure also does not compromise safety. A 1000 foot restriction keeps the aircraft within a height/velocity curve to accomplish a safe landing in case of an emergency power loss. This 1000 foot altitude requires a higher than normal rate of descent at the beginning of the descent approach until the aircraft starts a turn to final approach. This procedure steepens the final approach into Children's Hospital, but the entire sequence does not diminish safety margins.

The airspeed procedures described in the approach and departure plan are designed to maintain airspeed for a longer period of time to limit the time exposure of the noise of the aircraft. This procedure does not compromise safety.

The departure is the reverse of the approach except that an accelerated rate of climb is sustained in order to get to a higher altitude more quickly. As long as no aircraft design limitations are exceeded, this is a safe and acceptable practice.

Medical Pavilion and Construction Cranes

The specific layout at the Kitchen Garden site presents no unusual safety problems with respect to the medical pavilion and winds.

A medical pavilion building is proposed to be built more than 100 feet to the southeast of the proposed helistop takeoff and landing area. In addition to the building, cranes may be used during the construction stage.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The building will be located a sufficient distance from the helistop to diminish the effects of disrupted wind flow. In high winds from the southeast a turbulent condition could be produced. However, it is difficult to determine exactly the degree of effect this would have on the site. A pilot could expect similar conditions anywhere he lands in proximity to a structure. It would require an unusual set of circumstances for building-induced wind conditions to affect safety significantly at this location. Specific conditions could conceivably make the helistop site unsuitable for landing aircraft. However, if these conditions existed it is also unlikely that Airlift Northwest aircraft would be flying.

The use of a construction crane at the proposed building site does not present a significant problem because the approach and departure paths do not penetrate the area where the crane will be located. To provide an extra margin of safety the hospital may wish to:

Notify in writing all potential users of the helistop site of the construction project's effective dates and provide a detailed map of the area.

Provide lighting for the crane.

Notify the Federal Aviation Administration of the construction activity's effective dates.

Protocols for Coordinating Two Aircraft Approaching the Site

Known and established methods of aircraft operation into and out of areas without controlling or advisory facilities can form the basis for safely coordinating two aircraft approaching the Kitchen Garden site.

This would require creation of communications protocols to allow aircraft to make their presence known, monitor each other's activities and exchange information affecting safety and operations. A system using visual flight rule reporting points and corridors provides known reference points, aircraft separation, noise abatement, smooth traffic flow and improved safety.

Flight Path Monitoring and Enforcement

Aircraft flight paths can be monitored by several different methods. One of the most accurate and cost effective systems is the development of visual flight rule reporting points and ground personnel to monitor an appropriate radio frequency. This procedure would be satisfactory for the Children's Hospital helistop operations.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The flight paths and reporting points required for the flight coordination protocols above would also assist monitoring and enforcement of flight paths.

The project should be submitted to local Federal Aviation Administration authorities prior to implementation. Established flight paths with check points and protocols would be distributed to all potential helistop users. Traffic advisory and monitoring services could be provided from a base station located at the hospital. The service need be active only when flights are known to be in progress. A time and position log would be maintained for each aircraft report and kept on file by the hospital.

Similar methods of operation are used at controlled airports to control the flow of helicopter traffic. They allow ground personnel to maintain traffic separation and increase safety by performing a "listening watch".

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Comparative Safety Evaluations of Alternative Sites

In addition to the analysis of the proposed Kitchen Garden site, inspections were conducted at the existing site at Children's Hospital and at the intramural field. These sites were evaluated to identify any specific elements of concern and to determine the overall safety of each helistop.

The evaluations also reviewed the sites for compliance with the Federal Aviation Administration Guidelines on heliport design (Advisory Circular 150/5390-2).

The implications of noncompliance with the Advisory Circular can be far-reaching. The FAA can use deficiencies in a helistop to limit or restrict operations. In addition, demonstrated noncompliance can be used for enforcement or liability actions after an accident or incident.

The FAA is not always consistent with interpretation or enforcement of regulations and advisory circulars. It is, therefore, difficult to predict the regulatory consequences of noncompliance with the circular. However, due to the increased scrutiny of safety of aeromedical operations by the FAA, it is prudent to strive toward full compliance with the circular.

Existing Children's Hospital Landing Site

The existing helicopter site located near the entrance to Children's Hospital and Medical center fails to meet all of the FAA recommendations for heliport design. Specific areas of noncompliance include:

Takeoff and Landing Area

Location of the takeoff and landing area does not provide for the recommended minimum clearance from buildings, walls, vehicles and other objects that could be struck by the main or tail rotor. The size of the takeoff and landing area does not comply with the recommended minimum size. The surface of the takeoff and landing area does not conform to recommended surface design gradients, soil stabilization or pavement design.

Helipads and Helidecks

The size of the helipad does not conform with the recommended minimum size, and the existing site does not meet soil stabilization or pavement design recommendations.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Approach and Departure Route

The site lacks the minimum one unobstructed approach and departure route required by the circular.

Heliport Lighting (night operations)

The site lacks perimeter lights to define the takeoff and landing area as well as floodlights to illuminate the operational area.

Fences

The site lacks fences or hedges to prevent unauthorized entry.

In addition to these items of noncompliance with the FAA circular, the site has other safety problems:

Construction of the Medical Pavilion will further limit the maneuvering area for helicopters.

There is nothing to identify the existing landing site. This creates difficulties for pilots who have not used the site during night approaches.

The final approach and departure corridors require flight either over or in close proximity to populated areas; provide a limited number of clear and unobstructed forced landing areas; do not allow routes which take advantage of various wind conditions; and limit fly away capability in the event of an aborted approach.

Boiler room stacks extending from the roof of the hospital on the emergency room side, which are in proximity to the landing site, are not lighted and, therefore, not easily seen, creating safety considerations for night landings.

The helipad does not have adequate drainage. Therefore, the turf is unstable when wet and may contribute to safety problems during helicopter operations.

Intramural Field Site

The following list identifies the specific areas of noncompliance of the Intramural Field Site with AC 150/5390-2.

Heliport Markings

Boundary and identification markings not provided.

Heliport Lighting

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Perimeter lights to define the takeoff and landing area for night operations are not provided.

Wind Direction Indicator

No method is provided to allow pilots to determine wind direction as per Advisory Circular recommendations.

Fences or Hedges

Fences or hedges to prevent unauthorized entry are not provided as per Advisory Circular recommendations.

Other safety problems were identified at the intramural field site:

Because property, air and zoning rights are outside the control of the hospital, there is no protection provided for the innermost portion of the approach and departure routes.

A bird nesting area is in close proximity to the landing site creating a potential hazard.

The site has a grass watering system that could be a hazardous obstruction.

A large pile of grass clippings and sand was found in close proximity to the aircraft landing site. This material could present a hazard to a landing aircraft. Due to lack of operational control over the landing site, this information would not be known to the pilot prior to landing.

Conflicting activities (golf driving range, baseball, etc) could create safety hazards for aircraft. Poor soil stabilization, lack of pavement support and the presence of a draining ditch constitute additional hazards.

There was no evident method for providing security against unauthorized entry while the site is in use.

Ground communication on or near the landing site is not provided for the aircraft.

ANALYSIS OF PROJECTED ROTARY-WING LANDINGS AT CHILDREN'S HOSPITAL MEDICAL CENTER 1990 - 1995

FINAL REPORT
APRIL 24, 1989

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXECUTIVE SUMMARY

As part of the planning effort for the Environmental Impact Statement (EIS) required for construction of a helistop at Children's Hospital and Medical Center (CHMC), this study was commissioned by CHMC to: 1) review Airlift Northwest's current pediatric rotary-wing experience, and 2) project future pediatric rotary-wing volumes.

The January 1988 draft of the Final Environmental Impact Statement (FEIS) contains a Proposed Action as well as a Preferred Alternative. The Proposed Action involves the construction of a helistop available for landing all Airlift Northwest helicopters transporting critically ill and injured patients to CHMC. The Preferred Alternative, developed as a compromise proposal in the FEIS, allows only the most critical patients to land at a paved, secured helistop at the CHMC campus. The designation of patients who are most critically ill and require transport directly to CHMC's campus is currently, and will continue to be, determined on a case by case basis by the Airlift Northwest medical team on board the helicopter. All other critical pediatric patients would land either at Harborview, Intramural Field or Boeing Field and be transferred via ground ambulance to CHMC.

Specifically, this study defines and identifies three factors:

1) The geographic service area of Airlift Northwest's existing pediatric program;

2) The percentage of pediatric flights ultimately destined for CHMC (regardless of where they land) as well as the pediatric flights that actually land at CHMC; and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3) A projection of future Airlift Northwest pediatric flight volumes and a calculation of the number of flights likely to land at CHMC through the year 1995 under both the Proposed Action and the Preferred Alternative.

All data used in the review and analysis of current and projected CHMC landings were provided by Airlift Northwest.

A population/use-rate based projection method was applied to the two scenarios, the Proposed Action and the Preferred Alternative, to develop estimates of likely utilization. Only one element in the methodology differentiates the two scenarios. In the scenario assuming the Preferred Alternative one additional step was required to define the number of patients actually landing at CHMC. This step involved the determination of the percentage of 1987 and 1988 pediatric flights actually landing at CHMC. A review of the combined, two year data identified the following:

1987-1988 Airlift Northwest Rotary Wing Landings
Ultimately Destined for CHMC
by Landing Site

CHMC landings	23.1%
Intramural landings	66.2%
Harborview landings	9.9%
Boeing Field landings	.5%
Other (Weather related)	.3%
Total	100.0%

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The actual calculation of projected pediatric Airlift Northwest landings at CHMC in the years 1990, 1992 and 1995 is premised on several assumptions. These assumptions assume four constants: a constant use rate, a constant percentage of missed flights, a constant percentage of Airlift Northwest pediatric flights landing at CHMC, and a constant out-of-area utilization through 1995. The projected utilization under each scenario is as follows:

Year	Proposed Action	Preferred Alternative
1990	190 landings	44 landings
1992	194 landings	45 landings
1995	200 landings	46 landings

BACKGROUND/INTRODUCTION

Airlift Northwest is a non-profit emergency air ambulance service established in 1982 by an inter-hospital agreement among four member hospitals. The member hospitals are: Children's Hospital and Medical Center, Harborview Medical Center, Providence Medical Center and University Hospital. The service was established as a fixed wing service in response to a demonstrated need to serve rural hospitals in Eastern Washington, Southeast Alaska and Montana and to provide advanced medical care to those communities in the greater Western Washington area that did not have tertiary level capabilities. Two years later, in early 1985, in response to increasing requests for transport from Western Washington hospitals and emergency response programs, Airlift Northwest inaugurated a rotary wing service. The first helicopter landing by Airlift Northwest at CHMC occurred in August, 1985.

The first emergency landings by helicopter at CHMC occurred in the 1970's. By the early 1980's a need for a permanent helistop at the Hospital was becoming evident. In 1984, CHMC applied for a Master Use Permit to allow construction of a helistop at the hospital. As part of the application process the Department of Construction and Land Use determined that an Environmental Impact Statement would have to be prepared. The Draft EIS contained a "Proposed Action" to land all critically ill and injured pediatric patients directly at CHMC. A "Preferred Alternative",

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

to land at the CHMC helistop only with the most critically ill patients-- less critical patients would be unloaded at Harborview, Boeing or Intramural Field and then transported by ground ambulance to CHMC, was developed as a compromise proposal and presented in the FEIS. As part of the EIS planning process, this study was commissioned by Children's Hospital dical Center to define and identify three (3) factors:

1) The geographic service area of Airlift Northwest's existing pediatric program;

2) The percentage of pediatric flights ultimately destined for CHMC (regardless of where they land) and the nature of pediatric flights that actually land at CHMC; and

3) A projection of future Airlift Northwest pediatric flight volumes and a calculation of the number of flights likely to land at CHMC through the year 1995 under both the Recommended Action and the Preferred Alternative.

This study is divided into three main sections. The first section, Description of Methodology and Assumptions, describes the sources and types of data used in this study. This section also details the specific methodology supporting the utilization estimates. The second section, Projections of Future Utilization, calculates the likely pediatric utilization of Airlift Northwest's rotary-wing program in the years 1990, 1992 and 1995 under both the Proposed Action and the Preferred Alternative. Findings and Conclusions, the final section provides an overview and analysis of the air-ambulance utilization projections.

DESCRIPTION OF METHODOLOGY AND ASSUMPTIONS

DESCRIPTION OF METHODOLOGY AND ASSUMPTIONS

All data used in the review and analysis of current and projected CHMC landings were provided by Airlift Northwest.

A review of Airlift Northwest's 1987 and 1988 patient flight origin[1] was undertaken to identify the primary geographic area from which all rotary wing flights, and specifically pediatric flights were generated. Patient origins were originally defined by local community but reconciled for this study into County boundaries.[2] Reconciliation into County boundaries was needed to allow for future projections of pediatric rotary-wing air ambulance use.

The data analysis identified the primary geographic area for Airlift Northwest's rotary program as: bounded on the west by the Pacific Ocean; bounded on the north by the Canadian border; bounded on the south by Lewis County, and bound on the east by the Cascade Mountains.

---

1 After review of flight data for the years 1985-1988, and after discussions with Airlift Northwest administration it was concluded that both 1985 and 1986 represented "start-up" years for the rotary-wing program. In contrast 1987 and 1988 experience was relatively constant between months, and likely reflected the experience of a mature operation. Consequently, because the averaging of 1987 and 1988 data represents the most comprehensive and best available information on rotary wing use, it was used in this evaluation. This analysis assumes that the actual 1987-1988 transport experience remains relatively constant through the year 1995.

2 In review of the flight data, it became apparent that not all areas of King County equally request the services of Airlift Northwest. As such, King County was divided into the five distinct planning areas utilized by the Puget Sound Health Systems Agency and by the Department of Social and Health Services in the planning of health care resources. These planning areas are Central King, North King, East King, Southeast King and Southwest King.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Once the primary geographic area was identified, a further review of actual 1987 and 1988 utilization was undertaken by applying a widely accepted use-rate based projection method.[1] The specific steps in the methodology include the following:

1) A review and accounting of the 1987 and 1988 transports (adult and pediatric) generated from the specific Counties within the primary geographic area. Initially, it was necessary to evaluate all flights, not just pediatric, to allow for the inclusion of "missed flight" data. Airlift Northwest's missed flight data did not differentiate between adult and pediatric patients. [2]

2) Review and accounting of all 1987 and 1988 missed flights (adult and pediatric) and the reconciliation of these missed flights into the appropriate Counties.

3) The actual numbr of flights missed, by County, due to inclement weather was subtracted from "total missed flights" to ascertain the actual number of flights missed due to factors other than weather.

4) A calculation of missed flights as a percentage of total flights. It was assumed that the percentage of flights missed was consistent between the adult and pediatric populations.

---

1 The 1987 Washington State Health Plan adopts use-rate based methods for projection of most hospital and acute medical services.

2 Missed flights are defined as those flights that are not responded to due mainly to either inclement weather or the non-availability of transport equipment.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5) Adding the percentage of missed flights by primary geographic area to the actual 1987 and 1988 pediatric flight volumes to arrive at a total potential pediatric flight number.

6) Dividing the average 1987-1988 potential pediatric population (by primary geographic area region) by the average 1987-1988 pediatric population in each region to calculate the 1987-1988 "use rate" of each region. 1

Appendix 1 details the missed flight, total potential pediatric flights and county-specific use rate projections.

---

1 The use rate is defined as the average number of transports the pediatric population generates during a given calendar year. The statistic is presented as transports per 1,000 pediatric (ages 0-14) population. While specific age data are not kept, according to Airlift Northwest staff, the majority of pediatric flights are for patients aged 0-14. CHMC recalculated the use rate assuming a pediatric population encompassing those age 0-19. The obvious conclusion was a lowering of the use rate; therefore this population and related use-rate was not employed in this analysis. Appendix 2 contains the calculations on the population 0-19.

PROJECTIONS OF FUTURE UTILIZATION

PROJECTIONS OF FUTURE UTILIZATION

To project pediatric rotary-wing flight utilization in the years 1990, 1992 and 1995, the projected pediatric population for each planning area was identified. The source of the population data, for all areas except King County, is the Office of Financial Management.[1] Applying the projected population to the previously developed use rate provides an estimate of the projected population in each County likely to require pediatric air ambulance transport in the years 1990, 1992 and 1995. These projections are depicted in Appendix 3.

The January, 1988 FEIS contains a Proposed Action as well as a Preferred Alternative. The Proposed Action calls for the construction of a helistop to be used as a landing area for all helicopters transporting critically ill and injured patients to CHMC. The Preferred Alternative is characterized by the most critical patients landing at a paved, secured helistop on CHMC's campus. All other critical pediatric patients trans-

---

[1] Since OFM data is county wide and does not sub-divide the areas, the following method was utilized to develop the population projections for the sub-areas of King County. A Puget Sound Health Systems Agency report entitled "Projections of the Population by Age, Northwest Washington Health Service Area, By Planning Area: 1990" identified the percentage of individuals age 0-14 within each sub-area of King County. These percentages were assumed to remain constant and applied to the King County population estimates published by the Office of Financial Management. The percentage of population 0-14 within each King County planning area was held constant as follows:

Central	11.0%
East	33.9%
North	13.4%
Southeast	29.9%
Southwest	11.8%

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ported by helicopter to CHMC would land either at Harborview, Intramural Field or Boeing Field. The Preferred Alternative represents a continuation of the actual 1987-1988 CHMC landing experience.

A population/use-rate based projection method was applied to the two scenarios, the Proposed Action scenario and the Preferred Alternative scenario, to develop estimates of likely utilization. Only one element in the methodology differentiates the two scenarios. In the scenario assuming the Preferred Alternative one additional step was required to define the number of patients actually landing at CHMC. This step involved the calculation of the percentage of 1987 and 1988 pediatric flights actually landing at CHMC. The specific formula for each scenario is described below.

Proposed Action

The formula for projecting the number of pediatric landings at CHMC, under the Proposed Action in the years 1990, 1992 and 1995, incorporates the number of projected landings and adds a factor for out-of-area use.

The out- of-area use factor was based on the actual 1987-1988 pediatric Airlift Northwest experience. In the two year period under revieeew, 2.23% of all pediatric flights destined for CHMC were generated from areas other than those defined in the primary geographic area analysis. This actual experience was assumed to remain constant. The formula for projecting landings at CHMC is as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Total Airlift Northwest rotary wing patients destined for CHMC

+

out-of-area factor

=

Total rotary wing landings at CHMC

Using the above methodology, the projection of landings at CHMC under the Proposed Action is as follows:

1990:	190
1992:	194
1995:	200

Preferred Alternative

One additional step is required to define the number of pediatric patients directly landing at CHMC under the Preferred Alternative. This step involves the calculation of the percentage of 1987-1988 pediatric flights actually landing at CHMC. A review of the actual data identifies the following:

CHMC landings	23.1%
Intramural landings	66.2%
Harborview landings	9.9%
Boeing Field landings	.5%
Other (Weather related)	.3%
Total	100.0%

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

For projection purposes, the actual average 1987-1988 pediatric landing percentages, by site were assumed to remain constant. The formula for projecting the number of pediatric landings at CHMC, assuming the preferred alternative in the years 1990, 1992 and 1995 is as follows:

Total Airlift Northwest rotary wing patients destined for CHMC

x

CHMC Average 1987-1988 landing percentage (23.1%)

+

out-of-area factor

=

Total rotary wing landings at CHMC

Incorporating the above assumptions and formula, projections of pediatric rotary wing landings at CHMC are as follows:

1990	44 landings
1992	45 landings
1995	46 landings

Specific detail on the projected CHMC landings in the years 1990, 1992 and 1995, under both scenarios are included as Appendix 3.

---

1 A review of actual Airlift Northwest data reveals a decrease in the percentage of pediatric landings at CHMC from 23.9% in 1987 to 22.2% in 1988, for an average of 23.1%. However, should this trend continue into 1989 and beyond, the result would be a decrease in the landings at CHMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FINDINGS AND CONCLUSIONS

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FINDINGS AND CONCLUSIONS

The calculation of projected pediatric Airlift Northwest landings at CHMC in the years 1990, 1992 and 1995 is premised on several assumptions. The major assumptions assume four constants: a constant use rate, a constant percentage of missed flights, a constant percentage of Airlift Northwest pediatric flights landing at CHMC and a constant percentage of flights from out-of-area through the year 1995.

These projections make no assumptions regarding unknown variables which may increase or decrease demand for air ambulance services. For example, the reconfiguration of health care services, changes in technology, or changes in the health status of the population could have the impact of either increasing or decreasing utilization over time.

After conducting a literature search and reviewing all applicable studies, no generally accepted standards were identified that would allow for the incorporation, with confidence, of such variables into the calculation of use rates and subsequent landings. Therefore, it was concluded that the 1988 actual experience is the best indicator of future utilization and that any attempt to quantify the above unknown variables would reduce the reliability and validity of the projections.

BEFORE THE HEARING EXAMINER

CITY OF SEATTLE

In the Matter of the Appeals of

CHILDREN'S HOSPITAL AND
MEDICAL CENTER AND
LAURELHURST COMMUNITY CLUB

FILES NOS. MUP-87-060(W) and
MUP-87-061(W)

ORDER CONTINUING HEARING

RECEIVED
DEC 7 1987
DEPT OF CONSTRUCTION AND LAND USE

from a decision by the Director, Department of Construction and Land Use, on a master use permit application

Appellant, Laurelhurst Community Club, by its attorney, Peter J. Eglick, moved, at the prehearing conference on these matters, for a continuance of the hearing scheduled in these appeals to be held December 14, 1987. The basis for the motion was the required consolidation of any appeal from an interpretation of the Land Use Code which was expected to be issued November 30, 1987. Appellant/applicant Children's Hospital and Medical Center, by its attorney, Mitchell J. Olejko, Davis Wright & Jones, filed a letter acquiescing in appellant's motion. The Director, Department of Construction and Land Use, by the City Attorney, Dennis McLerran, assistant, indicated by telephone no objection.

Therefore, based on agreement as to good cause for a continuance, the hearing is continued to Tuesday, February 16, 1988, at 9:00 a.m.

Entered this 4th day of December, 1987.

DEPT. OF CONST. & LAND USE

March 25, 1987

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

This letter responds to your request for an updated response to Beatrice Ryan's August 30, 1985 request for an opinion about the medical need for the Children's Hospital and Medical Center to establish a helistop on hospital grounds. I've enclosed a copy of Ms. Ryan's letter for your convenience.

As indicated to me by the Department of Construction and Land Use (DCLU), the City of Seattle's Land Use Code permits the establishment of a helistop at a major institution like Children's as a conditional use, if the City Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

I was asked for my opinion on the question of medical need in my role as Director of the Seattle-King County Department of Public Health, as a licensed physician, and as Medical Program Director for Emergency Medical Services in King County, pursuant to State law. My response should be viewed as an informed opinion rather than an expert opinion, however, since I am not a pediatric or emergency medical specialist.

In order to review the facts of this issue, I have spoken with numerous physicians, administrators, community residents, and former patients. Because this is an informed opinion, and not a scientific survey, I did not employ formal bias control techniques or a standard question format. I have

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

400 Yesler Building Seventh Floor Seattle, Washington 98104 (206) 587-4600

reviewed the medical literature on emergency medical services delivered by helicopter, viewed a simulated transport/helicopter landing at Graves Field and near the Children's proposed helistop site, examined helicopter and transport equipment, toured the Children's facility, and reviewed Airlift Northwest logs and individual patient charts. To obtain additional information, I also held a fact-finding public hearing October 24, 1985 in the City Council chambers from 6:00 to 9:00 p.m. The written testimony and tape recording of this hearing are available upon request.

Existing Pediatric Emergency Medical Services System in Seattle

Personal health care can, in general, be subdivided into three functional levels: a primary level, where the health care system is entered and basic service received and where all health services are mobilized and coordinated; a secondary level, represented by ambulatory services of a specialist nature and inpatient services provided in a community hospital-type facility; and the tertiary level, which includes the highly complex and sophisticated services available only at a "medical center" (Alberta Parker, "The Dimensions of Primary Care" in Primary Care: Where Medicine Falls, 1974, New York, John Wiley and Sons).

Although there is no formal classification system, by industry standards Children's is a tertiary care center. Based on a self-assessment questionnaire prepared by nearly all Washington hospitals, the State of Washington's Profile of Critical Care Hospital Facilities (Second Edition, January 1980) lists Children's as a level 3 facility for all services profiled (trauma, burns, cardiac, respiratory, neonatal, and head and spinal). Under the State's classification scheme, level 3 generally indicates in-house, 24-hour availability of a physician, supervision and 24-hour on-call availability of specialists, specialized facilities, capability to perform specialized surgery and special therapies, and availability of special transport teams. The State's level 3 corresponds with the generally accepted definition of tertiary care.

One of the purposes of the State's Profile of Critical Care Hospital Facilities is to provide assistance to physicians in selecting the most appropriate facility and corresponding treatment level for their patients. Physicians caring for critically ill patients in areas served only by secondary or community hospitals will refer those patients to tertiary care centers when their conditions require treatments that other hospitals cannot provide. Another source of assistance in making patient referrals is the referral "hotline" offered by the University of Washington (UW) Hospital. By calling this hotline, attending physicians can obtain help making diagnoses and planning treatment, including transport of their patients to more appropriate facilities for their presenting condition. In some cases, attending physicians will refer their patients based on professional associations with specialists affiliated with particular tertiary facilities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pediatric and neonatal emergencies within Seattle which are hospitalized are generally admitted at one of the 19 neonatal intensive care (NICU) or 17 pediatric intensive care beds (PICU) at Children's or one of the 19 neonatal intensive care unit beds at the University of Washington Medical School Hospital. Other pediatric intensive care units in the Western Washington region are a 25-bed NICU at Tacoma General Hospital, a 6-bed PICU at the affiliated Mary Bridge Children's Hospital, and an NICU at Madigan Army Medical Center. Tacoma General and Mary Bridge have a wide range of pediatric specialties represented on their staff, and handle most neonatal and pediatric emergencies, generally referring only those patients requiring sophisticated pediatric surgery, such as cardiac surgery, to Children's or the UW Hospital. According to Dr. Robert Scherz, President of Medical Affairs at Mary Bridge, and Dr. John Coombs, Vice President of Medical Affairs at Tacoma General, most of the patients admitted to these hospitals come from South King, Pierce, Thurston, and Mason Counties. The only other pediatric or neonatal intensive care beds in the State are located in Spokane. Pediatricians and neonatologists from within the State and from surrounding states (Alaska, Montana, Idaho) generally use Children's and the UW as referral centers for the most seriously ill children and neonates requiring tertiary specialty care. Most highly sophisticated pediatric surgery in the region is done at Children's.

The University of Washington has a program which admits high-risk mothers so that low birthweight babies do not have to be transported between hospitals. This method of delivering high-risk mothers has been found to substantially reduce the morbidity and mortality associated with the delivery of low birthweight babies (Hickok, D. et al., "Decreased Mortality of Very Low Birthweight Infants After Maternal Transport," Department of Obstetrics and Gynecology, University of Washington School of Medicine, unpublished paper).

But even with an excellent maternal transport program, there will still be individual patients who deliver small birthweight babies at small community hospitals throughout the State, where the infant needs to be stabilized and transported to a tertiary care hospital. Children's is the hospital generally designated for the care of these infants. The University Hospital and Children's also refer patients to each other, when beds are full. The same pediatric medical staff, including interns and residents, delivers services at both hospitals. In addition to small birthweight babies who have undeveloped lungs and intestines and require intensive support for survival and growth, there are transfers from hospitals around the State to Children's for pediatric surgery or acute infection. Trauma patients generally go first to the region's trauma center, Harborview Medical Center, but may be transferred to Children's for follow-up after surgery and stabilization.

This referral pattern exists regardless of transportation mode.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopter Transport

The American Academy of Pediatrics (AAP) Committee on Hospital Care has published general guidelines on pediatric patient transport ("Guidelines for Air and Ground Transportation of Pediatric Patients," Pediatrics, 1986 Nov.; 78(5): 943-50). The AAP guidelines indicate that the factor of paramount importance in selecting mode of transport is "the optimal interhospital transport time indicated by the nature and severity of the patient's clinical condition...If a patient's medical condition is unstable, even a minimal shortening of transport time to the referring hospital by one mode of transportation rather than another may be lifesaving." The AAP guidelines also indicate that "referrals are made and accepted based upon the judgment of the referring physicians rather than upon a specific set of criteria."

The State Medical Society's EMS Committee is working on the delineation of medical necessity or medical reasonableness for medical transport and under Dr. Lothar Pinker's direction is hoping to have guidelines published into the Washington Administrative Code (WAC) in 1987. As proposed in the enclosed February 18, 1987 draft of the guidelines, the selection and utilization of an air ambulance service should be based on the level of medical care the patient's illness or injury requires during the transport, the urgency of transport, and on dispatch protocols adopted in each county. The proposed guidelines include general examples of critical cases and conditions, and require review of treatment protocols, assessment of field performance, and critique of air ambulance runs by an air ambulance medical director functioning through the delegation of statutory responsibility by the local Medical Program Director. As Medical Program Director for King County, I would be responsible for developing and supervising the review process.

There are several studies in the literature that assess the severity of illness and injury in pediatric air transport. In one study, Mayer and Wallie prospectively evaluated 636 patients transported over 79 months of service to a regional children's center. Of these patients, 57.5% were transported by helicopter. Eighty-one percent of patients were taken to surgery or admitted to the intensive care unit immediately on arrival at the regional children's hospital. Overall mortality was 9%; a trauma score was used to classify patients (Ann. Emerg. Med. 1984 Feb.; 13(2):108-11). At Johns Hopkins, Dr. Columbiani et al., reviewed 267 children over a one-year period; 46% of patients arriving directly from the injury scene were delivered by helicopter. Fourteen of seventeen deaths resulted from head injury; a more aggressive approach to the management of brain trauma was advocated (J. Pediatric Surg. 1985 Feb.;20(1):8-13).

Another study evaluating air transport in a rural EMS system looked at 569 patients with multisystemic injuries. The emergency helicopter service was rated, utilizing strict specific guidelines as either essential, helpful, or not a factor in the preservation of life. The helicopter was essential to 16.5% and helpful to 10.9% of patients. In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8).

Similarly, in a study in Michigan, Rhee et al., found that based on an objective Trauma Intervention Scoring System (TISS) which measures the intensity of medical care provided in a 24-hour period, 65% of patient transports by helicopter were thought to be medically necessary both at the time of the flight and later; 17% were thought to be appropriate using the information available at flight time, but were later found not to be; and 18% were found not to be necessary. These researchers concluded that TISS is a useful, objective measure of helicopter transport program performance and should be tested in other helicopter transport programs (Annals Em. Med. 1986 Jan; 15:1;79-82).

Baxt et al., looked at a group of 1,273 blunt trauma patients who were treated and transported from the site by seven different hospital-based rotorcraft aeromedical emergency care services and saw a 21% reduction in expected mortality ($p<.05$) in five of the seven services. There is some debate about methodologic errors in the study. An editorial in the same journal issue (Annals Em. Med. 1985 Sept.; 14:9;859-61) states that

> The effectiveness of aeromedical evacuation of battlefield casualties is well established; the transfer of this technology to the civilian setting is a logical event. Its effectiveness for civilian trauma care should be based on the following three principles; 1) early field resuscitation; 2) rapid transport; and 3) delivery to the hospital best suited to admit and treat the patient definitely and without delay. As Baxt and colleagues point out, helicopter emergency medical service (HEMS) patients may benefit from a highly integrated team effort at the receiving trauma center that is the direct or indirect result of a program but for which the helicopter (unless distance is a factor) is the least important component. This is a strong argument for the concept of regional trauma care that concentrates multiply injured patients in trauma centers organized to best care for them. The potential role of HEMS in making regional trauma care a reality should be explored by EMS systems.

My conclusions from the literature review are that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting a helicopter versus ground ambulance transport but do not help in

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, does not clearly shed any statistical light on your question at issue, the Graves field site versus the hospital site a minimum of 10 minutes away (patient transfer and driving time). There is very little in the literature concerning the interhospital transport of non-trauma patients.

Current Data

Children's admits approximately 700 patients per month in 200 beds, including 36 intensive care beds. In Children's Fiscal Year 1986 (October 1 - September 30), 283 patients were admitted after air transport; 166 were fixed-wing transports and 117 were rotary-wing transports (115 Airlift Northwest, 1 MAST, and 1 KIRO). Of the 117 patients transported by rotary-wing, 32 landed at the emergency room entrance of the hospital. Nineteen of those 32 died; the remaining 13 had an average length-of-stay of 17.5 days, compared to the average 7.1 days for all admissions.

Review of the case files of the children flown directly to Children's indicates that with one possible exception, all presented life-threatening conditions that warranted transport right to the doors of the hospital. Review of 30 additional randomly selected cases flown by helicopter to Harborview for ground transport to Children's shows that all cases met the State's proposed criteria for use of air transport but were less severe than those flown directly to the hospital. Referring physicians and Children's appear to be sorting patients appropriately.

Recommendations

It is my professional opinion that there are hospital transfers to Children's where 10 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small. Decisions regarding air transport of these patients must rest on the judgment of the attending physician and consider distance, stable clinical condition during transport, severe injury or illness requiring tertiary center treatment (rather than secondary or community hospital level), and the possibility of decompensation (severe clinical deterioration) during transport. The most important part of the transport, in most cases, will be in getting a specially trained team out to community hospitals around the State. The key to any transportation of sick people is the stabilization of the patient, making sure that vital signs are stable and that the general physical condition is not deteriorating. One of the most important aspects in the case of the critically ill neonate is the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse, to the community hospital to stabilize a deteriorating baby. Once stable, a patient can be transported much more safely.

In most cases, Harborview or Graves Field would be adequate sites for most patients transported by helicopter to Children's; however, there will be a small number of cases where the ability to land at the hospital may be life-saving.

It is difficult to derive reliable projections of total numbers of patients who would be transported by helicopter to Children's. Given that a medical breakthrough, catastrophe, addition of competing helicopter service, increasing specialization, or some other situation might change their projection, Children's estimates that by 1990 the number of children transported by helicopter for admission to Children's in any given month may be 15 to 20. Based on actual experience in 1986, 4 to 5 of these patients may have a medical need for helicopter transport to the doors of the hospital.

The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any estimate of the number of transports to the doors of Children's would have to include an additional number of patients whose condition at time of referral was appropriate for air transport but who over time were determined not to have need of helicopter transport as essential. There also needs to be some flexibility for seasonal variation in disease.

Taking into account these factors, I would estimate six (6) critically ill pediatric patients per month as an upward bound for helicopter transports to the doors of Children's in the next decade.

I recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with guidelines for use, rather than a hospital-by-hospital provided service. The proposed WAC guidelines for air ambulance use appear to support this approach. A consortium of hospitals providing helicopter services such as the one in Airlift Northwest is certainly a most sensible approach and will make it easier to establish a systematic approach to provision of these services. We are, however, just beginning to integrate helicopter transport into our EMS system. The proposed WAC guidelines are a first step in this direction. They condition licensure of air ambulance services on meeting standards for equipment, personnel, community need, and use, and place air ambulance services under the medical control of local medical program directors.

Based on my review of Children's case files, I conclude that the Children's helistop meets the City's land use permit requirement that it save lives. I also believe, given Children's experience to date and the prospect of State-mandated controls, that use of the helistop can be restricted to life-threatening emergencies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

While it is beyond the scope of my expertise to comment on the City's requirement that the helistop be located so as to minimize impacts upon surrounding residential property, I strongly recommend that the City give careful consideration to the issue of helicopter safety. From a public health standpoint, the risk of an accident must be weighed against the medical benefit of helicopter transport.

I hope that these updated observations and recommendations will assist you in your permit deliberation; please let me know if any comments need further clarification. Again, my thanks to DCLU staff, to a wide variety of health professionals involved in delivery care, to the staff and administration at Children's, to the community residents of Laurelhurst, and to a number of other interested individuals who helped me to reach a better understanding of the emergency medical services delivered to infants and children in our community and the many factors which affect those services.

Sincerely,

Bud Nicola ms

Seattle
Department of Construction and Land Use

Beatrice Farrar Ryan, Interim Director
Charles Royer, Mayor

August 30, 1985

RECEIVED
SEP 4 19[illegible]
OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT OF PUBLIC HEALTH

Bud Nicola, Director
Health Department
7th Floor, Yesler Building

Dear Mr. Nicola:

I am writing to ask your help.

As you know, this Department has received an application from the Children's Orthopedic Hospital to establish a helipad on hospital grounds. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

We must make a recommendation to the City Council and our report must examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas as part of the analysis.

The question of medical need is beyond our area of expertise and this is where I am asking for your Department's assistance. In the past, helicopters have made emergency landings at the Graves athletic field and patients are then transported by ambulance to either Children's Orthopedic or to the University of Washington Medical Center. This request by Children's Orthopedic would mean those patients destined for Children's would instead land on hospital grounds with those destined for the University of Washington continuing to land at Graves field. The University of Washington may subsequently apply for a permit for a helistop on the grounds of the U. W. medical campus.

You have agreed to sponsor a public hearing and to give us your opinion on the question of medical need. The questions I would like your opinion on are:

1. What are existing emergency services in Seattle and how does the service fit into the existing services?
2. What emergency services does COH offer that are unique and unavailable elsewhere?
3. Is there a medical need for emergency helicopter service to serve the hospitals in this immediate area, (Children's and University of Washington primarily)? What, if any, would be the effect on the well-being of a patient transported by helicopter versus helicopter and ground transport as it is presently done? Are direct flights versus air/ground transports medically significant in terms of patient morbity and mortality?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Is the current site at Graves athletic field adequate, or is there a medical need to locate such facilities on the hospital grounds? Or are there alternative sites? Would one such facility either at COH or U. W. be a preferred location?
5. What data are available regarding the number of emergencies that are likely to be generated by the population to be served by the helicopter services? How many landings per week will result?
6. If there is an established medical need, how would you define "occurrences involving life-threatening emergencies," as the use must be restricted to such occurrences? Are there other restrictions we should consider, based on existing medical care facilities capabilities?
7. How would you suggest we monitor the occurrences to ensure that the use is restricted to life-threatening emergencies should the use be permitted? Can we ensure that the service is used for emergency purposes only?

We have asked Children's Orthopedic Hospital for more information to support their application for the helistop (see attached). This information is necessary for your consideration of these questions. As soon as we receive it, we will send you a copy. As you know, we are happy to help with the scheduling and public notice of the hearing.

Thank you for your assistance. If you have questions, please call me at 625-2262 or Katy Chaney at 625-4274.

Sincerely,

Katy Chaney

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

THIS DRAFT INCLUDES CHANGES SUGGESTED AT THE 2-18-87 WSMA EMS STANDARDS COMMITTEE MEETING. Changes from the original draft are typed in this larger print so they can be easily identified.

WAC 248-17-020

DEFINITIONS. For the purpose of these regulations, the following words and phrases shall have the following meaning unless the context clearly indicates otherwise.

(1) "Department" means the state of Washington Department of Social and Health Services.

(2) "Emergency Medical Services Advisory Committee" means the committee appointed by the Governor, pursuant to RCW 18.73.040.

(3) "Air ambulance" means any privately or publicly owned aircraft specifically designed, constructed or modified which is intended to be used for and is equipped with the intent to be used for the transportation of individuals who are sick, injured, or otherwise incapacitated or helpless.

(4) "Air ambulance service" means a service that is currently certified under Federal Aviation Administration (FAA) rules, 14 CFR Part 135, (Air Taxi Operators and Commercial Operators of Small Aircraft) and is certified by the department as an air ambulance service and meets the minimum requirements for personnel and equipment as described elsewhere in this chapter.

(5) "Local EMS Medical Program Director" means a licensed physician authorized by the department to perform duties specified in RCW 18.71 and 18.73.

(6) "Medical control" means physician responsibility for supervision of EMT training programs, the establishment of field protocols, and the recommendation for certification and decertification of EMTs certified under this chapter.

(7) Medical control as defined above does not include first responders, except as provided in WAC ___-___ (the WAC covering First Responder defibrillation).

(8) "Basic life support" means out of hospital emergency care which includes some or all of the techniques and procedures taught in a state approved emergency medical technician basic training course.

(9) "Advanced life support" means an advanced level of out of hospital emergency care that includes basic life support functions plus some or all of the following techniques or procedures:

(a) Cardiac monitoring.

(b) Cardiac defibrillation.

(c) Telemetered electrocardiography.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(d) Administration of specific medications, drugs, and solutions.

(e) Use of adjunctive medical devices.

(f) Trauma care.

(g) Airway management techniques.

(h) Other techniques and procedures authorized by medical control.

(10) Air Ambulance Support Personnel

(a) Air Ambulance Medical Director. A physician licensed by the State of Washington who is knowledgeable of potential medical complications which may arise because of aeromedical evacuations and who is engaged by the air ambulance service to oversee and assure that the appropriate aircraft, medical personnel and equipment are provided for patients transported by the air ambulance service. The air ambulance medical director and alternates function through delegation of responsibility of the local Medical Program Director in the county where the service is licensed.

(b) Registered Nurse. A person licensed and certified by the state of Washington to perform nursing functions pursuant to RCW 18.88.

(c) Paramedic. An emergency medical technician who has completed an advanced life support training program approved by the department, who is certified by the department as a mobile intensive care paramedic pursuant to RCW 18.71.

(d) Emergency Medical Technician. An individual who has completed a basic life support training program approved by the department, and who is certified by the department pursuant to RCW 18.73.

(e) Pilot. An individual certified by the Federal Aviation Administration and licensed with the state of Washington Department of Transportation pursuant to RCW 47.68. This individual must meet certain criteria set forth by the department.

(f) Patient. An individual who, as the result of illness or injury, needs immediate medical attention, whose physical or mental condition is such that he is in imminent danger of loss of life or significant health impairment, or who may be otherwise incapacitated or helpless as a result of a physical or mental condition.

(g) Communications System. A radio or landline network connected with a dispatch center which makes possible the alerting and coordination of personnel, equipment and facilities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-17-135 Air ambulance services - Requirements for Licensure. The department is authorized to issue licenses to services conforming to these regulatory standards:

(1) No air ambulance service shall function as an air ambulance service in this state unless the agency holds a currently valid license to do so.

(2) An application for an original or renewal license shall be made to the department and shall contain as a minimum, but is not limited to, the following:

(a) Articles of incorporation and current business license, where applicable.

(b) The name and address of the owner of the air ambulance service or proposed ambulance service.

(c) The name under which the applicant is doing business or proposes to do business.

(d) The training and experience of the applicant in the transportation and care of patients.

(e) A description and general location of each aircraft to be used as an air ambulance, including the make, model, year of manufacture, registration number, or other distinguishing characteristics.

(f) The geographical area served.

(g) The air ambulance medical director for a geographic area who shall review treatment protocols, assess field performance and critique air ambulance runs with the local medical program director. The air ambulance medical director shall be designated in writing by the local medical program director.

(h) Agreement to abide by the review process designated by the department and/or the local medical program director as defined in WAC 248-15-020.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(j) A current roster of medical personnel which includes level of certification or licensure.

(k) Agreement to provide reports to the department for each trip made, on forms or a data format specified by the department.

(l) They shall provide evidence of coordination with the local medical program directors in communities where the service intends to operate.

(3) The department shall review each application for licensure based upon type of service to be offered, equipment, trained personnel, and whether the public convenience and necessity requires the proposed service. Before issuing a license to a new service, the department shall inspect the vehicle, the ambulance equipment and the personnel roster.

(4) An ambulance service license will be issued for a period of three years from the date of issue and will remain valid for this period unless revised, modified, revoked or suspended by the department. Inspections shall be conducted to assure compliance. The vehicle license will be for a period of one year and updated annually.

(5) Grounds for denial, suspension or revocation of air ambulance license shall include, but are not limited to proof that the applicant and/or service

(a) Has been guilty of misrepresentation in obtaining the license.

(b) Has engaged or attempted to engage in service that is not authorized by the license.

(c) Has demonstrated incompetence or has otherwise been unable to provide adequate service.

(d) Has violated or aided and abetted in the violation of any provisions contained in RCW chapters 18.73 and 18.71.

(e) Has demonstrated unprofessional conduct in the course of providing services.

(f) Has failed to meet requirements in associated statute and rule.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-17-136 Air ambulance services - Personnel Requirements.

(1) Air ambulance medical director.

(a) Each air ambulance service must have at all times an air ambulance medical director (or his/her alternate) who is a licensed physician knowledgeable of the air medical requirements of patients. It is the responsibility of the air ambulance service applicant to provide in writing to the department the name of the medical director and approved alternate(s).

(b) The air ambulance medical director (and alternate) must have training in altitude physiology and be familiar with the emergency medical services communications system.

(c) The air ambulance medical director (or alternate) will:

(i) Be knowledgeable of the capabilities and limitations of the aircraft used by his service.

(ii) Be knowledgeable of each of the medical attendants' capabilities relative to meeting the patient's medical needs.

(iii) Be knowledgeable of potential medical complications which may arise because of aeromedical evacuation of patients being transported by the air ambulance.

(iv) Match during interfacility transports appropriate aircraft, medical personnel and medical equipment necessary in the care of patients' medical needs or any anticipated inflight complications.

(v) Be knowledgeable in the application, use, maintenance, removal and hazards of any routine or special medical equipment used in the transport of patients by the air ambulance service.

(vi) Assure current certification, training requirements, and education requirements are met by all medical attendants providing services for the air ambulance service.

(vii) Ensure that all medical attendants are adequately trained to perform inflight duties prior to functioning in an inflight capacity.

(viii) Ensure that each medical attendant meets the requirements necessary to provide given levels of medical care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(d) The air ambulance medical director is responsible to coordinate with local medical program director(s) in every county where service is provided.

(2) Air ambulance medical attendant.

(a) At least one medical attendant accompanying the patient shall be a person who:

(1) Has current Washington state certification or licensure as a Paramedic, Registered Nurse, or Physician.

(ii) Must have training and be familiar with altitude physiology, aircraft safety and Washington emergency medical systems communications, as determined by the department.

(iii) Must be knowledgeable in the application, operation, care, and removal of all medical equipment used in the care of the patient. The medical attendant(s) must have a knowledge of potential inflight complications and their treatment which may arise from the use of such devices.

(iv) Will be required to know and follow all policies and procedures of the air ambulance service's medical director.

(v) Must have available during transport a current copy of all written protocols authorized for use by the air ambulance medical director. Patient care shall be governed by these authorized written protocols.

(b) The air ambulance medical director may designate additional attendants with specialized skills to meet the specific needs of the patient.

(3) Pilot. In addition to being licensed with the state of Washington department of transportation pursuant to RCW 47.68, the pilot must:

(a) Possess commercial rotorcraft certification and a minimum of 2,000 rotorcraft flight hours as pilot in command.

(b) Be factory trained or equally prepared and have at least five (5) hours in the specific type of aircraft, before flying as pilot in command on patient missions.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(c) Meet FAA requirements for medical certification, licensing and type of ratings for the flight(s).

(d) Have training and be familiar with altitude physiology and EMS communications

(e) The final decision to fly or not to fly will be made by the pilot.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-17-137 Air Ambulances - Required Equipment. All air ambulances shall carry at least the following medical equipment:

(1) Cardiac monitor/defibrillator with strip-chart recorder and battery back-up power. Monitor should be tested to insure that it does not produce electromagnetic interference with aircraft navigation and communication equipment.

(2) Litter or stretcher approved by FAA for type of aircraft with straps for securing patient to litter and litter to frame.

(3) Medical oxygen source (installed or portable). The minimum amount of oxygen carried should be sifficient to supply one patient for one hour at 10 LPM. Oxygen bottles should be secured to aircraft in an approved manner.

(4) Portable suction device with battery back-up power, tested and certified to function at all altitudes.

WAC 248-17-138 Air Ambulances - Selection and utilization. The selection and utilization of an air ambulance service shall be determined by the medical program director in the county of patient origin or the air ambulance medical director and the referring physician prior to response based upon the following:

(1) Level of medical care the patient's illness or injury requires during transport, or non-availability of local transport.

(2) The urgency of transport (immediate or not immediate). In special circumstances, because of urgency of transport, an action of providing less than minimal air ambulance transport care may occur.

(3) The dispatch protocols adopted by the medical program director of the county of origin.

(4) Any agency (requesting agency and transporting service) that dispatches a service that does not meet the minimum requirements is required to prepare and submit a written justification to the local medical program director and the state Emergency Medical Services Training and Licensing Section within 14 days of the action.

(5) Other aircraft not herein defined by this chapter shall not be used for transportation of patients who may require medical attention enroute, except that such transportation may be used when a disaster creates a situation that cannot be served by licensed ambulances.

AIR AMBULANCE PROTOCOLS

INTRODUCTION

Chapter 248-17, Washington Administrative Code (WAC), establishes minimum standards for licensing air ambulance services and aircraft.

The purpose of this document is to set forth air ambulance policies adopted by the State of Washington Department of Social and Health Services to promote and protect the health and safety of the people of this state.

Field use of an air ambulance shall only occur when there is reasonable cause to believe that the patient's death or increased morbidity will result if any means other than air ambulance is utilized.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CRITERIA FOR USE OF PREHOSPITAL AIR AMBULANCES

I. To provide rapid delivery of a critical patient(s)* to an appropriate definitive care facility when ground transport times would be protracted (more than 15 - 20 minutes). For example:

Long distances
Terrain problems
Traffic congestion
Long field extraction times
Hazardous road conditions or other road obstruction

II. To provide rapid delivery of special critical care medical personnel to the scene otherwise staffed by non-critical care personnel, for example, paramedics/Rns/physicians assistants/EMTs - experts to assist in disaster or hazardous materials incidents.

III. To provide extrication from otherwise ground inaccessible sites and/or assist in search and rescue operations (mountains/islands).

IV. To provide integrated support in multiple patient incidents, e.g., most seriously injured patients - to deliver skilled personnel or needed supplies/equipment.

CRITERIA FOR NON-UTILIZATION OF AIR AMBULANCE

I. Obviously fatal injury (decapitation, rigormortis).

II. Cardiac arrest of any etiology.

III. If the ground ambulance is capable of arriving at the hospital with the Patient before the air ambulance can arrive at the scene of the accident or illness.

* CRITICAL CASES - EXAMPLES

A. Trauma

1. Physiologic Criteria

a. Trauma score 12 or less

b. Glascow Coma Scale 10 or less

2. Mechanism of Injury Criteria

a. Motor vehicle accident with:

Extrication time more than 20 minutes
Structural intrusion into victim's space by more than 1 foot

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a. Motor vehicle accident (continued):

Victim ejected from the vehicle
Associated death in the same vehicle
Pedestrian struck and thrown 15 feet or more
Child under 12 years struck by vehicle

b. Falls of 15 or more feet

c. Evidence of rapid deceleration

3. Anatomic Criteria

a. Penetrating injury anywhere from the head through the groin

b. Amputation above the ankle or the wrist with potential reimplantation

c. Critical burns or burns by inhalation injury, electrical burns, or other accompanying trauma

d. High voltage electrical injuries (more than 1,000 volts)

e. Spinal cord injuries

f. Toxic inhalation injuries

g. Three or more long bone fractures

h. Injuries of two or more body systems

4. Comorbid Factors

a. Age - 12 or less/60 or older

b. Underlying medical conditions, for example

5. Criticality Criteria

a. Deteriorating conditions which may include loss of consciousness, onset of shock and/or respiratory distress within 30 minutes of injury (define vs. remove)

B. Medical - requiring emergent (within 15 minutes) definitive care center intervention, for example

Rupturing aortic aneurysm

Severe hype or hyperthermia

Acute subarachnoid hemorrhage

c. Obstetric or neonatal - requiring emergent (within 15 minutes) definitive care center intervention

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CRITERIA FOR INTERHOSPITAL AIR AMBULANCE UTILIZATION

GENERAL

1. Requirement for critical care enroute, not otherwise available
2. Time critical injury or illness
3. Need to minimize time out of hospital
4. Alternate travel means unavailable or undesirable

SPECIAL CONDITIONS

1. Cardiac
   a. Acute coronary occlusion
   b. Cardiogenic shock
   c. Dysrhythmias, life threatening
   d. Pericardial tamponade
   e. CHF with decompensation
2. Respiratory
   a. Respiratory failure
   b. ARDS
   c. Ventilator dependency
   d. Severe asthma
   e. Epiglottitis
   f. Aspiration
3. Other Medical
   a. Renal failure (acute fluid overload or electrolyte imbalance) requiring dialysis
   b. CNS bleeds requiring airway and/or ventilator management
   c. Shock (hemorrhagic, DKA, septic, anaphylaxis)
   d. Coma requiring airway and/or ventilator management
   e. Overdose requiring airway and/or ventilator management or accompanied by shock, dysrhythmias
4. Trauma
   a. Multisystem trauma (Champion-Sacco Criteria)
   b. Trauma score $\leq$12
   c. Glasgow Coma Score $\leq$8
   d. Severe extremity injury (amputation, crush injury, unstable long bone fracture)
5. Other Surgical
   a. Acute vascular catastrophe
   b. Acute abdomen
6. OB
   a. Premature labor
   b. Pregnancy induced hypertension
   c. Poorly controlled D.M.
   d. Premature rupture of membranes
   e. Prolapsed cord
   f. Vaginal bleeding (including abruptio placenta, placenta previa)
   g. Fetal distress

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7. Neonatal
   a. Respiratory distress syndrome
   b. Prematurity
   c. Sepsis
   d. Congenital anomalies
   e. CHF
8. Pediatrics
   a. Respiratory distress
   b. Decreased level of consciousness
   c. Poisoning
   d. Severe infections (epiglottitis, meningitis, severe pneumonia)
   e. CHF

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Department of Construction and Land Use

Beatrice Farrar Ryan, Interim Director
Charles Royer, Mayor

Re: Scoping of Environmental Impact Statement
MUP 8405870

Nancy Greenawalt
Children's Orthopedic Hospital
P. O. Box C5371
4800 Sand Point Way N.E.
Seattle, Washington 98105

Dear Ms. Greenawalt:

Based upon the Department's analysis and upon letters received during the scoping comment period, our scoping determination for the Environmental Impact Statement for your application for a helistop permit is as follows:

AREAS OF IMPACT

Noise
Vibrations
Safety
Cumulative land use impacts of emergency medical transport by helicopter in the Seattle-King County region
Alternatives
- alternative sites off-campus, including UW Graves Field (soccer field)
- shared usage of sites
- no action alternative

MITIGATION MEASURES

Possible mitigation measures discussed in the EIS shall include the following:
- flight paths
- number of flights
- usage and location of U. S. Army (M.A.S.T.) or other agency helicopter landings
- off-campus pick-up of medical teams
- liability insurance
- criteria for use of helicopters
- plan for monitoring use

Comment letters should be carefully reviewed by the consultants preparing the EIS. The letters contain concerns regarding background data, impacts, study methodology and possible mitigation measures, within the scope of the EIS just outlined.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If you have questions on this scoping determination, please call me at 625-4509.

Sincerely,

BEATRICE FARRAR RYAN
Interim Director

RECEIVED
JUL 23 1986
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

INTENT TO PREPARE A
SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT (SEIS)*
and
INITIATION OF THE SCOPING PROCESS

Project Name: University Hospital Helistop

Description: Use of the helistop on the roof of the new east wing addition to University Hospital for transporting emergency patients.

A Supplemental Environmental Impact Statement (SEIS) will be prepared on this project. The University has identified the following elements of the environment for discussion in the SEIS: risk of upset, noise, and light and glare. A copy of an environmental checklist, which provides additional information about the project, is attached.

Scoping: Agencies and members of the public are invited to comment on the scope of the SEIS, including reasonable alternatives, mitigation measures, probable significant adverse impacts, licenses or other approvals that may be required. Comments should be sent to Sally Marks, Campus Planning Office, FJ-05, University of Washington, Seattle, Washington 98195 (543-9071) by August 12, 1986.

Date: July 22, 1986 Signature: H. F. Vanneman

*Supplementing the University of Washington General Physical Development Plan

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

UNIVERSITY OF WASHINGTON
ENVIRONMENTAL CHECKLIST

A. BACKGROUND

1. Name of proposed project.

University Hospital Helistop

2. Name, address, and telephone number of applicant:

University of Washington
Seattle, Washington 98195

3. Name, address, telephone number of contact person.

Sally Marks, Environmental Planner
Campus Planning Office, FJ-05
University of Washington
Seattle, Washington 98195 (543-9071)

4. Date checklist prepared: July 9, 1986; Revised July 15, 1986

5. Agency requesting checklist: University of Washington

6. Proposed timing or schedule (including phasing, if applicable):

Helistop proposed to become operational within one month following issuance of conditional use permit.

7. Do you have any plans for future additions, expansion, or further activity related to or connected with this proposal? If yes, explain.

No

8. List any environmental information you know about that has been prepared, or will be prepared, directly related to this proposal.

An EIS for construction and use of a helistop at Children's Orthopedic Hospital is currently being prepared. This helistop would be used to accommodate helicopters from Airlift Northwest which will transport critically ill or severely injured infants, children, and adolescents. This service would not duplicate the service proposed for University Hospital, which would focus on providing care to high-risk obstetrical patients, neo-natal patients, and, to a lesser extent, cardiac and other patients. More discussion will be included in the University Hospital Helistop EIS.

9. Do you know whether applications are pending for governmental approvals of other proposals directly affecting the property covered by your proposal? If yes, explain.

None are pending

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

10. List any government approvals or permits that will be needed for your proposal, if known.

Approval from FAA
Conditional Use Permit from City of Seattle

11. Give brief, complete description of your proposal, including the proposed uses and the size of the project and site. There are several questions later in this checklist that ask you to describe certain aspects of your proposal. You do not need to repeat those answers on this page.

It is proposed to transfer the landing site for helicopters transporting patients to and from University Hospital from the University's Intramural Activities (IMA) fields to the helistop on the roof of the East Wing Addition to University Hospital. The helistop is located on the roof of the sixth floor of the Northeast portion of the addition (Figure 1). This roof has been designed to accommodate helicopter landings; structural support and adequate clearance have been provided. No structural changes are required. This roof area is approximately 9,088 sq. ft. The helistop will be a circular area of approximately 3,300 sq. ft. (Figure 2). Exterior elevations of the wing with the helistop location can be found in Figure 3.

A circular yellow band 18 inches wide and approximately 62 ft. in diameter will be painted on the roof's concrete topping slab to mark the total landing and take off area. A white circular band 18 inches wide and approximately 45 ft. in diameter will be painted to mark the touchdown area. Inside the white band a circular area with a large white cross will be painted. Inside the cross a red "H" five ft. six inches across will be painted. The weight limit of the helistop will also be marked inside the touchdown area. (See Figure 4).

The helistop will be used for the landings of helicopters carrying critically ill patients requiring immediate care in the hospital's specialized facilities. It is anticipated that the types of patients transported will be primarily high risk obstetrical patients, infants requiring care in the hospital's neonatal intensive care unit, and severely ill cardiac patients. Of the 43 patients transported via the Airlift Northwest helicopter during the period July 1, 1985 through June 15, 1986, 19 were obstetrical patients, 8 were infants, 12 were cardiac patients, and 4 had other diseases/conditions. These flights are currently landing in the IMA fields; patients are then transferred to an ambulance and transported to the Hospital Emergency entrance via Montlake Blvd. NE and NE Pacific Street.

Most patients will be transported in the Airlift Northwest helicopter, an Augusta 109A MKII. This is one of the quietest helicopters on the market. It is a modern, fully enclosed helicopter with a four blade propeller and retractable landing gear. The helicopter has a cruise speed of 180 m.p.h. and a maximum speed of 194 m.p.h.

any quantifiable description (dBA, eq.?)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

need to know about MAST and other copters

Other helicopters bringing patients to the hospital will also land on the helistop. However, the helistop has a maximum weight limit of 6,000 lbs., so larger helicopters, such as those used by the MAST (Military Assistance to Safety and Traffic) system, will not be able to use the helistop. Any MASTflights that continue to come to University Hospital will land in the IMA Field and patients will be transferred by ambulance to the hosptial.

It is anticipated that in the future approximately 70-82 flights per year (or 6-7 per month) will land on the helistop. These landings will occur at any time during a 24-hour period. However, during the period July 1, 1985 through June 15, 1986, 72% of the 43 Airlift Northwest helicopter flights (31 flights) bringing patients to University Hospital landed (via the playfields and ambulance) between 8:00 a.m. and 8:00 p.m. Seven percent (3 flights) landed between midnight and 8:00 a.m. and 21% (9 flights) between 8:00 p.m. and midnight. It is anticipated that this pattern will continue. This would result in a maximum of 59 flights per year (5 per month) occurring between 8:00 a.m. and 8:00 p.m.; 17 flights per year (1.4 per month) occurring between 8:00 p.m. and midnight; and 6 flights per year (.50 per month) occurring between midnight and 8:00 a.m.

The preferred flight path for landings is from the east over Union Bay (Figure 5. The alternate approach will be from the northeast over the IMA Building and Edmundson Pavilion. — why?

12. Location of the proposal (street address or section, township, and range, if known). Provide a site plan, vicinity map, and topographic map, if reasonably available.

1959 NE Pacific Street, Seattle, WA 98195. See Figure 2 for a site plan for the hospital. See Figure 1 for vicinity map.

TO BE COMPLETED BY APPLICANT

B. ENVIRONMENTAL ELEMENTS

1. Earth

a. Indicate general description of the site: Roof of hospital

b. What is the steepest slope on the site (approximate percent slope)?

N/A

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

c. What general types of soils are found on the site (for example, clay, sand, gravel, peat, muck)? If you know the classification of agricultural soils, specify them and note any prime farmland.

N/A

d. Are there surface indications or history of unstable soils in the immediate vicinity? If so, describe.

N/A

e. Describe the purpose, type, and approximate quantities of any filling or grading proposed. Indicate source of fill.

N/A

f. Could erosion occur as a result of clearing, construction, or use? If so, generally describe.

N/A

g. About what percent of the site will be covered with impervious surfaces after project construction (for example, asphalt or buildings)?

The site is an existing roof top. Impervious surface is 100%. No construction is involved.

h. Proposed measures to reduce or control erosion, or other impacts to the earth, if any:

N/A

2. Air

a. What types of emissions to the air would result from the proposal (i.e., dust, automobile, odors, industrial wood smoke) during construction and when the project is completed? If any, generally describe and give approximate quantities if known.

Additional emissions from helicopter flights would be minimal as helicopter transports to the University IMA fields and University Hospital already take place. Discontinuance of the ground ambulance transport of patients from the IMA fields to University Hospital would decrease emissions from motor vehicles. Airborne particulates and dust at the site will increase during take-offs and landings.

b. Are there any off-site sources of emissions or odor that may affect your proposal? If so, generally describe.

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

c. Proposed measures to reduce or control emissions or other impacts to air, if any:

The helistop will be regularly swept and/or washed to minimize dust which could be disturbed during take-offs and landings.

3. Water

a. Surface:

1) Is there any surface water body on or in the immediate vicinity of the site (including year-round and seasonal streams, saltwater, lakes, ponds, wetlands)? If yes, describe type and provide names. If appropriate, state what stream or river it flows into.

Union Bay, Lake Washington Ship Canal, Portage Bay

2) Will the project require any work over, in, or adjacent to (within 200 feet) the described waters? If yes, please describe and attach available plans.

No

3) Estimate the amount of fill and dredge material that would be placed in or removed from surface water or wetlands and indicate the area of the site that would be affected. Indicate the source of fill material.

None

4) Will the proposal require surface water withdrawals or diversions? Give general description, purpose, and approximate quantities if known.

No

5) Does the proposal lie within a 100-year floodplain? If so, note location on the site plan.

No

6) Does the proposal involve any discharges of waste materials to surface waters? If so, describe the type of waste and anticipated volume of discharge.

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

b. Ground

1) Will ground water be withdrawn, or will water be discharged to ground water? Give general description, purpose, and approximate quantities if known.

No

2) Describe waste material that will be discharged into the ground from septic tanks or other sources, if any (for example: domestic sewage; industrial, containing the following chemicals ...; agricultural; etc.). Describe the general size of the system, the number of such systems, the number of houses to be served (if applicable), or the number of animals or humans the system(s) are expected to serve.

None

c. Water Runoff (including storm water):

1) Describe the source of runoff (including storm water) and method of collection and disposal, if any (include quantities, if known). Where will this water flow? Will this water flow into other waters? If so, describe.

A separate drainage system has been provided to drain the roof area where the helistop will be located. This system drains liquids (rain water, spilled fuel, other liquids) from the roof to separating holding tanks, located in the parking lot east of the hospital. The separating tanks would separate any fuel which might be spilled from water drained from the roof, and drain the water off into the University's storm drain system which drains into Lake Union. In the case of a fuel spill, it would be necessary to drain the separating tank to remove the fuel. The fuel would be disposed of by incineration or reprocessing.

2) Could waste materials enter ground or surface waters? If so, generally describe.

Since no helicopters will be based at the site, no maintenance or refueling activities will occur there. No waste materials are expected to enter ground or surface water from this project.

d. Proposed measures to reduce or control surface, ground, and runoff water impacts, if any:

Please see B.3.b.2 above

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Plants

a. Types of vegetation found on the site: None
___ deciduous tree: alder, maple, aspen, other
___ evergreen tree: fir, cedar, pine, other
___ shrubs
___ grass
___ pasture
___ crop or grain
___ wet soil: cattail, buttercup, bullrush, skunk cabbage, other
___ water plants: water lily, eelgrass, milfoil, other
___ other types of vegetation

b. What kind and amount of vegetation will be removed or altered?

N/A

c. List threatened or endangered species known to be on or near the site.

None

d. Proposed landscaping, use of native plants, or other measures to preserve or enhance vegetation on the site, if any:

None

5. Animals

a. Indicate any birds and animals which have been observed on or near the site or are known to be on or near the site:
birds: songbirds, shorebirds have been observed near the site
mammals: grey squirrels have been observed near the site.
fish: salmon, trout, perch and bass are found in the Ship Canal, south of the site.

b. List any threatened or endangered species known to be on or near the site.

None

c. Is the site part of a migration route? If so, explain.

Some shorebirds probably fly over the site to and from nesting areas in the East Campus.

d. Proposed measures to preserve or enhance wildlife, if any:

The relocation of the helistop from the East Campus will reduce noise levels in the wildlife area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. Energy and Natural Resources

a. What kinds of energy (electric, natural gas, oil, wood stove, solar) will be used to meet the completed project's energy needs? Describe whether it will be used for heating, manufacturing, etc.

Electricity would be consumed to run the lights on the helistop at night. Petroleum is now consumed in the transportation of critically ill or injured patients via helicopter to the IMA fields and by ambulance to University Hospital. Petroleum would continue to be consumed for helicopter transport; petroleum consumption for ambulance transport would be eliminated.

b. Would your project affect the potential use of solar energy by adjacent properties? If so, generally describe.

No

c. What kinds of energy conservation features are included in the plans of this proposal? List other proposed measures to reduce or control energy impacts, if any:

N/A

7. Environmental Health

a. Are there any environmental health hazards, including exposure to toxic chemicals, risk of fire and explosion, spill, or hazardous waste, that could occur as a result of this proposal? If so, describe.

The possibility of a helicopter crash en route to the University Hospital or at the helistop is highly unlikely, but does exist. However, based on current statistics, the probability of a helicopter accident related to the service to the hospital would be approximately one every 261 years. The flight path for the helicopter has been chosen largely to avoid densely populated areas and avoid potential obstacles (Figure 5).

1) Describe special emergency services that might be required.

Procedures for action to be taken in the unlikely event of a helicopter crash at the helistop have been developed by University Hospital. A crash on other areas of University property would be handled by University Police, Environmental Health and Safety, and City of Seattle/King County civil emergency response groups. More information will be included in the EIS.

2) Proposed measures to reduce or control environmental health hazards, if any:

See 7.a.1) above

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

b. Noise

1) What types of noise exist in the area which may affect your project (for example: traffic equipment, operation, other)?

None

2) What types and levels of noise would be created by or associated with the project on a short- or long-term basis (for example: traffic, construction, operation, other)? Indicate what hours noise would come from the site.

At the time of landing and take off, the helicopter will create a noise disturbance. The noise level of the Airlift Northwest helicopter at take-off (peak maximum performance) was measured at 84db at 150 yds and 74 db at 500 ft. above ground level. It is possible for landings to occur at all hours of the day and night. As stated in Section A11. of this checklist, it is anticipated that the majority of the flights will occur between 8:00 a.m. and 8:00 p.m.

Patient rooms are located as close as approximately 56 feet from the helistop (Figure 6). Additional information regarding existing noise levels and noise impacts, including the impact on patients and nearby communities of the noise from the helicopter landings and take offs, will be included in the Draft Environmental Impact Statement.

noise (dBA) contours around flight path(s).

3) Proposed measures to reduce or control noise impacts, if any:

The preferred landing pattern is from the east over Union Bay which avoids residential areas and the University campus population centers. Whenever possible, helicopters will approach the University over water. (See Figure 5). For the most part, relatively quiet helicopters will be used.

8. Land and Shoreline Use

a. What is the current use of the site and adjacent properties?

The site is currently the roof of the East Wing Addition to University Hospital. Adjacent to the hospital are the remainder of the Health Sciences complex, parking, NE Pacific Street and Montlake Blvd. NE. The Montlake residential area is located within 1/4 mile of the site. The Laurelhurst community is located near the alternate flight paths.

b. Has the site been used for agriculture? If so, describe.

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

c. Describe any structures on the site.

The rooftop where the landings will occur has no structures on it. To the immediate southwest of the landing pad is a portion of the hospital housing elevators and miscellaneous offices. A patient unit is attached to the southwest side of this elevator and office core. (See Figure 6)

d. Will any structures be demolished? If so, what?

No

e. What is the current zoning classification of the site? I-MP

f. What is the current comprehensive plan designation of the site?

The General Physical Development Plan classifies the site as hospital and clinics.

g. If applicable, what is the current shoreline master program designation of the site?

Not applicable

h. Has any part of the site been classified as an "environmentally sensitive" area? If so, specify.

No

i. Approximately how many people would reside or work in the completed project?

No personnel

j. Approximately how many people would the completed project displace?

None

k. Proposed measures to avoid or reduce displacement impacts, if any:

None

l. Proposed measures to ensure the proposal is compatible with existing and projected land uses and plans, if any:

The site is located in an area devoted to hospital and medical uses. The helistop is consistent with existing and projected uses of the site and the immediate surrounding area. The site is planned to continue as hospital use and the helistop will enable critically ill patients to reach the hospital more rapidly than is now possible.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

9. Housing

a. Approximately how many units would be provided, if any? Indicate whether high, middle, or low-income housing.

None

b. Approximately how many units, if any, would be eliminated? Indicate whether high, middle, or low-income housing.

None

c. Proposed measures to reduce or control housing impacts, if any:

Not applicable

10 Aesthetics

a. What is the tallest height of any proposed structure(s), not including antennas; what is the principal exterior building material(s) proposed?

The helistop is approximately 62 feet above ground level at the second floor of the hospital (ground level at the east end of the hospital). The portion of the hospital immediately to the southwest of the helistop contains the elevator and is twelve feet higher than the rooftop. The area west of the elevator area rises to 29 feet above the rooftop. (See Figure 3) The helipad and the roof of the building are concrete.

b. What views in the immediate vicinity would be altered or obstructed?

None

c. Proposed measures to reduce or control aesthetic impacts, if any:

None

11. Light and Glare

a. What type of light or glare will the proposal produce? What time of day would it mainly occur?

For landings during hours of darkness, the lights for the helistop will be used. There are four quartz lights mounted on the building immediately to the southwest of the rooftop landing area. The Airlift Northwest helicopter has

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

standard clearance lights. The helicopter also has a three million candlepower searchlight which would be used only if the helistop lighting failed. The searchlight would be turned on about one minute prior to landing. This would be prior to reaching the approach corridor shown in Figure 5.

b. Could light or glare from the finished project be a safety hazard or interfere with views?

No

c. What existing off-site sources of light or glare may affect your proposal?

None

d. Proposed measures to reduce or control light and glare impacts, if any:

The lighting for the helistop will be used only at times of take off and landing during hours of darkness, and is necessary for safety reasons. On-site lighting will be shielded to prevent overspill and effects on patient rooms or nearby community areas.

12. Recreation

a. What designated and informal recreational opportunities are in the immediate vicinity?

The NN Courtyard, a courtyard adjacent to the Hospital cafeteria, the CDMRC patio, and the open space south of the Hospital along the Montlake cut provide passive recreation opportunities.

b. Would the proposed project displace any existing recreational uses? If so, describe.

No

c. Proposed measures to reduce or control impacts on recreation, including recreation opportunities to be provided by the project or applicant, if any:

Under the present arrangement the IMA field must be cleared by the Campus Police before a helicopter can land. Moving the helicopter landing site to the roof of the hospital will decrease the number of times the IMA field must be cleared of sports participants in order to allow helicopters to land. This should improve the recreational opportunities in the IMA fields as well as the safety of sports participants at the time of landings.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

13. Historic and Cultural Preservation

a. Are there any places or objects listed on, or proposed for, national, state, or local preservation registers known to be on or next to the site? If so, generally describe.

No

b. Generally describe any landmarks or evidence of historic, archaeological, scientific, or cultural importance known to be on or next to the site.

None on or next to the site.

c. Proposed measures to reduce or control impacts, if any:

Not applicable

14. Transportation

a. Identify public streets and highways serving the site, and describe proposed access to the existing street system. Show on site plans, if any:

University Hospital is served by the Montlake Boulevard NE on the east of the site, and NE Pacific Street on the north of the site. SR 520 also serves the site with access from SR 520 to the hospital via Montlake Boulevard NE. 15th Avenue NE also serves the west end of the UW Health Sciences Center. University Hospital is at the east end of the Health Sciences Center. Please see Figure 2.

b. Is site currently served by public transit? If not, what is the approximate distance to the nearest transit stop?

Yes. University Hospital is served by Metro routes 43, 46, 48, 65, 70, 75, 133, 167, 205, 244, and 252 along NE Pacific Street and for Montlake Boulevard NE.

c. How many parking spaces would the completed project have? How many would the project eliminate?

No parking spaces would be added or eliminated by the project.

d. Will the proposal require any new roads or streets, or improvements to existing roads or streets, not including driveways? If so, generally describe (indicate whether public or private).

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

e. Will the project use (or occur in the immediate vicinity of) water, rail, or air transportation? If so, generally describe.

The project will involve air transportation. Approximately 5 emergency patients per month will be transported via helicopter to the hospital, with landings on the rooftop helistop. The flight pattern is described in item A.11 of this checklist Figure 5. The helicopter used in these flights will not be based at University Hospital. Only patient transport will occur at the site. No maintenance or refueling will occur at the site.

f. How many vehicular trips per day would be generated by the completed project? If known, indicate when peak volumes would occur.

None. For each patient transport flight to or from the hospital helistop, a round trip of an ambulance will be eliminated. Vehicle trips by University Police also will be eliminated. If the helicopter does not land on the rooftop helistop, it will land in the IMA field and the patient will be transported from there to the hospital via ground ambulance.

g. Proposed measures to reduce or control transportation impacts, if any:

None for vehicular ground traffic. Please see item B.7.b.3 for noise mitigation measures.

15. Public Services

a. Would the project result in an increased need for public services (for example: fire protection, police protection, health care, schools, other)? If so, generally describe.

No. currently fire protection services would be adequate. Special fire protection devices have been built into the structure. These include a deluge system with standpipes to which fire hoses can be attached. The City of Seattle Fire Marshall required that these systems be proved functional before an occupancy permit for the patient care units in the East Wing addition was granted in April 1986.

b. Proposed measures to reduce or control direct impacts on public services, if any.

Campus police services would be reduced as a result of this project. The campus police now are called to clear the IMA field for safety reasons each time a helicopter lands there. This would not be the case with the rooftop landing site.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

16. Utilities

a. Utilities available at the site: electricity, natural gas, water, refuse service, telephone, sanitary sewer, septic system.

b. Describe the utilities that are proposed for the project, the utility providing the service, and the general construction activities on the site or in the immediate vicinity which might be needed.

Electricity - Seattle City Light
Water - Seattle Water Department
Telephone - Pacific Northwest Bell

17. Final Action

Final action on the project is considered to be acceptance of the final environmental impact statement and approval of mitigating measures by the Board of Regents, and is scheduled for February 1987.

C. SIGNATURE

The above answers are true and complete to the best of my knowledge. I understand that the lead agency is relying on them to make its decision.

AIRLIFT NORTHWEST
INTER-HOSPITALS AGREEMENT

This Agreement is entered into by Children's Orthopedic Hospital and Medical Center, Harborview Medical Center, Providence Medical Center and University Hospital, hereinafter referred to individually as COHMC, HMC, PMC, and UH, or collectively as Participating Hospitals.

Recital

WHEREAS, there is a demonstrated need for facilities to appropriately and quickly transport patients with a serious medical need in an appropriately controlled environment to and from Seattle hospitals; and no such facilities are presently available; and

WHEREAS, COHMC, HMC, PMC, and UH wish to jointly share the risk of providing a patient air transportation program, which program shall be referred to as Airlift Northwest, hereinafter ("ALNW") and desire to set forth the terms and basic structure of this program in this Agreement; and

WHEREAS, ALNW has provided valuable services to the people of Washington, Alaska, Montana and Idaho since its inception in February of 1982; and

WHEREAS, Providence Medical Center was an originating hospital of ALNW, and since the establishment of ALNW, PMC has supported the operation by direct payments in an amount in excess of the use or benefit which PMC has received from the operation; and

WHEREAS, PMC desires to reduce its costs in connection with the ALNW program, and has contemplated withdrawal from the program; and

WHEREAS, COH, HMC and UH each acknowledge and agree that the ALNW operation is stronger with PMC's continued participation and the remaining participating hospitals wish to accommodate PMC in return for its continued participation in ALNW and,

WHEREAS, COH has not yet obtained the necessary local and state approvals for its proposed helipad but is seeking to establish said helipad as quickly as possible;

NOW, THEREFORE, in consideration of the mutual promises contained herein and for good and valuable consideration hereby acknowledged, the parties hereby agree to as follows:

I. Program Description

ALNW is being operated to serve a need for critical care aeromedical transport which is recognized by each Participating Hospital. There is no flight or other service which satisfactorily addresses the transportation needs of the acutely ill patient who would benefit from transportation to and from these regional Participating Hospitals. The continuation of ALNW by these Participating Hospitals is based on the belief that a low cost, effective transport system staffed by highly skilled professionals will best meet the needs of patients in the region.

5/6/85

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

II. Program Direction

The Participating Hospitals shall maintain an Executive Committee with one representative from each Participating Hospital for the purpose of jointly operating ALNW. The Chief Administrative Officers of the Participating Hospitals or their designees with final decision-making authority, the Executive Director of the University of Washington Hospitals and the Executive/Medical Director of ALNW shall comprise the Executive Committee. When it is necessary for the Executive Committee to formally vote, the chief administrative officer or designee of HMC and the Executive/Medical Director of ALNW will jointly cast one vote and the Chief Administrative Officer of University Hospital and the Executive Director of the University of Washington Hospitals will jointly cast one vote.

The Executive Committee shall be responsible for the direction of ALNW and shall establish appropriate policies, procedures, rules and regulations to accomplish the mutually agreed-upon purposes of ALNW. Specific duties of the Executive Committee shall include but not be limited to the following:

1. Development of a statement of purpose.
2. Appointment of an Executive/Medical Director.
3. Approval of annual operating and capital budgets.
4. Approval of all contracts affecting participation in ALNW or the services provided by ALNW,
5. Policy development and program planning,
6. Review of periodic financial and statistical reports,
7. Development of Executive Committee rules and regulations.

The Executive Committee shall conduct business only when a majority of the Participating Hospitals are represented at a meeting called after at least seven days notice or with the agreement of all Participating Hospitals are represented at a meeting called after at least seven days notice or with the agreement of all Participating Hospitals. The consent of a majority of the members of the Executive Committee shall be required to approve motions, except that the consent of four members of the Executive Committee shall be required to approve the budget of ALNW or to approve any expenditure on behalf, or by reason of, ALNW which has not been budgeted previously. The Executive Committee shall reserve the right from time to time to delegate to committees and/or staff appropriate tasks to be performed for them.

A Steering Committee shall serve in an advisory capacity to the Executive Committee. The Steering Committee shall make recommendations regarding the operation of ALNW to the Executive Committee. The Steering Committee shall be composed of one nurse and one physician from each Participating Hospital, the Associate Director of Operations of ALNW, and the Chief Flight Nurse of ALNW. The Executive/Medical Director shall serve as the chairperson of the Steering Committee. The Steering Committee shall develop its own operating rules and subcommittee structure, which shall include a Quality Assurance Committee.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

III. Personnel

The Executive Committee shall appoint an Executive/Medical Director. The Executive/Medical Director shall recommend an individual to serve as the Associate Director of Operations of ALNW and an individual to serve as Chief Flight Nurse, and such appointments shall be subject to the approval of the Executive Committee. The Executive Committee shall evaluate the performance of the Executive/Medical Director annually.

1. Executive/Medical Director

   The Executive/Medical Director shall be a physician who will also serve as Medical Director of the program. The duties of the Medical Director shall include a) provision of the medical and administrative leadership, b) selection and training of medical staff, c) evaluation of medical staff performance, d) evaluation of staff. The Executive/Medical Director shall be paid a salary to carry out his responsibilities. The job description of the Executive/Medical Director is included as Exhibit I and incorporated by reference.

2. Associate Director of Operations

   The duties of the Associate Director shall include fiscal and administrative management, liaison with contracting flight service, and general program coordination. The job description of the Associate Director is included as Exhibit II and incorporated by reference herein. The Associate Director shall be paid a salary to carry out his responsibilities.

3. Chief Flight Nurse

   The duties of the Chief Flight Nurse shall include approval and training of flight nurses, performance evaluations and coordination of the aircraft retrofit. A job description is included as Exhibit III and incorporated by reference herein. The Chief Flight Nurse shall be paid a salary as prescribed by the Higher Education Personnel Board of the State of Washington which shall be adjusted from time to time as prescribed by the Higher Education Personnel Board.

IV. Medical Equipment

With the authorization of the Executive Committee, HMC shall purchase shared medical equipment and supplies for use in caring for patients being transferred. The cost of the equipment and supplies shall be shared according to the method described under Payment of Shared Fixed Costs and Variable Costs by the Participating Hospitals. Title to said equipment shall be shared equally by all Participating Hospitals and held by HMC on behalf of those Participating Hospitals. In the event that ALNW does not continue in operation after the expiration of this Agreement, the jointly owned equipment shall be sold at fair market value and the proceeds divided equally among the Participating Hospitals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

V. Name and Logo

The Executive Committee shall take all steps necessary to preserve and protect the rights of the Participating Hospitals in and to the name ALNW and the selected logo. The name and logo shall be owned jointly by the Participating Hospitals and no individual Participating Hospital without authority from the Executive Committee shall have the right to use the name and logo for its own purposes, or to transfer the name and logo to a third party. The Participating Hospitals shall cooperate to prevent the unauthorized use of the name ALNW and the selected logo. The Participating Hospitals shall share all expenses incurred in securing any trademarks, tradenames, copyrights or other formal protection or federal or state registration of the name and logo, and subject to the approval of the Executive Committee in prosecuting any legal action to enforce their rights in and to the name and logo.

VI. Rights and Obligations

HMC shall be the primary contractor of ALNW with a flight service which provides aircraft and pilots to serve the needs of ALNW. The Executive Committee shall approve any contract and amendments to any contract in support of ALNW. COHMC, PMC, and UH agree that their rights and obligations in connection with the service provided by the contracting flight vendor shall be those of the Participating Hospitals, as described in the contract and between that vendor and HMC, a copy of which is labeled as Exhibit IV and incorporated by reference herein. From the effective date of this contract until February 15, 1986, PMC shall qualify as a Participating Hospital, with all attending rights and obligations. PMC's status beyond February 15, 1986 will be determined by the Executive Committee.

VII. Payment of Shared Fixed and Variable Costs

This section shall be approved as an addendum to the Inter-Hospital Agreement.

VIII. Sharing Revenues

Net revenues generated from charges made to non-participating hospitals for flights flown to those hospitals will be shared by COHMC, HMC, and UH on the same basis as described for expenses above. Net revenues in this case mean those revenues remaining after appropriate expenses, uncompensated services and contractual allowances are deducted from the charges to those non-participating hospitals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

IX. Organization Review

It is agreed by all participating hospitals that the Executive Committee shall proceed immediately with a review of the organization and legal structure of ALNW. A part of the review shall include new methods for sharing the revenues and expenses of ALNW.

X. Hold Harmless and Indemnification

The parties hereto agree that each party shall defend, indemnify, and hold the other parties harmless from any liability, claim, loss or damage, including court costs, reasonable attorneys' fees and other reasonable costs of defense, arising out of the negligent acts or omissions of its respective employees and agents during their care and treatment of a transported patient: provided that such defense and indemnification shall not apply to the claim of a party's employees brought pursuant to RCW 51.24.030; provided further that for purposes of this paragraph, any non-employee physician, nurse or other health care provider accompanying a patient on a flight shall be the agents of the hospital that sent the health care providers on that flight regardless of which hospital receives the patient. The parties further agree that each party accepts sole responsibility for the qualification, selection and training of its employees and agents who constitute the health care team accompanying its patient and agrees to defend, indemnify and hold the other parties harmless from any liability, claim, loss or damage, including court costs, reasonable attorneys' fees and other reasonable costs of defense, arising out of the negligent selection, staffing or training of the health care team.

In addition, the parties agree that they will share equally in the payment of and costs associated with any liability, claim, loss or damage, including court costs, reasonable attorneys' fees and other reasonable costs of defense, arising out of the negligent acts or omissions of the Executive Committee, the Steering Committee, or the Medical/Executive Director, Associate Director of Operations, Chief Flight Nurse, or Flight Technician, when acting within the scope of their duties of administration and implementation of the ALNW patient transportation program, including but not limited to provision of medical supplies and medical equipment which are jointly purchased, maintenance of medical equipment by the Flight Technician, and determinations of whether any person will be offered air ambulance services and whether participation in ALNW or the services provided by ALNW through the contracting flight vendor will be extended to other hospitals. For purposes of this paragraph it is agreed that the payments and costs associated with the claim of a party's employee pursuant to RCW 51.24.030 shall not be shared by the hospital which is the employer of the claiming employee.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

XI. Access to Records

If Section 952 of the Omnibus Budget Reconciliation Act of 1980 (P.L. 96-499) and the regulations promulgated thereunder are determined to apply to this contract, then HMC agrees as follows:

A. Until the expiration of four years after the furnishing of services pursuant to this contract, HMC shall make available, upon written request to the Secretary of Health and Human Services or upon request to the Comptroller General of the United States, or any of their duly authorized representatives, the contract, and books, documents and records of HMC that are necessary to certify the nature and extent of costs incurred by the Participating Hospitals under this contract, and

B. If HMC carries out any of the duties of this contract through a subcontract, with a value or cost of $10,000 or more over a twelve-month period, with a related organization, such subcontract shall contain a clause to the effect that until the expiration of four years after the furnishing of such services pursuant to such subcontract, the related organization shall make available, upon request to the Secretary of Health and Human Services, or any request to the comptroller General of the United States, or any of their duly authorized representatives, the contract, and books, documents and records of such organization that are necessary to verify the nature and extent of such costs.

XII. Furnishing Services to Nonparticipating Hospitals

The Participating Hospitals shall have no obligation to provide or arrange for any flight services for patients to be flown to any hospital other than a Participating Hospital. ALNW may provide flight services when clinically indicated and when the service is not being used by a Participating Hospital upon the express request for such services by a representative of that nonparticipating hospital, and the express approval of that request by the Executive/Medical Director of ALNW or his or her designee. Such approval shall not be in any way automatic, but rather shall be solely within the discretion of the Executive/Medical Director, or his or her designee. The Executive Committee shall establish a schedule of commercially reasonable rates to charge a nonparticipating hospital which receives the services of ALNW and shall establish such rules and qualifications as it shall deem necessary. Such rates shall reflect the total cost of establishing and operating the service.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

XIII. Additional Participating Hospitals

The Executive Committee shall establish guidelines and procedures for extending to the nonparticipating hospitals the right to participate in ALNW. A nonparticipating hospital shall become a Participating Hospital only upon the approval of at least four members of the Executive Committee. In the event of such approval, this Agreement shall be amended to include such new Participating Hospital.

XIV. Licensure

The Participating Hospitals agree that both they and the flight service shall maintain for an air ambulance license as required by the State of Washington.

XV. Term and Termination

This agreement shall take effect on May 1, 1985. Unless otherwise terminated as provided below, this Agreement shall expire on May 1, 1990.

With the exception of PMC, all Participating Hospitals shall continue their participation until at least MAY 1, 1988. Following that time, a hospital may terminate its participation in ALNW at any time, with or without cause, providing that six months written notice to the other Participating Hospitals has been given.

In the event a Participating Hospital terminates its participation in ALNW, the withdrawing Participating Hospital shall forfeit all its rights and interests in and to (1) the medical equipment and supplies described above, and (2) the name and logo described above.

Upon termination of ALNW, any Participating Hospital planning to continue to operate a service which is substantially similar to ALNW shall offer to all other Participating Hospitals of ALNW an opportunity to join on a substantially equal basis their venture.

XVI. Assignment

Neither this Agreement nor any rights or obligations hereunder shall be transferred or assigned in whole or in part by any Participating Hospital without the prior written approval of the nonassigning Participating Hospitals. In no event, however, shall a Participating Hospital assign or transfer in whole or in part any of its rights or obligations under this Agreement to a nonparticipating hospital.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

XVII. Amendments

This Agreement may be amended provided such an amendment is reduced to writing and approved by all parties.

XVIII. Waivers

No waiver of any of the provisions of this Agreement shall be valid unless in writing, signed by the party against whom such waiver is sought to be enforced, nor shall failure to enforce any rights hereunder constitute a continuing waiver of the same or waiver of any other right hereunder.

XIX. Notices

All notices, requests, demands, instructions or other communication in connection with this Agreement shall be in writing and delivered in person or sent by certified or registered mail, return receipt requested, postage prepaid, and properly addressed as follows:

Mr. Treuman Katz, Executive Director
Children's Orthopedic Hospital and Medical Center
4800 Sand Point Way N.E.
Seattle, WA 98105

Mr. David W. Gitch, Administrator
Harborview Medical Center
325 Ninth Avenue
Seattle, WA 98104

Mr. Peter Bigelow, Administrator
Providence Medical Center
500 - 17th Avenue
Seattle, WA 98124

Ms. Irma Goertzen, Administrator
University Hospital
1959 N.E. Pacific Avenue
Seattle, WA 98195

or to any other such address as the party to receive the notice or communication shall designate by notice to the other party. Such notice shall be deemed to have been received five days from the date on which it is mailed by the sender or when personally delivered.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

XX. Governing Law

This Agreement shall be governed by, and construed in accordance with, the laws of the State of Washington.

IN WITNESS WHEREOF, the parties hereto have executed this Agreement.

EXHIBIT I

AIRLIFT NORTHWEST

TITLE: EXECUTIVE/MEDICAL DIRECTOR

BASIC FUNCTIONS AND RESPONSIBILITIES

The Executive/Medical Director shall serve as the chief medical and administrative officer of the patient air transportation program. As such, he/she will represent the program in all matters related to its operation. The Executive/Medical Director will be responsible for the formulation, conduct and quality of patient care provided by the transport program and the operational management of that program.

CHARACTERISTIC DUTIES AND RESPONSIBILITIES

1. Participates as a full member of the Executive Committee of Airlift Northwest.
2. Provides appropriate leadership to the staff of the Participating Hospitals of Airlift Northwest.
3. Assures that the conduct of medical and nursing practice is consonant with the policies and objectives of Airlift Northwest and the Participating Hospitals.
4. Serves as the medical consultant to the Executive Committee on matters related to professional care provided by the staff of Airlift Northwest.
5. Consults and collaborates with other medical staff from Participating Hospitals regarding the operation of Airlift Northwest.
6. Assures that the policies of the Airlift Northwest program are effectively carried out.
7. Serves as Chairman of the Steering Committee.
8. Recommends appropriate program changes to the Executive Committee of Airlift Northwest.
9. Develops and manages an effective training program for all Participating Hospitals of Airlift Northwest.
10. Establishes and maintains a quality review program for Airlift Northwest.

ACCOUNTABILITY

The Executive/Medical Director is appointed by and accountable to the Executive Committee of the Participating Hospitals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

QUALIFICATIONS

The Executive/Medical Director shall hold an M.D., be licensed to practice medicine in the State of Washington, have a faculty appointment at the University of Washington, School of Medicine, and have demonstrated competence in emergency medicine management, critical care management, and medical affairs administration.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT II

AIRLIFT NORTHWEST

TITLE: ASSOCIATE DIRECTOR OF OPERATIONS

BASIC FUNCTIONS AND RESPONSIBILITIES:
The Associate Director of Airlift Northwest shall be charged with responsibility for the day-to-day administrative operations and management of Airlift Northwest. This responsibility includes providing staff support to the ALNW Executive Committee, supervision of staff as appropriate, budgeting, financial reporting, program planning, promotion and marketing of the program, referral relations, vendor relations, contract management, and assisting the chief flight nurse in completing performance evaluations of staff.

CHARACTERISTIC DUTIES AND RESPONSIBILITIES:

1. Coordinates the day-to-day administrative management of Airlift Northwest under the general direction of the Executive/Medical Director.

2. Prepares budgets and monitors budget performance for ALNW as on operating entity and assures the timely preparation of financial and statistical reports.

3. Develops and maintains a program planning and marketing system in support of Airlift Northwest as a joint venture of the participating hospitals.

4. Arranges for ALNW Executive Committee meetings, maintains committee records, provides staff support and makes reports as required or requested by the chairperson.

5. Assists in the development of policies and operating procedures for the program.

6. Negotiates contracts and monitors contract performance. Assists the contractor in its interactions with the participating hospitals as needed.

7. Serves as liaison with community groups, regulatory agencies, referral institutions, vendors and contractors.

8. Assists participating hospitals in the provision of the service and advises referring hospitals in establishment and maintenance of suitable landing sites for the helicopter and team support upon arrival.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

9. Assists the Chief Flight Nurse with staff performance evaluation and review.

10. Serves as a member of the Steering Committee of Airlift Northwest and provides staff support as needed.

11. Performs other duties as requested by the chairperson of the AlNW Executive Committee and the Executive/Medical Director.

ACCOUNTABILITY:
The Associate Director of Operations will be responsible for implementing the governance decisions of the AlNW Executive Committee and is accountable to the chairperson of the Executive Committee and the Executive/Medical Director for effectively administering the program in accordance with approved contracts, policies, budgets and operating plans.

QUALIFICATIONS:
The Associate Director for Operations shall have a Bachelor's degree in Business or the equivalent, and two years of experience in planning and/or management in a health care facility. Experience working with aeromedical programs is highly desirable. Excellent verbal and written communication skills and an ability to promote and market the program is essential.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT III

AIRLIFT NORTHWEST

TITLE: CHIEF FLIGHT NURSE
Responsible to: Medical Director

Summary: The Chief Flight Nurse is a professional Nurse whose role is:

1) To facilitate all activities related to nursing care in the flight program at HMC.

2) To promote public relations

3) To act as an advisor to the flight nurses in affiliated hospitals.

He/she will demonstrate leadership in the following function.

Management and Leadership:

1) Responsible for daily and long range planning for staffing 24 hours/day/seven days/week.

2) Schedules assignments

3) In collaboration with the Medical Director interviews and hires new staff.

4) Develops departmental goals and objectives in consultation with the Medical Director.

5) Participates in the development of the budget; monitors cost and charges; investigates problem areas; recommends equipment and staffing needs.

6) Establishes standards of nursing care for flight nurse performance.

Clinical Responsibilities:

1) Is qualified to function as a flight nurse and keeps these skills current.

2) Plans orientation and educational experiences for all flight nurses.

3) Assists with the training of the flight nurses and support personnel.

4) Insures that compliancy to perform required technical skills is documented for flight nurses.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Counseling and Evaluation:

1) Evaluates the performance of flight nurses using criteria drawn from job descriptions.

2) Counsels employees with special needs and/or problems.

3) Documents the evaluation and counseling process.

Flight Nurse Advisor Function for Affiliated Hospitals:

1) Maintains a public relations program with the nursing staff to insure a professional public image.

2) Acts as a liaison with other nurse coordinators in matters affecting the flight nurses' interaction with other units.

3) Acts as a liaison with the lead pilot in those matters affecting the flight nurses' interaction with the flight crew.

4) In conjunction with the lead pilot, develops an educational program to assure safe operating procedures and practices of the flight crew.

5) Participates in meetings as assigned or appropriate.

6) In conjunction with other nurse coordinators establish educational programs, evaluate flight nurse performance, and counsels employees with special needs and/or problems.

Qualifications:

1) Licensure and certification

Registered nurse in Washington State in addition to CCRN or CEN within one year after hire.

2) Education/experience

Minimum: Three years critical care experience (ICU/CCU/ER)

One year managerial experience preferred.

Flight nurse experience preferred

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3) Physically and emotionally healthy - vision and hearing within normal limits - must be able to lift and/or help lift and carry patients - must be able to work in any climate conditions.

4) Special Skills

a. Excellent public relations skills

b. Must be able to make independent decisions and perform special technical skills.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT IV

AGREEMENT

This agreement is entered into by and between Seattle Jet Center, Inc., a Washington corporation, hereinafter referred to as "SJC", and Harborview Medical Center, hereinafter referred to as "HMC".

WITNESSETH:

WHEREAS, HMC and certain other Seattle-area hospitals wish to cooperate in making a patient air transport service available; and

WHEREAS, HMC wishes to have SJC perform certain air transportation services as an independent contractor to transfer patients to and from HMC and other hospitals designated by HMC, hereinafter referred to as participating hospitals; and

WHEREAS, SJC wishes to provide certain air transportation services and associated services for HMC and the participating hospitals;

NOW, THEREFORE, in consideration of the mutual promises contained herein and for the good and valuable consideration hereby acknowledged, the parties hereby agree as follows:

SECTION I
AIRCRAFT AND SPECIFICATIONS
AVAILABILITY AND USE REQUIREMENTS

A. SJC agrees to make a Piper Cheyenne III airplane continuously available for use by HMC and participating hospitals on a 24-hour-a-day, seven-day-a-week basis for departure from Boeing Field, Seattle, Washington for purposes of transporting patients, except as provided for herein.

B. SJC represents and warrants that the above airplane will be maintained and equipped to meet the requirements contained in Section II of HMC's Request for Proposals for an Air Transportation Service, hereinafter referred to as "RFP", with mutually agreed upon exceptions. A copy of the above-mentioned section of the RFP is attached as Exhibit I and incorporated by reference herein as if fully set forth. It is understood that all of the equipment specified in the above subsections for medical retrofit of the airplane is subject to approval by HMC, which approval shall not be unreasonably withheld.

C. SJC agrees to identify the dedicated aircraft to HMC's specifications and to maintain that scheme throughout the duration of this agreement. A copy of the specifications is attached as Exhibit II and incorporated by reference herein.

D. SJC agrees to have available or maintain access to a turbine aircraft that will accept a medical transport load for trips greater than 900 nautical miles round trip. Such aircraft shall have a means of securing medical equipment, supplies and patient stretchers or incubators to the aircraft frame.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

E. SJC further agrees to furnish additional aircraft equipped in the manner indicated in the paragraph above should there regularly be more requests for the use of the dedicated aircraft than can be reasonably accomodated by one dedicated aircraft. The use of an additional aircraft as described herein shall not result in an increase in the fixed monthly payment to SJC, but HMC will reimburse SJC for each incident of service according to the rates per nautical mile in Exhibit V, a copy of which is attached and incorporated by reference herein.

F. SJC agrees to make a helicopter as defined in Exhibit III continuously available for use by HMC and the participating hospitals on a 24 hour a day seven day a week basis, for departure from Boeing Field, Seattle, Washington, to pick up a medical team at HMC or other designated hospitals for purposes of transporting patients, except as provided for herein.

In the event that the dedicated helicopter is out of service for unscheduled maintenance for more than 8 hours or for scheduled maintenance more than 24 hours, SJC agrees to make its best effort to provide a backup helicopter capable of accepting a medical transport load.

G. SJC represents and warrants that the above helicopters will be maintained and equipped to meet the requirements contained in Section VIII of HMC's RFP, with mutually agreed upon exceptions. A copy of the above-mentioned section of the RFP is attached as Exhibit IV and incorporated by reference herein as if fully set forth. It is understood that all of the equipment specified in the above subsections for medical retrofit of the airplane is subject to approval by HMC, which approval shall not be unreasonably withheld.

H. SJC agrees to paint the dedicated helicopter to HMC's specifications and to maintain that paint scheme throughout the duration of this agreement. A copy of the specifications is attached as Exhibit II and incorporated by reference herein.

SECTION II
AIRCRAFT OPERATIONS

A. SJC represents and warrants that all fixed wing aircraft or helicopter and flights under this agreement will conform to all applicable rules, regulations and requirements of the Federal Aviation Administration (FAA) of the United States Government, Washington state laws and regulations, and any and all requirements of the insurance policy referred to in Section VII herein. SJC represents and warrants that it and its subcontractors hold a current FAR, Part 135 certificate and will maintain it or whatever successor certificate is required by the FAA during the term of this agreement. SJC agrees to notify HMC in writing within 24 hours of notice to SJC or any subcontractor of the suspension or termination of the certificate by the FAA. Upon suspension or termination of SJC's Part 135 certificate, SJC agrees to cease all flight operations immediately under this agreement until such certificate is restored.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. SJC shall have the sole right and obligation to determine whether or not a given flight requested by HMC or a participating hospital should be made and how such flight should be conducted from the standpoint of weather conditions or aircraft safety, provided that SJC shall inform the Transport Team of any flight conditions that SJC has knowledge of, including but not limited to turbulence, which could reasonably be expected to adversely affect the patient. HMC or the participating hospital shall have the sole right and obligation to determine which patients and health-care personnel should be carried on any flight and whether a patient is stable enough to be transported. SJC must transport all persons presented by the medical team, including patients with communicable diseases, unless they constitute a threat to flight safety.

SECTION III
ADMINISTRATION

A. SJC shall supply a phone number to HMC for the sole use of the on-call team, to be designated by HMC and the participating hospitals, in requesting an aircraft at any time 24 hours a day, and SJC shall assume all responsibilities for arranging for the aircraft and flight to the destination indicated.

B. When HMC or a participating hospital requests use of an a fixed wing aircraft pursuant to this Agreement, SJC agrees to have the aircraft ready to load a transport team and leave Boeing Field within one hour of the initial request therefore, provided that delays beyond one hour required by weather or by Air Traffic Control at Seattle shall not be attributable to SJC; provided further that in the event that the dedicated aircraft will not be used for any flight, SJC shall provide a back-up aircraft within a reasonable period of time after the request.

C. When requested by HMC, SJC shall provide or arrange for ground transportation for the Transport Team from HMC or the participating hospital to Boeing Field after the flight.

D. When HMC or a participating hospital requests use of the helicopter pursuant to this Agreement, SJC agrees to take off from Boeing Field within ten minutes of the initial request therefore, provided that delays beyond ten minutes required by weather or by Air Traffic Control at Seattle, shall not be attributable to SJC.

E. SJC shall make available an individual to attend Transport Team meetings at HMC on reasonable notice.

F. SJC shall develop and present a training program to the staffs of HMC and participating hospitals as necessary, which shall include familiarization with aircraft and medical retrofit systems and proper response to an aircraft emergency.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

G. SJC shall keep a flight log containing the following information: dates of service; destination; intermediate stops, if any; names of all persons on board during the flight; take-off and landing times; block speed; and unusual occurrences, as normally recorded in the flight log pursuant to FAA regulations. HMC shall have access to such log upon reasonable notice during business hours.

SECTION IV
RATES AND BILLINGS

A. Within three working days after the conclusion of each flight, SJC will submit an invoice to HMC containing the information in Section III, G and the name(s) of the patient(s), name of the referring and receiving hospital, aircraft used, and statement of charges. A report will also be rendered monthly to HMC by SJC by the 5th of each calendar month for the entire prior calendar month's service detailing incidents of service with reference made to the statement sent immediately after the incident of service. If the flight has been initiated by a participating hospital, SJC will look to that hospital for payment of the expenses for the incident of service (not the fixed monthly rate), provided that HMC will be responsible for that payment in the absence of payment by the participating hospital. Payment will be made by HMC or the participating hospital to SJC within thirty (30) days of the issuance of an invoice; if payment is not made by the payment deadline, HMC or the participating hospital will pay interest at the rate of one percent (1%) per month on the unpaid balance.

B. For fixed wing and helicopter services rendered by SJC during the first year of the contract, HMC will pay in advance on the first day of each month a fixed monthly rate identified in Exhibit V, regardless of the number of incidents of service during any month. In addition, for each incident of service, HMC or the participating hospital will pay at the rates listed in Exhibit V, plus any applicable federal or state tax, including but not limited to federal transportation tax, plus costs attributable to layovers at the destination. Layover costs do not include charges for any time or other costs for the pilot or crew because such costs have already been included in computing the fixed monthly rates to be paid pursuant to Exhibit V. SJC and HMC shall agree upon mileage between frequently-used transport sites and agree on the mechanism for establishing mileage to less frequently used transport sites.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

C. For services rendered by SJC during subsequent years of the contract period, the fixed monthly rate and rates per nautical mile shall be adjusted according to the formula described in Exhibit I.

D. SJC agrees to notify HMC of all price increases in fuel to them at Boeing Field during the term of this agreement by sending a copy of the fuel supplier's notice of price increase to HMC within seven days of SJC's receipt of the notice of price increase.

E. HMC or the participating hospital shall have the sole discretion to determine whether passengers besides the crew, transport team, and patients shall be carried on a particular flight, provided that SJC may overrule that decision if the extra weight would cause safety problems. SJC agrees to inform the transport team when carrying extra passengers will require additional stops for fuel, resulting in a longer flight. In the event that passengers besides the patient(s) are transported, SJC shall not be entitled to any additional compensation.

SECTION V
HOSPITAL RESPONSIBILITY

A. HMC agrees that it or the participating hospital shall have the sole responsibility for providing and paying all personnel utilized during any flight in the medical care and treatment of transported patients, with such personnel being the "Transport Team" referred to in this Agreement (SJC's flight crew and other employees are not part of the "Transport Team" as the term is used in this Agreement).

B. All use of medical equipment and supplies and all on-board medical care and treatment of persons transported on the aircraft pursuant to this Agreement shall be the sole responsibility of and undertaken only by members of the Transport Team furnished by HMC or the participating hospital.

SECTION VI
FACILITIES, MAINTENANCE AND PERSONNEL

A. Throughout the duration of this Agreement, SJC agrees to provide the facilities and services described in Section XV of the RFP, a copy of which section is attached as Exhibit VI and incorporated by reference herein.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. SJC agrees that the maintenance of aircraft used pursuant to this Agreement shall be performed and/or supervised by F.A.A.-licensed, factory-trained maintenance personnel or the equivalent with a minimum of five years maintenance experience.

C. SJC further agrees that the scheduling of maintenance of the dedicated fixed wing aircraft and helicopter shall be given priority over scheduling of maintenance of all other aircraft serviced or maintained by SJC. Maintenance will be done on a progressive schedule.

D. SJC agrees to arrange for maintenance on a timely basis of the medical equipment attached to and as part of the dedicated aircraft.

E. SJC shall clean and maintain the aircraft cabin interior after each flight in accordance with standards acceptable to HMC.

F. SJC shall furnish two pilots per fixed wing flight with a current F.A.A.-certified rating, type certificate, as applicable, who meet the experience and training guidelines contained in Exhibit VII.

G. SJC shall furnish one pilot per helicopter flight with a current FAA certified rating, type certificate, as applicable. All helicopter pilots shall meet the minimum requirements for experience and training contained in Exhibit VIII.

H. SJC shall perform routine maintenance on the aircraft as expeditiously as possible, and at times when the aircraft is least likely to be needed for emergency flight. The contractor shall pay all costs of service, maintenance and operation, including fuel, for all flights.

I. SJC shall demonstrate on a periodic basis that a fund no less than that recommended by the manufacturer is maintained to finance periodic large maintenance costs or that a suitable material support contract is maintained.

SECTION VII
INSURANCE

A. SJC and its subcontractor shall furnish and maintain during the term of this Agreement liability insurance coverage required by the Federal Aviation Administration and the Civil Aeronautics Board, as referred to in FAR, Part 135, Air Taxi Operations, but in no event shall such coverage be less than $20 million limit per single occurrence without a per seat limitation.

B. On or prior to the effective date of this Agreement, and on each subsequent anniversary date thereof, SJC and its subcontractor shall furnish to HMC a certificate of insurance evidencing the above-required coverage, and confirming the following:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. That Harborview Medical Center, University Hospital, Providence Medical Center of Seattle, Children's Orthopedic Hospital, Virginia Mason Hospital, and the Board of Regents of the University of Washington are included as additional insureds to the full extent of SJC and its subcontractor's aircraft liability insurance coverage.

2. That SJC and its subcontractor waive subrogation in favor of the above additional insureds as respects any physical damage to the aircraft and loss of use.

3. That the insurance provided is primary and non-contributory to any other insurance available to the above additional insureds.

4. That the insurance policies contain a standard "Severability of Interest" clause.

5. That HMC will be furnished 30 days written notice prior to cancellation of, or any material change in, the policies.

6. That the coverage and provisions specified in this section shall apply to all aircraft provided pursuant to Section I of this agreement."

C. SJC shall maintain hull insurance equal to the value of the dedicated fixed wing aircraft. SJC shall ensure that the helicopter provided by its subcontractors also has hull insurance for the full value of the helicopter.

"Section VIII
INDEPENDENT CONTRACTORS -- INDEMNITY

A. It is understood and agreed that SJC and its subcontractors and HMC and the participating hospitals are independent contractors. Thus, SJC and its directors, officers, employees, agents and subcontractors are not employees or agents of HMC and the participating hospitals, and HMC and the participating hospitals and their trustees, officers, employees and agents (including but not limited to the Transport Team) are not the employees or agents of SJC.

B. SJC agrees to defend, indemnify and hold HMC and any participating hospitals harmless from and against any suits, claims and other liabilities, including reasonable attorneys' fees, court costs and other related costs of defense, arising out of injuries to any persons or property damage caused by the negligent, grossly negligent and/or intentional acts or omissions of SJC, its directors, officers, employees, agents and subcontractors in the performance of this Agreement.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

C. HMC agrees to defend, indemnify and hold SJC and its subcontractors harmless from and against any suits, claims and other liabilities, including reasonable attorneys' fees, court costs and other related costs of defense, arising out of injuries to any persons or property damage caused by the negligent, grossly negligent and/or intentional acts or omissions of the Transport Team, HMC and/or of the other participating hospitals, their respective trustees, officers, employees and agents, in the performance of this Agreement.

D. SJC accepts responsibility for risk of loss of any equipment owned by HMC or the participating hospitals due to its own negligence while stored on SJC's premises or being used on SJC's aircraft. A list of equipment presently stored at SJC is attached as Exhibit IX and incorporated by reference herein as if fully set forth. This list will be updated periodically by HMC.

SECTION IX
OTHER

A. SJC shall not be in breach of this Agreement for failure to make a flight or for failure to provide the dedicated or backup aircraft or for failure to provide the dedicated or backup aircraft due to weather, earthquake, natural disasters and other acts of God as well as due to strikes, government actions, and disorders, riots, war-like action or other causes beyond its reasonable control, which includes but is not limited to reasonable maintenance and/or repair down-time or replacement time.

B. When written notice is required to be given pursuant to this Agreement, it is deemed given after receipt by or delivery to the respective parties at the following addresses, or such other address in the State of Washington which a party provides to the others in writing:

For SJC: Charles Culver
Seattle Jet Center, Inc.
Seattle Aviation Center
Boeing Field International
Seattle, Washington 98108

For HMC: The Administrator
Administration Office
Harborview Medical Center
325 Ninth Avenue
Seattle, Washington 98104

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

C. SJC represents and warrants that it and its subcontractors is duly incorporated and in good standing in the State of Washington and hold all licenses and certificates necessary to perform the services required pursuant to this Agreement.

D. This Agreement is binding upon all successors and assigns of the parties, provided that any assignment by SJC of its rights and obligations under this Agreement may be made only with the express written approval of HMC.

E. If Section 952 of the Omnibus Budget Reconciliation Act of 1980 (P.L. 96-499) and the regulations promulgated thereunder are determined to apply to this contract, then SJC agrees that until the expiration of four years after the furnishing of service pursuant to this contract, SJC shall make available, upon written request to the Secretary of Health and Human Services, or upon request to the Comptroller General of the United States, or any of their duly authorized representatives, the contract, and books, documents and records of SJC that are necessary to certify the nature and extent of costs incurred by HMC or the participating hospitals under this contract. If SJC carries out any of the duties of this contract through a subcontract, with a value or cost of $10,000 or more over a twelve-month period, with a related organization, such subcontract shall contain a clause to the effect that until the expiration of four years after the furnishing of such services pursuant to such subcontract, the related organization shall make available, upon written request to the Secretary of Health and Human Services, or upon request to the Comptroller General of the United States, or any of their duly authorized representatives, the subcontract, and books, documents and records of such organization that are necessary to verify the nature and extent of such costs.

F. It is the understanding of HMC that helicopter services are to be provided by SJC through a sub-contract with Hospital Air Transport, a subsidiary of Aircraft at Your Call. Any change in the subcontractor providing helicopter services requires the advance written approval of HMC.

G. HMC's investigation of the safety record of SJC and its subcontractors shall not be deemed a waiver of the contractor's responsibility for assuring adequate safety measures.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

H. SJC expressely acknowledges that HMC and the participating hospitals are dependent on the receipt of significant operating revenues to continue the portion of the agreement pertaining to provision of helicopter services. In the event that HMC determines in its sole judgment that it is not financially feasible to continue the helicopter services until the expiration date of this agreement, then HMC may terminate the portion of this Agreement pertaining to helicopter services at no penalty upon 70 days' notice to SJC, provided that HMC may not enter into another contract for helicopter services within six months of the date of termination of these services.

I. HMC shall have the right to terminate this Agreement in part or in whole upon giving SJC written notice of SJC's failure to substantially perform any of the terms and conditions hereof, provided however, that with respect to such breach SJC shall have 30 days from receipt of such written notice to remedy or cure any such default or breach on SJC's part. If the default or breach is cured within that 30 day period, this Agreement shall not terminate because of such default or breach.

SECTION X
CAPTIONS AND CONSTRUCTION OF AGREEMENT

The captions of this Agreement are for convenience only and do not amplify or limit the terms and provisions of this Agreement. This Agreement has been jointly drafted by the parties following negotiations between them. It shall be construed according to the fair intent of the language as a whole and not for or against either party.

SECTION XI
TERM

This contract shall be in effect from the date of signature until May 1, 1990.

SECTION XII
INTEGRATION

This written Agreement contains the entire understanding of the parties in connection with the subject matter, and it supercedes and replaces all prior negotiations, agreements or representations, whether oral or written. Any amendments to this agreement must be in writing and signed by the parties.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

IN WITNESS WHEREOF, the parties have executed this Agreement this 28th day of June, 1985 to be effective as of the 1st day of May, 1985.

EXHIBIT I

FIXED WING SPECIFICATIONS

I. GENERAL

1. This section of the Request for Proposals (RFP) outlines the specifications for the fixed wing Patient Air Transport Services to be provided by a selected Air Charter Service Contractor (herein called "Contractor") to Harborview Medical Center (hereinafter called HMC).

2. The Contractor shall supply on an "as needed" basis a pressurized fixed wing multi-turbine engine aircraft. The aircraft will be made available on a 24 hour a day, 7 day-a-week basis. For trips of greater than 600 nautical miles HMC may request the use of a turbo jet/turbo fan type aircraft.

II. AIRCRAFT EQUIPMENT AND PERFORMANCE

All aircraft furnished under this agreement shall be of the multi-engine turbine powered type equipped for operating under IFR conditions. In addition to the items below the following characteristics are important: loading and unloading, acceptance of the medical retrofit package, the amount of maintenance or down time, internal noise levels, speed, and general internal cabin configurations. Specifically, the aircraft must meet the following minimum standards (All equipment is subject to approval by HMC):

A. Ability to maintain a 5,000 foot cabin pressure during all operations.

B. Engines that are of turboprop or turbo fan/turbo jet type.

C. Ability to operate out of a 3,000 foot unprepared strip at sea level on a standard day at 1,000 pound pay load.

D. A cruise speed of not less than 200 nautical miles per hour.

E. A cruising range of at least 900 nautical miles plus IFR PART 135 reserves with a 1,000 pound load.

F. All equipment required for FAA, PART 135, day or night, all weather, including known icing conditions, IFR operations.

G. A cabin configuration that allows the easy installation and removal of a patient transport incubator or stretcher. The patient should not have to be tilted greater than 20 degrees when loaded into the aircraft.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

H. The cabin must be large enough to allow unrestricted access to at least two adult patients or transport incubators while in flight by at least two transport team members as well as adequate room for medical supplies and equipment.

I. A means of securely anchoring the transport incubator or stretcher, air-oxygen bottle, ventilators, etc. to the air frame.

J. A method of providing for air and oxygen to the patient care portion of the aircraft with one air and one O_2 outlet for each patient. Outlets must be standard hospital type. The system must be capable of supplying 50 psi (hospital standard) of air and 100% oxygen for approximately five hours of transport ventilators (15 liters per minute). The contractor will be responsible for providing full air and oxygen tanks for the aircraft at the start of each transport. The air and oxygen installation must also have provisions for an air/O_2 blender/regulator as an integral part of the retrofit.

K. A 115 volt, 60Hx A/C sine wave power source with a standard three-prong double receptacle for each patient capable of operation with either engine inoperative and of enough integrity to operate sophisticated solid-state circuitry and servo motors. The system must have a minimum load capacity of 2,200 watts and have a minimum of three outlets per patient.

L. A means of aircraft-to-hospital communication.

M. An adequate light source to provide proper patient care within the aircraft (100 foot candles on the incubator or stretcher). Lighting must be of the non-fluorescent type with dimming capabilities.

N. Suction available in the cabin. The suction unit must be able to supply 40 cm Hg of vacuum to each outlet. There must be one outlet per patient.

O. I.V. holders available for each patient.

P. The heating system must have the capability of maintaining the cabin temperature at about 75°F during all phases of operation.

Q. The aircraft provided shall be equipped and configured with the avionics and non-avionic equipment needed to satisfy the demands of the program.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

R. The Contractor shall provide for each aircraft life jackets and a survival package containing items agreed upon by the contractor and the hospital.

S. The Contractor shall provide adequate storage space for specialized equipment near the aircraft.

T. It will be the Contractor's responsibility to maintain in good working order all Contractor-provided equipment.

U. Equipment for overwater operations.

V. Cargo-door configurations.

III. IDENTIFYING THE AIRCRAFT

It will be the responsibility of the Contractor to identify each aircraft with colors, decals or markings that satisfy HMC's requirements and to maintain that scheme throughout the duration of the contract. The bidder should propose a method of identifying the aircraft in his/her response to the RFP.

IV. AIRCRAFT OPERATIONS

A. All aircraft and flights under this contract shall conform to all rules, regulations, and requirements of the Federal Aviation Administration (FAA) of the United States Government. The Contractor shall maintain a current FAA, PART 135, Certificate.

B. The Contractor shall have the sole right to determine whether or not a given flight requested by HMC or a participating hospital should be made from the standpoint of safety of operating the aircraft.

C. Harborview Medical Center or a participating hospital may designate as passengers or medical team members anyone it chooses. The contractor must transport all persons presented by the medical team, including patients with communicable diseases, unless they constitute a threat to flight safety.

D. When HMC or a participating hospital orders an aircraft, the Contractor must be able to have an aircraft ready to load the transport team and the incubator or the stretcher, and fly within 30 minutes of the initial order.

E. The Contractor shall submit flight request protocols detailing what actions the Contractor proposes to take when a flight is requested.

F. The Contractor will be responsible for providing full oxygen tanks for the aircraft prior to departure. Medical oxygen will be provided by HMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT II

The dedicated airplane shall have the following identification scheme:

1. HMC's Flight Program name and logo as specified (dimensions) by HMC.

2. Identification that the aircraft is operated by SJC.

The dedicated helicopter shall have the following paint scheme:

1. HMC's flight program name and logo as specified (dimensions) by HMC.

2/26/85

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT III

DESCRIPTION OF AIRCRAFT
ACCESSORIES AND EQUIPMENT

The Aircraft described in this agreement includes the following accessories and equipment:

Agusta 109A Basic Helicopter, plus the following options:

Interior-EMS see Exhibit A.1

Exterior-Overall Color,
Major Stripe,
Accent Color,

Dual Controls
Rotor Brake
Flight Director and Autotrim
Tedico Zappers
Shoulder Harness, w/Inertia Reel (Pilot and Copilot)
Windshield Wipers (Pilot and Copilot)
Cabin Fire Extinquisher
Radio Altimeter and Landing Gear Caution System
Copilot Flight Instruments
Copilot Nav. Instruments
FAA Single Pilot IFR Package
Includes:
Automatic Flight Control System
Radio/Instrument front-provisions
Radio/Instrument back-provisions
Heavy Duty Battery (22 A/H)
Alternating Current Kit
Pilot Nav. Instrument
First VHF 20A Collins
Second VHF 20A Collins
ADF AD 60 Collins
First VOR-VIR 31A Collins with Marker
Beacon and Glideslope
Transponder TDR 90 Collins
DME 40 Collins
Intercommunications Systems (ICS) AG06
Second VOR-VIR 31A Collins
Encoder Altimeter
Sperry 444 RMI R.H.
Attitude Indicator Stand-By

Bleedair Heater
Freon Airconditioner
Sound Proofing - Silent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Basic EMS Interior Specifications for the Agusta 109A Mark II

a. Seat Covering
   1. Aft forward facing seat to be covered in Blue Vinyl
   2. Pilot & Copilot Seats - Corporate styling to be covered in Blue Fabric
b. Medical Pouches
c. Curtain between pilot and aft cabin
d. 4-IV Hooks
e. Vinyl Floor Covering - Color Blue - cockpit, cabin and baggage compartment
f. Drains in Floor in Aft Cabin (2)
g. Sidewalls to be plastic - not covered
h. Window trim to match sidewalls
i. Headliner to be plastic - not covered
j. 115 Volt Outlet with Inverter
k. Air and Vac Pumps with Control Panel in side windows
l. Flood Lights (2)
m. High Intensity Lamp
n. Second Litter aft bulkhead mounts
o. Lighting Cabin, Standard Type
p. Seat Belts for all passengers to match vinyl
q. Brush Aluminum air outlets, lighting outlets, seat buckles, and door handle
r. Storage Pockets for aircraft papers
s. Storage Pockets for pilot door - vinyl
t. Enlarged cockpit and cabin air vent outlets

All materials are to be selected from current stock. Special ordering of materials may result in a surcharge and delays.

All additional equipment as specified in Exhibit IV and incorporated herein by reference, will be supplied by HAT as required.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT IV

HELICOPTER SPECIFICATIONS

VII. GENERAL

1. This section of the RFP outlines the specifications for the helicopter patient air transport services to be provided by a selected Air Charter Service Contractor ("Contractor") to Harborview Medical Center ("HMC").

2. The Contractor shall supply on an "as needed" basis a twin engine helicopter. The helicopter will be made available on a 24 hour a day, 7 day-a-week basis.

VIII. HELICOPTER EQUIPMENT AND PERFORMANCE SPECIFICATIONS

All helicopters furnished under this agreement shall be twin engine aircraft equipped for operations in IFR conditions. In addition to the items below, the following characteristics are important: loading and unloading, acceptance of the medical retrofit package, the amount of maintenance or down time, internal and external noise levels, speed and general internal cabin configurations. Specifically, the aircraft must meet the following minimum standards (All equipment is subject to approval by HMC):

A. A cruising speed of not less than 100 miles per hour.

B. A cruising range of not less than 300 miles plus appropriate reserves.

C. All equipment required for FAA, Part 135, day or night, VFR and IFR operations.

D. A cabin configuration that allows the easy installation and removal of patient transport incubators or stretchers. The patient should not have to be tilted greater than 20 degrees when loaded into the aircraft.

E. Capability of operating within the hospital service area while carrying:

1. a two-member transport team

2. two adult patients or two transport incubators

3. equipment and supplies with an approximate total maximum load of 700 pounds for all the foregoing, excluding over water equipment.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The hospital service area referred to herein is the area within the following geographic boundaries:

To the north, the Canadian border; to the west, the Pacific Ocean; to the east, the Cascade mountain range; to the south, the Washington-Oregon border.

It is not anticipated that the aircraft will be used to fly over the Cascade range. However, there will be a considerable amount of transport over large bodies of water. Therefore, the appropriate FAA over-water transportation regulation equipment should be included in the bid and specifically detailed. The geographic area described roughly provides a 100 mile distance to the north of Seattle, 90 miles to the west, 150 miles to the south and 70 miles to the east.

F. Means of securely anchoring an isolette or stretcher, air, oxygen bottles and ventilators to the air frame.

G. A method of providing air and oxygen to the patient care portion of the aircraft. Outlets must be of standard hospital type. This system must be capable of supplying 50 PSI hospital standard of air and 100% oxygen for approximately 3 hours of operation of transport ventilators. The air and oxygen installation must also have provisions for an air/O_2 blender/regulator as an integral part of the retrofit. The contractor will be responsible for providing full air oxygen tanks for the aircraft at each departure.

H. A 115 volt, 60mx A/C sine wave power source with a standard three-prong double receptacle for each patient capable of operation with either engine inoperative and of enough integrity to operate sophisticated solid-state circuitry and servo motors. The system must have a minimum load capacity of 2,200 watts and have a minimum of three outlets per patient.

I. A means of aircraft-to-hospital communication. This must be a first-person communication between the transport team and either the referring or receiving hospital personnel.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

J. An adequate light source to provide proper patient care within the aircraft (100 foot candles on the incubator or stretcher). Lighting must be of the non-flourescent type with dimming capabilities.

K. Suction available in the cabin. The suction units must be able to provide 40 CM HG of vacuum to each outlet. There must be one outlet per patient.

L. IV holders available overhead.

M. The contractor must provide for each aircraft life jackets and a survival package containing items agreed upon by the contractor and HMC.

N. The heating system must have the capability of maintaining the cabin temperature at about 75° during all phases of operation.

O. The helicopter provided shall be equipped and configured with the avionics and non-avionic equipment needed to satisfy the demands of the program.

P. It will be the Contractor's responsibility to maintain in good working order all contract provided equipment.

IX. IDENTIFYING THE AIRCRAFT

It will be the responsibility of the Contractor to identify each aircraft with colors, decals or marking that satisfy HMC's requirements and to maintain that scheme through the duration of the contract. The Bidder should propose a method of identifying the aircraft in his/her response to the RFP.

X. FLIGHT OPERATIONS

A. All aircraft that fly under this contract shall conform to all rules, regulations and requirements of the Federal Aviation Administration (FAA) of the United States Government. The Contractor shall maintain a current FAR Part 135 certificate.

B. The Contractor shall have the sole right to determine whether or not a given flight requested by HMC should be made from the standpoint of safety of operating the aircraft.

C. HMC may designate as passengers or medical team members anyone it chooses. The Contractor must transport all persons proposed by the medical team, including patients with communicable diseases, unless they constitute a threat to flight safety.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT V

RATE STRUCTURE

Fixed Wing -

For the period from the effective date of this contract through June 30, 1986, rates shall be as follows:

	Fixed Monthly Cost	Cost Per Mile
Cheyenne III (dedicated)	$15,000	$2.59
Cheyenne III (backup)	0	$2.59
Cheyenne II (backup)	0	$2.40
(Jet)	0	$3.15

Helicopter -

For the period from the effective date of this contract through April 30, 1986, rates shall be as follows: For services rendered by SJC and its helicopter subcontractor HMC shall pay $2,000.00 (two thousand dollars) for each flight hour spent in transport, except that all public relations and training flights will be paid at a rate of $350 per flight hour. If the total number of flight hours during the twelve month period, May 1, 1985, through April 30, 1986, reaches 336 hours, then all additional flights will be charged at a rate of $800 per hour.

For the period from May 1, 1986 through June 30, 1986, rates shall be as follows:

For services rendered by SJC and its helicopter subcontractor HMC shall pay a fixed monthly rate of $30,000.00 (thirty thousand dollars) in advance on the first of each month, and in addition shall pay $800.00 (eight hundred dollars) for each flight hour spent in transport up to and including an accumulated average total of 360 hours per contract year and thereafter at the rate of $550.00 (five hundred, fifty dollars) per flight hours spent in transport, except that all public relations and training flights will be paid at a rate of $350 per flight hour.

Hours will be measured with a flight hour meter and shall include only hours spent in transport, measured from the amount of lift off to the moment of landing.

On July 1, 1986, rates shall be increased for the period July 1, 1986 through June 30, 1987, as follows: For each one per cent (1%) increase in the United States Department of Labor's consumer price index (CPI) for the United States city average for all urban consumers for all items except fuel, May 1986 vs. May 1985, the monthly rate and the rate per mile for the fixed wing aircraft will

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

be increased by seventy-two hundredths (0.72%) of one percent (0.7%) and the monthly rate and the hourly rate for the helicopter shall be increased by nine-tenths of one percent (0.9%).

On July 1, 1987, July 1, 1988, and July 1, 1989, rates shall be increased according to the same formula described above.

Effective July 1, 1986, HMC or the participating hospital will pay, in addition to the rate per nautical mile identified above, an additional amount calculated as follows:

Fixed Wing:

An amount equal to 2/5 ¢ (two-fifths cent) per nautical mile (nm) for each 1¢ (one cent) increase per gallon in the cost of fuel to SJC at Boeing Field, Seattle, since the effective date of this agreement. Expressed as a formula, it would be:

Additional payment = $0.004 x nm x cents/gallon increase.

For example, assuming a flight of 1000 nm and a price increase of 30c/gallon, the additional payment under this formula would be:

$0.004 x 1000 x 30 = $120 additional payment.

This additional payment shall be computed in increments of 5¢ (five cents). Thus when the cost of fuel to SJC reaches 5¢ (five cents) above the price at the time this contract is signed, the price per mile of transport will increase 2¢ (two cents). When the price of fuel reaches 10¢ (ten cents) above the initial price, the cost per mile of transport will be 4¢ (four cents) above the base price agreed upon in Exhibit V. And so on.

Helicopter:

An amount equal to $2.75 per flight hour for each 5¢ (five cents) increase per gallon in the cost of fuel at Boeing Field, Seattle, since the effective date of this agreement.

Any decrease in fuel prices will result in a decrease in the rate per mile and per hour of transport according to the same principles described in the above paragraphs.

SJC shall provide HMC with verification of its current price per gallon for fuel and shall submit documentation of any change in price.

5/8/85

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EXHIBIT VI

XV. FACILITIES

THE CONTRACTOR SHALL PROVIDE:

A. Hangar facilities at Seattle's Boeing Field.

B. On site capabilities for routine (progressive) maintenance.

C. On field fuel 24 hours a day/7 days a week.

D. Priority handling of flight operations and maintenance of the aircraft over other operations and maintenance conducted by the Contractor.

E. Ambulance access to the aircraft.

F. On field or vendor controlled off-field maintenance facility for:

1. Routine air frame

2. Power plant including hot section and/or engine exchange.

3. Avionics

XVI. SAFETY

A. For HMC and the participating hospitals, safety is of the utmost importance and is our number one priority. The safety record of the Contractor will be investigated and will play an important role in the selection. The safe operation of the aircraft shall be reviewed as a function of aircraft maintenance, pilot training and experience, and operational protocols and other safety factors as may be appropriate.

B. Bidders must submit their safety records, including the records of the firm, the aircraft proposed for use and the pilots proposed for the service.

XVII. LIABILITY

A. The Contractor must agree to defend, indemnify and hold HMC and any participating hospitals harmless from and against any suits, claims and other liabilities, including reasonable attorneys' fees, court costs and related costs of defense, arising out of injuries to any persons or property damage caused by the acts or omissions of the Contractor, its directors, officers, employees and agents in the performance of the agreement entered into with HMC.

B. The Contractor must agree to accept responsibility for risk of loss of any equipment owned by HMC or the participating hospitals while stored on the Contractor's premises or being used on the Contractor's aircraft.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

PILOT HIRING POLICY

Seattle Jet Center currently uses the following experience guidelines in selecting pilots for employment. These guidelines far exceed FAR Part 135 requirements and meet or exceed our company insurance requirements.

Pilot-in-Command (Captain)		Second-in-Command (Co-Pilot)	
Total P.I.C. time	3500	Total P.I.C. time	2000
Multi-engine-P.I.C.	1000	Multi-Engine-P.I.C.	250
Turbine - P.I.C.	500	Turbine experience preferred	
Cheyenne experience preferred		ATP Preferred	
ATP Required			

SEATTLE JET CENTER GUIDELINES

Initial Training - All Pilots

2 day ground school conducted in-house for each type of aircraft operated.

3 hours of simulator instrument proficiency training with emphasis on S.E. Alaska approaches.

2 hours of aircraft training followed by a minimum of 20 hours of enroute training for captains and 10 hours of enroute training for co-pilots.

18 hours FAR Part 135 ground school.

Recurrent Training - All Pilots

1 day refresher ground school on aircraft systems and equipment every 12 months.

1 day FAR Part 135 Recurrent ground school every 12 months.

3 hours per crew of simulator training on a quarterly basis.

2 hours per crew of aircraft training every 12 months.

One pilot will attend factory school yearly and conduct a refresher ground school upon return.

MASTER USE PERMIT

September 1, 1986

DRAFT ENVIRONMENTAL IMPACT STATEMENT - PUBLIC HEARING

Seattle's Department of Construction and Land Use has issued a Draft Environmental Impact Statement (EIS) for the proposed:

Project Description

4800 SAND POINT WY NE ZONE I-4/I-2/SF 5 PROJ #8405870/KROLL 16W TO CONSTRUCT AN EMERGENCY HELISTOP FACILITY ACCESSORY TO AN EXISTING HOSPITAL/ MEDICAL CENTER (CHILDREN'S HOSPITAL & Medical Center).

The following Master Use Permit components are part of this application
SEPA ENVIRONMENTAL DETERMINATION
COUNCIL CONDITIONAL USE
TO ALLOW A HELISTOP WITHIN A MAJOR INSTITUTION ZONE.

Further Information Available:
A copy of the Draft EIS is available for public review at the downtown Seattle Public Library, 1000 Fourth Avenue the Governmental Research Assistance Library, Seattle Municipal Building, and the branch library in the neighborhood in which the project is located.

Additional information and a limited number of copies of the draft EIS are available through the Master Use Information and Notification Center, Room 408, Seattle Municipal Building (625-5200).

Opportunity For Public Involvement

A public hearing to gather comments on the environmental impacts of the proposal will be held on
SEPTEMBER 23, 1986 at LAURELHURST ELEM SCHOOL 06:00PM.
4530 46th Ave. N.E.
In addition, written comments may be submitted through OCTOBER 02, 1986

Comments should be addressed to: Director, Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.
If you wish to receive notice of the decision(s) on this project or to receive notice of the availability of the Final EIS (which responds to comments made at the public hearing or on the Draft EIS), please return the completed form below to: Seattle Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.

Re: Draft Environmental Impact Statement
for Children's Hospital Helistop

Dear Ms. Miller:

The Noise Section of the Draft Environmental Impact Statement (DEIS) is adequate and well done, however, I do have concerns about the adequacy of the DEIS in other areas that may relate to noise concerns. Specifically, one of the alternative Helistop locations is the proposed University of Washington Helistop noted on page 39 where it indicates that there is an already-constructed Helistop on the roof of an expansion wing. I visited the University of Washington and examined the so-called Helistop there. This area would be, for several reasons, very inappropriate to be used as a Helistop. First, the Helistop would cause an extremely disruptive noise impact for the patients at the University Hospital. Secondly, the safety of the proposed Helistop is in question. This is mainly because of the additional structure to the south of the proposed Helistop which would prevent any aborted landing attempts and also, if the winds were coming out of the south, cause downdrafts which would make it very difficult to land the aircraft at the proposed Helistop. This and other safety considerations have been discussed with helicopter pilots and they concur that the area would not be an ideal Helistop. When inspecting this site I also noted that there is a very substantial steel rail around the area which could pose another very significant safety problem for approaching and departing aircraft.

One of the few logical Helistop areas near the University Hospital would be the roof of an existing garage just north of the proposed University Helistop. Using the roof of this garage which has been stressed to handle the weight of the newer, heavier helicopters, one could take patients from the arriving helicopter, transport them either to the University through the existing system of elevators and tunnels or transport them to Children's Hospital via ground transport. I will have a complete analysis of the proposed University Helistop at a later date, however, several things such as the strength of the existing roof and its capability of holding the newer, heavier aircraft, is in question at this time, and I feel that using it as an alternative would be unwise.

Environmental Health Division Room 1510 Public Safety Building Seattle, Washington 98104 (206) 587-2722

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There are other anomalies in this DEIS, one of which is Table 5. It indicates that there were no rotary-winged aircraft transports to Childr s Hospital between the years of 1981 through 1984. It was my understanding that Graves Field had been used prior to 1984 for transporting patients to Children's Hospital, and if this is not the case it should be made more clear than Table 5 indicates. Other areas of concern include the reference to the Washington Administrative Code 248-18-285, indicating that a helicopter cannot be prohibited from landing without violating that code. The applicable federal law should also be referenced. In addition, approach and departure routes other than those indicated should be noted since, during certain weather conditions, the indicated approach and departure routes may not be the safest. Different approach and departure routes would also bear on the noise impact suffered by the community.

In conclusion, I feel that the DEIS as it now stands should have a supplement that would be more detailed to satisfy the various noise concerns that would be caused by other procedures such as landing at the University of Washington, landing at Graves Field, and alternate approach and departure routes.

Sincerely,

Curt Horner

MASTER USE PERMIT

September 1, 1986

DRAFT ENVIRONMENTAL IMPACT STATEMENT - PUBLIC HEARING

Seattle's Department of Construction and Land Use has issued a Draft Environmental Impact Statement (EIS) for the proposed:

Project Description

4800 SAND POINT WY NE ZONE I-4/I-2/SF 5 PROJ #8405870/KROLL 16W
TO CONSTRUCT AN EMERGENCY HELISTOP FACILITY ACCESSORY TO AN EXISTING HOSPITAL/ MEDICAL CENTER (CHILDREN'S HOSPITAL & Medical Center).

The following Master Use Permit components are part of this application
SEPA ENVIRONMENTAL DETERMINATION
COUNCIL CONDITIONAL USE
TO ALLOW A HELISTOP WITHIN A MAJOR INSTITUTION ZONE.

Further Information Available:
A copy of the Draft EIS is available for public review at the downtown Seattle Public Library, 1000 Fourth Avenue the Governmental Research Assistance Library, Seattle Municipal Building, and the branch library in the neighborhood in which the project is located.

Additional information and a limited number of copies of the draft EIS are available through the Master Use Information and Notification Center, Room 408, Seattle Municipal Building (625-5200).

Opportunity For Public Involvement

A public hearing to gather comments on the environmental impacts of the proposal will be held on
SEPTEMBER 23, 1986 at LAURELHURST ELEM SCHOOL 06:00PM.
4530 46th Ave. N.E.
In addition, written comments may be submitted through OCTOBER 02, 1986

Comments should be addressed to: Director, Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.
If you wish to receive notice of the decision(s) on this project or to receive notice of the availability of the Final EIS (which responds to comments made at the public hearing or on the Draft EIS), please return the completed form below to: Seattle Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.

P. O. Box C5371
4800 Sand Point Way N.E.
Seattle, Washington 98105

Dear Ms. Greenawalt:

Based upon the Department's analysis and upon letters received during the scoping comment period, our scoping determination for the Environmental Impact Statement for your application for a helistop permit is as follows:

AREAS OF IMPACT

Noise
Vibrations
Safety
Cumulative land use impacts of emergency medical transport by helicopter in the Seattle-King County region
Alternatives
- alternative sites off-campus, including UW Graves Field (soccer field)
- shared usage of sites
- no action alternative

MITIGATION MEASURES

Possible mitigation measures discussed in the EIS shall include the following:
- flight paths
- number of flights
- usage and location of U. S. Army (M.A.S.T.) or other agency helicopter landings
- off-campus pick-up of medical teams
- liability insurance
- criteria for use of helicopters
- plan for monitoring use

Comment letters should be carefully reviewed by the consultants preparing the EIS. The letters contain concerns regarding background data, impacts, study methodology and possible mitigation measures, within the scope of the EIS just outlined.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If you have questions on this scoping determination, please call me at 625-4509.

Sincerely,

BEATRICE FARRAR RYAN
Interim Director

FACT SHEET

Title and Description	The proposed action is for approval of a Council Conditional Use Permit to allow development of a he'istop outside the Emergency Room entrance of Children's Hospital and Medical Center (Children's). Implementation of the Proposed Action would allow 15-20 critically ill children to be brought by helicopter to Children's each month without exposing the child to the risk of life-threatening delays or transfers associated with ground transport. Alternatives to the Proposed Action include the construction of a helistop at University of Washington's Intramural Field, or sharing a helistop with University Hospital, both of which involve ground transport of critically ill patients to Children's, a Limited Landings at Children's Alternative involving no construction of the Proposed Action or alternatives and landing of helicopters at Boeing Field and Harborview with ground transport to Children's and with only a few helicopter flights (with destabilizing patients) landing on the grassy area outside Children's Emergency Room entrance. In addition, a No Action Alternative is characterized by all flights landing at Boeing Field, Harborview or other helistop, with ground transport of patients to Children's.
Action Sponsor	Children's Hospital and Medical Center 4800 Sand Point Way N.E. Seattle, Washington 98105
Approximate Date of Implementation	Construction would be completed within approximately two months of approvals.

ELEMENTS OF THE ENVIRONMENT

Following is a list of Elements of the Environment as set forth in Chapter 25.05.444 of the Seattle Municipal Code. Items marked "Reviewed" are discussed in this document, on pages specified in the preceding Table of Contents. Items marked "Not Reviewed" have impacts deemed to be non-significant, for reasons briefly stated thereafter.

1. Natural Environment

a. Earth

i. Geology	Not reviewed; no unusual conditions exist on this urban site.
ii. Soils	Not reviewed; no unusual conditions exist on this urban site.
iii. Topography	Not reviewed; no unusual conditions exist on this urban site.
iv. Unique Physical Features	Not reviewed; no unique physical features exist on this urban site.
v. Erosion/Enlargement of Land Area (Accretion)	Not reviewed; construction-related erosion would not be significant.

b. Air

i. Air Quality	Not reviewed; helicopter emissions would not be significant.
ii. Odor	Not reviewed; helicopter emissions not expected to generate significant odor.
iii. Climate	Not reviewed; construction of helistop and operation of helicopter would not result in significant impact.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

c. Water		
	i. Surface Water Movement/ Quantity/Quality	Not reviewed; no surface water on site.
	ii. Runoff/Absorption	Not reviewed; amount of impervious surfaces would not be significant.
	iii. Floods	Not reviewed; not applicable to this urban site.
	iv. Groundwater Movement/ Quantity/Quality	Not reviewed; not applicable to this urban site.
	v. Public Water Supplies	Not reviewed; water consumption of proposal expected to have no impact on overall City of Seattle supply.
d. Plants and Animals		
	i. Habitat for and Numbers or Diversity of Species of Plants, Fish or other Wildlife	Not reviewed; currently only usual urban birds or small mammals can reasonably be expected on site.
	ii. Unique Species	Not reviewed; none exist on site.
	iii. Fish or Wildlife Migration Routes	Not reviewed; not applicable to site.
e. Energy and Natural Resources		
	i. Amount Required/Rate of Use/Efficiency	Not reviewed; insigificant amounts of energy consumed.
	ii. Source/Availability	Not reviewed; energy requirements would have insignificant effect on overall supplies.
	iii. Nonrenewable Resources	Not reviewed; the only use of resources would be for normal building materials, and energy requirements.
	iv. Conservation and Renewable Resources	Not reviewed; no significant impacts on conservation and renewable resources.
	v. Scenic Resources	Not reviewed; no significant impacts on scenic resources.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2.	<u>Built Environment</u>	
a.	Environmental Health	
	i. Noise	Reviewed
	ii. Risk of Explosion	Reviewed; discussed under Traffic Hazards (Helicopter Safety).
	iii. Releases or Potential Releases to the Environment Affecting Public Health, such as Toxic or Hazardous Materials	Not reviewed; proposal involves no significant hazard in this area.
b.	Land and Shoreline Use	
	i. Relationship to Existing Land Use Plans and to Estimated Population	Not reviewed; proposal involves no significant departure from land use.
	ii. Housing	Not reviewed; proposal has no significant impact on housing.
	iii. Light and Glare	Not reviewed; increase in light and glare determined to be non-significant.
	iv. Aesthetics	Not reviewed; proposal involves no significant changes to aesthetic character.
	v. Recreation	Not reviewed; no significant demand for recreation resources would be generated.
	vi. Historic and Cultural Preservation	Not reviewed; no affected historic or cultural resources have been identified.
	vii. Agricultural Crops	Not reviewed; small therapeutic garden on-site would be relocted.
c.	Transportation	
	i. Transportation Systems	Not formally reviewed; the proposed action by its nature would alter the transport of pediatric medical teams and patients; discussed under Introduction, Description and Traffic Hazards (Helicopter Safety).
	ii. Vehicular traffic	Not reviewed; proposal not expected to have significant impact on vehicular traffic.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

iii.	Waterborne, Rail and Air Traffic	Not reviewed; proposal would generate relatively insignificant amount of air traffic, which is quantified in description of proposed action.
iv.	Parking	Not reviewed; not applicable to site or proposed action.
v.	Movement/Circulation of People or Goods	Not reviewed; proposal would not have significant impact on movement/circulation.
vi.	Traffic Hazards	Reviewed
d.	Public Services and Utilities	
i.	Fire	Not reviewed; existing and future services not significantly affected.
ii.	Police	Not reviewed; existing and future services not significantly affected.
iii.	Schools	Not reviewed; no significant increase in school population is anticipated to result from development of this project.
iv.	Parks or Other Recreational Facilities	Not reviewed; not applicable to site.
v.	Maintenance	Not reviewed; owner would contribute taxes to pay for maintenance of public systems.
vi.	Communications	Not reviewed; proposed action not expected to disrupt communications.
vii.	Water/Storm Water	Not reviewed; project would be served by existing system with minimal upgrade.
viii.	Sewer/Solid Waste	Not reviewed; project would not require sanitary sewer or generate solid waste.
ix.	Other Governmental Services or Utilities	Not reviewed; provision of energy discussed in energy section; demand for government services would be small.

EXECUTIVE SUMMARY

Introduction

This environmental impact statement examines the University District and Laurelhurst neighborhoods of northeast Seattle and the potential impacts associated with construction and operation of the proposed Children's Hospital Helistop. The proposed action is the approval of a Council Conditional Use Permit to allow development of the Children's helistop located on the campus of the Children's Hospital and Medical Center at the northeast corner of Sand Point Way N.E. and N.E. 47th Street. The sponsor of the project is the Children's Hospital and Medical Center.

The sponsor's objective in developing the proposal is to create a landing pad for helicopters transporting critically ill or injured children to Children's. The specific objectives of the proposed action are to minimize both the patient transport time and the number of potentially destabilizing patient transfers from the place of patient pickup to the Emergency Room entrance at Children's while maintaining appropriate medical treatment and to construct a helistop and to operate the helicopter service so as to minimize potential environmental impacts.

The Children's campus is located in the Laurelhurst neighborhood, less than one mile east of the University of Washington. The Children's campus is situated on an east-facing hillside and consists of one large hospital building and a detached parking garage along the north edge of the campus boundary. The proposed helistop pad would be located approximately 120 feet north of the Emergency Room entrance, somewhat southwest of the parking garage and in the central portion of the campus.

Description of the Proposed Action and Alternatives

The proposed action would relocate the existing "Kitchen Garden" to a new site on campus and would remove three tall trees and assorted shrubbery prior to grading and construction of the helistop. The 40-foot-square helistop would be marked by a large red "H" and would be surrounded by a fence 2.5 to 3.5 feet tall. The helistop would be identified from the air by the red "H" and at night by ground lights that would be turned on for emergency landings. The helistop would initially involve ten patient transports per month and over time would receive up to an estimated 15-20 critically ill patients each month. For the near-term, approximately ten patients per month are expected to be transported by helicopter to Children's. The majority of these flights would be performed by Airlift Northwest (ALNW), a Seattle vendor based at Boeing Field; although flights could occur by other ambulance services, U.S. Army MAST helicopters, or private helicopters. Two takeoffs and two landings would be associated with each ALNW patient delivered to Children's--one landing and takeoff for the pickup of the pediatric medical team, the other for the delivery of the patient and departure of the helicopter.

Nearly all of these flights would approach Children's from the southwest, along Sand Point Way N.E., before turning to the south over the parking garage and making final approach to the helistop from the north. In

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

rare conditions of strong winds from the northwest quadrant, the helicopter would approach and land from the northeast (final flight paths would be approved by the FAA). Upon arriving at the helistop, the engine would be shut down, a ground crew would assist the on-board medical team for transporting the patient to the Emergency Room. The patient would be removed from the helicopter, placed on a gurney, and wheeled to the Emergency Room entrance. Once the patient is inside the Emergency Room and medical equipment is retrieved, the pilot would restart the engines and depart, following approximately the same flight path as the approach, but with greater altitude.

There are four alternatives to the proposed action discussed in the EIS. The University of Washington Intramural Field Helistop Alternative would consist of construction of a secured helistop at Graves Field on the University of Washington athletic field complex. The helistop would receive a similar number of Children's-destined flights as the proposed action. As with the proposed action, four flights wold be associated with each patient delivery. Patients landing at the Intramural Field Helistop would be transferred to a ground ambulance for the trip to Children's Emergency Room. Total transfer and transport time from helicopter touchdown to entry to the Children's Emergency Room would be a minimum of 10 minutes.

The University of Washington Hospital Helistop Alternative would consist of receiving approval by the Seattle City Council for a Conditional Use Permit on an already constructed, secured helistop on the roof of the hospital's expansion wing. As with the Intramural Field Helistop Alternative, this alternative would receive a similar number of Children's-bound patients as the proposed action in addition to an undetermined number of University of Washington-destined flights. As with the Intramural Field Helistop Alternative, this alternative would require the transfer of Children's-bound patients to a ground ambulance for the transport to Children's. Total transfer and transport time from landing to Children's Emergency Room is estimated at a minimum of 17 minutes.

The third alternative examined in this document is the Limited Landings Alternative, under which Children's-destined patients would be flown to Boeing Field and/or Harborview Hospital, stabilized, and transferred to a ground ambulance for transport to Children's. Occasional landings of destabilizing patients would occur in the grass area outside the Children's Emergency Room.

The final alternative is the No Action Alternative under which all Children's destined patients would be flown to Boeing Field and/or Harborview Hospital, stabilized and transferred to a ground ambulance for transport to Children's. No landings would be allowed on the Children's campus.

Impacts on patient outcome are expected to be more favorable under the proposed action than under the Intramural Field Helistop Alternative, the University Hospital Helipad Alternative, Limited Landings or the No Action Alternative. The increased time of transport and increased manipulation of patients that would result from any of the alternatives other than the proposed action could result in suffering, the need for prolonged treatment, or even death.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Environmental Impacts of the Proposed Action and Alternatives

Through the mandatory scoping process, two elements of the environment were identified as warranting analysis in the EIS. These elements are Noise and Vibration, and Helicopter Safety. "Cumulative Impacts" was added as a scoped element because of the possibility that the proposed action could serve as a precedent for the development of other helistops in Seattle.

An evaluation of noise and vibration impacts expected to be caused by the proposed action indicates that although helicopter noise would be noticeable, it would not cause significant impact during daytime hour, when three-quarters of the patient transports are expected to occur. During sleeping periods, helicopter flights could cause sleep disturbance of varying degrees to 15-30% at the closest, line-of-sight residences. The worst case impact of monthly helicopter noise exposures would increase ambient levels of 55-58 dBA by 3-5 dBA at residences closest to the helistop, which does not represent a significant increase over existing levels. Structural vibrations due to helicopter flights are not expected to be significant, although helicopter-induced vibrations could cause movement of small household objects, such as dishes, in the residences nearest the flight path. The Intramural Field Helistop Alternative would not be expected to create noise impacts when the primary approach and departure paths are used, although some impact could occur to the occupants of the University of Washington dormitories and classrooms when the secondary path over the University of Washington is used. The University Hospital Helistop Alternative would result in noise impacts for residents south of the Montlake Cut; due to a slightly greater distance from the flight path, these impacts would be slightly less than those impacts expected for residents in the vicinity of the Children's Helistop. Under the Limited Action Alternative, helicopter flights and resultant Ldn noise levels are expected to remain at current levels, resulting in occasional but not significant impacts. Under the No Action Alternative, there would be no noise impacts from helicopter operations at Children's or in the vicinity; however, there would be noise at Boeing Field and Harborview Hospital. Any alternatives to the proposed action could result in ambulance sirens being used between the landing area and Children's. These sirens are approximately as loud as the helicopter.

Helicopter safety impacts associated with the proposed action would be similar to those associated with the Intramural Field Helistop Alternative and the University Hospital Helistop Alternative. The difference between the three would be the probable location of potential helicopter accidents. Based on available data, the worst case expected statistical frequency of a helicopter accident on a flight destined for one of the proposed helistops would be one in every 5,459 flights, which, assuming an ave age of 20 patient transports a month, translates to a worst case of an accident occurring once every 23 years. Such an accident could occur anywhere along the flight path. Since the number of helicopter flights in the area would be less under the Limited Landings or No Action Alternatives than any of the other alternatives, the resulting helicopter safety impacts on the University/Laurelhurst area would be expected to be less as well, with the potential for impacts displaced to the other approach and departure loca-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

tions, i.e. Boeing Field and Harborview Hospital. It should be noted that limited landings in the grassy area do pose some public safety risks because the site is not secured.

In addition to helicopter safety, there are safety issues associated with ground ambulance transport and the natural gas meter house located near the site of the proposed action. In the case of a helicopter accident on the Children's site that breached the natural gas supply line, the natural gas would flare until shut off at the main valve across from Children's on Sand Point Way N.E. Under the Intramural Field Helistop Alternative, the University Hospital Helistop Alternative, and the Limited Landings and No Action Alternatives, patients destined for Children's would require ground transport from the Intramural Field, the University Hospital, and Boeing Field, Harborview Hospital, respectively, creating the possibility of traffic accidents that would not exist under the proposed action. Although specific statistics are not available regarding the frequency of traffic accidents involving ground ambulances, it is considered to be higher than the frequency associated with non-emergency vehicles.

The potential for cumulative impacts associated with the action alternatives centers around the likelihood of helistops proliferating at additional Seattle-area hospitals. There are three primary factors that would tend to discourage the improper use and proliferation of helicopter services in Seattle. First, the land use criteria used by the City of Seattle to evaluate helistop applications limit the use of helistops to those facilities that can demonstrate that the helistop is needed to save lives. (Only a few Seattle area hospitals that serve as tertiary care centers, offering specialized services to the region, are routinely involved in treating life-threatening emergencies that are referred from other hospitals and physicians in the region.) Therefore, the few hospitals in the Seattle area that can demonstrate the need or unique medical services and capabilities would be the only likely candidates for helistops. Second, the Puget Sound Health Systems Agency (PSHSA) has written two proposals to develop guidelines for the siting of helistops and to develop policy options for integrating helicopter services with regional and statewide Emergency Medical Service planning efforts. The Washington State Medical Association is drafting guidelines for assisting referring physicians in the selection of appropriate emergency medical transport. Finally, through the Certificate of Need process, the State Department of Social and Health Services (DSHS) will evaluate all future helistop installations at hospitals. (It should be noted that DSHS has exempted the Children's helistop proposal from the Certificate of Need process and, therefore, has not reviewed this proposal.) It is assumed that only those institutions with a demonstrated need for a helistop would be granted DSHS approval.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I. INTRODUCTION

The purpose of this document is to provide decision-makers, regulatory agencies, and interested citizens with a review of pertinent background information, a description of the construction and operation of a proposed helistop that would allow critically ill patients to be brought by helicopter to Children's Hospital and Medical Center (Children's), a description of alternative means of transporting critically ill patients (including alternative helistop locations), and an analysis of the potential impacts and mitigation associated with the proposed action.

This document is organized into three primary chapters: Background Information, Description of the Proposed Action and Alternatives, and Affected Environment, Significant Impacts and Mitigating Measures. The chapter on background information is intended to provide the reader with a context for the consideration of the proposed action. The chapter profiles the provision of general health care and describes the unique medical services offered by Children's; describes the conditions of patients who have been and would be transported to Children's by helicopter; characterizes the transport of critically ill patients--highlighting the role of helicopter transport; and reviews the authority of various public and private agencies with respect to the helistop construction approval and the provision of emergency helicopter transport services.

The chapter on the Proposed Action and Alternatives identifies the proponent's objectives, describes the process used to identify potential helistop sites; explains the derivation of the number of anticipated flights; and for each alternative characterizes flight operations and flight paths, and describes the transfer of the patient from the helicopter to the Emergency Room entrance at Children's.

The chapter on the Affected Environment, Significant Impacts and Mitigating Measures provides a detailed analysis of the elements of the environment that were determined to be significant during the scoping process. These elements are noise and vibration, helicopter safety, and cumulative impact.

Although the issue of medical need is not within the scope of this EIS, it is a requirement of the City Council's Conditional Use Permit and, therefore, is related to this proposal. At the request of the Seattle Department of Construction and Land Use, a report on medical need issues was prepared by Dr. Nicola, Director of the Seattle-King County Health Department. Dr. Nicola's report is appended to this document.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

II. BACKGROUND INFORMATION

Health Care Services

The evolution of medicine has been characterized by increasing sophistication of both medical professionals and the capabilities of technical support equipment. The complexities of the medical system are reflected in the emergence of numerous specialty disciplines within the medical profession. In simple terms patients with complex illnesses or injuries are now commonly referred to specialists who have the particular expertise and equipment for their effective treatment. Because of the relative infrequency of need of their expertise (on a per capita basis), medical specialists are generally affiliated with regional medical centers located in populated areas, with patients coming from the surrounding urban center, as well as from rural and remote areas (Nicola, 1986). This aspect of the provision of health care is referred to as the regional medical referral system.

The provision of medical services can also be considered from the perspective of the age of the patient: neonatal (less than one month old), children, adults and the elderly. Each of these stages in life development are unique in that the health care of the individual requires attention to specific physiological and psychological conditions. Pediatrics is the specialized branch of medicine that deals with the development, care and diseases of children.

In the Pacific Northwest, many clinics, hospitals and medical centers offer pediatric services; however, Children's is the largest medical center that is equipped and, with 1,050 active physicians, staffed to offer full service, tertiary care for children and as such is an integral component of the regional health care network. Tertiary care is defined, by Children's and University Hospital, as those services necessary to deal with illnesses characterized by complex patho-physiologic processes. The most effective management of these illnesses requires integrated diagnostic and therapeutic services provided by multiple specialists. Tertiary care services require continuous management from the presentation of an illness to its resolution. Complex illnesses may present numerous conditions, such as severe congenital anomalies, multiple organ system trauma, prematurity in newborns, poisonings and neuropsychiatric disorders (Neff, 1985). Children's is recognized as the regional, tertiary referral center for children in the Pacific Northwest. A summary of 1984-1985 cases indicate that of the 621 Children's patients affiliated with the Blue Cross system, 64% were categorized as unique cases (defined as patients diagnosed with illness or medical need common to no other or one other patient affiliated with the Blue Cross system).

In the Puget Sound area, hospitalized neonatal emergencies are generally admitted to the Neonatal Intensive Care Unit (NICU) at Children's, which has 19 beds, or to the NICU at the University of Washington Medical School Hospital (University Hospital), which has 12 beds. The only other NICU beds in the Puget Sound area are the twelve located at Tacoma General Hospital. The only other neonatal intensive care beds in the state are located in Spokane. Pediatric medical emergencies in the Puget Sound region

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that require hospitalization are generally admitted to the Pediatric Intensive Care Unit (PICU) of Children's, which has 17 beds. Children's, through its formal affiliation agreement, is the pediatric teaching hospital for the UW School of Medicine. There are an average of 450 occupied pediatric beds (excluding NICU beds) in the state of Washington; one-third of these are locted at Children's.

The University Hospital high-risk obstetrical program uses the University Hospital's NICU beds so that most low birthweight babies born at the University Hospital do not have to be transported between hospitals. Even with an excellent maternal transport program, there are still mothers who deliver low birthweight babies in community hospitals; many of these babies need to be stabilized and transported to a tertiary care hospital (Nicola, 1985). Because the University Hospital's NICU is often busy caring for the babies of mothers who delivered at University Hospital, low birthweight babies born in outlying hospitals are frequently transported to Children's. The two institutions have developed a system for coordinating the transport of these infants to either hospital based on the child's needs and the availability of services.

Children's has seven of the ten Board-certified pediatric surgeons in Washington, Alaska, Montana and Idaho. These surgeons offer a variety of unique capabilities including bone marrow and kidney surgery. Much of the pediatric surgery in the four-state region is currently performed at Children's.

Traumatized and severely burned children in the Puget Sound region generally go first to the region's recognized trauma center, Harborview Medical Center, but may be transferred to Children's for follow-up surgery or treatment and stabilization. (Harborview Medical Center is a County institution that is administered by the University of Washington.) Children's is not a trauma center, as it does not meet all criteria necessary to be so designated.

In 1985, Children's admitted 11,612 inpatients and 66,006 outpatients. As Table 1 indicates, 55% of these patients were from King County; 22% from Snohomish, Pierce and Kitsap Counties; 11% from other counties west of the crest of the Cascades; 7% from east of the Cascades; 2% from Alaska; 1% from Montana; and the remainder from other states and countries. The distribution of origins is displayed in Figure 1.

Emergency Transport of Patients

A key element of the regional medical referral system is the transport of the critically ill or injured patient to the referral hospital. This referral may occur either for a patient in a clinic or hospital who needs the services offered by a more sophisticated and/or specialized medical facility, or for a patient in the "field" (home, work, play or the scene of an accident).

The Emergency Medical Service (EMS) system refers to the extension of medical services to critically ill patients and, if necessary, the transport of these patients to appropriate medical facilities. The State of Washington's Department of Social and Health Services coordinates EMS

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

planning for the entire state. The EMS transport system in the central Puget Sound region is comprised of Medic One units, Fire Department aid units, private ground ambulance, military and private helicopter services and the specific emergency medical services offered by area hospitals.

Transporting critically ill children to Children's has long been a service offered by the hospital. Sending a specially trained transport team to referral hospitals has ensured specialized medical care en route and increases the potential for better outcomes for the patients brought to Children's. The Children's/University Hospital pediatric ground transport team has been in operation about ten years and currently brings more than 300 transports per year to the intensive care units at both hospitals.

Interhospital Transport

Under emergency conditions the interhospital transport of patients may occur by ambulance, by helicopter, by fixed wing aircraft or by a combination of these modes. Although there are existing medical guidelines and standards for patient care while being transported (American Academy of Pediatrics and American College of Obstetricians and Gynecologists, 1985 as cited in Nicola, 1985), there are no standard published guidelines for determining which mode of transport should be used for particular patient conditions. The Washington State Medical Association's EMS Standards Committee is in the process of developing guidelines to assist in the selection of appropriate modes of transport, with final recommendations scheduled to be considered during the summer of 1986. (See discussion under Washington State Medical Association, below.) Because a patient's presenting conditions may be complex and the attending medical personnel are best able to observe and synthesize the medical data with which they are presented, it is the opinion of the Seattle-King County Department of Public Health that any recommendations be used as guidelines and not standards (Nicola, 1986).

Distance is one factor in determining the selection of ambulance, helicopter and/or fixed-wing aircraft in the emergency transport of patients. Helicopter transport may be preferred in instances where distance is not great but when ground transport time would be long because of crossing Puget Sound, because of poor traffic conditions, or other circumstance that would significantly delay the critically ill patient receiving treatment that could only be available at the referral hospital. Additional determinants are the condition of the patient, the patient's ability to withstand transfers, and weather.

Field Transport

Field transport refers to the transport of injured or ill patients from non-hospital settings to hospitals or other medical centers. King County coordinates the delivery of certain emergency medical services throughout King County. The King County EMS system is a layered system response program: local Fire Departments' Aid Service, staffed by an Emergency Medical Technician (EMT), responds to all calls. EMT's have a minimum of 81 hours of training while paramedics, who are trained to perform emergency work in the field, have at least 1500 hours of training. Thus, paramedic units are dispatched to the more severely injured or ill patients in the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

field, including patients facing life-threatening medical situations. In King County, seven area hospitals provide medical control to paramedics:

Auburn General	Auburn
Evergreen General	Kirkland
Harborview Medical Center	Seattle
Highline Community	Burien
Overlake	Bellevue
Northwest	Seattle - Shoreline
Valley Medical Center	Renton

Volunteer medic units are also located in Carnation, Duvall, Enumclaw, Issaquah and on Vashon (Call, 1986b).

Paramedics operate as an extension of the physician services offered at the base hospital. Unless otherwise stipulated by the patient or patient's physician, paramedics will recommend transport of those patients requiring advanced treatment to the closest facility that provides the appropriate level of care. To that end, the King County Medical Society, the King County Emergency Medical Society, the King County Emergency Medical Services Coordinating Council and EMS Division of the Seattle-King County Department of Public Health have developed a classification of hospitals according to the services that they provide. The King County EMS Division has prepared a Patient Distribution Guide to assist field and base hospital medical staff in determining the appropriate medical center for treating the patient. The King County Medical Society has assumed responsibility for periodically updating the Guide.

The Patient Distribution Guide classifies Children's as both a Group A and Group B hospital. The Group A hospitals, of which there are 25, are characterized by the following services (King County Division of Emergency Medical Services, 1978):

- 24-hour Emergency Room Physician, trained in resuscitative measures
- Intensive Care Unit, staffed and operated at all times
- Coronary Care Unit, staffed and operated at all times
- Laboratory and X-ray unit services available at all times
- Major sub-specialty services available (on call) within one hour of notification

The 15 Group B hospitals satisfy the criteria for categorization as Group A and also have a neurosurgeon "actively involved with the hospital and [who] will examine and operate on patients in that hospital if it becomes necessary" (King County Division of Emergency Medical Services, 1978).

Only Harborview Medical Center is categorized as either a Group C (operating room staffed 24 hours a day) or Group D (intensive burn patient care) hospital.

Group E hospitals are subgrouped into specialized services including alcohol, psychiatric, neonatal, cardiac bypass and hyperbaric treatment. Only two hospitals--Children's and University--offer neonatal services, while Children's is one of six designated hospitals that can perform cardiac

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

bypass surgery. Although not a formal subgroup, pediatric emergency services involving critically ill or injured patients are generally referred to Children's (Call, 1986b). In 1985, there were a total of 141 patients who were served by the County's EMS system and subsequently transported to Children's--two of these by helicopter (Call, 1986b). Additional EMS ground transports were made by the Seattle Fire Department, which provides comparable services in incorporated Seattle.

The County's EMS Division has established guidelines for paramedics in South King County in order to assist in selecting air or ground transport for critically ill patients (Call, 1986a). The underlying principle is the consideration that air transport provides a rapid method for getting the appropriate medical help to the patient, not that the patient gets to the hospital quickly (Call, 1986a). The following guidelines are used by EMS paramedics in South King County in order to assess the need for helicopter transport (Call, 1986a):

"1. Must be an extremely ill patient [such] that the arrival at a hospital capable of providing specialized care will immediately save their life or reverse their medical deterioration.

   Examples of presenting medical problems that would most likely indicate use of a helicopter in order to expedite transport of a patient are as follows:

   a. Gunshot wound with vitals of blood pressure (BP) less than 80 and heart rate (HR) over 120 with possible respiratory problems

   b. Aneurysm (aortic) with BP less than 100 and dropping, or other internal bleeding signs requiring immediate intervention.

   c. Major medical problems in a pediatric patient where time is critical for survival of the mother and/or baby.

   d. Multiple injuries that indicate bleeding of such a nature that the patient is in danger of bleeding out within minutes.

   e. Obstetrical problems that require immediate medical intervention and that are not generally handled at local hospitals.

   f. Major head injuries.

2. Time must be the major consideration when using a helicopter. Overall, the time discussed means the helicopter must be able to reach the designated receiving hospital, in less time than the paramedic unit could reach the hospital if they scooped and ran. The time on scene is always a major concern and under no circumstances should there be a delay at the scene waiting for a ride from the helicopter. If a patient is committed to a ground vehicle, under most circumstances transportation should continue in the vehicle to avoid unnecessary delays or interruption in treatment by the ground vehicle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Generally, a helicopter should only be used in areas in eastern and southeastern King County when the patient must be transported for specialized care to a distant hospital such as:

Harborview Medical Center	- Major trauma, head injuries, burns
Children's Orthopedic Hospital	- Pediatric medical emergencies that would be delayed by ground transportation
University Hospital	- Obstetrical emergencies

4. Permission to use any helicopter by a paramedic must be obtained from the medic unit's base hospital physician.

5. Helicopters should only be requested when there are qualified emergency medical personnel on scene who can evaluate the patient's needs. Paramedics should be responsible for requesting helicopter transport as they are usually the most qualified medical personnel. While in route to an accident, it may be appropriate for paramedics to consult with EMTs on scene regarding the patient's condition.

6. Under no circumstances should paramedics request dispatch centers to get comparative estimated time of arrival from MAST and Airlift Northwest. The paramedics are expected to make a decision regarding which helicopter transport service can best serve the needs of the patient, and to request it. If the first service of choice is not available, then the second helicopter service should be requested."

The Role of Helicopters in the Transport of Patients in Western Washington

The Korean conflict was the first to recognize that the helicopter's ability to land nearly anywhere and then to transport the patient rapidly to Mobile Army Surgical Hospitals (MASH) greatly increased the ability of wounded soldiers to receive medical treatment. During the Vietnam War, the airborne MASH teams provided rescue, medical stabilization, and evacuation to approximately one million military and civilian personnel. Postwar studies on the application of military helicopters in a civilian context provided the basis for the development of medevac operations that were inaugurated by the Maryland State Police in 1970. The first civilian helicopter ambulance service in the United States was initiated in 1972 at Saint Anthony's Hosital in Denver. In the past 14 years, this concept has expanded to include 75 hospital-based helicopter services that land at more than 900 hospital helistops (Reich and Kania, 1985).

Patients who are transported to Children's by helicopter are in critical condition. Children's defines critically ill or injured patients as those patients who might die or become seriously damaged unless appropriate treatment is received immediately (Neff, 1986). Critically ill patients who are brought to Children's include but are not limited to near-drownings, premature children, severe injuries, overwhelming

KEY CHARACTERISTICS OF CRITICALLY ILL PATIENTS
TRANSPORTED BY AIRLIFT NORTHWEST HELICOPTER DIRECTLY TO CHILDREN'S
(August 1, 1985 - June 10, 1986)

Admission Date	Time[1]	Referring Hospital/Scene	Age/Weight	Presenting Condition	Admitted To	Discharge/Current Status
8/3/85	1600-1800	Naval Hospital Bremerton, WA	Newborn	Perforated bowel; two surgeries	IICU	Expired 8/4/85
8/20/85	1100-1550	Forks Community Hospital, Forks, WA	Premature infant; 2 lbs	Collapsed lung; extreme prematurity	IICU	Dischgd. Olympic Memorial 9/25/85; dischgd. home 10/85
8/27/85	1800-2022	St. Helen's Chehalis, WA	1 month	Fulminating meningitis (bacterial inflammation of the brain); coma; neurologically damaged	IICU	Dischgd. home 12/13/85
10/15/85	0630-0800	Wenatchee	Premature newborn; 27 wk. gestation	Multiple congenital abnormalities; spinal Trisome 18; CPR in route with twin	ER	Expired 10/15/85
11/19/85	0300-0400	Covington, WA (scene)	Premature newborn; 28 wk. gestation; 2-1/2 lbs.	Delivered at home; extreme prematurity; developed overwhelming infection; chronic lung disease	IICU	Discharged to Valley General 2/22/86
11/27/85	1150-1225	St. Joseph's Bellingham, WA	Newborn; 37 week gestation	Respiratory distress; severe pneumonia; overwhelming blood borne infection and shock	IICU	Discharged 12/5/86
11/28/85	1125-1255	St. Peter's Olympia, WA	2 months	Subdural hematomas; some vision and brain damage	IICU	Dischgd. to St. Peter's, Olympia, 12/16/85
12/4/85	0935-0945	Harrison Memorial Bremerton, WA	Premature newborn; 32 wk. gestation; 4 lbs.	Severe lung disease; overwhelming infection; respiratory failure	IICU	Expired 12/14/85
12/13/85	2215-2245	St. Helen's Chehalis	Newborn; 37 wk. gestation	Pneumomediastum (air dissecting around heart and lungs)	IICU	Dischgd. home 1/5/86
12/22/85	1329-1350	Skagit Valley Hospital Mt. Vernon	7 months	Overwhelming infection and shock; meningitis (bacterial inflammation of brain); no brain activity; possible loss of some fingers	PICU	Dischgd. to Skagit Valley Hospital 1/8/86
1/11/86	1510-1740 (Boeing) -1800 (COH)	Ketchikan, AL	Newborn; 35 week gestation; 4-1/2 lbs.	Overwhelming infection; Group B strep; intracranial bleeding; from Alaska to Boeing 2 seizures;	IICU	Expired 1/20/86

Table 2 (continued)

Admission Date	Time[1]	Referring Hospital/Scene	Age/Weight	Presenting Condition	Admitted To	Discharge/Current Status
1/20/86	0735-0805 (Boeing) -0815 (COH)	Yakima Valley Hospital, Yakima, WA	18 months	Massive bleeding from intestines and lungs; shock	PICU	Expired 1/20/86
2/12/86	2100-2200	Grays Harbor Community Hospital, Grays Harbor	3 year old	Lost child found in river. Extremely low temp. 37.5 degrees C. Decision made to begin extensive resuscitation efforts. Required continuous CPR.	ER	Expired 2/12/86
2/13/86	1040-1055	Whidbey General Whidbey Island	Newborn term infant	Massive generalized body edema, heart failure. Difficulty breathing at birth, collapsed lung cyanotic. Later determined congenital problems resulting in ruptured bladder.	IICU	Expired 2/14/86
3/21/86	2225-2245	Harrison Memorial Hospital, Bremerton, WA	Newborn; full term	Critical congenital anamoly collapsed lung; diaphragmatic hernia (surgery performed at COHMC)	IICU	Expired 3/22/86 following surgery
4/5/86	1005-1020	Federal Way (scene)	19 months	Child found partially submerged in lake by father; cold, pulseless and no spontaneous respiration. Pupils fixed and dilated. Father began CPR, Medics arrived and contacted ALNW. During hospitalization, child developed aspiration pneumonia. She was treated successfully and should be completely normal in every respect.	ER/PICU	Discharged to home 4/10/86
4/18/86	1510- -1600 (COH)	Sunnyside Hospital Sunnyside, WA	Newborn; full term 5 lbs.	Multiple congenital anamolies including a diaphragmatic hernia, no anus, possible heart disease and absence of a part of the lower spinal canal. At birth the child was severely acidotic , requiring intubation and mechanical ventilation with high pressures. Immediate surgery was the child's only hope for survival. The child was transported to Boeing by fixed wing and by helicopter to COH.	IICU	Expired 4/18/86
5/21/86	0850-0910	Bainbridge Island Middle School Winslow, WA	14 year old	Born with transposition of great vessels. Had cardiac surgery at COH 10/84. Had seizure in gym class with acute caridac arrest. Paramedics were called who in turn called ALNW. Child showed gradual improvement with a very rapid downhill course 12 hours before she died. She was found to have increased intracranial pressure and herniation of her brain stem.	PICU	Expired 5/26/86

Table 2 (continued)

Admission Date	Time[1]	Referring Hospital/Scene	Age/Weight	Presenting Condition	Admitted To	Discharge/Current Status
5/31/86	0015-0040	Whidbey Island	Newborn; full term	At delivery, child had marked progressive respiratory difficulty requiring increasing amounts of O2 by mouth. Chest x-ray showed child had aspirated newborn fecal material and had a right-sided partially collapsed lung. Possibility of complicating pneumonia.	IICU	Discharged to Whidbey Island 6/3/86
6/1/86	1218-1235	Medic 6[2] (Auburn Area) (scene)	21 months	Chemical ingestion (Pine-Sol). Child had respiratory distress, became cyanotic and comatose in a short time and had vomited. Child had a past history of asthma and showed evidence of penumonia.	PICU	Discharged home 6/11/86
6/17/86	0915-0940	Bremerton Naval Hospital	Newborn; 35 week gestation, 6 lbs.	Child born to diabetic mother. Increasingly severe respiratory distress. Child was acidotic with low blood oxygen. Child was intubated. Shows evidence that blood is being intermittently shunted away from the lungs, making it impossible for the baby to completely oxygenate his own blood, even with 100% oxygen.	IICU	Still at COH 6/20/86

[1]Time left referring hospital's Emergency Room or scene, to time of arrival at Children's
[2]EMS referred field pickup

infections, and ingestion of toxic substances. It is important to note that not all patients in these medical situations warrant helicopter transport to the Emergency Room entrance: that is a decision properly made by the referring physician in consultation with the advanced care unit or by the transport physician (Nicola, 1986). Although many outlying hospitals are equipped and staffed to appropriately deal with these medical conditions, there are situations when the severity of the condition warrants treatment at a tertiary care center. For example, pediatric surgeons and pediatric plastic surgeons are most capable of performing surgery on severed arteries, severe toxic shock may require dialysis, other conditions are best served by the recognized medical specialists that work in the infant and pediatric intensive care units. Table 2 presents data on the medical conditions of patients who were transported directly to Children's by helicopter.

The two main objectives of a helicopter transport system are to reduce the time before appropriate advance treatment can begin and to decrease patient manipulation.

Critical Time Saved

Surgical emergencies in the child, as well as infections, near drownings and trauma, are some of the conditions that need immediate intervention. Since time is critical, transport time has a direct bearing on the patient's prognosis. For critical patients, every moment lost increases mortality (Neff, 1986). Table 3 illustrates the time savings hypothetically involved in transporting and transferring an infant and equipment from Enumclaw to Children's Emergency Room.

Decreased Patient Manipulation

Whenever a patient is loaded or unloaded during an emergency transport, there are risks involved not only because of time loss but also because of patient handling. Two major risks are the possibility of losing critical life support tubes and lines, and the consequences of a lowered body temperature (hypothermia).

Isolettes are self-contained units that incorporate advanced life support systems. If an isolette that keeps a transported premature infant warm is opened to replace a tube that has been jostled, there is a risk that the child will become hypothermic if the outside temperature is below the ideal temperature of approximately 91°F (Neff, 1986). The hypothermic infants will try to breathe faster due to increased oxgen needs, which only results in more heat loss. In addition, a build-up of acid in the blood is also associated with hypothermia, which can contribute to the rupture of a premature infant's fragile blood vessels in the brain, which can cause brain damage or brain death.

The role of helicopter transport is generally described in a statement from the Puget Sound Health Systems Agency:

> "Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care en route can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services" (PSHSA, 1985).

The City of Seattle's Department of Construction and Land Use requested that Dr. Nicola, the Director of the Seattle-King County Department of Public Health, provide expertise in the assessment of medical need for the proposed Children's helistop. Dr. Nicola prepared recommendations based on a review of the literature, discussion with transport physicians, a review of helicopter flight logs, public hearing and discussions with knowledgeable individuals both in and out of the region (Nicola, 1986). Dr. Nicola's findings are appended to this report.

In Dr. Nicola's review of the literature examining the situations warranting helicopter transport, there are several cited studies that relate severity of illness to need for transport. One study revealed that over a six and one-half year period 81% of the patients transported by helicopter to a regional center were admitted to the ICU or were taken to surgery (overall mortality of 9%). A second study demonstrated that nearly one half of the patients arriving directly from the injury scene were delivered by helicopter (overall mortality of 6%). Another study cited in Nicola's report evaluated air transport of 569 patients in a rural EMS system and, using uniform guidelines, determined that helicopter transport was essential to 16.5%, helpful to 10.9%, and not a factor to the preservation of life in 54.7% of the cases. "In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8)" (Nicola, 1985).

A fourth study examined seven hospital-based helicopter transport medical emergency services that treated and transported 1273 blunt trauma patients. The study indicated that there was a 21% reduction in expected morbidity, however, there is some debate about methodologic soundness of the study (Nicola, 1985). The authors noted that the data must be viewed with caution and further suggested that predicted reduction in total trauma-related mortality may be more directly correlated to experienced medical teams reaching a patient than to the transport of a stabilized patient by helicopter rather than by ground transport (Baxt and Moody, 1983).

Dr. Nicola's review of literature prepared for DCLU concluded:

"...that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transporta-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

tion, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on (DCLU's) question (of the appropriate location for siting Childr n's helipad)." (Nicola, 1985)

Dr. Nicola also concluded that of the te patients that he estimated would be transported to Children's by helicopter each month, an estimated three or four "may have a medical need for helicopter transport to the doors of the hospital" (Nicola, 1985). The outcome of these patients may be adversely affected by a 3-5 minute delay in receiving treatment in the hospital (Nicola, 1985).

Dr. Nicola further noted tha. "the literature review indicated that there are not definitive predictive clinical indicators of prognosis; that is, any number [of transferred patients] would have to include an additional number of patients whose condition at time of referral was appropriate for air transport..." (Nicola, 1985).

Helicopter transport in the central Puget Sound area is provided by two general services: Military Assistance to Safety and Traffic (MAST) and Airlift Northwest.

MAST

MAST is responsible for the emergency transport of all military personnel and their dependents within 100 nautical miles of Fort Lewis. Military personnel and their dependents have no choice but to use MAST, unless a private airlift service is arranged and paid for by them or the military. MAST will fly civilians in areas where there are no civilian transport programs or where civilian programs do not have the appropriate equipment to respond (e.g., a mountain rescue). MAST units accept missions according to the following criteria: 1) life and death emergencies; 2) loss of limb or eyesight; 3) undue suffering; 4) only accessible transport due to terrain, etc.

MAST helicopters transfer patients from accident sites within a 100 nautical mile radius of Fort Lewis to Harborview, Children's, and other hospitals in Seattle and to St. Joseph in Tacoma. The MAST program in Puget Sound is based at Fort Lewis where six "Huey" helicopters are located; a seventh "Huey" is located at the U.S. Army's Yakima facility. The "Hueys" are Vietnam-era helicopters that are noisy, slow and characterized by a lot of vibration. The military plans to phase in UH60 Blackhawks in 1989. Compared to the "Hueys," the dual-jet-engine Blackhawks are larger inside, faster and more quiet. A representative of MAST has indicated that it is possible the plans to phase-in the Blackhawks may be altered (Greenawalt, 1986).

MAST is a training program for military medics, and as such is designed to support military capabilities and operations. In times of peace, MAST personnel develop and maintain patient care skills and are trained by both

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

civilian and military personnel, including physicians. New personnel entering the MAST unit are graduates of the military basic training program and also of advanced training programs in which they are taught military occupational skills. Serving in the MAST program and communicating and working with civilian hospitals allows recruits to continue Emergency Medical Technician (EMT) training.

MAST patient transport missions may be requested by anybody. MAST flys with EMTs and without advanced life support (ALS) and, therefore, no drugs unless the condition of the patient warrants that the helicopter pick up a physician/paramedic team from either Madigan Army Medical Center, a local hospital, or an emergency rescue program. MAST does not pick up the medical transport team at Children's. When a newborn is transferred by MAST to Children's, Madigan supplies the physician team (on an as available basis) to accompany the baby. Madigan had two pediatric staff and two neonatal fellows; however, as of July 1, 1986, Madigan no longer has neonatal fellows.

For those hospitals willing to supply their own physicians for MAST flights, understaffing during the physician's absence could exist for the referring hospital. Because MAST must return as quickly as possible to their base, they do not fly physicians, paramedics, or other civilian personnel back to the originating site unless that site is on the return flight path. Thus, the referring hospital will be without the services of the physicians involved in the transport until they are able to return. Other medical personnel may need to fill in for the medical team involved in the transport. On missions to Seattle hospitals, MAST will fly physicians back to Madigan, as long as they are ready to go quickly, because Madigan is on the MAST return flight path.

In 1985 Fort Lewis-based MAST flew approximately four hundred missions. Approximately 70% of these missions were field-site pickups and the remainder were hospital transfers. Transports were evenly divided between civilian and military personnel. From 1983 to date, MAST transported 29 patients to Children's; 12 of the patient missions to Children's were interhospital transfers (Kranz, 1986). These transfers occurred days or hours after the onset of the illness or injury.

MAST has a civilian advisory committee, chaired by Dr. Jay Kranz, a Seattle surgeon. The committee purchases equipment with State Department of Transportation monies and donations. Purchased equipment includes an incubator and three radios and installation kits; the latter was provided to enhance communications between the helicopter and emergency room staffs. Dr. Kranz independently reviews MAST transports for appropriateness.

Airlift Northwest

After nearly ten years of transporting critically ill children by commercial carrier and charter flights, Children's joined with three other regional medical centers (University of Washington Hospital, Harborview Medical Center, and Providence Medical Center) to form Airlift Northwest. The four-year-old Airlift Northwest is a Seattle-based airborne patient transport service designed to support the regional medical referral system and specifically to make specialized critical care accessible to patients throughout the Pacific Northwest and Alaska. Airlift Northwest provides

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

medically outfitted, ventilator-equipped turboprop jet and rotary winged aircraft, with a medical team of ICU physicians and ICU nurses to resuscitate and provide proper medical care to patients who are being transported. Patients requiring tertiary care generally will be transported to appropriate care facilities of one of the four members of the Airlift Northwest consortium. Airlift also will transport patients to non-consortium hospitals.

Airlift Northwest is a cooperative venture among the four public and private member institutions, with Harborview serving as the primary administrative arm of the consortium. Each of the three associate institutions has a contract with Harborview. The contract characterizes the airlift program and organizational structure, the roles of support personnel, the sharing of equipment, the allocation of costs and distribution of revenues, indemnification, record-keeping, services extended to non-participating hospitals, and provisions for amendment and termination of the contract (Childs, 1986b).

The turboprop jet, a Cheyenne III, is used for the transport of patients who are located more than 120 miles from Airlift Northwest's King County Airport (Boeing Field) base. This fixed wing aircraft is always used to transport patients from Alaska and for the majority of missions flown east of the Cascade Mountains in Washington, and elsewhere (Idaho and Montana) in the four-state referral area. Airlift also will accept missions to other states. Two other Cheyennes and a Sabreliner provide back-up capabilities in the event the primary Cheyenne III is unavailable.

In order to more effectively transport patients from areas in the Puget Sound region that are not easily accessible by ground transportation and not served efficiently by fixed wing, Airlift Northwest added a helicopter service in May of 1985.

The helicopter that Airlift Northwest operates is a twin-engine Agusta A109 Mark II helicopter, one of the fastest and quietest helicopters manufactured. The helicopter's specifications are listed in Table 4.

Standard medical equipment on Airlift Northwest's helicopter includes the following:

- 2 patient stretcher rack
- Patient oxygen system with two 50 psi oxygen outlets
- Compressed air system with one 50 psi air outlet
- Patient suction system with continuous and intermittent regulator capabilities
- 115 volt electrical system with 2 wall-mounted outlets in cabin
- Overhead lighting with high intensity halogen lamp
- Overhead IV hooks
- Double lock narcotics safe
- Lifepak 5 cardiac monitor/defibrillator
- Holter infusion pumps
- Doppler

The helicopter also can carry a 160-pound isolette unit (with ventilator) for the transport of neonates and babies. This isolette unit is

powered by the aircraft electric system while in the helicopter or by its self-contained battery pack. Additional medical equipment can be carried to provide the specific support necessary to individual patients.

The medical transport team of ICU physicians and nurses are based at Harborview, except for the pediatric team, which is based at Children's. When not flying, the pediatric medical transport team members work in the ICU at Children's. The transport team is medically trained and also receives a two-day orientation from Airlift pilots on helicopter operations and safety procedures. This safety orientation is maintained through biannual training.

Airlift Northwest annually transports hundreds of patients by aircraft. Table 5 indicates the frequency of use in previous fiscal years, in the current year and projections for the next ten years. From 1981 through mid-1985, Children's destined patients represented one-third of the total number of Airlift's fixed-wing transports.

With respect to Children's-destined patients, the Airlift Northwest helicopter transit service provides intensive care support to a number of critically ill or injured patients. Table 2 describes Airlift helicopter transports to Children's through mid-June 1986. This table identifies the date, time, origination of flight and the age, condition of patient, admitting unit, and discharge data or status. Approximately 63% of the children transported directly to Children's were newborns. Only one patient was older than three years old.

A Review of the Authority of Federal, State, Local and Private Agencies with Respect to Air Ambulance Service and Helistop Siting

This section highlights key jurisdictional issues with respect to emergency helicopter transport.

A review of the missions of various public and private agencies indicate that there is no single agency with jurisdiction regarding the siting of a helistop and the operation of an emergency airborne patient transport service. Rather, there are a number of agencies that have specific, defined authority. These agencies include the Federal Aviation Administration, the State of Washington's Department of Social and Health Services and the Seattle City Council, which is supported by the Department of Construction and Land Use and the Seattle-King County Department of Public Health.

In addition, there are a number of agencies that provide support of an informal and/or advisory nature. Among these agencies are the Washington Department of Transportation, Puget Sound Health Systems Agency, the Seattle Area Hospital Council, the Washington State Medical Association, American Society of Hospital-Based Emergency Air Medical Services, and the National Emergency Medical Services Pilots Association.

Federal Aviation Administration (FAA)

The FAA is a federal regulatory agency charged with the promotion of aviation safety. As such it provides programs certifying pilots and

[1] July 1-June 30 fiscal year.

[2] Fixed wing service began February 1982.

[3] Rotary service began in May 1985. The total number of patients transported to Children's including landings outside the emergency room, and landings with ground transports from Graves Field, Boeing Field, Harborview Medical Center.

[4] "... [these forecasted] numbers may well turn out to be significantly higher or lower than reality... These numbers are considered 'ballpark' figures from which actual volumes may deviate significantly" (Childs, 1986a).

Note: The number of transports reflects the total number of patients transported and does not reflect all flight segments for the pickup of medical transport team pickup and delivery of patient and return of the helicopter to base.

Source: Childs, 1986a, 1986b.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ensuring that aircraft are operated in a manner consistent with established regulations. There are no specifications for the construction of helistops. Rather, there are guidelines for the construction contained in an Advisory Circular, "Heliport Design Standards."

Helicopter operations are subject to specific FAA regulations, including Parts 61, 91, and 135. Parts 61 and 91 of these regulations pertains to General Rules for Aviation and to the qualifications of pilots and airmen, and equipment specifications. Generally, helicopters are given more latitude in their operations than fixed wing aircraft.

The establishment of a helistop facility requires the proponent to file Form 7480, which identifies the proposed approach and departure paths. The FAA will review the form and either approve or deny the request for flight path approval. It is important to note that the FAA does give pilots discretion in deviating from the flight path; they will investigate complaints but would generally not take action on a complaint unless the pilot was operating in an inherently unsafe manner (Benedict, 1986). Children's submitted a form 7480 to FAA on February 14, 1985. Because the proposed flight path has been revised, an updated application will need to be submitted.

State of Washington Department of Social and Health Services (DSHS)

Health planning in the State of Washington is performed both on a statewide as well as on a subregional basis. The DSHS is the designated health planning agency for the state. Its duties include needs assessment, planning, evaluation, implementation of the state health plan, and administration of the Certificate of Need program.

Certificate of Need Program. The state Certificate of Need program is a process for reviewing the following: construction, development or establishment of new health care facilities; significant capital expenditures; changes in number or distribution of beds; acquisition of major medical equipment; and the provision of new institutional health services.

A recent amendment to the Washington Administrative Code (248-19-230(1)(b)), effective March 30, 1986, specifies that helistops are subject to review:

> (i) The specific services subject to review under this subsection are limited to:
>
> (A) Air ambulance services licensed under chapter 18.73 RCW including a change between fixed wing and rotor aircraft. This includes, but is not limited to, acquisition of aircraft or construction of landing facilities...
>
> (ii) The services listed in subsection (1)(b)(i) of this section are subject to review under any one of the following circumstances:
>
> ...(F) The establishment of a new or different landing site for an air ambulance service.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

With respect to the proposed construction of a helistop at Children's, DSHS has determined that a Certificate of Need review is not required because the regulations specifically requiring a Certificate of Need were issued after Children's received a ruling that it was not subject to Certificate of Need review (Chestnut, 1986b).

Emergency Medical Services. The State of Washington, through RCW 18.73, amended, provides statewide emergency medical services (EMS) program planning with funding and guidelines to continue EMS systems development and improvement. Key functions of the EMS Division of DSHS are to prescribe minimum requirements for equipment (including ambulances) and personnel engaged in prehospital EMS, to establish EMS system standards, and to evaluate program development, expansion and improvements. The Washington Administrative Code (248-17-135) provides specifics on air ambulances. The Washington Administrative Code (248-18-285) also provides specific regulations for the provision of emergency care services:

> "Emergency care services. The hospital shall have a well defined system for providing emergency care services. The nature and scope of the hospital's emergency care services should be in accord with the community's needs and the hospital's capabilities.
>
> (1) The hospital shall provide the following basic, outpatient emergency care services.
>
> (a) Assessment of a person's condition to determine the nature, acuity, and severity of the person's immediate medical need.
>
> The condition of each person, who comes or is brought to the hospital for emergency medical care, shall, upon arrival, be assessed by a registered nurse, physician, or physician's assistant for the purpose of determining the nature and urgency of the person's medical need and the timing and place of the person's care and treatment.
>
> (b) Immediate diagnosis and treatment of any life threatening cardiac arrythmia, respiratory insufficiency or shock.
>
> (c) Appropriate transfer or referral of a patient who needs medical care services not provided by the hospital. Prior to transfer of an emergency patient to another health care facility, the hospital shall:
>
> (i) Perform the emergency procedures needed to minimize aggravation of the patient's condition during transport to the other health care facility; and
>
> (ii) Ascertain that the means by which the patient is to be transported to the other health care facility are suitable for the patient."

Currently, the EMS Division has no direct authority with respect to the proposed Children's helistop, except for equipment and personnel being certified to meet State standards. The Systems Development Administrator of the EMS Division staffs the Washington State Medical Association's EMS Standards Committee's Subcommittee on Air Ambulances (see below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

City of Seattle - Land Use

The City of Seattle guides land use through its comprehensive plan and land use policies and regulates land use through its Land Use Code. As a major medical center, Children's is designated a major institution and, as such, is subject to Seattle's Major Institutions Policy and specific regulations contained in the Major Institutions Chapter (23.48) of the Seattle Municipal Code (SMC).

The purpose of Seattle's Major Institutions Policy (SMC 23.16.10) "is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods adjacent to institutions." A series of nine implementation guidelines (plus one guideline specific to the University of Washington) provides the basis for considering the institutions' needs in conjunction with those in the surrounding area. Relevant policies include the following:

Implementation Guideline 4 - Institutional Classifications

f. Mitigate adverse impacts associated with the use of the proposed facility so that the location of parking and the routing of traffic do not create serious noise, safety problems or blighting influences on the surrounding area.

g. Reduce adverse impacts of light and glare.

i. Promote safety for those living, working and visiting the area.

Helistops are conditional uses that are permitted in Major Institutions subject to the following provisions of the SMC:

23.48.05 Conditional Uses

A. Helistops

1. A helistop may be permitted as a Council conditional use if the Council finds that:

a. The helistop is needed to save lives;

b. The helistop is located so as to minimize impacts upon surrounding residential property;

c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

This EIS is designed to fulfill the SEPA requirements of the Conditional Use Permit. With respect to the specific findings of medical need necessary to secure a conditional use permit, DCLU requested that Dr.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Nicola, the Director of Seattle King County Department of Public Health, assist DCLU in the medical need determination. The issue is independent of the SEPA process and the EIS. (For the convenience of the reader, Dr. Nicola's report is appended to this EIS.) The other conditional use issues, including restricted use, sensitive siting and alternative locations are addressed in subsequent chapters of this EIS.

Seattle-King County Department of Public Health

As a joint City/County agency, the Seattle-King County Department of Public Health serves all residents of King County. The Department operates health centers throughout the County, numerous satellite clinics in schools and community centers, a regional center for tuberculosis control, and a sexually transmitted disease control program and clinic located at Harborview Medical Center. The agency provides health services for the jail, vital statistics information, and operates the public health laboratory.

The Department includes the Divisions of Alcoholism and Substance Abuse, Emergency Medical Services, and the Medical Examiner. The Division of Emergency Medical Services plans, develops and administers paramedic services outside of Seattle, and assists fire departments to improve emergency medical services.

The Department has also provided expertise to the City of Seattle's Department of Construction and Land Use regarding the issues of medical need and noise and vibration associated with siting a helistop at Children's.

Washington State Department of Transportation

The Washington Department of Transportation has the responsibility of providing statewide planning services, enhancing safety and funding transportation improvements. The Division of Aeronautics deals specifically with air transportation, by participating in statewide transportation planning, assisting in the enforcement of FAA Regulations, investigating aircraft accidents, providing search and rescue support for missing General Aviation aircraft and providing funding for public aviation facilities. The Department does not have specific authority with respect to the siting of a helistop at Children's or the operation of the helicopter service (Hamilton, 1986).

Puget Sound Health Systems Agency

Puget Sound Health Systems Agency (PSHSA) is a non-profit, quasi-public corporation that was founded in 1976 for the purpose of assisting in implementing the (National) Health Planning and Resource Development Act. PSHSA is actively involved in health planning throughout its health service area: the ten counties of northwestern Washington. PSHSA also assists DSHS in review of Certificate of Need applications and offers services to companies, hospitals and other clients in research, data collection and analysis, education, health program development and policy analysis.

The responsibility of all Health Systems Agencies in the state, including PSHSA, is:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"...the provision of effective health planning for its health service area and the promotion of health services, manpower, and facilities which meet identified needs, and reduce documented inefficiencies..." (RCW 70.38.085)

To that end, PSHSA assembles and analyzes data; establishes, annually reviews and, as necessary, amends a health system's plan and implementation plan; prepares recommendations to the Department of Social and Health Services with respect to new institutional health services proposed within its service area; and periodically reviews institutional and home health services offered in its service area.

PSHSA has recently submitted a (revised) proposal to the Seattle-King County Department of Public Health and another proposal to the State Emergency Services Office to investigate the key issues surrounding the development of helicopter transport in the region and in the state. The goal of the State project is to develop a state plan and implementation strategies that will integrate air ambulance services with the EMS system. The State of Washington has withdrawn its commitment to participate in the development of this proposal (Nicola, 1986b). Specific project objectives under the statewide proposal are:

- Assess the current status of air ambulance services in Washington State and describe the development trend of this service in other locations across the nation.
- Identify and assess current and projected problems and needs with respect to air ambulance services.
- Establish goals for development of this service and criteria for evaluation, including WSMA user guidelines.
- Identify and assess a series of alternative State policies to meet identified problems and needs.
- Evaluate and select from among various options available a set of policies and a plan for development of air ambulance services in the state of Washington that integrates and coordinates these services with the EMS System. (PSHSA, 1986)

The original purpose of the proposed Seattle-King County project was to supplement the overall State plan with an air ambulance services plan and implementation strategy for the King County area. The objectives of the supplement were as follows:

- Monitor development of the statewide air ambulance plan, and review and comment on various aspects of the plan during its evolution.
- Conduct an inventory and analysis of air ambulance services in King County and present as input into development of State plan.
- Conduct a King County needs assessment regarding air ambulance services, including the development of a need projection model, and make recommendations regarding its adoption to the statewide steering committee.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. Analyze the state plan to determine if more specific policies and a more specific plan should be adopted in Seattle-King County.

. Develop strategies to implement the state plan and local alternatives in Seattle-King County and work with local agencies on implementation. (PSHSA, 1986)

At this time, the status of the PSHSA proposal is unclear (Nicola, 1986b).

American Society of Hospital Based Emergency Air Medical Services and National Emergency Medical Services Pilots Association

The American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS) and the National Emergency Medical Services Pilots Association (NEMSPA) are voluntary organizations that were established within the EMS helicopter industry to provide organization and guidance to the industry. These organizations do not have legal authority to impose regulations except to the extent that a hospital or helicopter operator must meet their guidelines in order to be accepted as members. As a result of the relatively high number of EMS helicopter accidents in 1985, ASHBEAMS and NEMPSA leaders met in February of 1986 and agreed that uniform guidelines and standards were needed in the industry. A first draft of the guidelines is expected to be available in the summer of 1986. According to Nina Merrill of ASHBEAMS, the guidelines and standards will address three primary issues:

. Creating a training program for hospital administrators in the aviation-related aspects of EMS helicopter programs in order to educate non-aviation personnel on aviation safety issues.

. Providing additional aviation safety orientation to air and ground medical crews that are involved with the transfer of patients.

. Recommending the requirement that EMS helicopter pilots undergo (a yet undetermined) amount of continuing pilot education every year. This continuing education requirement would be in excess of existing FAA regulations, which require one test flight every year to determine that the pilot is still capable of flying the aircraft.

These guidelines are being developed primarily to bring some of the smaller operations into conformance with unofficial standards to which major vendors within the industry already conform (Merrill, 1986).

Washington State Medical Association

The Washington State Medical Association is a trade organization that represents medical doctors in the state. Physician members voluntarily serve on committees that include, among others, the EMS Standards Committee, which has a subcommittee that is specifically addressing issues involving air ambulance services. The subcommittee is focusing on several issues (Pinkers, 1986; Cvitanovic, 1986) that will enable the creation of "User Guidelines" for the use of helicopter services:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. Medical indications, procedures, appropriate skills of personnel to administer procedures and guidelines for selection of the most suitable transport vehicles for prehospital (field) transports.

. Medical indications, procedures, appropriate skills of personnel to administer procedures and guidelines for selection of the most suitable transport vehicles for interhospital transports.

. Procedures and capabilities for flight crews.

. Coordination between air and land services considering:

- the need to have land units financially survive,
- the development of land-air transfer points to reduce total flight time,
- the effect of medical crew/patient origin on patient outcome.

Key principles of these user guidelines are that helicopters are a useful, but expensive, instrument of patient care and that care protocols must be designed to enable MAST to continue to operate in western Washington (Pinkers, 1986). It is anticipated that the Subcommittee on Air Ambulance Medical Standards will have a preliminary report submitted to the full committee during the summer of 1986.

Washington State Hospital Association

The Washington State Hospital Association is an independent trade organization that represents approximately 90% of the hospitals in the state. The Association activities include advocacy, education and lobbying of both the legislature as well as regulatory agencies. The Association is not directly involved in the issue of emergency airborne transport services (Mero, 1986).

Seattle Area Hospital Council

The Seattle Area Hospital Council is a trade organization that represents the major hospitals in King County and southern Snohomish County. The purpose of the Council is to provide a forum for issue identification, discussion, and collective action that is responsive to the needs expressed by member hospitals in their continued efforts to discharge their individual and collective responsibilities. The Council is not directly involved in the issue of emergency airborne transport services (Nell, 1986).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

III. DESCRIPTIONS OF THE PROPOSED ACTION AND ALTERNATIVES

This section states the sponsor's objectives, identifies how alternative helistop locations were developed and screened, characterizes the process used to project the estimated number of patients transported by helicopter to Children's and the associated number of flights, and provides a detailed description of the proposed action and alternatives, including descriptions of the helistop and flight paths.

Sponsor's Objectives for the Proposed Action

The proposed action is the construction of a helistop outside the Emergency Room of Children's Hospital and Medical Center (Children's). The helistop would be used as a landing area for a helicopter transporting critically ill patients to Children's. The objectives of the proposed action are:

- to make specialized medical expertise available to critically ill patients in the least amount of time
- to minimize transport time from place of patient pickup to the Emergency Room entrance of Children's
- to minimize the number of patient transfers that could result in patient destabilization
- to construct a helistop and operate the helicopter service so as to minimize potential environmental impacts in a manner that would not sacrifice proper patient medical treatment

Overview and Location

The 25-acre Children's Hospital and Medical Center campus is located at 4800 Sand Point Way N.E., Seattle, Washington, along a portion of the western edge of the Laurelhurst neighborhood. The campus is less than one mile east of the University of Washington campus (Figure 2, Vicinity Map.) The campus boundary on the northwest is Sand Point Way N.E. to and along N.E. 50th Street south along 44th Avenue N.E. to and along N.E. 47th Street to and south along 45th Avenue N.E. to N.E. 45th Street, to approximately 42nd Avenue N.E., if extended, and north to Sand Point Way N.E. (Figure 3, Campus Map).

Children's campus generally slopes downward to the west and south. It is landscaped and provides a sense of open space to the area. Principal access to the campus is via a signalized intersection with Sand Point Way N.E. The principal drive--Penny Lane--winds generally east to west and provides access to the various entrances to the medical center building and parking areas. The principal structural feature of the hillside campus is the medical center building, which contains the medical facilities and equipment. A parking garage contains four levels of parking: three for staff, and one for patients and visitors. There are two primary paved surface parking areas and several smaller parking areas that provide additional parking for visitors, service vehicles and medical staff. A

IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

permit application has been filed to construct a five-level medical office building north of the main structure.

The proposed helistop pad would be located approximately 120 feet north of the Children's Emergency Room entrance and approximately 115 feet northwest of the proposed Medical Office Building. North of the site is Penny Lane and the parking structure; east of the site is the driveway to the Emergency Room entrance and parking lot; west of the site is the service driveway that provides access to the loading dock and temporary oxygen tank (Children's recently has received a building permit to relocate the oxygen tank into the interior of the medical center complex). A brick, natural gas meter house is located approximately 48 feet northwest of the pad (Figure 4).

The neighborhood consists primarily of single-family residences, with densities ranging from one dwelling unit per 9,600 square feet (primarily along the Lake Washington shoreline) to the maximum single-family density of one unit per 5,000 square feet to the northwest of Children's campus. South and east of the hospital there is a large area zoned for one unit per 7,200 square feet, with a number of smaller, non-conforming lots in this area. One block east of the campus is the Laurelhurst Elementary School. A half block southeast of the Children's campus is the Battelle Memorial Institute research campus.

There are several multifamily residential and commercial uses concentrated along both sides of Sand Point Way N.E. and the Burke-Gilman Trail. Multifamily densities range from medium density, Lowrise 3 developments to low density, Lowrise 2 developments. In the area near the hospital, there are multifamily developments immediately to the north and west of the hospital. Laurelon Terrace, with many elderly occupants, is adjacent to the campus on the west. To the northwest of the hospital, there is a Planned Unit Development that includes a mixture of single-family, multifamily and open space uses. Commercial uses in the area include an Albertson's Supermarket just north of the Burke-Gilman Trail at 40th Avenue N.E., a medical/dental office building and a bank/office building at Sand Point Way N.E. and 40th Avenue N.E., and several small retail shops along the south side of Sand Point Way N.E. and N.E. 45th Street.

Open space in the area is provided by two playgrounds, a cemetery, and the Burke-Gilman Trail, a pedestrian and bicycle path that runs approximately parallel to Sand Point Way N.E. through most of the project area. The Laurelhurst Playground is located immediately to the southeast of the southeast corner of the Children's campus. The Burke-Gilman Trail passes within a quarter mile of the hospital across Sand Point Way N.E. Additional open space is provided by schoolyards, churchyards, and the Battelle campus.

The proposed action is the construction of a secured, concrete helistop outside the Emergency Room entrance of Children's. Transports would be limited to critically ill patients, as determined by the referring physician/medical team in consultation with Airlift Northwest and/or Children's medical personnel. Initially, approximately ten patients would be transported to Children's each month. Over time, these numbers would increase. For the purpose of this EIS, it is estimated that by 1990 a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

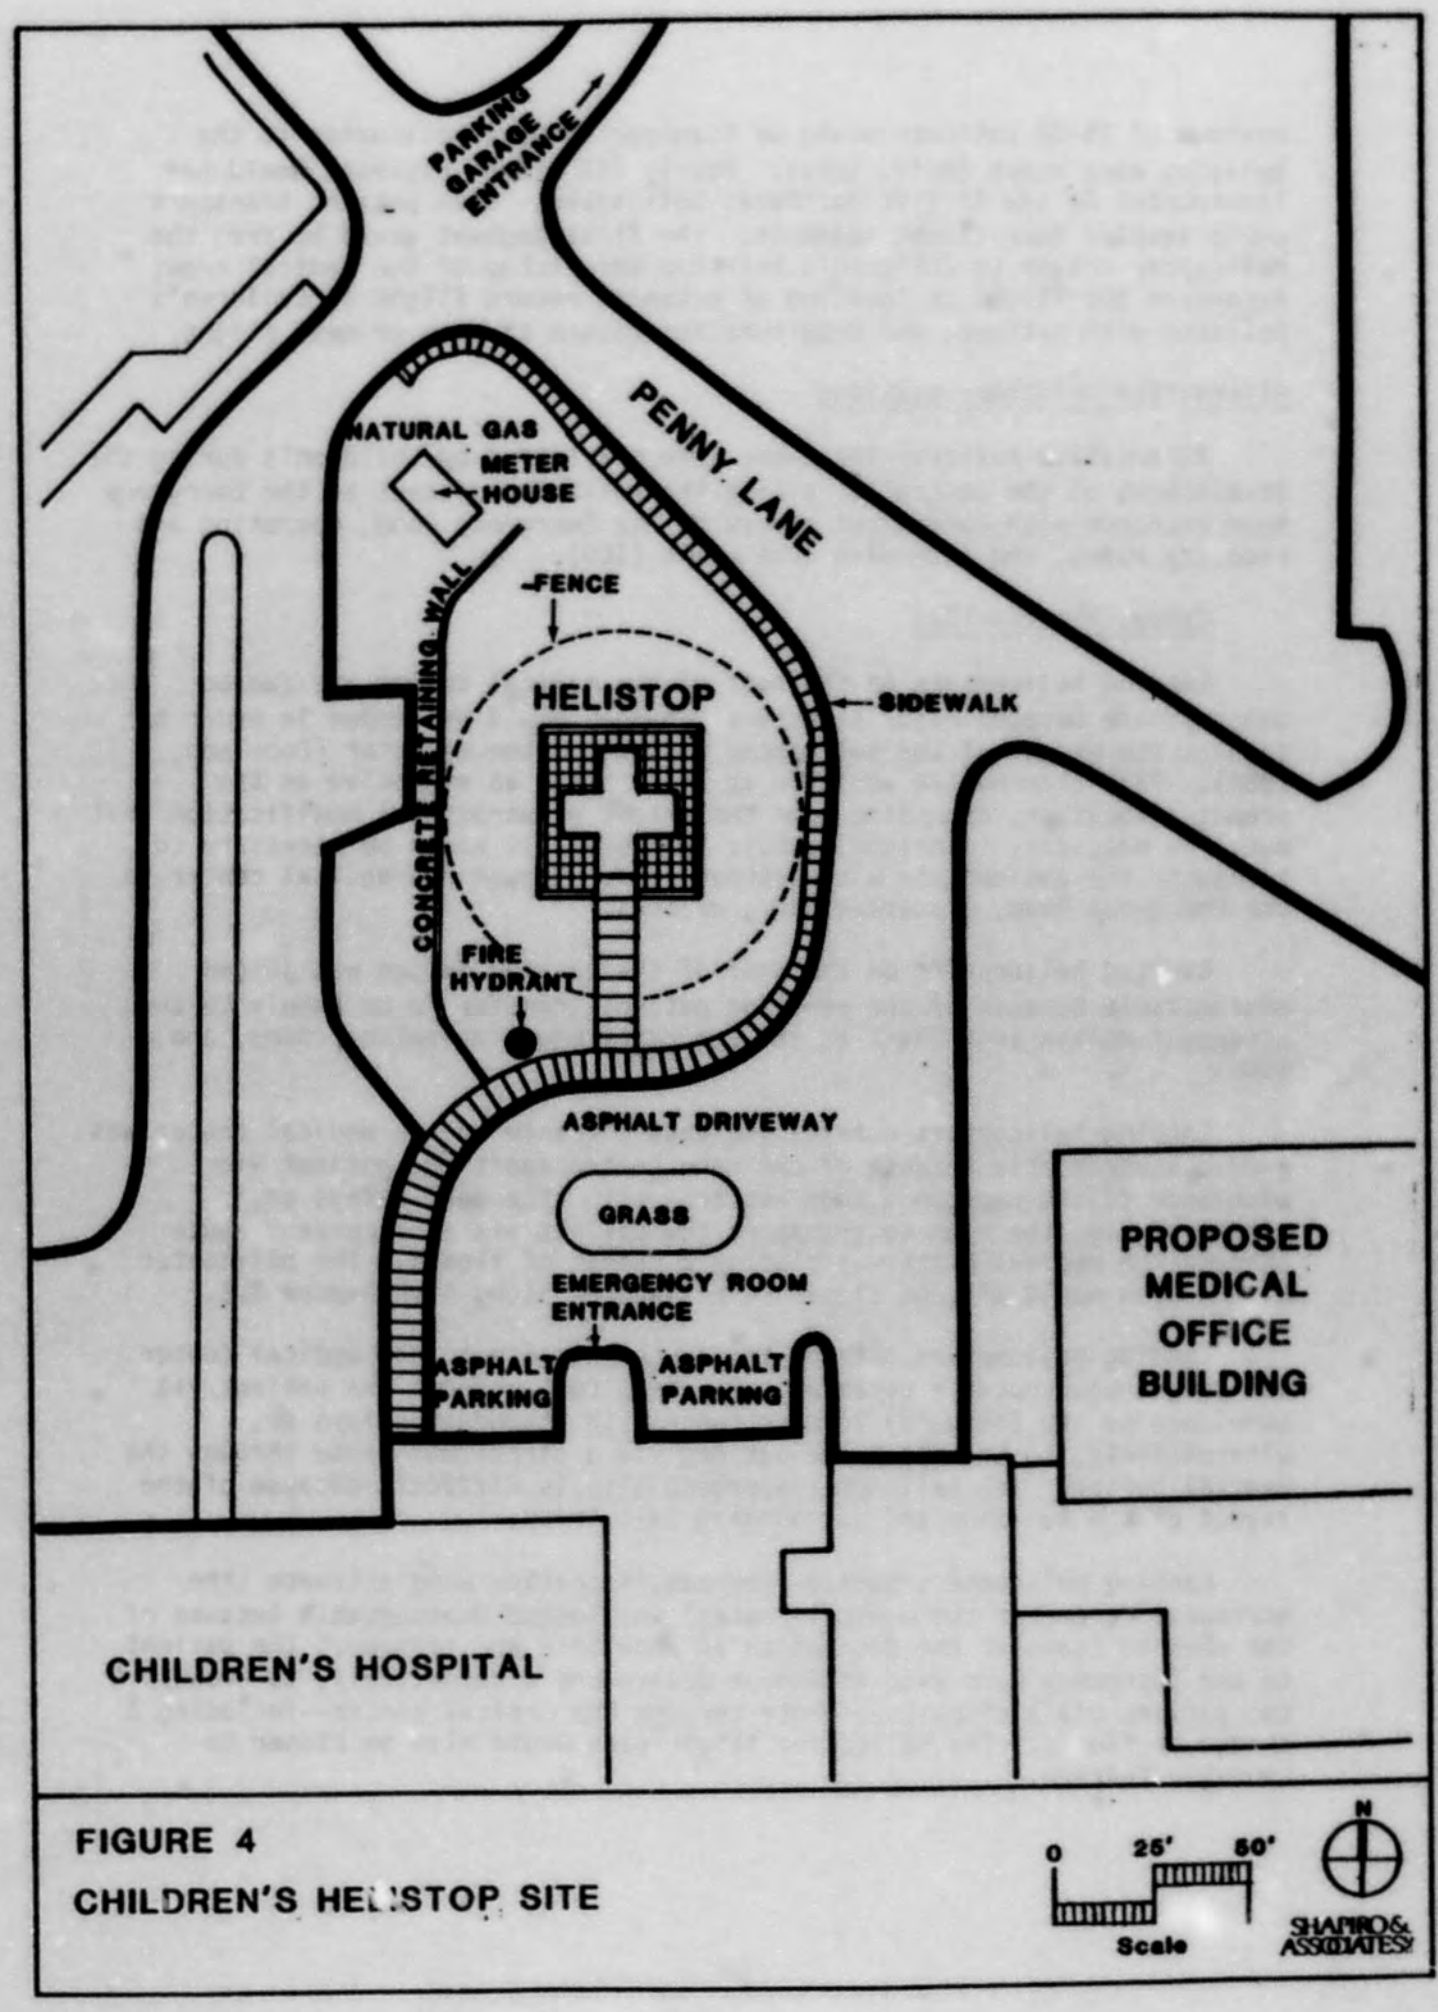

FIGURE 4

CHILDREN'S HELISTOP SITE

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

maximum of 15-20 patients would be transported by a helicopter to the helistop each month (Neff, 1986). Nearly all of the patients would be transported by the Airlift Northwest helicopter. Each patient transport would involve four flight segments: the first segment would be from the helicopter origin to Children's helistop for pickup of the medical crew; departure and flight to location of patient; return flight to Children's helistop with patient; and departure for return to base or next flight.

Alternative Helistop Locations

Alternative helistop locations were considered by Children's during the development of the concept of siting the helistop adjacent to the Emergency Room entrance with convenient access to the Emergency Room, operating and recovery rooms, and intensive care units (ICU).

Campus Alternatives

Landing helicopters on the roof of the medical center was judged unacceptable because major structural changes would be needed in order to support the weight of the helicopter and extend the elevator (Donelson, 1986). This alternative would be at least twice as expensive as the proposed location, depending upon the extent of structural modification that would be necessary (Donelson, 1986). Moreover, it would be necessary to transport the patient via a circuitous route through the medical center to the Emergency Room, operating room, or ICUs.

Landing helicopters on the roof of the parking garage was judged unacceptable because of the need for patient transfer to an ambulance and attendant delays in transit to the Emergency Room, operating rooms, and ICUs.

Landing helicopters outside the east entrance to the medical center was judged unacceptable because of the need to transport the patient via ambulance to the Emergency Room entrance with attendant delays or, alternatively, the need to transport the patient via a circuitous route through the medical center--including a change of floors. The helicopter flight path would also be closer to residences along 45th Avenue N.E.

Landing helicopters outside the south entrance to the medical center was judged unacceptable because of the need to transport the patient via ambulance to the Emergency Room entrance with attendant delays or, alternatively, to transport the patient via a circuitous route through the medical center. The helicopter approach also is difficult because of the layout of the building and surrounding tall trees.

Landing helicopters outside the administrative wing entrance (the northwest corner of the medical center) was judged unacceptable because of the need to transfer the patient to an ambulance and transport the patient to the Emergency Room with attendant delays or, alternatively, to transport the patient via a circuitous route through the medical center--including a change of floors. The helicopter flight path would also be closer to Laurelon Terrace.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Landing helicopters on one of the surface parking lots was judged unacceptable because of the need to transfer the patient to an ambulance for transport to the Emergency Room entrance with attendant delays. Moreover, the helistop and helicopter flight paths would be closer to residences to the east.

From a safety perspective, flat surfaces, such as rooftops, generally present the least accident risk during landing due to an absence of vertical obstructions. Rooftops, however, are less safe in the unlikely event of engine failure due to the structure's height and lack of a uniform surface on which to make an emergency landing. The other Campus Alternatives discussed above are all considered to be somewhat less safe than the proposed action due to their proximities to obstructions, their locations in topographically depressed areas, or their proximities to residential or educational land uses (Hill, 1986). The significance of the safety distinctions are believed by the pilots to be negligible (Hill, 1986).

Off-Campus Alternatives

The principal off-campus helistop locations that have been suggested include University of Washington's Intramural Field, sharing a helistop with University Hospital, Sand Point, sharing Harborview's helistop, sharing radio/television station helistops and bringing patients to Boeing Field. As part of the EIS scoping process, two off-campus alternatives were selected for detailed analysis: a helistop at the Intramural Field and a shared helistop with the University Hospital.

The Intramural Field helistop alternative involves the construction of a secured, concrete helistop or the designation of an unsecured landing area at Intramural Field. A maximum of 15-20 Children's-destined, patients would be brought to the helistop or landing location each month. Each patient would involve four flight segments--similar to the proposed action--plus ground transport of the patient to Children's.

The University of Washington is proposing the approval of a secured helistop already constructed on the roof of its expansion wing. A maximum of 15-20 Children's-destined, critically ill patients would be brought to the helistop each month; additional flights would involve University Hospital-destined patients. Each patient would involve four flight segments--similar to the proposed action--plus roof-to-ground and ground transport to Children's.

With the objectives of needing to minimize transfers and attendant transport time, the proposed project location was judged to be the most suitable for landing critically ill patients. Moreover, the helistop is located near the central portion of the campus; such a location meets the objective of minimizing off-site impacts without sacrificing patient care.

The Proposed Action

Demolition, Site Development and Improvements

The proposed helistop site is located at a landscaped site called "the Kitchen Garden." The garden would be relocated to a new site on campus.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Three taller trees and shrubbery that exist in the helistop area would be removed--some of the smaller shrubs would be transplanted elsewhere on campus. Prior to tree removal, Children's would require the contractor to implement standard erosion control measures (such as installing hay bales, plastic sheets, etc.) to minimize construction-related erosion.

Following clearing, a new concrete retaining wall would be constructed along the western edge of the site. Approximately 410 cubic yards of earth would be imported to the helistop site, where it would be used to raise the western portion of the site to the (base) level of the eastern portion of the site. The fill would be removed from other (as yet unspecified) locations on Children's campus.

The helistop would be constructed of concrete shaped into a "plus" sign. The two arms of the "plus" would be approximately 30 feet long and ten feet wide (see Figure 4). This concrete helipad would be within a 40 foot square grasscrete area (alternating one foot square areas of grass and concrete) that, in turn, would be within a 45 foot radius circular area. The concrete pad and grasscrete surface would delineate the pad and provide stable support for the helicopter. The concrete center of the pad would be marked with a 4x7.5 foot, red "H" that would designate the helistop from the air. A 2.5 to 3.5 foot tall fence with locked gate would surround the circular area. An approximately 40 foot long concrete walk would link the helipad to the existing sidewalk.

The helistop would require the construction of 1,610 square feet of concrete (impervious) surface. Forty eight hundred square feet would be sodded and 6,540 square feet, according to the Landscape Plan, would be landscaped in juniper, azalea, and other low shrubbery. Blue star juniper would be planted along the outside of the fence and, in time, would partially obscure the fence.

The helistop would be equipped with ground lights that would be turned on for emergency nighttime landings. These lights would meet minimum FAA standards and would not have any off-site spillage because of the absence of horizontal throw. In effect these pilot-preferred lights "glow," rather than emanate direct ray lights (Hill, 1986). The shrubbery and positions of the medical center building and parking garage would prevent any helistop safety lighting creating glare off-site.

Signs warning motorists of the possibility of helicopter operations would be posted on Penny Lane and, if necessary, on Sand Point Way N.E. No aviation fuel would be stored on campus.

Number of Transports and Flights

Children's projects that initially ten patients per month would be transported by helicopter directly to Children's. Children's also estimates that in the future up to 15-20 critically ill patients could be transported directly to the medical center by helicopter each month. Each patient transport involves four separate flight segments: one for the pickup of the specialty pediatric transport crew, the second for departure with transport crew, the third segment delivering the patient, and the fourth for return to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

base or next operation. Thus, there could be a maximum of 60-80 overflights (flight segments) per month. Based on data from existing flights (Table 2), it is estimated that 20% of the flights would occur in nighttime hours (10 p.m.-7 a.m.). The worst-case estimate of 15-20 patients is for the year 1990 and exceeds Airlift Northwest's projections (see Table 5). The worst-case estimate is derived by Children's medical and planning staff by assuming that the Airlift helicopter patient transports will increase at the rate of 10% per year from 1987 through 1990. This figure is greater than the projected patient population increase of 5.6% from 1985-1990 in the primary and secondary service area (Hunter, 1986) and reflects an anticipated continuing trend in referring physicians using Airlift. Thus, by 1990, there would be an average of 13 transports per month based on existing capabilities and use. This figure is consistent with Airlift's projections. In addition, Children's anticipates that there could be one to two MAST patient transports that would be made by either MAST "Hueys" or by Airlift or other air ambulance carrying patients that would previously have been carried by MAST aircraft. The remaining five to six patient transports reflect several factors that are difficult to predict with any reliability but that, nevertheless, could influence the number of patient transports: breakthroughs in medical technologies; growth in population of adolescents; inability to predict disasters--such as toxic spills, nuclear facility accidents, earthquakes; increased poverty that results in increase in premature births (Neff, 1986); or changes in the hospital referral patterns or the capabilities of Children's or of other community hospitals (Nicola, 1986b). Initially, an average of ten critically ill patients would land at the proposed helistop each month; however, as physicians in outlying areas become more familiar with Airlift Northwest services Children's projects that they will become more likely to use Airlift for the interhospital transport of critically ill patients.

The Seattle-King County Department of Public Health (Nicola, 1985) estimates a maximum of ten critically ill patients a month should currently be transported by helicopter to Children's. This estimate is based on a review of Airlift Northwest flight/medical logs, interviews of transport and other physicians. Nicola estimates that three or four would have a clear medical need for direct transport to Children's Emergency Room entrance--such that delays or transfers could affect patient outcome (Nicola, 1986); however, this estimate is not definitive (Nicola, 1986b). The difference between the maximum (10) and the clear medical need cases (3-4) are the (6-7) patients whose condition at time of referral was appropriate for helicopter transport (as determined by the attending physician and/or medical team) but who in retrospect were determined not to have need for helicopter transport directly to the Emergency Room doors (Nicola, 1985).

Airlift Northwest confirms that with their existing service they can fly a maximum of 80-90 helicopter transports a month, and, assuming that Children's share of 17% of all helicopter flights remains constant (see Table 5), that a maximum of 15-20 transports for Children's-destined patients is a reasonable estimate (Childs, 1986).

Children's is obligated by state requirements (WAC 248.18.285) to treat all patients brought to the hospital: the hospital construes this statute to mean that no helicopter transporting an emergency patient can be refused permission to land at the proposed helistop, if constructed, or elsewhere on the campus grounds.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In order to ensure that the patients brought by helicopter to Children's are critically ill, consistent with the provisions of Section 23.48.05 of the Seattle Municipal Code, representatives of Children's are meeting with MAST personnel in order to develop landing and communications guidelines. As a policy, Children's will encourage only critically ill MAST transports patients that are destabilizing or at risk of destabilizing, as determined by on-board medical personnel, to land at the helistop. Any MAST flights to Children's, however, would not involve four flight segments, as there would be no pickup of the pediatric medical crew at Children's.

Helicopter Operations

The process of transporting a patient to Children's may be considered by separating the operation into a series of discrete steps. The following description is designed to provide the reader with an overview of the process and does not constitute the full array of operational or medical procedures that would be involved in a patient transport by helicopter. There is a difference in the process depending on whether the patient is in the field, or is the subject of either a pre-arranged or unscheduled interhospital transfer. There are also distinctions between private air ambulance services and the military (MAST) service. For illustrative purposes, an unscheduled Airlift Northwest interhospital transfer to Children's is profiled.

- The system is activated by an attending physician contacting Airlift Northwest's physician and/or Medical Director.
- The patient's medical profile is described and the attending physician, referral hospital and landing area are identified.
- The Airlift Northwest Medical Director and/or physician assesses whether helicopter transport is warranted and, if so, provides the referring physician with an estimated time of arrival (ETA).
- The helicopter pilot is alerted, as is the pediatric medical crew, which is based at Children's. (Because of distinct treatment requirements, there are separate medical crews for adult and child patients). The helicopter takes off.
- Children's secures the area surrounding the helistop and stops traffic on adjacent Penny Lane--only ambulances and medical staff on emergency call are allowed to pass into the secured area.
- Approximately six minutes after the helicopter leaves Boeing Field it lands at the proposed Children's helistop. Following two minutes to shut down the rotor, it takes approximately two minutes to load medical crew (physician and flight nurse), and equipment. Following loading, the aircraft takes off. In some situations, loading of medical crew and equipment would occur without the rotor being shut down.
- The helicopter arrives at the referring hospital's designated landing area or helistop. The patient may be at the landing area and prepared for flight or the medical crew may have to go to and prepare

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the patient. Elapsed time could be as little as three minutes for the former or two hours for the latter. Transfer by ground ambulance from the referring hospital to the helicopter may or may not be involved.

. The medical crew monitors the patient en route and administers medication and/or other care as needed. En route the helicopter contacts Children's and relays medical condition and needs, and flight information (e.g., ETA).

. Again, the helistop area is secured prior to ETA.

. The helicopter arrives and shuts down the engines at the proposed Children's helistop, where a ground team assists in disconnecting monitoring systems, unloading the patient and wheeling the transport gurney to the Emergency Room door, approximately 40 yards away. After retrieval of equipment, the pilot restarts the engines and after an estimated total ground time of three to six minutes returns to Boeing Field.

Thus, each patient transported by Airlift typically involves four segments: first, to pick up the pediatric medical crew at Children's; second, to fly the medical crew to the patient; third, to fly the patient and medical crew to Children's; finally to return to base or the next operation. Those flights in which a patient is first transported to Boeing by fixed wing already have a pediatric medical crew in attendance. Consequently, there usually would be no need to pick up a crew at Children's, and, therefore, no need for two of the four flight segments.

Flight Path - General

For all construction alternatives, with the helistop at Children's, Intramural Field and UW Hospital, the flight path would be comparable for flying into the vicinity. Only the individual approach and departure routes would be different. Flight path information in this section is based on the approaches and departures that have been recently designed by Airlift Northwest pilots. Final approach and departure routes will require FAA approval pursuant to Airspace Review; however, the FAA allows the pilot to deviate from flight paths (Benedict, 1986). In selecting flight paths, the Airlift Northwest helicopter pilots are sensitive to safety, reducing patient transport time, and noise considerations. In general, when and where possible, the pilots avoid flying over hills, over or near densely populated areas, or at altitudes less than 1000 feet (Hill, 1986). Typical altitudes are in excess of 2,000 feet (Hill, 1986).

In general north-south flights would follow the I-5 corridor. When headed from the south, flights would turn toward Children's once past Capitol Hill. When headed from the north, flights would turn toward Children's when approximately even with the southern end of Green Lake. Flights from the east would generally pass south of Webster Point and north of Madison Park, before turning north over Union Bay and entering the final approach. Flights from the west would generally pass between Magnolia/Queen Anne and Ballard/Fremont and turn toward Children's once past I-5 (see Figure 5, Generalized Flight Paths).

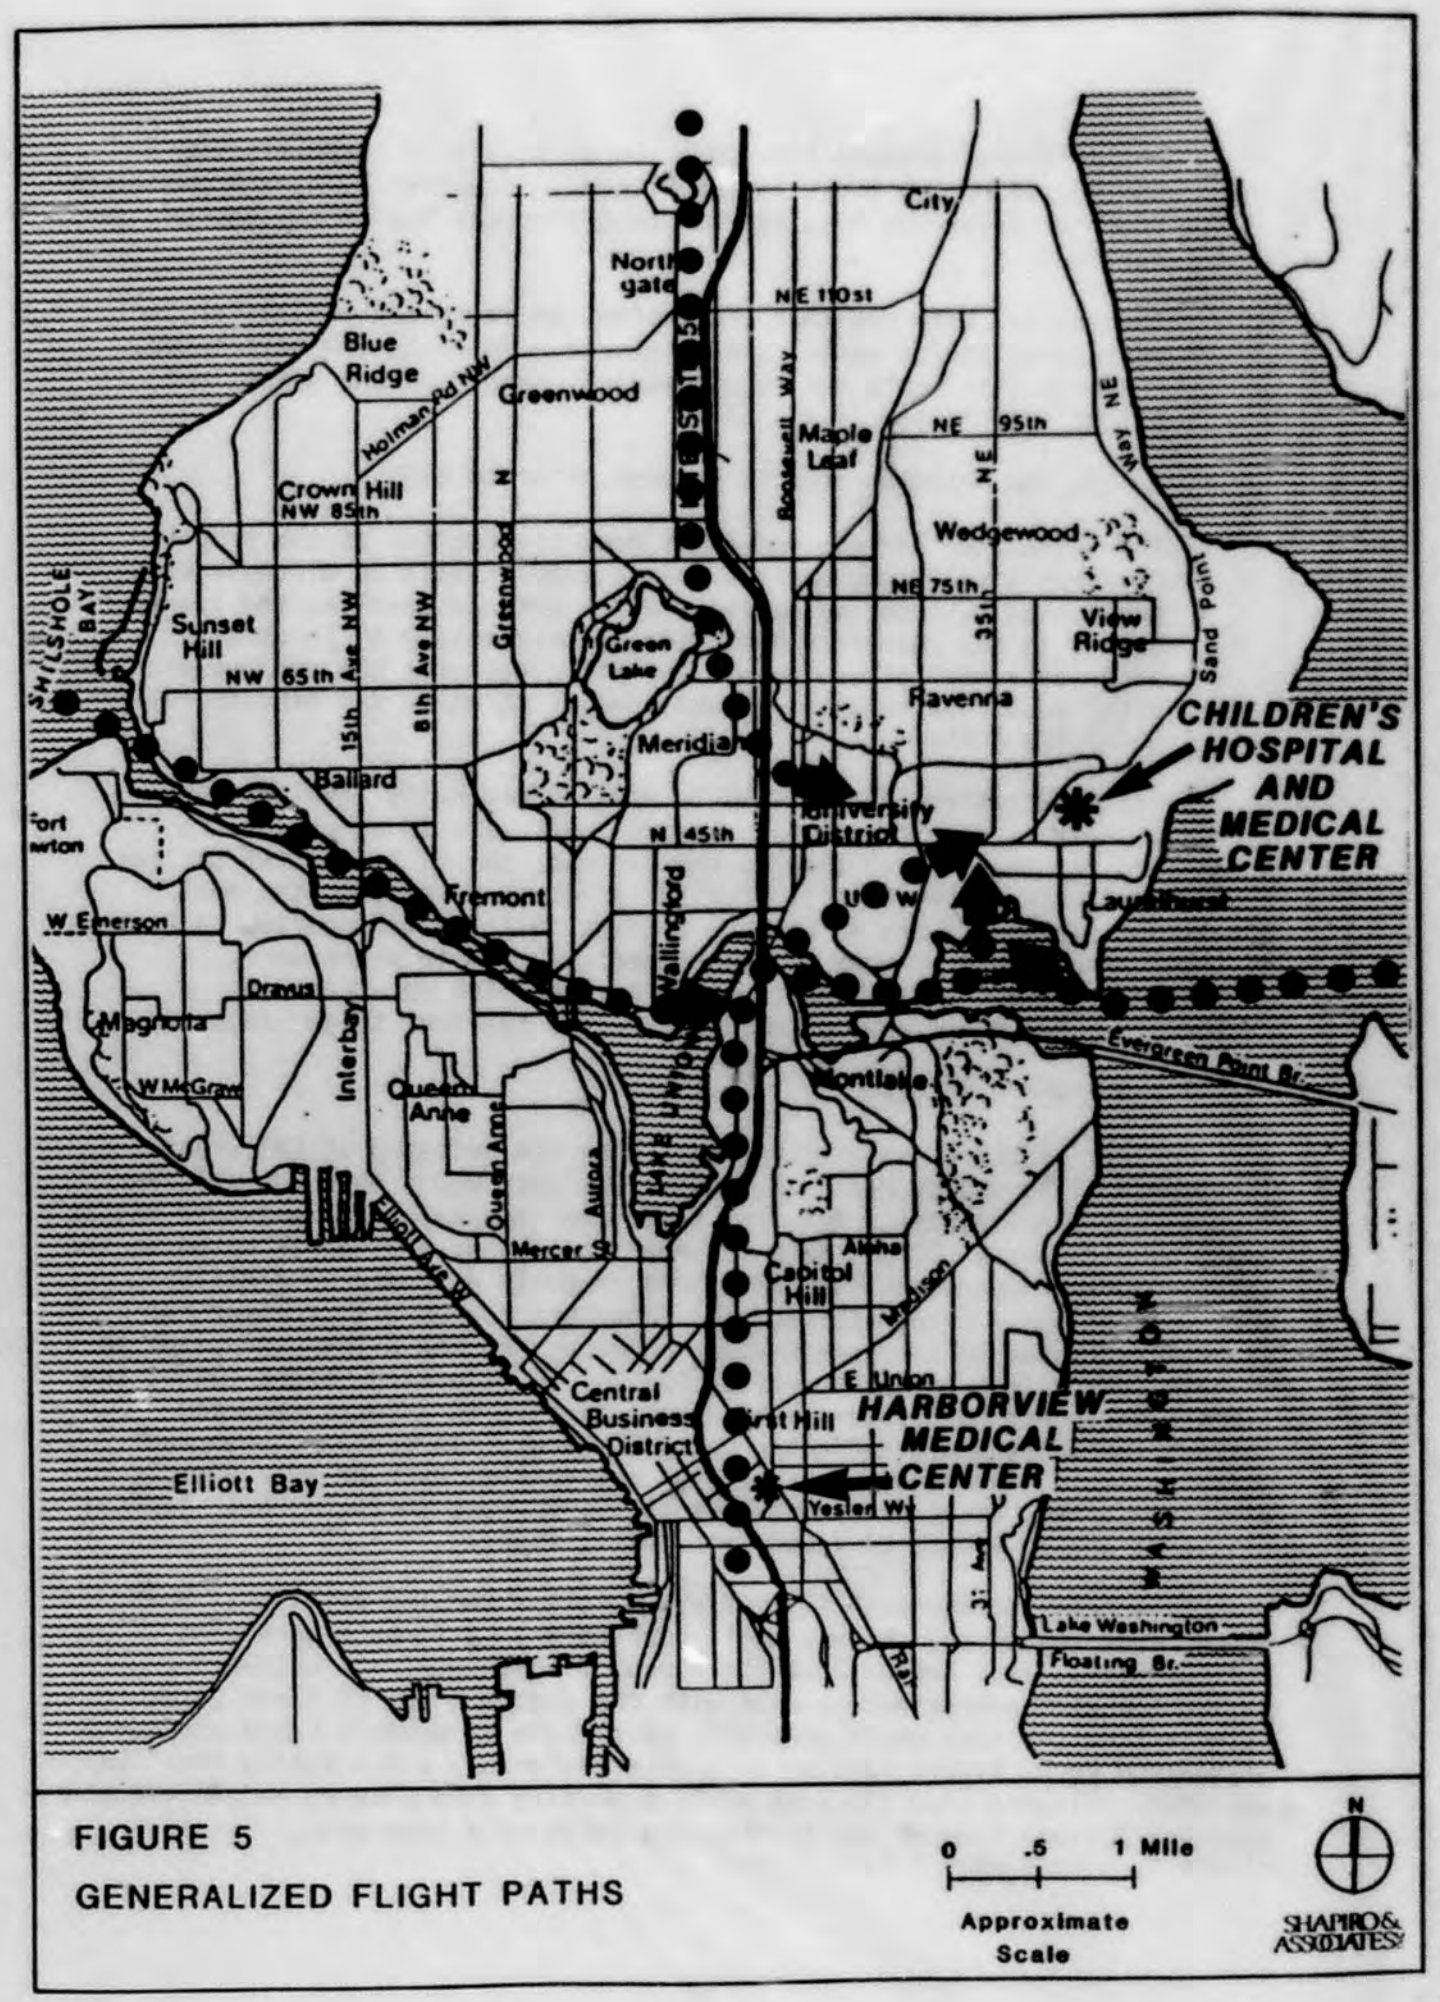

FIGURE 5

GENERALIZED FLIGHT PATHS

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The land uses in the areas over which Airlift Northwest helicopters would primarily fly vary considerably, ranging from urban freeway to commercial to residential.

Actual flight paths could be different depending on meteorological and patient conditions, and specific origin of the flight. The helicopter would not be used during adverse weather conditions. For daytime flights, the FAA minimum standards must be met: the helicopter is not used if there is less than a 300-foot ceiling or less than one-half mile visibility. Airlift pilots also have the option to use the company's guidelines of a 500-foot ceiling or less than one-mile visibility. The helicopter, as a company policy, does not fly in winds in excess of 40 knots (Hill, 1985, 1986).

Flight Path - Approach and Departure to Children's Helistop

Two final approach-departure paths into the Children's helistop would be used by Airlift Northwest. A primary approach-departure path would be used under most wind conditions, a secondary approach-departure path would be used during northwesterly winds that are in excess of approximately 17 knots. Based on surface wind data for Sand Point this latter situation is expected approximately 0.2% of the time, and would be most likely to occur during the winter months (U.S. National Climatic Center, 1982). For either the primary or secondary approach-departure a "noise abatement" profile would be followed.

The primary approach to the Children's helistop (see Figure 6) would originate approximately at the intersection of N.E. 45th Street and Union Bay Place at an altitude of 1,000 feet. At that approximate point, the pilot would decelerate from approximately 160 to 120 knots but not reduce altitude. The pilot would maintain the 1,000-foot altitude and airspeed for approximately the next 1,500 feet, while staying within the general N.E. 45th Street/Sand Point Way N.E. corridor. Approximately southwest of the intersection of Sand Point Way N.E. and 40th Avenue N.E., the landing gear would be extended and the pilot would begin to descend at a rate estimated at 1,500 feet per minute. The helicopter would continue northeast along Sand Point Way N.E., decelerating to a speed of approximately 74-80 knots prior to the turn onto the Children's campus and final approach. As illustrated in the profile of the noise abatement approach-departure path in Figure 7, the rate of descent decreases considerably in the final stages of the approach. The helicopter would enter the Children's campus north of the main entrance and while approximately over the parking garage at an altitude of 100 feet turn south toward the helistop. Under most wind conditions, the helicopter would then make its final descent to the helistop directly from the north. In the case of infrequent strong easterly winds (less than one-tenth of one percent of all winds) the helicopter would turn more tightly over the main entrance and approach the pad more from the west. In the case of strong westerly winds (also less than one-tenth of one percent of all winds) the helicopter would make a wider turn over the parking garage and approach the pad more from the east.

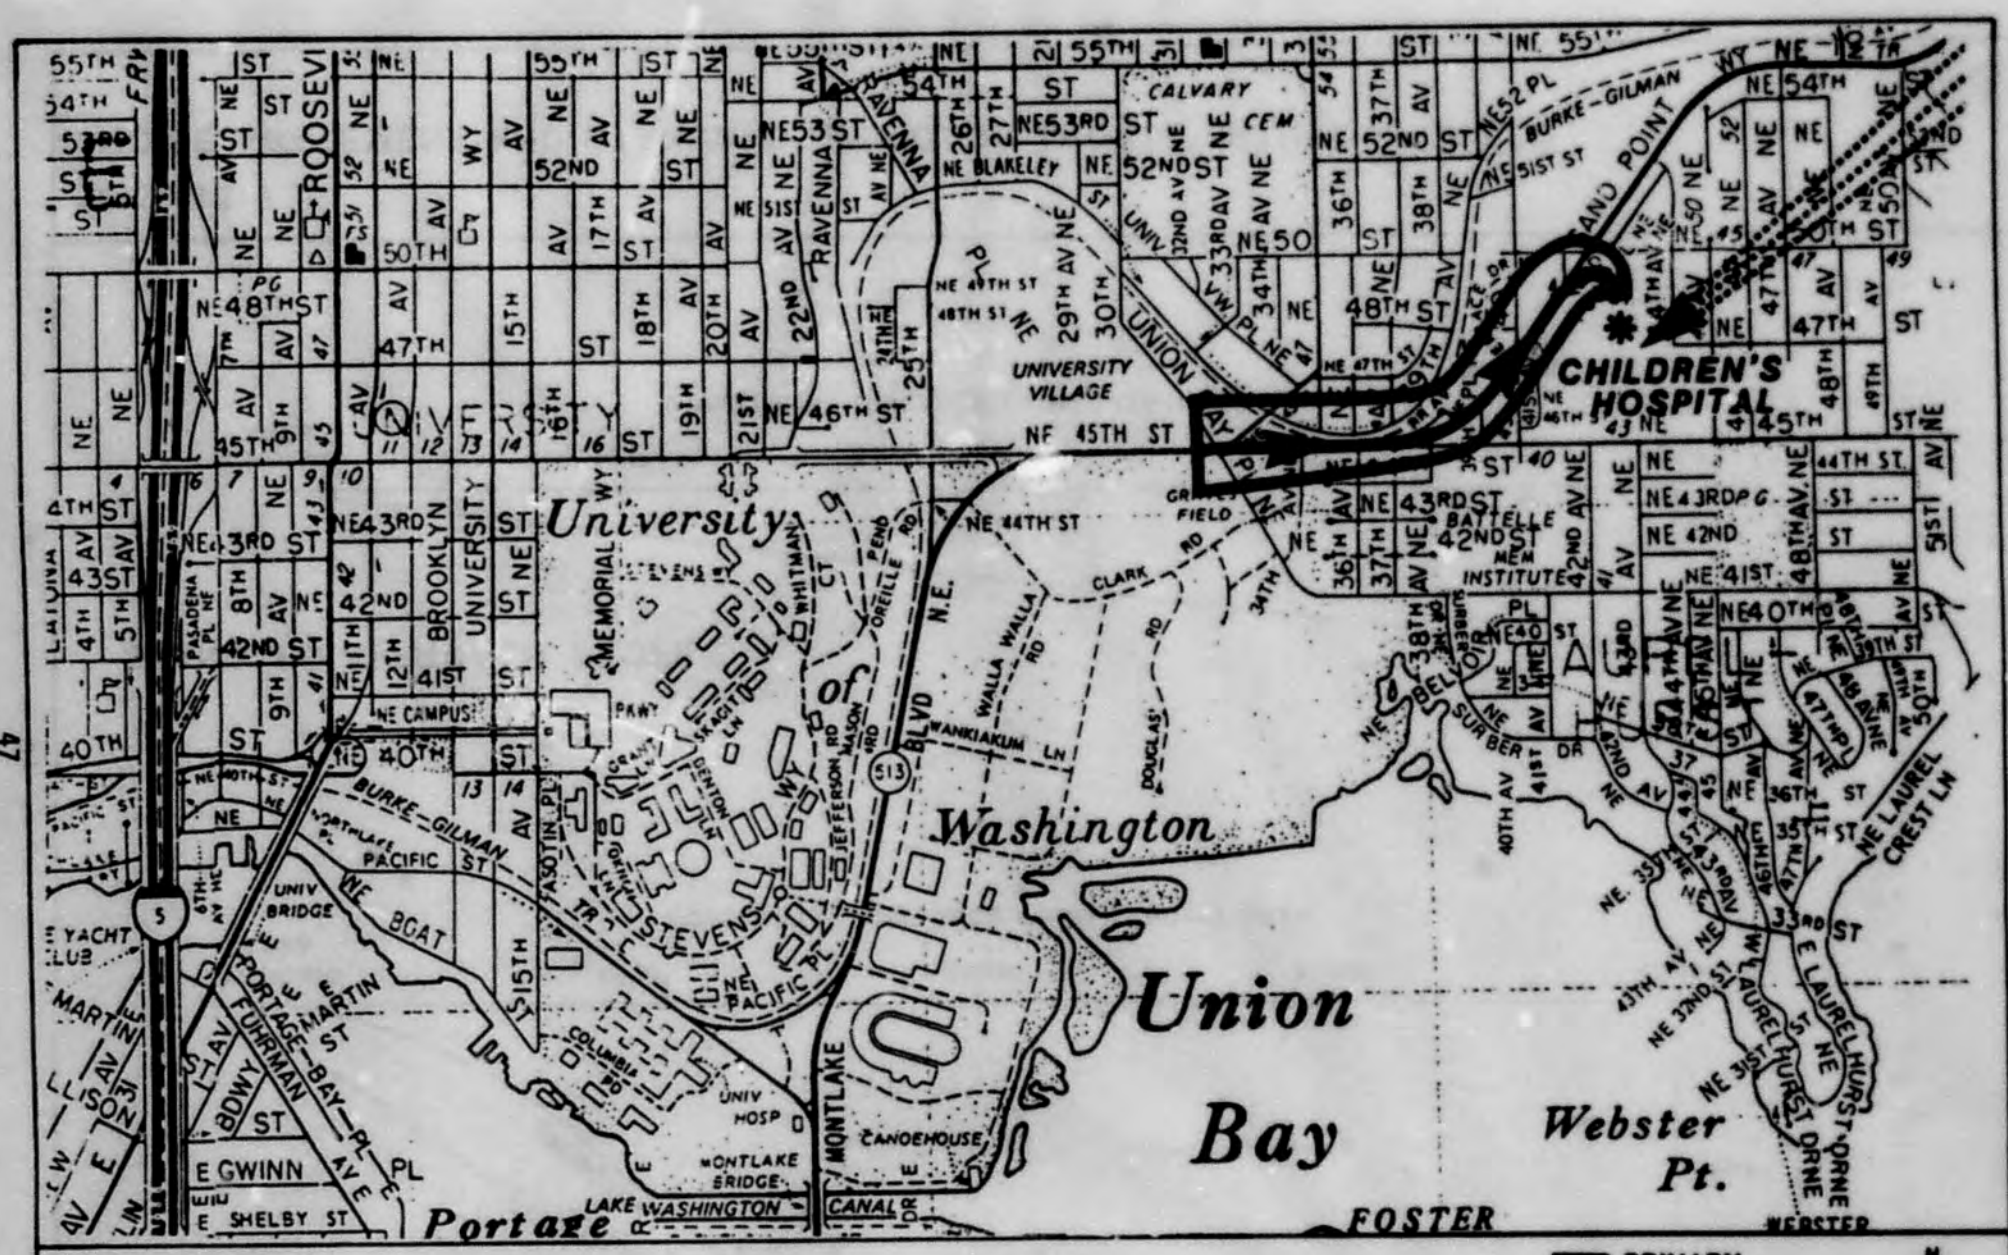
The helicopter generally would land on the helistop facing south. For medical crew pickup and patient discharge, the helicopter typically would shut down its engines on the helistop. In departing, the helicopter would rise to approximately 35 feet, turn counter-clockwise toward the north and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

climb rapidly so as to be at approximately 500 feet when over the parking garage. The departure path would be over the same area but at a higher altitude than the approach paths, so that at the end of the climb (at the point of commencing deceleration on the inbound flight) the helicopter would be at 2000 feet (see Figures 6 and 7).

The secondary approach to the Children's helistop would be used only in conditions of strong winds (above 17 knots) from the northwest quadrant. This approach would be from the northeast and also would use the noise abatement profile (see Figures 6 and 7). This approach would originate just north of the intersection of 55th Avenue N.E. and Windermere Road and would proceed in a direct line to the Children's helistop. The profile of the final descent would be similar to that explained under the primary approach, above.

The departure characteristics of the secondary route would reflect the secondary approach path in terms of the area over which the helicopter would fly, and the primary departure path in terms of altitude (see Figures 6 and 7).



Ground Activities - Patient Transport to the Emergency Room Entrance

Once at the helistop, the medical crew on board the helicopter would be assisted by ground-based medical personnel after the engines are shut down. The critically ill patient would be removed from the helicopter. Electrical monitoring systems that were connected to the patient while in the helicopter would be disconnected, the patient would then be transferred to a gurney and wheeled to the Emergency Room entrance. Neonates or babies in isolettes, which have self-contained ALS systems, could be transported directly to the ICU from the helicopter. Total elapsed time from helicopter touchdown to the patient entering the hospital building is estimated at three minutes. After the patient enters the Emergency Room entrance, the pilot would restart engines and depart. (If the patient is transported in an isolette, the pilot will usually wait for the isolette to be returned.)

The delivery of critically ill patients to the Children's Emergency Room entrance minimizes both the transport time for patients and the need to transfer patients from one mode of transport to another. This is the objective of the Proposed Action. The reduced transport time to the advanced services offered at Children's, and the avoidance of additional transfers minimizes the risk of the patient destabilizing during transit and allows advanced treatment to commence at the earliest possible time. This time savings can reduce suffering, decrease hospital stay time and, in the most severe cases, can mean the difference between life and death.

It should be noted that although transport guidelines for referring physicians may provide guidance in determining the appropriate mode of transit, it is ultimately the attending physician or medical team members who makes the decision to transport by helicopter and where to fly. The risk of exposing a patient to destabilizing circumstances must be evaluated by the attending medical team (Nicola, 1986), and the appropriate medical response (to land at Children's or not) made.

NOISE ABATEMENT AND STANDARD APPROACH AND DEPARTURE PROFILES

SHAPIRO & ASSOCIATES

Mitigation Measures that are a Part of the Proposed Action or Alternatives

As part of the Proposed Action, the proponent has agreed to implement measures that will reduce the adverse impacts associated with the project. During construction the contractor will be required to implement erosion control measures. Children's is moving the location of its oxygen tank, thereby minimizing that potential hazard. The helistop will incorporate a fire-prevention system. No aviation fuel will be stored on campus. The helistop is fenced for security, and procedures for controlling vehicular and pedestrian traffic have been developed with responsible personnel trained. Warning signs will be posted on Penny Lane. The helistop will be landscaped. "Glow" rather than direct beam landing lights will be used--these lights will only be turned on during nighttime use. Engines normally will be shut down during medical crew pickup and patient delivery.

Flights will be limited to those associated with critically ill patients. Children's and Airlift have actively participated in the development of communications guidelines to ensure communication from air-to-ground is facilitated. As a policy, Children's will only encourage destabilizing patients on MAST transports to land at the helistop.

Airlift's flight path has been designed to reduce, as far as practicable, flight over sensitive properties--with general flight paths following I-5, water bodies and arterials. The primary approach and departure path has been redesigned so as to minimize impacts on adjacent properties. A noise abatement flight path--involving flying higher for a longer period during approach and departure--will be used.

Airlift Northwest guidelines on acceptable weather conditions are more restrictive than those of the FAA. In addition, Airlift has personnel levels (pilots per aircraft) that exceed NEMSPA/ASHBEAMS levels, a minimum experience requirement and ongoing certification for pilot hiring that exceeds ASHBEAMS requirements, and ongoing training for pilots and medical team personnel that address the guidelines and standards that are being developed by ASHBEAMS and NEMSPA.

Children's has agreed in principle to the development and participation on a review panel composed of physicians and others involved in helicopter transport in order to examine the appropriateness of individual flights, to enhance air-land communications, and to improve operations.

Descriptions of Alternatives to the Proposed Action

Intramural Field Helistop Alternative

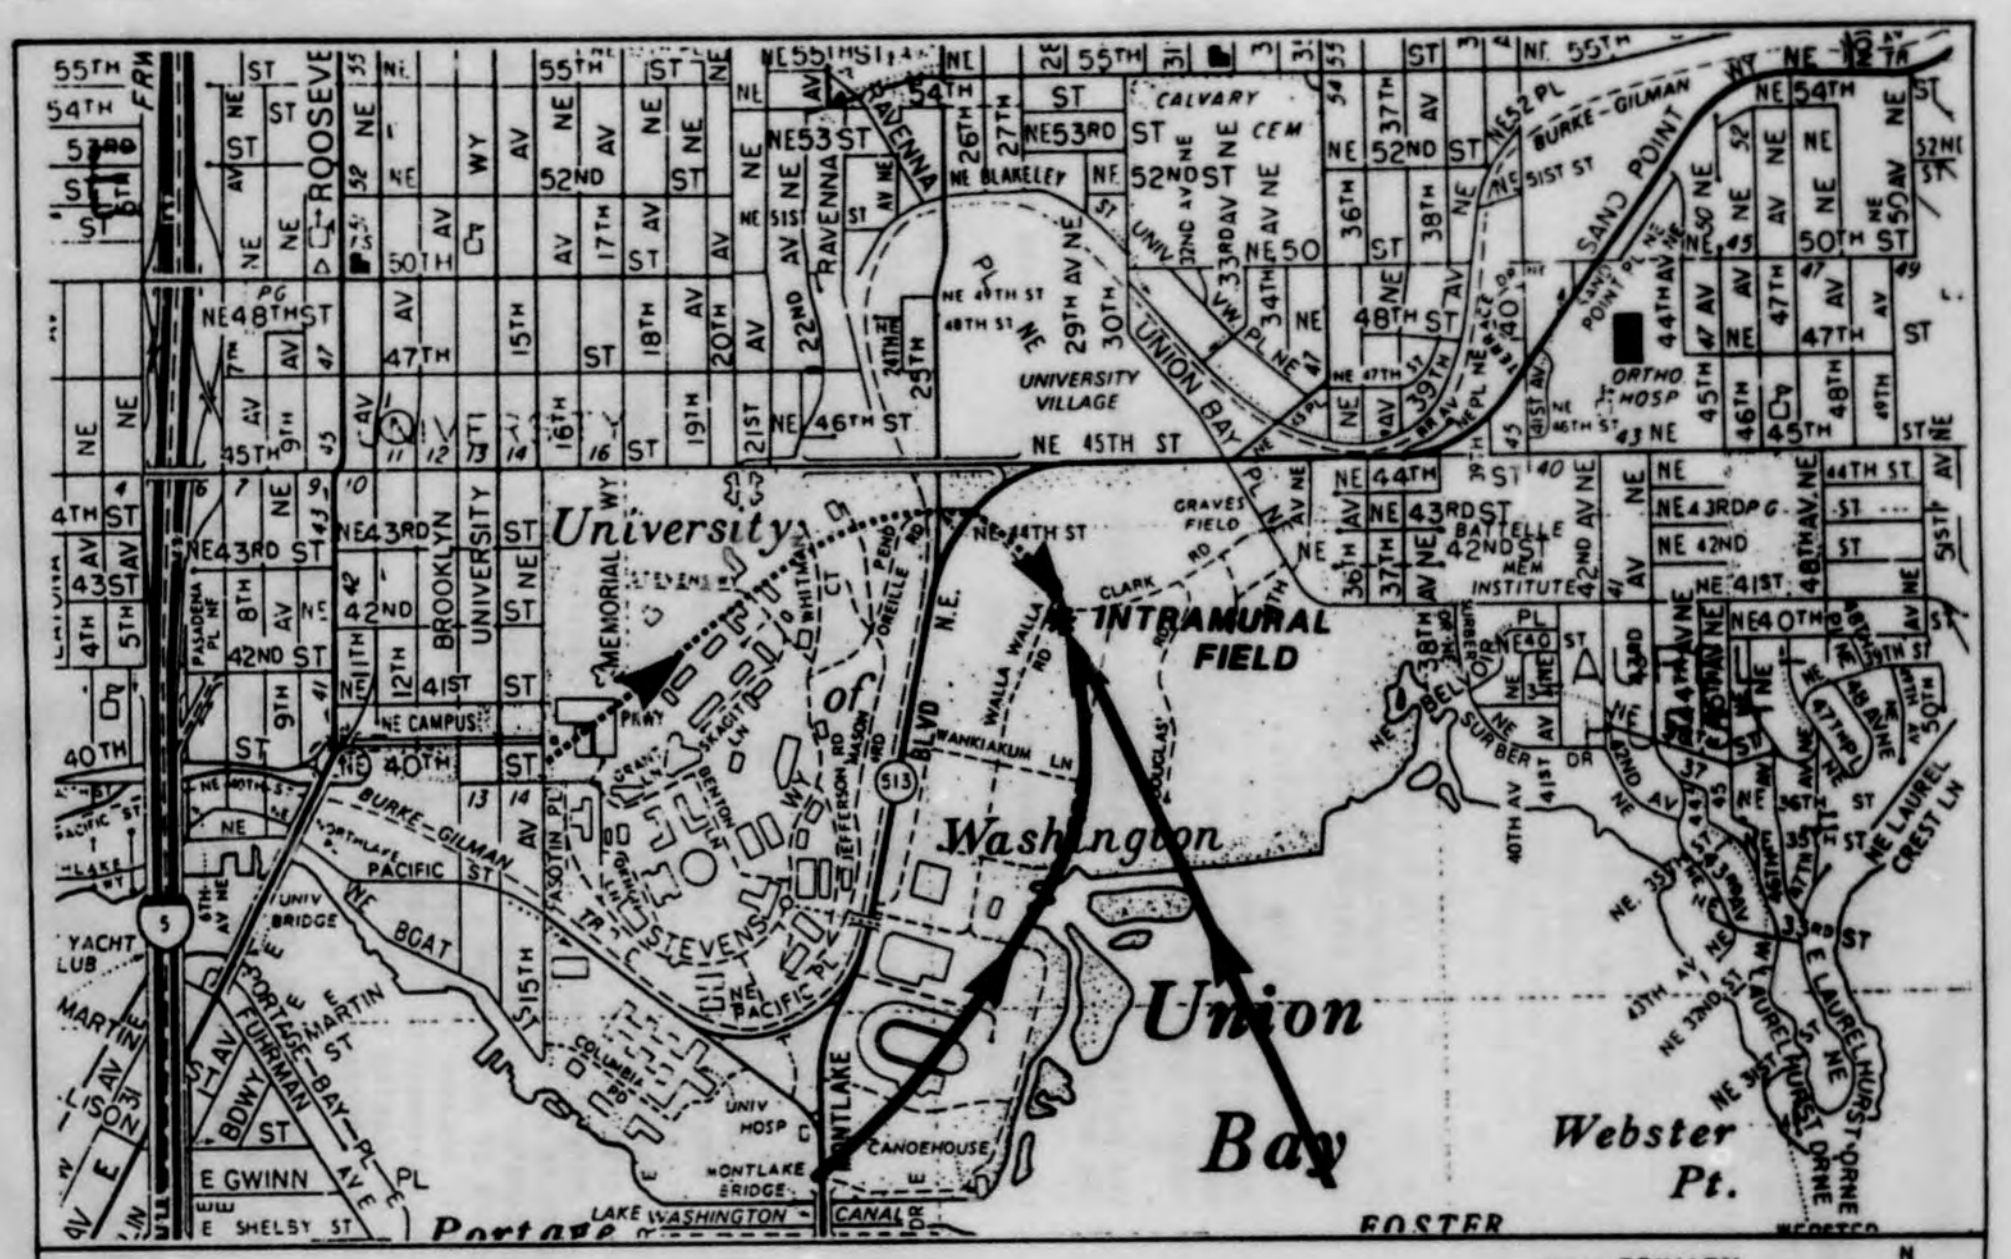
The Intramural Field Helistop Alternative is distinguished by the construction of a fenced, lighted, helistop similar to that design proposed for Children's but without perimeter landscaping. The helistop would be located near the University of Washington's Intramural Field, off Union Bay Place N.E., approximately one road mile from Children's Emergency Room entrance (see Figure 8). Purchase, lease or permission to use the property would need to be acquired from the University of Washington. The University has indicated its opposition to a fenced, concrete helistop constructed on

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

any of its Intramural Fields (Trask, 1986). Electricity for landing lights also would need to be extended to the site.

The Intramural Field Helistop Alternative also differs from the proposed action in terms of the helicopter's final approach and departure routes, in the pick-up of the medical crew at the Intramural Field (or Harborview) and in the need to transfer the patient to ground ambulance for transport to the Children's Emergency Room entrance.

The Intramural Field site is located in the midst of the University of Washington Athletic Field complex just east of the University Campus, south of N.E. 45th Street, and west of the Laurelhurst neighborhood. The primary land use surrounding the site is athl ic fields and parking lots. The University Village shopping mall is located north of the site, across N.E. 45th Street, with residential uses to the north, east, and west of University Village. The University of Washington Campus is located to the west of the site, the Laurelhurst neighborhood to the east.



Flight Path. The flight path to the general vicinity of the Intramural Field Helistop, whether for pick up of the medical crew or for unloading the critically ill patient, would follow that path described under Flight Path - General, above. Two primary and one secondary final approach and departure paths have been proposed by the pilots of Airlift Northwest. Final paths would need to be approved by the FAA.

The two primary approaches to the Intramural Field Helistop site are a linear approach from the southeast and a curved approach from the southwest (see Figure 8). These alternatives would involve 1-2 minutes less flight time per segment, depending upon point of origin, than that required under the proposed action. The southwesterly approach would be used when flying from the south or west; the southeasterly approach would be used when flying from points to the east. The southwesterly approach would originate just northwest of the Montlake Bridge and fly over Husky Stadium and the athletic fields. The southeasterly approach would originate just north of Foster Island, north of the University of Washington Arboretum and fly over the University of Washington athletic fields.

The secondary approach would be employed only in times of winds in excess of 17 knots from the northwest quadrant. This approach would fly over the University of Washington campus before making a final approach from the northwest. All three of these approach patterns could also serve as departure routes depending upon the destination of the flight.

In that Airlift Northwest would use a standard approach (as opposed to a noise abatement approach) for any of these approach patterns, the helicopter would begin its final approach at an altitude of 500 feet. Approximately 4,000 feet from the landing zone the pilot would begin his/her descent and decelerate from 160 to approximately 120 knots (see Standard Approach Profile in Figure 7). The descent would continue uniformly at a rate of 175 feet per 1,000 feet of horizontal distance until touchdown at the helistop. The average speed during the final approach would be approximately 40 knots.

The departure would involve vertical lift to an altitude of 35 feet, turning and ascending along one of the routes designated as an approach path depending on flight destination. The ascent rate would be approximately half that proposed for the proposed action: an altitude of 1000 feet would be achieved at a distance of 4000 feet from the helistop.

Ground Activities - Patient Transport to the Children's Emergency Room Entrance. Once the helicopter with medical crew and patient has landed, the pilot typically would shut off engines. A ground-based medical crew with ambulance and driver would meet the aircraft and assist the helicopter's pediatric medical crew in preparing the critically ill patient for transport. This process could involve some or all of the following steps:

- any of the helicopter monitoring systems that were connected directly to the patient while in the helicopter may have to be disconnected (Patients in isolettes would need to be disconnected from aircraft systems and the battery pack connected.);
- the patient must be transferred from the helicopter into the ambulance and may have to be reconnected to support systems in the ambulance; the patient would face the greatest risk of advanced life support systems disconnecting during this transfer;
- the patient may require stabilization before the ambulance can leave the soccer field;
- the patient and medical team would be driven from the helistop to the Children's Emergency Room entrance; and,
- the patient's support systems would have to be disconnected at the hospital for final transfer from the ambulance to the emergency room.

The transfer process, depending on life support system and stabilization needs, and the ground travel time, depending on traffic, could result in a minimum of ten minutes or as long as 20-30 minutes elapsing before the patient is in the hospital (Andrews, 1986). The 15-minute transfer process (for an isolette) is comprised of two minutes helicopter cool down, eight to nine minutes transfer out of the helicopter across the field to the waiting ambulance and stabilization in the ambulance, three minutes transit time from the parking area to the Emergency Room entrance and one minute unloading at Children's; transfer of a child not in an isolette is easier and requires an estimated ten minutes (Andrews, 1986). This transfer process exposes the patient to the risk of destabilizing. For transport of patients on a gurney or in the isolette, the transfer is more difficult because if any IVs are inadvertently disconnected, then reconnection must be made and stabilization must occur prior to the ambulance leaving for Children's. Exposure to adverse weather and/or field conditions increase the potential for destabilization (Andrews, 1986).

The Seattle-King County Department of Health concluded that "there will be a small number of cases at (both Children's and University Hospitals) where the ability to land at the hospital may be life-saving" (Nicola, 1985). Delays in treatment of other patients, while perhaps not a life or death situation, could result in suffering, the need for prolonged

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

treatment, permanent disability or other unfavorable outcome. Examples of these other situations include patients with impaired breathing, diaphragmatic hernia, aspiration of a foreign body, cardiac irregularities, near drownings and vascular collapse from general infections. (Neff, 1986)

Because this alternative involves a minimum of ten minutes of additional transit time for ground transport, the transfer of the patient from the helicopter to the ambulance, and then out of the ambulance at Children's, as well as the possibility of disconnection/reconnection/ disconnection of advanced life support systems, this alternative does not meet the proponent's objective to minimize transport time and the number of transfers.

University Hospital Helistop Alternative

The University of Washington has proposed using the helistop located on the roof of the new wing to the University Hospital. The purpose of the helistop is to allow critically ill patients (high risk obstetrical patients, premature infants with respiratory distress, cardiac patients, etc.) destined for University Hospital to be transported directly from the helicopter to the University Hospital, thereby saving time and the need for potentially destabilizing patient transfers involved with patient transports from other landing locations. This alternative proposes that the University Hospital, also a member of the Airlift Northwest consortium, share the use of the University Hospital Helistop with Children's. For patient care and liability reasons, it is unlikely that the University Hospital would allow Children's-destined patients to be landed on the helistop on the roof of the hospital (Goertzen, 1986; Shawcroft, 1986).

The University Hospital Helistop has been designed as a 3,300-square-foot area on the roof of the Hospital's new east wing. The structure has been built to accommodate helicopter landings. The flight path and requirements for patient transfer are different than those proposed for either the Children's or Graves Field helistop Alternatives.

The University of Washington Hospital Annex is located on the southern boundary of the University of Washington Campus, immediately northwest of the Montlake Bridge. The hospital is surrounded primarily by the University of Washington Campus, which is located to the north, northeast, and east of the site. There are other University oriented uses to the west of the site, with some commercial activity along N.E. Boat Street, west of the site. To the southeast of the site immediately south of the Montlake Cut of the Lake Washington Ship Canal is an area of single-family residences and the Seattle Yacht Club. Portage Bay lies to the southwest of the site.

Flight Path. The flight path is more compact and the flight would generally be of slightly shorter duration (except for the southeasterly approach to the Intramural Field) than the approaches to either the proposed Children's or Intramural Field Helistop Alternatives. Moreover, the rooftop location decreases the total helicopter descent distance.

The two approach and departure routes for the University Hospital Helistop would be from the northeast and slightly south of due east (see Figure 9). The northeasterly approach would originate above the University

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

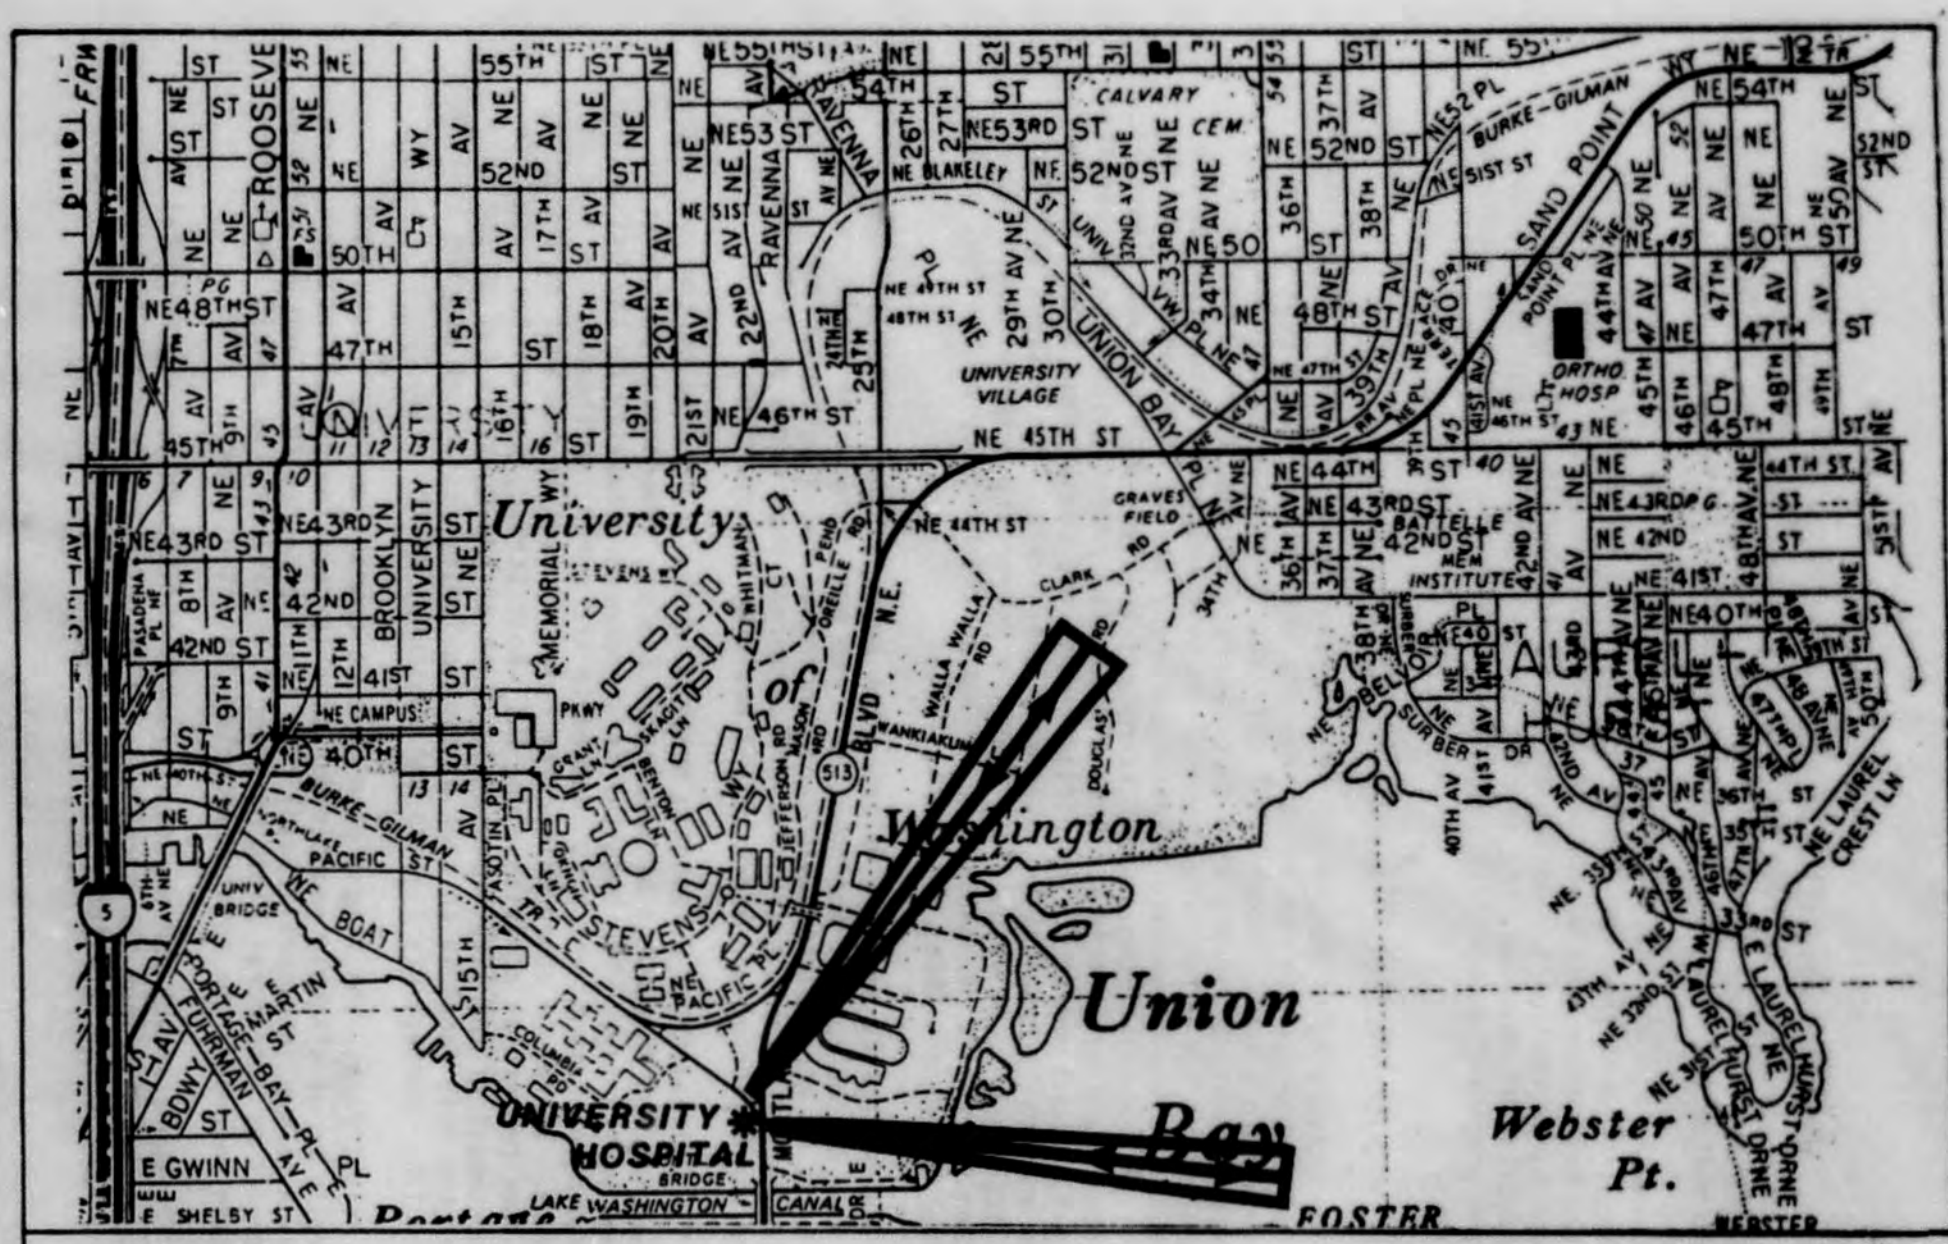

FIGURE 9

PRIMARY APPROACH AND DEPARTURE PATHS
TO UNIVERSITY HOSPITAL HELISTOP

of Washington athletic fields, near Intramural Field, and fly over Husky Stadium and Hec Edmundson Pavillion. The easterly approach would begin over Union Bay at a point slightly north of Foster Island. Due to the limited size of the landing area and the proximity of the hospital building to the pad, the helicopter would be unable to turn around over the pad, rendering it unable to depart in the same direction from which it approached (Hill, 1986). Thus, the helicopter would have to approach from one of the indicated directions, and depart from the other on every flight. Following liftoff, any flight path could be followed after the helicopter clears the building.

As with the approaches to the Intramural Field site, Airlift Northwest would approach the University Hospital helistop at a standard approach angle, as described above.

Ground Activities - Patient Transfer to the Children's Emergency Room Entrance. Once the helicopter, with medical crew and patient has landed, the pilot would shut off engines. A ground-based crew would meet the aircraft and, with the helicopter's pediatric medical crew, prepare the patient for transport. The patient would be transported via elevator down five floors through University Hospital to the Hospital's Emergency Room. The patient's medical crew would be met by ambulance and transported to Children's. The patient could need the disconnection of monitoring systems and reconnection in the ambulance and then disconnection of the system at the Children's Emergency Room entrance. The patient would face the risk of ALS systems disconnecting and destabilizing during these transfers.

The approximately two mile trip from the University Hospital to Children's would include travel along N.E. Pacific Street, N.E. Pacific Place, Montlake Boulevard N.E. and then onto N.E. 45th Street and Sand Point Way N.E. Traffic at the intersection of N.E. Pacific Place and Montlake Boulevard N.E. is likely to be congested during commuter hours and on event days at Husky Stadium, Hec Edmundson Pavillion or on campus. Compared to the Intramural Field Helistop Alternative, the elevator travel time and the additional road travel time is estimated to add seven minutes to the total patient transport time to the Children's Emergency Room entrance, but could be slightly shorter, or decidedly longer under extreme traffic conditions. Thus, it is estimated that from the time of landing on the roof of University Hospital, it would take a minimum of 17 minutes for a patient to arrive at Children's. If the patient is in an isolette, it would take a minimum of 22 minutes. Any manipulation of life support systems or need for restabilization would add to this travel time total. The risk to the patient would be greater than that for the Intramural Field Alternative. The need for transfer of the critically ill patient from the University Hospital rooftop, through the hospital to an ambulance and transport to the Children's Emergency Room entrance conflicts with the proponent's objectives for minimizing transfers and transport time.

Limited Landing - No Construction of the Proposed Action or Alternatives

The Limited Landing Alternative is characterized by no construction of a helistop at Children's or Intramural Field or use of the University Hospital's helistop, if its use is approved by the Seattle City Council. Critically ill patients who otherwise would be transported to Children's by

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

an Airlift Northwest helicopter would be off-loaded at Harborview or Boeing Field, transferred to a ground ambulance and driven (Code Red) to Children's. MAST helicopters would probably continue to land at the Intramural Field. There would, however, be continued limited landings in the driveway area outside the Children's Emergency Room entrance.

Prior to the ambulance departing from either Harborview or Boeing Field, critically ill patients would need to be disconnected from the support and monitoring systems in the helicopter, transferred to an ambulance, reconnected and, possibly restabilized. Ambulance travel time from Harborview Helistop to Children's averages 15 minutes; from Boeing Field to Children's, 25 minutes (Andrews, 1986). Actual transit time may be shorter or longer, depending on traffic conditions, and is likely to be lengthened or complicated during commute hours, during delays due to traffic backing up with Montlake Bridge openings, during events at the University, Seattle Center or other locations in Seattle, or during construction that affects traffic on I-5, SR-520, Montlake Boulevard or Sand Point Way N.E. Thus, total minimum elapsed time for transit from landing at Harborview or Boeing Field to a patient entering Children's Emergency Room entrance would be 20 minutes or 30 minutes, respectively, with an additional five minutes if the patient is in an isolette.

The helicopter's pediatric medical crew could judge, in consultation with Children's medical staff and/or Airlift's Medical Director, that patient and/or traffic conditions warrant the critically ill patient being landed at Children's in the driveway area outside the Emergency Room entrance. It is estimated that three to four patients a month could need to be landed for medical reasons at the Children's Emergency Room entrance (Nicola, 1986). These patients typically would be destablizing while in flight and/or those patients whose transport time could adversely influence the patient outcome. An additional, unknown number of patients would need to be transported to the Children's Emergency Room entrance area landing zone in order to avoid exposing the patient to a severe risk of destabilizing or of a potential adverse outcome due to a delay in receiving treatment at Children's.

In instances in which landings occur outside the Children's Emergency Room entrance, it would be necessary to secure the landing zone area. This would be accomplished by security and/or other personnel from Children's. The flight approach to this landing zone area is similar to that for the proposed helistop, however, it is different in the final approach off Sand Point Way N.E. where the flight path is altered to avoid the tall trees to the north of the landing area. Rather than turning directly onto the hospital grounds just north of the main entrance, the helicopter would turn to the northwest near the intersection of Sand Point Way N.E. and N.E. 47th Street. The pilot would make a wide 180 degree turn toward the hospital grounds while over an open field to the northwest of the Sand Point Way N.E./N.E. 47th Street intersection at an altitude of approximately 500 feet. It would then approach the hospital from the northwest and turn to the southwest over the west edge of the parking garage. It would then fly to a point directly west of the landing area before making a final descent from the west. Because of the tall trees in the area of the proposed helistop, the actual landing would be from the west.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In instances in which MAST helicopters land at the Intramural Field, it would be necessary to secure the landing zone area, which would be approximately the same location as the helistop site under the Intramural Field Helistop Alternative. This procedure involves security and/or medical personnel from Children's and/or the University controlling athletes, passersby and onlookers. The flight path in and out of the Intramural Field would be identical to that described under the Intramural Field Helistop Alternative. Muddy conditions on the field could also expose the patient to risk of complication in the event that attendant(s) slip during transport and jostle connecting lines to the ALS systems. An ambulance also has become stuck in the mud at this site.

Because of the additional transport time and need for potentially destabilizing transfers, the Limited Landing Alternative does not meet the proponent's objectives.

No Action - No Construction of the Proposed Action or Alternatives

Under a No Action Alternative, no helistop would be constructed at either Children's campus or the University of Washington's Intramural Field. Additionally, Children's-destined patients being transported by helicopter would not be permitted to land at the University Hospital Helistop, if approved, or in the driveway area outside the Children's Emergency Room entrance.

Children's-destined patients flown by helicopter would need to land either at Boeing Field or Harborview Hospital and transported by ambulance to Children's. As described in the Limited Landings Alternative, the total minimum elapsed time for transit from landing at Harborview or Boeing Field to a patient entering Children's Emergency Room entrance would be 20 or 30 minutes, respectively, with an additional five minutes if the patient is in an isolette.

It is Children's position that the Hospital is obligated by State Administrative Code (WAC 248-18-285) to provide basic emergency care services. The Hospital construes the administrative regulations to mean that it cannot prohibit a helicopter from landing on the campus even if by doing so the Hospital would be in violation of applicable land use laws and regulations. Moreover. the Hospital believes that the standard of care created by helicopters now landing at Children's cannot be diminished without violating the provision of Section 7.70.040 of the Revised Code of Washington, which establishes thresholds for assessing whether the health care provider has exercised expected care, skill and learning.

Because of the additional transport time and need for potentially destabilizing transfers, the No Action Alternative does not meet the proponent's objectives

Comparison of Environmental Impacts of Alternatives

Implementation of the Proposed Action or Build Alternatives would cause environmental impacts of varying degree. The important potential impact areas have been identified through the scoping process and are addressed in this document. These elements include noise and vibration; aircraft safety;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and the potential for the project to establish a precedent (cumulative impact).

Implementation of the proposed action would involve the creation of noise and vibration to which area residents would be exposed. Noise impacts would not be as great at the Intramural Field Helistop Alternative because residential areas are further from the proposed helistop location. Similarly, noise impacts on Montlake residents would not be as great for helicopter transports under the University Hospital Helistop Alternative. The Limited Landings Alternative involves some noise at Children's from landings and takeoffs, which would be particularly annoying to residents to the west and also involve noise at off-campus landing locations. The No Action Alternative is characterized by noise at Harborview or Boeing Field. Any alternative except the Proposed Action could involve ambulance siren noise.

The risk of aircraft accident is statistically possible under any alternative, including no action. The construction of a structurally sound, secured, lighted landing area increases the safety of takeoffs and landings but does not negate the risk. The potential for non-aircraft property damage or personal injury is probably the least under the secured Intramural Field Helistop Alternative followed by either Children's or the hospital helistop locations.

Approval of the Proposed Action or Alternatives is not expected to have an impact on the number of Emergency Helistops constructed in the region.

Benefits and Disadvantages of Reserving Implementation of the Proposed Action for the Future

The benefits of reserving implementation of the Proposed Action includes the near-term avoidance of environmental effects associated with project implementation: the preservation of the tall trees on the site; minimizing the number of helicopter flights landing at Children's and thereby reducing the exposure of area residents to noise and vibration, and reducing the risk of a helicopter accident.

Disadvantages of delaying project implementation include delay of up to 35 minutes in some critically ill patients receiving treatment offered only at Children's. This delay could cause unfavorable outcomes for the critically ill patients.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

IV. AFFECTED ENVIRONMENT, SIGNIFICANT IMPACTS AND MITIGATING MEASURES

In this chapter, analyses of environmental impacts that were deemed important through the scoping process are presented. These elements are: helicopter safety, and noise and vibration. For each of these elements, the proposed action is analyzed through a review of existing conditions, a description of probable impacts and impacts of the alternatives where such impacts differ substantially from those of the proposed action, and an identification of possible mitigating measures that are beyond those measures included as part of the proposed action or alternatives. An assessment of cumulative impacts also is included in this chapter, as is a summary of impacts that apparently cannot reasonably be mitigated.

HELICOPTER SAFETY

Introduction

This section presents information on helicopter safety. The characterization examines both general aviation (non-military) helicopter service for the years from 1976 to 1981, and Emergency Medical Service related helicopter service from 1972 through 1985. Trends in helicopter safety are also explored qualitatively.

Primary sources for this study are reports by the National Transportation Safety Board, which is the federal agency with the responsibility of maintaining accident statistics on air and ground transportation, and articles in periodicals dealing with helicopter safety and helicopter ambulance safety. In addition, personal interviews were conducted with recognized authorities in the field of hospital aviation safety, a rotorcraft safety specialist from the Federal Aviation Administration (FAA) and a helicopter pilot from Airlift Northwest, the EMS helicopter service consortium of which Children's is a member.

The National Transportation Safety Board (NTSB) maintains comprehensive statistics on accidents involving U.S. General Aviation, and publishes them annually in the Annual Review of Aircraft Accident Data. NTSB statistics for general aviation have not yet been published for the years 1982-1985, so this review is limited to 1975-1981. Data from other sources for the years since 1981 are also presented.

Helicopter Accident Frequency Trends

Between 1975 and 1981, there was a decrease of almost 60% in the rate of helicopter accidents as measured in number of accidents per 100,000 flight hours. As shown in Table 6, the number of accidents per year remained relatively stable, yet the number of total flight hours increased almost 150%. Therefore, over the seven year period, the number of accidents per 100,000 flight hours decreased steadily from 27.31 to 11.16.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 6

Accident Frequency For All Helicopters
(1975-1981)

Year	Number of Accidents	Elapsed Time	Accidents/ 100,000 hours
1975	266	947,000	27.31
1976	249	1,103,000	22.57
1977	247	1,170,000	21.11
1978	285	1,397,000	20.40
1979	267	1,522,000	17.54
1980	263	1,891,000	13.91
1981	257	2,303,000	11.16

Note: Includes turbine-powered helicopters

Source: National Transportation Safety Board, 1981.

One of the primary reasons for this increase in helicopter safety has been the increased use of turbine-powered engines and the corresponding decreased use of less dependable piston engines (Collett, Benedict, and Hill, 1986). Of the roughly 170 helicopters currently in use in nationwide air ambulance services, only one piston-powered helicopter is still in use (Collett, 1986); therefore, statistics on turbine powered helicopters generally are more representative of EMS helicopters. Unless otherwise noted, all NTSB statistics cited in the remainder of this report refer to turbine-powered helicopters.

As shown in Table 7, turbine-powered helicopters have shown a similar decrease of approximately 60% in the number of accidents per 100,000 flight hours over the same seven year period with a 1981 figure of 5.48 accidents per 100,000 flight hours. The annual number of accidents in turbine-powered helicopters nearly doubled between 1975 and 1981, but the number of flight hours more than quadrupled. In comparing Table 6 and Table 7 it is evident that with the exception of 1979, turbine-powered helicopters have consistently been more than twice as safe as all helicopters.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 7

Accident Frequency For All Turbine-Powered Helicopters
(1975-1981)

Year	Number of Accidents	Hours Flown	Accidents/ 100,000 hours
1975	47	351,000	13.39
1976	39	423,000	9.22
1977	56	599,000	9.35
1978	60	631,000	9.51
1979	80	663,000	12.07
1980	80	1,172,000	6.83
1981	78	1,424,000	5.48
Totals	440	5,263,000	8.36

Source: National Transportation Safety Board, 1981.

NTSB does not compile statistics specifically regarding EMS helicopter flights, but some data have been gathered by those in the helicopter and EMS fields. Howard Collett, publisher of Hospital Aviation magazine, and Nina Merrill, Executive Director of the American Society of Hospital-Based Emergency Air Medical Services (ASHBEAMS) have assembled data on all EMS-related accidents since the first helicopter ambulance service was started at St. Anthony's Hospital in Denver in 1972.

Since the Denver program was started, there have been a total of 57 accidents involving EMS helicopter flights. Although actual figures on the total number of air ambulance flight hours have not been kept, Collett used estimated average trip time per patient figures to determine that, from 1972 through 1985, EMS helicopter accidents have occurred at an approximate rate of 18 times per 100,000 flight hours. Some specific data have been compiled for the years 1980-1985 by the National EMS Pilots Association. These data indicate an accident rate of 22.9 accidents per 100,000 flight hours (see Table 8). The data also note that during the period from 1980-1985, the EMS helicopter accident rates peaked in 1982 at a rate of 29.3 accidents per 100,000 flight hours, decreased to 18.5 accidents per 100,000 flight hours over the next two years,and then rose to 20.7 during 1985.

Table 8

ACCIDENT FREQUENCY FOR EMS HELICOPTERS

Year	Number of Accidents	Number of Patients Transported	Accidents* per 100,000 Flight Hours	Average Number of Patients Between Accidents
1980	3	16,500	18.2	5,500
1981	6	23,000	26.1	3,833
1982	9	30,700	29.3	3,411
1983	7	37,900	18.5	5,414
1984	9	48,600	18.5	5,400
1985	15	62,000	20.7	4,133
Totals	49	218,700	22.9	4,463

*Based on a worst-case industry multiplier of 60 in-flight minutes per patient (Collett, 1986).

Source: Collett, 1986.

During the 1970s, many early EMS pilots were commercial pilots who branched out into EMS service: Many were "private rural pilots who wanted to relive the adrenalin rush of military helicopter service and expand the usage of their civilian aircraft businesses. Often their advertisements in the telephone yellow pages would list their aerial services as emergency medical, tourist, charter, cargo, and even crop dusting" (Reich and Kania, 1985). As the early industry organized (ASHBEAMS formed in 1980) and established safety standards, the number of these part-time operators declined, with a resultant improvement in safety.

Although industry experts acknowledge that 1985 was a particularly unsafe year, the data in Table 8 suggest fluctuations in EMS helicopter safety since the industry began to experience rapid growth in 1981. An article discussing the recent (1985) rash of accidents suggests that one reason for the accidents is the pilots' willingness to fly in adverse weather when other commercial helicopter pilots would not fly. As stated by Paul Procter, a business flying editor for Aviation Week and Space Technology, "Those guys absolutely hate the thought of losing a patient because they can't fly" (Ver Berkmoes, 1986).

EMS helicopters are frequently called in for particularly hazardous field pickups in locations that ground ambulances would have a difficult time reaching. Even on relatively routine EMS flights, the pilots often land in unfamiliar surroundings in makeshift landing areas in the field. Thus, EMS helicopters may never reach the same safety levels associated with general aviation. It should be noted, however, that the added risk associated with these types of flights is generally limited to the field and not designated landing pads (see Accident Potential with Respect to Phase of Flight, below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Nonetheless, there is an awareness in the industry that EMS helicopter safety can continue to improve. In an attempt to increase safety, ASHBEAMS and the National Emergency Medical Services Pilots Association (NEMSPA) are in the process of developing standards on pilot training, staffing, and operations protocols. (Aviation Week and Space Technology, 1986).

Fatal Accidents Involving Helicopters

General Aviation. As illustrated in Table 9, total fatal accidents declined from 1.71 fatal accidents per 100,000 flight hours in 1975 to 0.63 per 100,000 flight hours in 1981. The 73 fatal accidents identified in Table 9 account for a total of 139 fatalities during the seven year period. Of these, eight were ground fatalities (persons not in the helicopter at the time of the accident).

Table 9

FREQUENCY OF FATAL ACCIDENTS FOR ALL TURBINE-POWERED HELICOPTERS
(1975-1981)

Year	Number of Fatal Accidents	Hours Flown	Fatal Accidents/ 100,000 hours
1975	6	351,000	1.71
1976	8	423,000	1.89
1977	8	599,000	1.34
1978	11	631,000	1.74
1979	13	663,000	1.96
1980	18	1,172,000	1.54
1981	9	1,424,000	.63
Total	73	5,263,000	1.39

Source: National Transportation Safety Board, 1981.

EMS. In 14 years, there have been 17 fatal accidents (causing 46 deaths) involving EMS helicopters, resulting in an accident rate of approximately 6.5 fatal accidents per 100,000 flight hours, which is considerably higher than that of general aviation. Only two of these fatal accidents, however, have involved "major vendors" (defined as vendors serving three or more hospitals) [Collett, 1986], which represents an accident frequency of approximately 0.66 fatal accidents per 100,000 flight hours for major carriers--a 14-year total that is comparable with the safest year for general aviation, according to the NTSB figures. There has never been a ground fatality in an EMS helicopter accident. (Collett, 1986)

Accident Potential with Respect to Phase of Flight

General Aviation. The NTSB study identifies the location of helicopter accidents relative to the heliport or airport for 1981 only. These figures are available only for all helicopters (piston and turbine-powered). As shown in Table 10, more than half of the two hundred fifty seven accidents

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in 1981 (54%) occurred further than one mile from the airport or heliport. The second most frequent occurrence (22%) was at the site of an airport. 2.3% of the accidents occurred on heliports. Four percent of all accidents occurred within one mile of the heliports or airport.

Table 10

NUMBER AND FREQUENCY OF ALL HELICOPTER ACCIDENTS
IN RELATION TO AIRPORT OR HELIPORT
IN 1981

Location	Accidents	Percentage
On Airport	56	21.8
On Heliport	6	2.3

Miles From Port:		
Within 1/4	4	1.6
1/4 - 1/2	3	1.2
1/2 - 1	3	1.2
Beyond 1	139	54.1
Unknown/Not Reported	41	16.0
TOTAL	257	100.0

Note: Totals do not add to 100% due to rounding

Source: National Transportation Safety Board, 1981.

EMS. Of the 57 EMS helicopter accidents that occurred through 1985, two ocurred on the host hospital's landing area. (Both of these occurred when engines failed during takeoff from the landing area and takeoff had to be aborted. There were no injuries or deaths on either occasion.) There is no specific data available on the exact distance from the hospital of the other 55 accidents. Nina Merrill of ASHBEAMS was aware of only one other accident that occurred within one mile of the hospital; Tom Einhorn of NEMSPA thought that there may have been two or three. In either case, it appears that the great majority of EMS helicopter accidents have occurred in the field or en route at a distance of greater than one mile from the host hospital.

Reasons stated for the locations of these accidents include the pilot's lack of familiarity with the landing area, poor visibility at field landing areas, the panicky behavior of those on the ground attempting to guide the pilot, and the frequent need to land on marginally safe landing areas. The fact that the largest single cause of EMS helicopter accidents is flying into wires or obstacles (see "Causes of Accidents" section below) supports this assertion. In familiar landing areas, pilots and support teams know the locations of wires and obstacles and are careful to avoid them. At an

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

unfamiliar pickup point in the field, unknown wires present a more serious danger (Collett, Merrill, Poulton, Hill, Benedict).

Causes of Accidents

General Aviation. The NTSB uses 14 different designations for types and causes of helicopter accidents, including "hard landing, collision with wires or poles, engine failure or malfunction," etc. (see Table 11). In 1981 the largest number of accidents (42%) were caused by engine failure or malfunction. Seventy-two percent of these accidents caused either minor or no injury. The other most frequent causes of accidents were "controlled" collisions with the ground and collisions with wires or poles (each causing 10.3% of all accidents). Both of these categories caused higher percentages of fatal and serious injury accidents. Nonetheless, even among turbine-powered craft, which have relatively dependable engines, engine failure or malfunction was the single leading cause of serious injury or fatal accidents. No data are available on twin engine helicopters.

Table 11

GENERAL AVIATION, TURBINE-POWERED HELICOPTER ACCIDENTS IN 1981 BY TYPE AND CAUSE

Type of Accident	Number	Percentage
Hard Landing	6	7.7
Roll Over	5	6.4
Collision between Aircraft--both in flight	1	1.3

Source: National Transportation Safety Board, 1981,

EMS. Similar, although more general data have been assembled on causes of EMS helicopter accidents (see Table 12). The single greatest cause (32%) of EMS helicopter accidents has been striking wires or obstacles. (58% of this type of accident resulted only in damage to the craft, but no injuries.) The second leading cause of EMS helicopter accidents has been power loss or other mechanical failure, which has accounted for 26% of these

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

accidents. (The majority of this group of accidents (64%) caused no death or injury.)

Table 12

AIR AMBULANCE HELICOPTER ACCIDENTS BY CAUSE
(1972-1985)

Type of Accident	Number	Percentage	Associated Fatal Accidents
Struck Wires/Obstacles	17	31.5	4

* Pilot failure to switch to full fuel tank.

Note: Total does not add to 100% due to rounding.

Source: Helicopter Association International (HAI) Convention News, January 28, 1986.

The third leading cause of EMS helicopter accidents and by far the leading cause of fatal accidents is the loosely defined category "flew into ground," which accounts for 22% of all EMS aircraft accidents and more than half (53%) of the fatal accidents involving EMS aircraft. This designation was applied to accidents that occurred in poor visibility, when the helicopter hit the ground, and where there was no evidence of any mechanical failure. It is assumed that the causes of these accidents were pilots becoming disoriented by low visibility.

Time of Day (Light) and Weather Conditions

General Aviation. The NTSB report provides data on daylight and weather conditions for 1981 accidents, but does not provide that information specifically for turbine-powered helicopters. Therefore, the information in this section is based on all helicopters. The designations used by NTSB regarding weather conditions are limited to the "Visual Flight Rating" (VFR) and Instrument Flight Rating" (IFR) designations common to aviation regulation. These designations refer primarily to visibility, are not standardized, and do not necessarily account for other factors, such as wind. For example, in some areas of relatively flat topography, the ceiling and visibility limits that would trigger an IFR designation might be more permissive than in an area with greater topographic relief. Therefore, if ten different accidents occurred under VFR conditions, it is possible that the weather could have been different for each of the ten.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The statistics show that the majority (see Table 13) of helicopter accidents in 1981 occurred under VFR conditions. Although VFR conditions generally refer to better weather conditions than IFR conditions, this can be misleading. Most accidents occur under VFR conditions because far more pilots are qualified to fly under VFR conditions than those qualified for IFR flight (generally the more experienced pilots). One common situation is that a VFR rated pilot takes a helicopter out when the weather is good and when it turns bad, he/she is unprepared to deal with it. Many of the accidents that occur under conditions that are technically VFR, actually occur in poor weather (Stripling, 1986). The majority of accidents (88%) occur in daylight.

Table 13

LIGHT AND WEATHER CONDITIONS
ALL GENERAL AVIATION HELICOPTER ACCIDENTS IN 1981

Light Conditions	Type of Weather		Accidents	
	VFR	IFR	Number	Percent
Dawn	6	0	6	2.3
Daylight	216	9	225	87.5
Dusk	12	1	13	5.1
Night (dark)	9	2	11	4.3
Night (moonlight bright)	2	0	2	.8
TOTAL	245	12	257	100.0
Percentage	95.3	4.7		

Source: National Transportation Safety Board, 1981.

EMS. NEMSPA data indicate that approximately half of all fatal EMS helicopter accidents occurred at night, half during the day. Tom Einhorn of NEMSPA estimated that non-fatal accident records would be similar. Howard Collett, however, believed that a statistical analysis would show a greater percentage of non-fatal accidents occurring during daylight hours than at night.

Gene Hill, a pilot with Airlift Northwest, noted that under bad weather conditions, such as the fog that enveloped Seattle in December of 1985, the company does not fly at all. In fact, during that fog, Airlift Northwest refused to answer twenty calls over a two week period because they did not believe it was safe to fly. Additionally, it is company policy not to fly in winds in excess of 40 knots. Under marginal flying conditions, the company flies at the option of the pilot. In determining whether to fly or not, the pilot has the option of using FAA visibility criteria or more stringent Airlift Northwest guidelines. The FAA standards call for a minimum ceiling of 300 feet and minimum visibility of one-half mile; the Airlift Northwest guidelines are a 500-foot ceiling and one mile of visibility. The Airlift Northwest criteria were established specifically to give pilots the option of not flying if they were not comfortable flying in conditions that the FAA determined to be acceptable. In those cases of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

marginal weather conditions that the pilot decided to fly, they wouldn't land at Children's, but would land at Boeing Field or Sea-Tac, where the pilot could make an instrument controlled landing. Airlift Northwest would only land at Children's in conditions of good visibility.

Accidents by Make and Model of Helicopter

There are no assembled statistics available from NTSB on the makes and models of helicopters involved in accidents. However, Sue Godar, a marketing representative with Agusta, indicated that only one Agusta 109 had ever been involved in a fatal accident since the model was introduced in 1975. That accident involved two Agusta test pilots who were unable to maneuver out of a narrow dead-end canyon in the Italian Alps. According to Howard Collett, the Augusta 109 has been involved in two minor EMS related accidents. One occurred in Phoenix in 1983 and involved a blade slap against another helicopter while taxing at an airport. The other occurred in New Orleans in 1984 and involved an Augusta striking a parked, night camoflauged military helicopter, while performing a night landing at an airport. Neither of these accidents caused any fatalities or injuries.

Observations on Helicopter Safety

In addition to the empirical evidence presented in Tables 6 and 7, indicating a trend in greater safety in helicopter use over the seven years from 1975-1981, there is a general perception among sources in the industry, both EMS and general aviation related, that overall safety has improved and is continuing to improve. These sources offered several observations regarding this increased safety.

Gene Hill, the senior Airlift Northwest pilot, attributes improved helicopter safety, in part, to changes in the technology. He believes that the combined emergence of turbine-powered and twin-engine helicopters has eliminated most of the common equipment-related causes of accidents. Turbine engines are far more dependable than piston powered engines and, as a result, are used almost exclusively in professional flying today. Additionally, in a twin-engine craft, the likelihood of both engines failing at the same time is statistically remote. Illustrative of this point is the fact that the FAA no longer tests pilots of twin-engine helicopters for their ability to perform autorotation landings, which is the only way to land a single-engine craft with a failed engine.

Frank Benedict, a Seattle FAA inspector who certifies helicopter pilots, notes that another cause of improved helicopter safety is that the least safe type of flying, external load flying, has decreased. This type of flying involves carrying loads, such as logs or beams, suspended from the exterior of the craft.

Both Dr. Thomas Poulton, medical director of the St. Joseph Hospital Life Flight program in Omaha, Nebraska, a nationally recognized emergency medicine researcher, and Howard Collett have noted improvements in EMS flight safety. Dr. Poulton believes that most EMS programs are "extremely safe." He noted that a lot of early operators of air ambulance services were pilots who would use their helicopters to pick up patients as a sideline and frequently took unwarranted risks. He believes that most

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

programs operated by medium to large hospitals are professional and are safe. He speculated that some of the smaller programs operate on more restrictive budgets that might affect their judgments regarding which flights to take and which flights not to take.

Dr. Poulton's views are supported by Howard Collett's statistic that only two of the 17 fatal accidents that have occurred to date have involved "major vendors," which he defined as vendors serving three or more hospitals. He is of the opinion that the safety of these major vendors compares favorably with any sector of the helicopter industry. Although Collett believes that improvements in EMS safety have leveled off somewhat since 1982, he notes that the industry is committed to safety and that further improvements are likely in the future. This in part is reflected in the joint ASHBEAMS and NEMSPA convention that resulted in the agreement to establish more rigorous pilot guidelines and an aggressive training program (see ASHBEAMS and NEMSPA discussion in Chapter II).

The FAA considers air ambulance services as "Air Taxi" services in their permitting and licensing process. This type of use has to meet the requirements of more stringent regulations for the pilots, the companies, and the aircraft than other types of uses. First, the air taxi helicopters are examined and flight tested by the FAA at least annually, often more frequently. General aviation craft are rarely inspected more than every five years. Second, air taxi pilots undergo more stringent flight testing than general aviation pilots. FAA Inspector Benedict characterized the distinction by stating, "With general aviation pilots, we have to be convinced that there is no serious doubt as to their control over the aircraft. With air taxi pilots, there can be absolutely no doubt at all as to their full control over the aircraft at all times." Air taxi pilots are also required to have more flight hours than general aviation pilots, but Benedict noted that this is more stringently enforced in insurance company standards than in the FAA regulations. Gene Hill noted that Airlift Northwest has more stringent standards for pilots than either the FAA or the insurance companies.

Affected Environment

The Seattle metropolitan area is served by two major airports (Sea-Tac International Airport and Boeing Field), several smaller airports and airfields (including seaplane ports on Lake Union and Lake Washington, some of which are private docks along the shorefront), and several heliports.

Sea-Tac and Boeing Field receive all of the jet traffic in the area; the nearest other jet ports are Paine Field in Everett and McChord Air Force Base, southeast of Tacoma. General aviation fixed wing traffic is also handled at Sea-Tac and Boeing, as well as at smaller airfields in the area. Several commercial helicopter organizations are headquartered at Boeing Field. In addition to the helicopters based at Boeing Field, several local radio and television stations maintain their own helicopters for news gathering and traffic reporting purposes, and have heliports at their buildings, located in the Denny Regrade area.

Airlift Northwest, the organization that would be transporting nearly all patients to and from Children's, is headquartered at Boeing Field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There have been no accidents in the four and one half year history of Airlift Northwest. Since May of 1985, when Airlift Northwest began operation of the Augusta 109 helicopter, there have been 604 transports (through June 1986); no helicopter accidents have occurred.

Significant Impacts

General Impacts - All Alternatives

In assessing the potential for accidents associated with air ambulance service to Children's, several assumptions must be made regarding the number of flights and the average duration of these flights. Children's estimates that a maximum of 15-20 patients per month will be transported to Children's by helicopter. (See description of the derivation of the number of flights in the description of the Proposed Project).

Gene Hill of Airlift Northwest estimates, based on flight logs, the average total flight (engine) time to serve Children's is 48 minutes. The 48 minute average flight time per patient transport to Children's reflects a combination of interhospital and field transports as well as cases in which the helicopter is used for the final leg of a transport involving a fixed wing transport. A representative 48-minute flight can be into four segments (ground time not included):

1.	Boeing Field to Children's: medical crew pickup	6 minutes
2.	Children's to Patient	18 minutes
3.	Patient to Children's	18 minutes
4.	Children's to Boeing	6 minutes
		48 minutes

The 18-minute segment can be further broken down into one minute of approach/landing, one minute of departure and 16 minutes of flight time, which, assuming a speed of 160 knots, would be equivalent to covering a distance of approximately 49 miles. (It is important to note that the 48 minute average is lowered by flights where the patient is transported to Boeing by fixed wing and then on to Children's.)

Several different accident frequency figures are used to derive projections for different statistical accident frequencies for Children's air ambulance service (see Table 14). The results are presented as the statistical probability of an accident occurring on any given Children's flight; in other words, out of "x" number of 48-minute flights, one would be expected to result in an acident. The frequency of such accidents occurring on a Children's-destined flight would depend on the actual number of patients brought to Children's by helicopter. As a worst case scenario, the statistically probable number of years between acccidents on Children's-destined flights is presented, assuming a worst case forecast of 20 flights per month starting immediately and perpetuating indefinitely.

General accident calculations are based on accident rates for U.S. General Aviation (turbine-powered helicopters) for 1981 and for 1976-1981. Considering that the number of accidents per 100,000 flight hours decreased by more than half between 1976 and 1981 and there is reason to believe that

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TABLE 14

EXPECTED FREQUENCY OF ACCIDENTS
FOR HELICOPTERS TRANSPORTING PATIENTS TO CHILDREN'S

	ASSUMPTIONS				
	Accidents/ 100,000 Flight Hours	Flights/ Month	Minutes/ Flight	Probability of Accident	Statistical Frequency of Accidents (Expected (Number of Years Between Accidents)
1. U.S. General Aviation, Turbine-Powered Craft, 1981	5.5	20	48	1 in 28,810	95
2. U.S. General Aviation, Turbine-Powered Craft, 1975-1981	8.4	20	48	1 in 14,828	62
3. Fatal Flights U.S. General Aviation, Turbine-Powered Craft, 1975-1981	1.4	20	48	1 in 89,928	338
4. Ground Fatalities 1976-1981	.1	20	48	1 in 833,333	3,472
5. EMS Related Accidents 1980-1985 (approximate)	22.9	20	48	1 in 5,459	22.7
6. EMS Related Fatal Accidents 1972-1986 (approximate)	6.5	20	48	1 in 19,231	80
7. "Major Vendor" EMS Related Fatal Accidents 1972-1986 (approximate)	.7	20	48	1 in 189,394	790

Source: Shapiro and Associates, Inc., text and tables from body of report.

this trend has continued (if one assumes piston-powered helicopters have been taken out of service and replaced by turbine-powered craft), the results based on the 1981 figures are probably more accurate, yet may still be too high. Since total figures from 1976-1981 represent a larger volume of data, however, assessments using this information were calculated.

Since there was no trend in fatality statistics from 1976-1981, average rates for the seven year period were used to estimate expected frequency of fatal accidents for flights transporting Children's patients. Ground fatality projections are based on the same seven year totals. Projections based on past EMS helicopter safety records using approximate figures generated by Howard Collett and Nina Merrill were also prepared. These calculations are based on total EMS related accidents from 1972-1985, EMS related fatal accidents over the same time period, and EMS fatal accidents involving "major vendors" for the same 14 years. No "major vendor" projections were made for overall accidents because the necessary base data have not been compiled. No "ground fatality" projections for EMS related accidents are presented since no ground fatalities have ever resulted from an EMS related accident.

To summarize the results (see Table 14) a worst case scenario was generated using the overall accident rate for EMS helicopters. Under this scenario, a flight involving a Children's-destined patient would have a statistical probability of an accident one in 5,459 transports. The accident could occur at any point on the four segments of each flight. If one assumes 20 flights per month, then the first accident would be statistically expected to occur every 23 years or before the year 2010. If one assumes that the accidents would occur in the flight in a manner comparable to EMS helicopters history, then 10% of the accidents would occur within one mile of the Children's helistop.

At any of the sites, helicopter operations could distract motorists and pedestrians along neighboring streets, and thereby be the indirect cause of an accident.

Children's Helistop Alternative

Regarding the proposed location of the Children's heliport, FAA Inspector Benedict believes that it is an extremely safe site (Benedict, 1986). He compared it to landing areas near the Seattle Center and downtown Seattle that are over busier streets and more congested conditions. He believes that the Children's site is far safer than such landing areas, which are already safe themselves.

A natural gas meter house is located approximately 48 feet northeast of the Children's helistop site. No other buildings are located within one hundred feet. Communication with representatives of Washington Natural Gas discloses that the current protection of the meter with a fence and a concrete structure is considered reasonable and adequate to prevent a fire in the event of a helicopter accident (Jainga, 1985). In the event of a major accident that results in the breach of the gas supply line, the natural gas would flare until shut off at the main valve across from Children's on Sand Point Way N.E.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Other Alternatives

It is not anticipated that any of the alternative helistop locations would be more safe from a helicopter accident frequency perspective than the others. The Airlift pilots have indicated that a secured, lighted helistop--whether on a roof or on the ground--is preferred to unsecured, unlighted open field landing. Because the area immediately surrounding the Intramural Field and the primary and secondary approach/departure paths are located in an undeveloped area, potential physical damage from a helicopter accident would be relatively less for that alternative. Any distinction in potential accident risk among the alternatives would reflect any (minor) differences in flight time, with a no action alternative involving the least flight time, followed by University Hospital Helistop and Intramural Field Helistop.

All of the alternatives to constructing a helistop at Children's involve transport of patients and attending medical crew to Children's by ambulance. Although there is a risk of accident from transport by this mode, no statistics were available based on contacts with ambulance services, EMS agencies, the NTSB, insurance companies or other potential sources.

Mitigation Measures

Children's could contact Washington Natural Gas to discuss the possibility of receiving the necessary equipment and training to enable Children's personnel to shut off the main gas supply valve. This would allow any natural gas flare to be extinguished more quickly in an emergency situation.

Signs could be posted warning of helicopters operating in the vicinity of the helistop so as to inform them of potential distractions.

NOISE AND VIBRATION

Introduction

This chapter discusses noise and vibration impacts of the proposed helistop. The chapter was prepared by Towne, Richards & Chaudiere, Inc.

The report Helipad Noise Evaluation Children's Orthopedic Hospital (Seton, Johnson & Odell [SJO], 1985), prepared as part of the environmental checklist for this proposal, is a partial basis for the noise and vibration analysis. Data from Federal Aviation Administration (FAA) documents, from Airlift Northwest, and from other sources were also used to evaluate and supplement the SJO analysis.

Sound Level Descriptors and Criteria

Descriptors

Sound levels are measured in decibels, abbreviated dB. Environmental noise is measured as A-weighted sound level in decibels, often abbreviated dBA or dB(A) to denote the A-weighting. The A-weighting is a frequency-dependent level adjustment that is based on the sensitivity of human hearing at various sound frequencies and takes into account the human ear's lack of sensitivity to low frequencies.

Table 15 shows A-weighted sound levels associated with various noise sources and conditions.

The dBA measurements scale is a logarithmic rather than a linear scale, and is therefore not directly proportional to the energy or loudness of the noise. The smallest noticeable increase in noise is usually considered to be about 3 dBA, which is a doubling of sound energy. A doubling of judged loudness occurs for each 10 dBA increase in level. For example, 80 dBA is judged to be twice as loud as 70 dBA and four times as loud as 60 dBA. The increase in loudness of various sound level increases is judged as follows:

Sound level increase, dBA	Judged loudness increase
0 to 2	Barely perceptible
3 to 5	Noticeable
10	Doubling of loudness
20	Quadrupling of loudness

For evaluating the effect of noise on people, one must consider both the level, time of day, and duration of the noise. Noise descriptors that are based on the average sound energy have in the past ten years been found to be the best indicators of noise impact and community response, regardless of whether the noise is steady (such as a freeway) or fluctuating (such as local traffic and aircraft). Community noise, therefore, is often measured as an equivalent or average sound level, Leq, which is the level of a steady sound that contains the same acoustical energy as the fluctuating noise over a given time period.

TABLE 15

SOUND LEVELS OF VARIOUS NOISE SOURCES AND CONDITIONS

Sound Level, dBA	Source or Condition
140	Hearing damage risk for short exposure
130	Threshold of pain
120	Race car at 50 feet
115	Occupational noise limit for 15 minutes/day exposure
110	Orchestra fortissimo; rock concert
100	Occupational noise limit for 2 hours/day exposure; ambulance siren at 50 feet
95	Occupational noise limit for 4 hours/day exposure
* 90	Occupational noise limit for 8 hours/day exposure
* 85	Accelerating truck or bus at 50 feet; power lawn mower
* 80	Average downtown traffic noise; ambulance siren at 500 feet
* 75	Inside auto, accelerating
* 70	Inside auto, steady speed
* 65	Urban residential average noise; typical auto measured at residential setback
60	Normal conversation
55	Suburban residential average noise
50	General office
45	Residential indoor
40	Quiet indoor
20	Whisper
0	Threshold of excellent hearing

* Approximate sound levels of intermittent aircraft flyovers in Seattle area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Noise over 24 hours is measured as day-night average sound level, Ldn, which is the Leq over 24 hours with a 10 dBA penalty included when averaging the Leq for nighttime hours of 10 p.m. to 7 a.m., because of the greater noise sensitivity during nighttime. For locations exposed to intermittent aircraft noise, it is common for governmental agencies to use the yearly Ldn based on an average number of daily aircraft operations during the year to determine the average or long-term impacts of the aircraft noise. The Ldn based on a particular day or condition can also be used to evaluate short-term impact. Ldn is the most widely accepted noise descriptor in the U.S. The descriptor is used by the U.S. Environmental Protection Agency (USEPA), the U.S. Department of Housing and Urban Development (USHUD), and the FAA to evaluate noise impact and land use compatibility. Ldn noise criteria are based on studies or activity interference (speech and sleep), annoyance, and community reaction.

The highest instantaneous sound level occurring during a given time period is called maximum sound level, Lmax. The Lmax descriptor can provide information about intermittent sound levels from particular noise sources, and the amount of noise fluctuation.

Individual aircraft events are also measured as sound exposure level, SEL, which is the level of a steady one-second sound that would contain the same amount of sound energy as the entire event. The SELs of individual aircraft events are used to compute the overall Leq and Ldn.

Although the A-weighted sound level and the Leq and Ldn noise descriptors are currently considered the best overall measures of noise, there are other factors that may affect sensitivity to noise. Impulse noise associated with helicopter blade slap tends to distinguish the helicopter noise from other noise sources. (This blade slap noise is primarily a characteristic of helicopters with two-bladed rotors, whereas 90% of the flights to Children's would be by helicopters having four-bladed rotors and modifications to control blade slap noise.) Research to determine whether an adjustment should be made to the sound level based on the impulsivity of the helicopter sound has led to conflicting results. The current position of the FAA and the International Civil Aviation Organization (ICAO) is that an impulsivity adjustment is unnecessary to properly certificate aircraft and adequately assess human response.

Criteria

There are no local, State or Federal noise regulations specifically for helistops. The following is a discussion of existing noise standards and guidelines, and of noise effects.

Seattle Noise Ordinance. The Seattle Noise Ordinance (City of Seattle, 1977) exempts "sounds originating from aircraft in flight, and sounds which originate at airports and are directly related to flight operations." The ordinance also exempts "sounds created by emergency equipment and emergency work necessary in the interests of law enforcement or of the health, safety or welfare of the community." Exempt sound sources can also not be considered a public nuisance noise or public disturbance noise. Based on these exemptions, noise from aeromedical helicopters and from ambulance sirens would not be considered subject to the Seattle Noise Ordinance.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

United States Environmental Protection Agency (USEPA) Noise Guidelines. Day-night average sound levels, Ldn, affecting residential, hospital and educational activity can be evaluated using USEPA noise guidelines (USEPA Region 10, 1975). Significant impacts on these activities are considered to exist if exterior Ldn is 65 dBA or above. The guidelines consider overall noise increases due to a project of 0 to 5 dBA to cause slight impact, 5 to 10 dBA significant impact, and over 10 dBA very serious impact.

United States Housing and Urban Development (USHUD) Noise Standards. USHUD has established Ldn noise standards for USHUD-assisted projects and actions (USHUD, 1979). The USHUD standards are cited only as an additional reference, since this project is not USHUD-assisted. Ldn 65 dBA or less is "acceptable." Ldn exceeding 65 dBA but not exceeding 75 dBA is "normally unacceptable," and special approvals, environmental review and sound attenuation are required. Ldn exceeding 75 dBA is "unacceptable," and special approvals, environmental review and sound attenuation are required.

FAA Land Use Compatibility Criteria. The FAA (FAA, 1984) has developed land use compatibility criteria based on Ldn as shown in Table 16. The criteria basically consider residential or hospital land use to be not compatible where the yearly Ldn is 65 dBA or above, unless outdoor to indoor sound level reductions are 5, 10 or 15 dBA over standard construction sound level reductions of 20 dBA. All land uses are considered to be compatible where the yearly Ldn is below 65 dBA.

Sleep Interference. The probability of sleep disturbance from noise varies depending on the level and duration of the noise, stage of sleep, individual exposed, and adaptation. Intermittent indoor sound levels (up to a few minutes duration) above 70 dBA have a significant probability of causing sleep interference. Intermittent levels of 40 to 70 dBA are generally considered to have some potential for causing sleep interference. Continuous sound (for example, from air conditioners or fans) causes sleep interference above 35 to 45 dBA. Sleep interference can also occur at lower sound levels, although the probability of sleep disturbance diminishes significantly at the lower levels. Adaptation to a particular sound level or noise source is a factor in determining sleep interference. This factor can generally not be simulated in laboratory studies. Age is also a factor, with the elderly and children in certain age groups being more susceptible to awakening. Intermittent indoor sound levels up to about 55 dBA are generally not considered to cause impact, based on collated data such as shown in Figure 10. More conservative data from studies conducted in schools and hospitals, as shown in Figure 11, indicate a sleep interference threshold of 40 dBA, with probabilities of awakening from maximum sound levels of 50 dBA as 10%, 60 dBA as 20%, and 70 dBA as 30%.

Motor vehicle noise is the primary cause of sleep interference in residential areas. In typical residential areas, there is a relatively steady background sound level from distant traffic. Higher sound levels from local traffic events are superimposed on this background. Typical intermittent sound levels at the 30- to 50-foot setback of a residence would be similar to those that have been identified in national surveys (USDOT, 1978). At 31 miles per hour (50 kph) and 49 feet (15 m), the "national energy mean emission levels" of various vehicle categories are as follows:

* The designations contained in this table do not constitute a Federal determination that any use of land covered by the program is acceptable or unacceptable under Federal, State, or local law. The responsibility for determining the acceptable and permissible land uses remains with the local authorities. FAA determinations under Part 150 are not intended to substitute federally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise compatible land uses.

KEY TO TABLE

SLUCM	Standard Land Use Coding Manual.
Y (Yes)	Land Use and related structures compatible without restrictions.
N (No)	Land Use and related structures are not compatible and should be prohibited.
NLR	Noise Level Reduction (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.
25, 30, or 35	Land used and related structures generally compatible; measures to achieve NLR or 25, 30, or 35 must be incorporated into design and construction of structure.

NOTES FOR TABLE

(1) Where the community determines that residential uses must be allowed, measures to achieve outdoor to indoor Noise Level Reduction (NLR) of at least 25 dB and 30 dB should be incorporated into building codes and be considered in individual approvals. Normal construction can be expected to provide a NLR of 20 dB, thus, the reduction requirements are often stated as 5, 10 or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year round. However, the use of NLR criteria will not eliminate outdoor noise problems.

(2) Measures to achieve NLR of 25 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(3) Measures to achieve NLR of 30 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(4) Measures to achieve NLR of 35 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(5) Land use compatible provided special sound reinforcement systems are installed.

(6) Residential buildings require an NLR of 25.

(7) Residential buildings require an NLR of 30.

(8) Residential buildings not permitted.

SLEEP DISTURBANCE BY NOISE

N

SHAPIRO & ASSOCIATES

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Vehicle Category	Sound Level, dBA
Heavy truck	80
Medium truck	74
Automobile	62

Noise emissions from buses are similar to medium or heavy trucks. Noise emissions are several dBA higher when vehicles are accelerating. Typical maximum sound levels in residential areas are, therefore, between about 75 and 85 dBA due to occasional noisy vehicles. Where there is a significant amount of traffic, such as at residences adjoining Sand Point Way N.E., maximum levels between 80 and 90 dBA are common (TRC, 1982).

Outside to inside sound level reductions are about 25 dBA in the Northwest. Residential interior maximum sound levels due to occasional motor vehicles are typically 50 to 60 dBA, which can cause occasional sleep interference. With windows partly open, interior sound levels are typically 10 dBA higher, or about 60 to 70 dBA, and there is greater probability of sleep interference.

Ambulance sirens are another noise source that is occasionally present near Children's. The sirens produce between 90 and 106 dBA at 50 feet, depending on their power rating and orientation (Federal Signal Corp., 1986). The sirens, therefore, are capable of causing interior sound levels significantly above the sleep intereference thresholds.

In evaluating the sleep interference potential of the Children's helistop, it is important to consider those noise sources that are already present, and whether there would be a significant increase in intermittent and average sound levels.

Health Effects of Noise. The only clearly established health hazard of noise is hearing loss. State and Federal occupational noise exposure limits based on hearing loss are 90 dBA for eight hours exposure, or higher levels up to 115 dBA for shorter exposure periods.

Based on animal studies involving prolonged exposure to high sound levels, health effects other than hearing loss have been postulated. Between 1977 and 1980, several studies to identify possible adverse health effects on residents in high noise environments, such as neighborhoods adjoining Los Angeles International Airport, however, have been inconclusive. At the present time there is little valid scientific basis for claiming direct health impacts from aviation noise.

Noise-Induced Structural Vibration. Detectable vibration of portions of building structures can occur if exterior sound pressure levels in the low frequencies below 100 Hz (100 cycles per second) are above 65 to 80 dB, as discussed in the SJO report. Short-duration sound pressure levels above approximately 120 dB are considered to cause annoying rattles and fright (U.S. Department of the Interior, 1980). Sound pressure levels from diesel truck drive-bys and general aviation aircraft flyovers are approximately in the 65 to 80 dB range, based on USEPA sound pressure level data (USEPA, 1971), but are well below 120 dB.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The vibration response of a particular structure depends on the construction type and the window size and type. Residence vibration studies have generally been based on structures in southern California and other parts of the southern United States. It is likely that residences in the Northwest, which typically provide about 5 to 7 dB more outside to inside sound level reduction than residences in Southern California (based on airport acoustic insulation studies), are also less susceptible to structural vibration.

Detectable buzzing or rattling of windows due to structural vibration can result in increased annoyance, but is not damaging to the structure unless the outside sound pressure levels are above approximately 134 dB (U.S. Department of the Interior, 1980). Studies of historic building structures near airports with high sound pressure levels from aircraft noise, including 104 dBA from the Concorde supersonic jet transport (Hershey, Kevala and Burns, 1975), have shown that exposure to normal weather (such as thunder or wind loads) produces a higher probability of breakage than vibration from the noisiest aircraft, the Concorde. The contribution of aircraft to structural damage was found to be insignificant. Since the helicopter sound levels received at residences near Children's would be significantly lower than those measured for the Concorde, there is not expected to be any likelihood of structural damage from the noise.

Short-duration sound pressure of these levels can cause rattling and movement of dishes and other lightweight objects.

Helicopter Noise Sources

The Children's helistop would primarily be used by Airlift Northwest. Airlift Northwest uses the Agusta A109 Mark II helicopter, which is turbine-powered. The A109 represents near-current low-noise helicopter design. The helicopter has four blades per rotor instead of two, which results in less of the impulsive blade slap noise that is commonly associated with two-bladed helicopters. The Mark II has additional aerodynamic noise reduction features such as a cap on the rotor head to reduce the air flow angle into the blades and thereby reduce blade noise, and a vortex generator to control blade slap noise. Sound level data for this helicopter were obtained from measurements made by SJO at Children's, from FAA test data, and from measurements made at Harborview Medical Center (King County, 1986).

The MAST helicopters are two-bladed turbine-powered Bell UH-1Vs and have a more impulsive noise than the Agusta because of blade slap. A-weighted sound levels of the two helicopters are not significantly different, although because of the blade slap, the MAST is perceived as being considerably noisier. Sound level data for the MAST helicopter were obtained from measurements at Harborview Medical Center.

The loading of the helicopters (gross vehicular weight) has a negligible effect on their noise emission, because power settings, flight paths and blade speed are negligibly or unaffected (Hill, 1986).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Affected Environment

Helicopter flight paths are described in detail in Section III of the DEIS. The primary approach to Children's would follow the N.E. 45th Street/Sand Point Way N.E. corridor east of Union Bay Place N.E., enter the Children's campus north of the main entrance, turn south approximately over the parking garage, and land at the helistop. Departures would follow a similar flight path, but at higher altitude.

The existing noise-sensitive land uses are single-family and multiple-family residences near the N.E. 45th Street/Sand Point Way N.E. corridor, including Laurelon Terrace apartments and Laurelhurst West; and single-family residences east of Children's, primarily along 44th Avenue N.E. between N.E. 47th and N.E. 50th Streets. Laurelhurst School, located 1,000 feet east of the helistop site, is also noise-sensitive.

Existing sound levels were described in the SJO report for five locations that had been selected in coordination with the Seattle/King County Department of Public Health and the City of Seattle Department of Construction and Land Use. The measurement locations (see Figure 3, Campus Map) and existing day-night average sound levels, Ldn, were as follows:

Location	Ldn, dBA
1. 4720-4724 44th Avenue N.E. (NE of Children's)	52
2. 4530 45th Avenue N.E. (E of Children's)	53
3. Laurelhurst West (near Sand Point Way N.E.)	68
4. Laurelon Terrace (set back from Sand Point Way N.E., W of helistop)	55
5. 4757 41st Avenue N.E. (near Sand Point Way N.E., near main entrance to Children's)	63

Existing maximum sound levels were not measured in the SJO study, due to the relatively small number of sound level readings taken at each location. As discussed previously, however, typical maximum levels in residential areas are between about 75 and 85 dBA due to occasional noisy vehicles. Near Sand Point Way N.E., maximum levels between 80 and 90 dBA occur from motor vehicle traffic. Along ambulance routes, sirens produce maximum levels between 90 and 106 dBA.

A secondary flight path to Children's would be from the northeast over a single-family residential area. This flight path would only have to be used during wind conditions that exist about 0.2% of the time.

The primary helicopter approach and departure paths to the Intramural Field are from the south over water, or from the southwest from the Montlake Cut. Noise-sensitive land uses include residences near the Montlake Cut. The secondary approach path to the Intramural Field is over the University of Washington campus and northeast campus dormitories, considered noise-sensitive land uses.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The two approaches to the proposed University Hospital helistop are from the east and northeast, over the University of Washington sports facilities. The proposed helistop would be located across the Montlake Cut from a noise-sensitive residential area.

Impacts

Proposed Action - Children's Helistop

Noise impacts of the Children's helistop were described in the SJO report. The report assumed 20 patient transports or 40 round-trip flights per month, 29 during daytime hours of 7 a.m. to 10 p.m., and 11 during nighttime hours of 10 p.m. to 7 a.m. Each flight would consist of an approach, landing, takeoff, and departure. Impacts could in fact be less than those described in the SJO report, because of fewer flights. Current estimates are that initially ten patients per month would land at the helistop, with the number eventually increasing to 15 to 20 per month. It has been assumed that there would be two flights to Children's for each patient, the first to pick up the medical crew and the second to deliver the patient. The assumed 20 patients/40 flights per month is therefore a "worst case" assumption.

The number of nighttime flights is expected to be less than assumed by SJO. Current data (Airlift Northwest, 1986) indicate that between 19% and 25% of flights occur during nighttime hours of 10 p.m. to 7 a.m., versus 28% assumed by SJO.

The SJO report's comparison of monthly day-night average sound levels, Ldn, with and without the proposed helistop, based on noise tests of the Agusta helicopter at Children's, is shown in Table 17.

Table 17

SETON, JOHNSON & ODELL EXISTING AND PREDICTED Ldn

		Monthly Ldn, dBA			
	Location	Existing	Helicopter (40 flights)	Combined	Increase
1.	4720-4724 44th Ave. N.E.	52	55	57	+5
2.	4530 45th Ave. N.E.	53	48	54	+1
3.	Laurelhurst West	68	50	68	0
4.	Laurelon Terrace	55	56	59	+4
5.	Across from main entrance	63	52	63	0

Source: Seton, Johnson & Odell, 1985.

The projected worst case noise increase of 5 dBA in Ldn is considered a slight impact according to USEPA noise guidelines (USEPA, 1975).

The highest maximum sound level of the helicopter was measured by SJO to be 84 dBA at the closest receptor location, 4720-4724 44th Avenue N.E. Typical interior maximum sound levels from helicopters were estimated to be about 55 dBA, assuming typical outdoor maximum levels of 80 dBA and an

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

outdoor to indoor sound level reduction of 25 dBA. This level was estimated to awaken 15% of a normal population sample. As indicated previously, intermittent levels up to about 55 dBA are generally not considered to cause impact. At the closest receptors, the maximum sound levels would be about 84 dBA exterior and 59 dBA interior. This 59 dBA level would cause about a 20% probability of awakening, based on Figure 11. With windows partly open, interior maximum levels would be about 10 dBA higher, or up to 69 dBA, causing a 30% probability of awakening according to Figure 11. This probability of awakening is about 5-10% higher than for the estimated existing condition without helicopters, which is maximum levels of 60 to 65 dBA interior with windows partly open. Significant impacts (interior levels above about 70 dBA and also significantly exceeding existing maximum levels) are not expected to occur.

Based on discussions with Airlift Northwest concerning noise considerations, the primary flight path for Children's has been modified to allow a more gradual and direct turn into Children's than was used in the SJO noise tests, instead of the sharp turn that was previously made north of the intersection of Sand Point Way N.E. and N.E. 50th Street. The portion of the new flight path near the helistop would also be farther east of the Laurelon Terrace apartments, resulting in about 7-9 dBA lower maximum levels from helicopters than for the current flight path.

Maximum and day-night average sound levels were calculated for the new flight path using FAA noise test data for the Agusta A109 Mark II (FAA, 1985). The FAA data provides Lmax and SEL readings at the centerline and several side distances for various approach, takeoff, level flyover and hover operations. In addition to an average monthly Ldn, a "worst one-day" Ldn was also calculated, assuming two daytime and two nighttime flights. Results of the calculations are shown in Table 18.

The helicopter Ldns shown in Table 18 are considered to represent the "worst case" cumulative impact condition, as discussed previously.

The calculated monthly Ldn from helicopters are relatively close to those of SJO (see Table 17) at Locations 2, 4 and 5, but are lower at Locations 1 and 3, presumably because of differences in the flight path (affecting distance and exposure time) and possibly a difference in the helicopter altitude used to calculate levels at Location 3, Laurelhurst West. The helicopter Ldns shown in Table 18 are consistent with a current measured helicopter Ldn of 48 dBA 450 feet from the helistop at Harborview Medical Center (King County, 1986).

The calculated highest Lmax of 84 dBA at the closest residences is identical to the level measured by SJO.

The predicted sound levels are not expected to cause significant impact (interior Lmax above 65 dBA with windows closed, Ldn above 65 dBA due to helicopters, or more than 5 dBA increase in overall monthly and worst one-day noise). At all locations, the calculated monthly Ldn from helicopters would be less than the existing Ldn, resulting in a 3 dBA or less noise increase. There would, however, be increased sleep interference affecting Laurelon Terrace, residences west of the Children's main entrance that are not near Sand Point Way N.E., and the closest residences northeast

*Locations: 1 - 4720-24 44th N.E.
2 - 4530 45th N.E.
3 - Laurelhurst West
4 - Laurelon Terrace
5 - Across from main Hospital entrance

**The "existing worst one-day Ldn" in Table 18 was assumed to be the existing Ldn measured by SJO plus 3 dBA, since the existing Ldn varies from day to day depending on the traffic conditions and local activities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of the proposed helistop site. At these locations, interior Lmax from helicopters are likely to be several dBA above the currently existing Lmax from motor vehicles (up to 59 dBA predicted versus 50 to 55 dBA estimated existing). Assuming about 25% of the flights occur at night, there would initially be about two nighttime flights per month (one patient being transported), increasing to 10 per month under the "worst case" assumptions.

Because the rise in noise would be gradual, startle effects associated with rapid noise increases from sources such as blasting or sonic booms would not occur.

There would be slight noise impacts affecting Laurelhurst School. During landings and takeoffs, there would be brief exterior sound levels (FAA, 1985) of up to 72 dBA at the second story and 62 dBA at the first story and playgrounds, which are shielded by residential structures. The interior maximum sound levels would be about 47 dBA with windows closed and 57 dBA with windows open at the second story, and 37 dBA with windows closed and 47 dBA with windows open at the first story. These levels are approximately similar to sound levels currently caused by motor vehicle drivebys.

There would be sleep interference impacts several times per month affecting hospital patients whose rooms are exposed to helicopter noise. Maximum exterior sound levels at the portion of buildings closest to the helistop would be about 94 dBA. Interior maximum sound levels would be about 69 dBA with windows closed, which is considered to be the typical nighttime condition. These levels would cause about a 30% probability of awakening, based on Figure 11. Maximum sound levels would, however, be less than for the Limited Landings Alternative, since the helistop would be farther from the hospital building.

Low-frequency sound pressure levels from helicopters were estimated in the SJO report and found to be approximately similar to the levels at which perceptible structural vibrations are considered possible. The levels are also, however, similar to those that typically occur from diesel trucks and general aviation aircraft flyovers, as discussed previously. The estimated levels are significantly below levels that are considered to cause fright or structural damage.

The probability of structural vibration would be less than for the current flight path required by the Limited Landings Alternative. The helicopters must currently approach and depart west of the Children's emergency entrance in order to avoid existing trees, and must therefore fly close to Laurelon Terrace. Under the Proposed Action, maximum sound pressure levels at Laurelon Terrace due to helicopters would be reduced by about 7-9 dB.

Flights by the MAST helicopters would produce A-weighted sound levels almost identical to those of the Agusta, based on measurements at Harborview Medical Center (King County, 1986). The MAST helicopter noise would, however, be more noticeable than that of the Agusta because of more blade slap, as discussed previously.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There are no known adverse health effects associated with the predicted helicopter sound levels for the neighborhood around Children's.

There would be temporary noise impacts from intermittent construction noise during the two-month construction period, primarily affecting hospital patients whose rooms face the construction site. The noise would occur from trucks delivering about 400 cubic yards of fill material, grading and compaction of the site, and pouring of the Grasscrete surface. These activities would be limited to daytime hours. The Seattle Noise Ordinance (City of Seattle, 1977) contains stringent limits on construction noise received in residential areas during nighttime hours of 10 p.m. to 7 a.m. on weekdays and 10 p.m. to 9 a.m. on weekends. The daytime construction noise is not expected to affect residential areas because of the distance to these areas.

The following is a summary of impacts. The summary is consistent with the findings of the SJO report:

- Although the helicopter noise would be noticeable, it is not expected to cause significant impact during daytime hours due to its infrequent short-term nature and the relatively moderate sound levels that would be received at residences.

- Helicopter flights during sleeping periods could cause awakening probability of about 15-20% at the closest, line-of-sight residences and 30% at the closest hospital patient rooms.

- The impact of the monthly helicopter noise exposures as measured by Ldn would not be significant compared to the currently existing Ldn, although Ldn would increase by 3 to 5 dBA at residences closest to the helistop.

- Structural vibrations due to helicopter flights are not expected to be significant.

Intramural Field Helistop Alternative

The Intramural Field Alternative is not expected to result in noise impacts from helicopters when the primary approach and departure paths are used. There would, however, be impacts on student dormitory residents and possibly noise interference with class lectures on the few occasions when the secondary approach path over the University of Washington campus would be used.

This alternative would result in ambulance sirens occasionally being used between the Intramural Field and Children's. The sirens are approximately as loud as the helicopters, producing about 90 to 106 dBA at 50 feet and 86 dBA at 500 feet. Residences along Sand Point Way N.E., including the Laurel Village University of Washington housing, Laurelhurst West, portions of Laurelon Terrace, and several other single- and multiple-family residences, would experience higher maximum sound levels from ambulances than from the helicopters associated with the Proposed Action. The closest single-family residences to the east of Children's along 44th Avenue N.E., and patient rooms near the northern part of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's, would experience lower maximum levels than under the Proposed Action, assuming that the ambulance sirens are not used within the hospital property.

University Hospital Helistop Alternative

The University Hospital alternative would result in slight helicopter noise impacts affecting residents south of the Montlake Cut. These impacts would be several dBA less than those described previously for residents closest t[illegible]he Children's helistop, because of greater distance from the flight pa[illegible]ch.

This alternative would also result in the occasional use of ambulance sirens during transport between University Hospital and Children's. As indicated above, the ambulance sirens would produce higher maximum sound levels at residences along Sand Point Way N.E. than would helicopters, but lower levels at single-family residences to the east of Children's and at the northern hospital rooms.

Limited Landings Alternative

Under the Limited Landings Alternative, helicopter flights to Children's are expected to continue as they currently do in response to critical care emergencies, resulting in occasional noise impacts. Although there would be fewer flights than under the Proposed Action, these current operations are potentially more disruptive per event than the Proposed Action for residents of the Laurelon Terrace apartments, since the helicopter must approach and depart west of the Children's emergency entrance in order to avoid existing trees. This flight path results in exterior maximum sound levels of about 91 to 93 dBA at the closest Laurelon Terrace a[illegible]rtments, based on FAA data (FAA, 1985) and measurements at Harb[illegible]w Medical Center (King County, 1986) versus 14 dBA for the Proposed Act[illegible]nterior sound levels would be up to about 68 dBA with windows cl[illegible]sed and 78 dBA with windows open, causing potentially significant sleep interference impacts.

This alternative would also result in the occasional use of ambulance sirens during transport from Boeing Field or Harborview Hospital.

No Action Alternative

Under the No Action Alternative, noise impacts associated with helicopter approaches and departures would be limited to the area around Harborview Hospital and Boeing Field. In addition, there would be occasional use of ambulance sirens during transport from Boeing Field or Harborview.

Mitigating Measures

The following are proposed mitigating measures that are incorporated into the Proposed Action:

. The helistop would primarily be used by a modern, multi-blade helicopter representing near-current low-noise technology.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

- The proposed flight paths would keep the helicopter at high altitude above Sand Point Way N.E.

- The helicopter would use a noise abatement approach and departure that minimizes disturbances to residences.

- The helistop location maximizes ground distances to residences, and is shielded on the south by the hospital structure.

The following additional mitigating measure is possible:

- The medical crew could be picked up at a location other than Children's, resulting in a 50% reduction in the number of flights to Children's. The monthly and worst-day Ldn from helicopters as shown in Table 17 would then be reduced by 3 dBA, resulting in slightly lower noise increases. This measure, however, could result in noise impacts from ambulance sirens as discussed previously, and from helicopters near the alternative pick-up location.

A concrete wall noise barrier around the helistop would not be effective, since it would not shield helicopters in flight, and could be a safety hazard. Such a barrier, therefore, is not recommended.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CUMULATIVE IMPACTS

The potential for Children's helistop approval establishing a precedent for the siting of helistops at other Seattle-area hospitals was determined to be an issue through the scoping process.

There are several factors that discourage the improper use and proliferation of helicopter services in Seattle. First, the land use criteria used by the City of Seattle for the evaluation of applications for institutional helistops limit the use of helistops to those situations involving life-threatening emergencies. While local and community hospitals in the region are capable of treating most life-threatening emergencies, some patients with particularly complex or severe presenting conditions will need to be referred to the more sophisticated level of services and capabilities offered only at certain tertiary care hospitals and medial centers. As noted in Nicola's findings (1985), there are situations in which even seemingly minor delays in transporting a patient to Children's, one of these tertiary referral centers, could result in an adverse patient outcome. In Seattle, many hospitals are involved in treating critically ill patients who are facing life-threatening emergencies; however, only a few of these institutions serve as tertiary care centers that offer specialized services to the region and that are routinely and appropriately involved in treating specific life-threatening emergencies that generally cannot be treated by local hospitals. In Seattle, these referral centers and their areas of particular medical expertise are:

Children's - Neonatal/Pediatric Medical and Surgical Emergencies
Harborview - Trauma, Burn Emergencies
Providence - Adult Cardiac Emergencies
University - Neonatal and Adult Medical (including Cardiac) Emergencies

Harborview currently has a helistop; helicopters are landing at Children's and Harborview, with Children's having submitted an application for a helistop and University having received a Certificate of Need and being in the process of preparing an application for a helistop permit. No other Seattle hospitals are deemed likely candidates for helistops (Nicola, 1986). Based on a survey of Seattle-area medical institutions, Ballard Community Hospital, St. Cabrini Hospital, Group Health Cooperative, Northgate General Hospital, Northwest Hospital, Pacific Medical Center, Providence Medical Center (a member of the Airlift Consortium that shares the Harborview Helistop), Swedish Hospital and Medical Center, West Seattle Community Hospital, and Virginia Mason Clinic do not currently plan a helistop. These medical institutions represent all the major hospitals in the City of Seattle.

In order to receive a conditional use approval, any medical institution must demonstrate that the helicopter is needed to save lives. Although it is conceivable that the non-centrally located hospitals (Ballard, Northgate, West Seattle) could have occasion for patients to be transported from the hospital due to extraordinary circumstances (such as severe traffic congestion), it is unlikely that a dedicated helistop would be warranted.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Approval of the Proposed Action is not expected to have an impact upon the number of helicopter services. Rather, the creation of Airlift Northwest by a consortium of specialty, regional referral medical institutions was designed to avoid the proliferation of air ambulance services and to provide critically ill patients with the appropriate level of medical service. Any new helicopter services used expressly for emergency medical transport would require Certificate of Need approval from the State Department of Health Services.

Under PSHSA's current policies, Children's would be included in a regional emergency helicopter transportation program (Thompson, 1986). The recognized need for coordinating helicopter ambulance service has prompted the Puget Sound Health Systems Agency (PSHSA) to propose the development of guidelines for the siting of helistops and to develop policy options for integrating helicopter services with statewide EMS planning efforts. The Airlift Northwest service is consistent with PSHSA's policy statement, and, in fact, probably served as the model for the "consortium" discussion in that position paper. The establishment and operation of helistops at Children's, Harborview and University Hospitals (the member institutions of the Airlift Northwest consortium) is a logical extension of the provision of this helicopter service to the tertiary care, referral centers located in Seattle.

The Washington State Medical Association's guidelines for patient transport are expected to be available by the end of the summer; these guidelines can assist decision-makers in assessing the need for a particular institution to be served by a helistop.

The State Department of Social and Health Services (DSHS) evaluates hospital proposals for substantial change in service, with helistops clearly defined in the regulations as a substantial change. The Certificate of Need process is the formal procedure used to evaluate the need of a proposed facility or helicopter service. Any Certificates of Need applied for by Seattle hospitals would be examined by PSHSA, consistent with its role as a (public) health systems agency with review authority. It is presumed that only those institutions with a demonstrated need for a helistop would be granted DSHS approval.

The City's land use review process, the Washington State Medical Association's guidelines for patient transport, the (probable) development of guidelines for integrating the helicopter service into the regional EMS system, and the State's Certificate of Need program are expected to prevent the inappropriate development of helistops and helicopter services.

Mitigating Measures

A conditional use permit could be granted for a defined period pending a defined relationship to the existing regional and state EMS system and final development of criteria by the Washington State Medical Association's EMS Committee. As proposed by Dr. Nicola, helistop use could be reviewed for appropriate medical use in six months (Nicola, 1985).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

SIGNIFICANT IMPACTS THAT CANNOT BE MITIGATED

The risk of helicopter accidents is a potentially significant impact that cannot be entirely mitigated. No matter what location a helicopter flies into or out of, there is an attendent risk of accident and potential for personal injury or physical damage. The probability of an accident at a helistop increases with the number of transports.

Noise and vibration is not a significant impact based on regulatory criteria; however, it is recognized that helicopter noise could and probably would be disruptive of some adjacent residents' lives.

Beatrice Ryan, Interim Director
Department of Construction and Land Use
400 Municipal Bldg.
Seattle, WA 98104

Dear Ms. Ryan:

This letter is in response to your request of August 30, 1985 for an opinion about the medical need for the Children's Orthopedic Hospital (COH) to establish a helipad on hospital grounds.

In order to review the complete facts of this issue, I have spoken with numerous physicians, administrators, community residents, and former patients. I have reviewed the medical literature on emergency medical services delivered by helicopter, viewed a simulated transport/helicopter landing at Graves Field and near the COH proposed helipad site, examined helicopter and transport equipment, held a public hearing October 24, 1985 in the City Council chambers from 6:00 to 9:00 p.m., (written testimony attached), toured the COH facility, reviewed Airlift Northwest logs and individual patient charts.

Existing Pediatric Emergency Medical Services System in Seattle

Pediatric and neonatal emergencies within Seattle which are hospitalized are generally admitted at one of the 19 neonatal intensive care (NICU) beds or 17 pediatric intensive care beds (PICU) at Children's Orthopedic Hospital or one of the 19 neonatal intensive care unit beds at the University of Washington Medical School Hospital. The only other NICU beds in the region are the 12 beds at Mary Bridge Children's Hospital in Tacoma; the only other pediatric or neonatal intensive care beds in the State are located in Spokane. All pediatric surgery in the region is currently done at Children's. Pediatricians and neonatologists from within the State and from surrounding states (Alaska, Montana, Idaho) generally use COH and the UW as referral centers for the most seriously ill children or neonates requiring tertiary specialty care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Personal health care can, in general, be subdivided into three functional levels: a primary level, where the health care system is entered and basic services received and where all health services are mobilized and coordinated; a secondary level, represented by ambulatory services of a specialist nature and inpatient services provided in a community hospital-type facility; and the tertiary level, which includes the highly complex and sophisticated services available only at a "medical center" (Alberta Parker, "The Dimensions of Primary Care" in Primary Care: Where Medicine Fails, 1974, New York, John Wiley and Sons).

The University of Washington has a program which admits high-risk mothers so that low birth weight babies do not have to be transported between hospitals. This method of delivering high-risk mothers has been found to substantially reduce the morbidity and mortality associated with the delivery of low birth weight babies (Hickok, D. et al., "Decreased Mortality of Very Low Birthweight Infants After Maternal Transport," Department of Obstetrics and Gynecology, University of Washington School of Medicine, unpublished paper.)

But even with an excellent maternal transport program, there will still be individual patients who deliver small birthweight babies at small community hospitals throughout the State, where the infant needs to be stabilized and transported to a tertiary care hospital. Even though the UW is the hospital generally designated for the care of premature low-birthweight infants, its beds are frequently full and patients are referred to COH. The same pediatric medical staff, including interns and residents, deliver services at both COH and UW. In addition to small birthweight babies who have undeveloped lungs and intestines and require intensive support for survival and growth, there are transfers from hospitals around the State to COH for pediatric surgery or acute infection. Trauma patients generally go first to the region's trauma center, Harborview Medical Center, but may be transferred to COH for follow-up after surgery and stabilization.

This referral pattern exists regardless of transportation mode.

Helicopter Transport

There are existing guidelines and standards for patient care while being transported (Guidelines for Perinatal Care, "Interhospital Care of the Perinatal Patient," American Academic of Pediatrics and American College of Obstetricians and Gynecologists, 1985) but there are no standard published guidelines for which mode of transportation to use on a given patient or, for example, which criteria a patient should have to be transported by helicopter versus ambulance. The State Medical Society's EMS Committee is working on the delineation of medical necessity or medical reasonableness for medical transport and under Dr. Lothar Pinker's direction are hoping to have guidelines published in six months (see attached letter). There are some generalities that all the experts agree on.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Over 150 miles it is most timely, stable and economic to use fixed-wing aircraft, so most interstate transports occur in fixed wing. Between 100 and 150 miles, rotary-wing aircraft or helicopters appear most appropriate, so regional out-of-County transfers appear to be the general rule. Less than 70 miles, depending on geography, ground transport is the generally agreed preference.

The key to any transportation of sick people is the stabilization of the patient, making sure that vital signs are stable and that the general physical condition is not deteriorating. One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse to the community hospital to stabilize a deteriorating baby. Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to a baby's heart and lungs, and check the stability of its condition. There appears to be a balance between amount of transport time required and possibility of deterioration.

There are several studies in the literature that assess the severity of illness and injury in pediatric air transport. In one study, Mayer and Wallie prospectively evaluated 636 patients transported over 79 months of service to a regional children's center. Of these patients, 57.5% were transported by helicopter. Eighty-one percent of patients were taken to surgery or admitted to the intensive care unit immediately on arrival at the regional children's hospital. Overall mortality was 9%; a trauma score was used to classify patients (Ann. Emerg. Med. 1984 Feb.; 13(2):108-11). At Johns Hopkins, Dr. Columbani et al reviewed 267 children over a one-year period; 46% of patients arriving directly from the injury scene were delivered by helicopter. Fourteen of seventeen deaths resulted from head injury; a more aggressive approach to the management of brain trauma was advocated (J. Pediatric Surg. 1985 Feb.; 20(1):8-13). Other areas reviewed include a Hawaiian MAST system (Hawaii Med. J. 1984 Jun.; 43(6):200,202,204); a Kansas perinatal system (Respir. Ther., Mar.-Apr. 1985, 15(2):47-50, ISSN 0048-7392.

Another study evaluating air transport in a rural EMS system looked at 569 patients with multisystemic injuries. The emergency helicopter service was rated, utilizing strict specific guidelines as either essential, helpful, or not a factor in the preservation of life. The helicopter was essential to 16.5% and helpful to 10.9% of patients. In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Baxt et al. looked at a group of 1,273 blunt trauma patients who were treated and transported from the site by seven different hospital-based rotorcraft aeromedical emergency care services and saw a 21% reduction in expected mortality ($p<.05$) in five of the seven services. There is some debate about methodologic errors in the study. An editorial in the same journal issue (Annals Em. Med. 1985 Sept.; 14:9; 859-61) states that

> The effectiveness of aeromedical evacuation of battlefield casualties is well established; the transfer of this technology to the civilian setting is a logical event. Its effectiveness for civilian trauma care should be based on the following three principles: 1) early field resuscitation; 2) rapid transport; and 3) delivery to the hospital best suited to admit and treat the patient definitely and without delay. As Baxt and colleagues point out, helicopter emergency medical service (HEMS) patients may benefit from a highly integrated team effort at the receiving trauma center that is the direct or indirect result of a program but for which the helicopter (unless distance is a factor) is the least important component. This is a strong argument for the concept of regional trauma care that concentrates multiply injured patients in trauma centers organized to best care for them. The potential role of HEMS in making regional trauma care a reality should be explored by EMS systems.

My conclusions from the literature review are that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on your question at issue, the current Graves field site versus the hospital site 3-5 minutes away.

Current Data

COH admits approximately 1,000 patients per month in 200 regular beds and 36 intensive care beds (previously described) In August of 1985 82 patient admissions were ambulance transports to the emergency room, 34 were prearranged newborn ground transports, 30 were prearranged fixed-wing transports, and 6 were prearranged rotary transports. On an annual basis, there are 400-450 ground neonatal transports through the neonatal team; 80-85% of these transports go to COH, the rest to UW. During fiscal 1985 (a one-year period ending June 31) 279 patients were transported by air: 148 into intensive care units (see Attachment 1). Thirty-nine percent of these patients were under one month of age; 16% were greater than five years of age (see Attachment 2). Seventy-one percent (197) had peripheral intravenous lines, 27% (76) were intubated, and 2% (6) were undergoing CPR (see Attachment 2).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I also reviewed the detailed flight logs of Airlift Northwest for August, 1985. There were 52 fixed-wing flights with 859 average miles per flight; 18 (54%) flights were out of State; all flights were out of County; 30 flights were to (or from) COH. There were 34 rotary-wing flights from Airlift Northwest averaging 110 miles: no flights were out of state; all but one of the flights were out of County (a motor vehicle accident to Harborview from South King County); 6 flights to COH.

Recommendations

It is my professional opinion that there are hospital transfers to COH where 3 to 5 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small. The criteria for helicopter transport in these cases would include the previous comments on distance, stable clinical condition during transport, severe injury or illness requiring tertiary center treatment (rather than secondary or community hospital level), and a strong possibility of decompensation (severe clinical deterioration) during transport. The most important part of the transport, in most cases, will be in getting a specially trained team out to community hospitals around the State.

In most cases, one single site near Graves Field would be adequate for both the University of Washington and COH; however, there will be a small number of cases at each hospital where the ability to land at the hospital may be life-saving. From the transport physicians I have talked to, about 5-10% of all transported children might fall into that category.

The number of children transported by air into COH for any given month may be 30 to 40 and based on the above criteria and clinical estimates, 3 to 4 of these patients may have a medical need for helicopter transport to the doors of the hospital.

The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any number would have to include an additional number of patients whose condition at time of referral was appropriate for air transport but who over time were determined not to have need of helicopter transport as essential. There also needs to be some flexibility for seasonal variation in disease.

Taking into account these factors, I would estimate ten expected helicopter transports for critically ill pediatric patients per month as an upward bound for COH.

I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use, rather than a hospital-by-hospital provided service. A consortium of hospitals providing helicopter services such as the one in Airlift Northwest is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

certainly a most sensible approach and will make it easier to establish a systematic approach to provision of these services. We are, however, just beginning to integrate helicopter transport into our EMS system. Once a technology is made available to the medical community, it quickly becomes a standard of care for medico-legal reasons.

Until there is a defined systematic integration of these services on a County-wide (or regional or State-wide) basis, I would recommend that the permit granted be a conditional use permit pending a defined relationship to our existing State EMS system and final development of criteria by the Washington State Medical Association's EMS Committee, and that helistop use be reviewed for appropriate medical need in six months. Appropriate use could be monitored by review of individual patient records by an outside panel which includes recognized EMS/pediatric experts as well, perhaps, as out-of-County reviewers. The Health Department would offer our consultation services for that purpose, and I believe it might also be useful to ask the Department of Social and Health Services, Division of Health's Emergency Medical Services Program, and the Washington State Medical Society's EMS Committee for consultation assistance. If a helistop were being used for purposes outside those expressly permitted, I believe it would be appropriate to revoke the permit at the end of the six months.

I hope that these observations and recommendations will assist you in your permit procedure deliberations; please let me know if any comments need further clarification. My thanks to your staff, to a wide variety of health professionals involved in delivery care, to the staff and administration at COH, to the community residents of Laurelhurst, and to a number of other interested individuals who helped me to reach a better understanding of the emergency medical services delivered to infants and children in our community and the many factors which affect those services.

Sincerely,

Bud Nicola MD

SEATTLE-KING COUNTY DEPARTMENT
OF PUBLIC HEALTH

24 October 1985

Dr. Bud Nicola
Director, Public Health, King County
7th Floor
400 Yesler Way
Seattle, Wa 98104

Dear Bud,

I'm enclosing copies of some correspondence dating 1983 dealing with pediatric transport costs and times. The last figures on the second page are difficult to read, but the actual amount is $1463. These are 1983 dollars and represent air to ground transportation and ground to hospital. The figures for the helicopter are grossly different and while as I understand it from Dr. Copass, they do not charge the full cost to the patient, somebody has to pay the $2 - $3000 actual costs for those transports. I'm also enclosing the guidelines for perinatal care Chapter 8. Lastly, the reference that I had made was the pamphlet published by the neonatologist at the University entitled, Immediate Care and Transport of the Sick Newborn by Bethany Farris,RN and William E Truog, MD.

As we discussed, the actual deliniation of medical necessity or medical resonableness for helicopter is very scarce. We have made a start of it, at a State level, and may succeed in this in the next six months or so. The next meeting of the WSMA committee on EMS Standards will be in December and dealing with this subject.

If the preponderance of evidence suggests to you that a helipad should be permitted at COH, May I make the following suggestion. Since data is so sparce and since the Children's personna is so aggressive and resistant to review, I really think we need more data. I suggest that individual patient records should be reviewed for medical necessity by an outside panel which includes some people well established in emergency medical services fields as well perhaps out of County reviewers. I would also suggest a conditional use permit, for six to nine months, that would enforce this kind of record keeping and permit a retrospective judgment about the medical necessity for helicopter transport as well as gathering data on frequency

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of use, etc. If these items all seem appropriate, then an additional conditional use permit would be issued. If the preponderance of data suggested inappropriate use, then denial of an extension might be a reasonable course of action in the future.

I do not envy you your King Solomon role in "dividing up the baby" but the results of your efforts will be quite helpful on a full State basis.

Sincerely yours,

L.H. Pinkers, M.D. FACS

Re: INFANT TRANSPORTS: AIR VS. GROUND

While on call for the Hotline, I have been asked to arrange the transport of high risk infants to Seattle from hospitals that are outside the usual driving range of the COHMC-UW infant transport service, such as Bellingham (89 miles). I have found that the quickest way to move the patient to Seattle is for the referring hospital to assemble their own transport team (usually a nurse and respiratory therapist). Occasionally this is not possible and a ground or air transport team from Seattle is required. In the attached analysis, I have compared three modes of infant transport by compiling data from Sue Engman, Lori Kitchin, and some phone calls of my own. The total elapsed time required is given first. The second column is relevant when the patient requires stabilization by the Seattle team prior to leaving the referring hospital. The third column is relevant if the time "in transit" (outside either hospital) must be kept as brief as possible. Costs are included in the last column.

It is my hope that these data will help others who often wonder, "how long does it take?" and "how much does it cost?"

cc: Sue Engman, R.N.
Lori Kitchin, R.N.
Mike Copass, M.D.

chapter 8

Interhospital Care of the Perinatal Patient

Guidelines for Perinatal Care, American Academy of Pediatrics and American College of Obstetricians and Gynecologists, 1983.

The transport of pregnant women, mothers, and neonates between hospitals is a recognized and essential component of modern perinatal care. As noted in Chapter 1, transportation is one of the systems approaches to obstetric and newborn care. There are three types of patient transport: maternal-fetal, neonatal, and return.

Maternal-fetal transports involve pregnant women who are to be admitted for delivery, unlike obstetric consultations, which involve ambulatory evaluation without admission. Neonatal transports usually employ a team to evaluate and stabilize the neonate's condition, as well as to provide care when indicated. Return transports take patients back to their original or local hospital for further care when the problems that required transport have been resolved. Return transports should be recognized as an important benefit to the individual patient and system.

The Committee on the Fetus and Newborn of the American Academy of Pediatrics has established a policy on Level II neonatal units, stating that "Level II neonatal units must have ongoing liaison with a Level III neonatal intensive care unit." That firm support for a network can logically be extended to all perinatal services. The referral of high-risk mothers, as well as sick newborns, to regional centers for care has a positive impact on local perinatal care and makes it necessary to set guidelines for regional perinatal networks. The rising costs of care, the ascending expectations of consumers, and the constraints on spending are relevant considerations in a movement toward firmer guidelines for interhospital care of the perinatal patient.

Interhospital transport and care of high-risk perinatal patients make it reasonable to expect that every patient in a region will be cared for in an appropriate manner. A successful program of interhospital care should incorporate the following components:

1. Risk identification, which includes active anticipation of needs that will require the movement of patients in order to provide optimum care
2. Recognition that patient care is a continuous process
3. Local physicians who know the resources that are available and how to gain access to them
4. Physicians at all levels who have the knowledge and skills needed to identify the high-risk patient, to evaluate the patient's condition, and to stabilize and prepare the patient for transfer
5. An organized, appropriate, and available interhospital transport service
6. A political and economic environment that provides support for the interhospital transport system
7. Data collection and analysis for purposes of monitoring and evaluating the program

From the moment a perinatal problem is recognized, to the point of its resolution and follow-up, there should be a continuum of care. Because disease processes do not become static while a patient is being transferred, management is necessary during transport. The objective of interhospital care thus becomes the provision of the maximum degree of care possible within the constraints imposed by a moving ambulance, its restricted space, and its lack of support facilities (e.g., laboratory, blood bank, and radiology services).

INDICATIONS FOR TRANSPORT

The circumstances in which patients are transported vary according to the distribution of care facilities in each region. The decision should be made by the initial physician and a consultant, both of whom should be well-informed of the resources at each center. In general, transport should be considered when the resources immediately available to the maternal, fetal, or neonatal patient are not adequate to deal with the patient's actual or predicted medical or surgical complications.

The following patient conditions require more specialized care and may require patient transfer. The specific values are to be considered guidelines only. They will vary with individual patient needs or institutional capabilities.

I. Maternal Conditions
   - A. Obstetric complications
     1. Premature rupture of membranes (at less than 34 weeks' gestation or less than 2000 g expected birth weight)
     2. Premature labor (at less than 34 weeks' gestation or less than 2000 g expected birth weight)
     3. Any condition creating the probability of birth at less than 34 weeks' gestation or less than 2000 g expected birth weight
        - a. Severe preeclampsia or other hypertensive complication
        - b. Multiple gestation
        - c. Intrauterine growth retardation
        - d. Third trimester bleeding
        - e. Rh isoimmunization
        - f. Premature dilation of the cervix
   - B. Medical complications
     1. Infections in which the degree or nature of maternal illness may result in premature birth
        - a. Hepatitis
        - b. Pyelonephritis
        - c. Influenza
        - d. Pneumonia
        - e. Other febrile or hypermetabolic conditions
     2. Severe organic heart disease, functional class III or IV
     3. Poorly controlled diabetes mellitus
     4. Thyrotoxicosis
     5. Renal disease with deteriorating function or increased hypertension
     6. Drug overdose
     7. Miscellaneous severe illnesses
   - C. Surgical complications
     1. Trauma requiring intensive care or surgical correction beyond the capabilities of local facilities or where the procedure may result in the onset of premature labor
     2. Acute abdominal emergencies at less than 34 weeks' gestation or with a fetus weighing less than 2000 g
     3. Thoracic emergencies requiring intensive care or surgical correction

II. Neonatal Conditions
   - A. Gestation less than 34 weeks or weight less than 2000 g
   - B. Neonatal sepsis or infection

C. Respiratory distress and metabolic acidosis persisting after 2 hours of age
D. Neonatal blood loss
E. Hypoglycemia
F. Hemolytic disease of the newborn
G. Neonates of mothers taking hazardous drugs
H. Neonates of diabetic mothers
I. Neonatal seizures
J. Sepsis or meningitis
K. Congenital malformations requiring surgical care or observation
L. Shock or asphyxia persisting beyond 2 hours
M. Neonatal cardiac disorders with persisting cyanosis
N. Progressive, increasing respiratory distress syndrome
O. Any neonatal condition requiring ventilatory support for more than 1 hour
P. Neonates needing more than routine observation or care

THE ORGANIZED APPROACH TO TRANSPORT

The provision of adequate life support during the transport of critically ill mothers and neonates requires considerable knowledge, skill, experience, and specialized equipment not readily available in all hospitals. Many perinatal centers that provide Level III services have developed transport systems for their service regions because only experience with a large number of patients can maintain the skills required for care during transport. The referring staff can help the mother and neonate most by calling for assistance as soon as the need for transport becomes apparent and by using the time before transport to stabilize the patients and prepare for transport. This practice ameliorates the immediate problems and reduces the time that the transport team must be in the referring hospital.

In certain circumstances, it is reasonable for the referring physician to manage the transfer personally. Maternal-fetal transports are frequently conducted in this fashion. The procedure whereby transport originates at the referring hospital, frequently termed one-way transport, functions effectively in some locations; however, two-way transport systems, which operate from a base at the center, are more common. Any transport procedure is acceptable if the guidelines given here are utilized and its goals and objectives are attained.

Informal, poorly organized interhospital care is hazardous. In order to avoid compromising the patient, to ensure a predictable response for transportation requests, and to provide the highest quality of care, the approach to transport must be logical and organized. When the number of patients who require interhospital care is small, efforts to monitor and maintain the skill levels of the team become even more important. It is advisable in such instances to consider the consolidation of care programs.

An interhospital care system has five identifiable components: (1) organization, (2) communications, (3) personnel, (4) equipment, and (5) transport vehicles.

Organization

Interhospital care should be available 24 hours/day, in a program with defined response time and minimum capabilities of personnel. The director should be a specialist in maternal-fetal medicine or neonatal medicine, or a board-certified pediatrician or obstetrician with a special interest in these subspecialty areas. The director's responsibilities are:

1. Quality control of patient care through regular case review
2. Personnel training and supervision
3. Development and utilization of patient care protocols
4. Development and utilization of record-keeping systems and subsequent collation and evaluation of data for analysis
5. Review of operational aspects, e.g., response times, effectiveness of communications, and equipment maintenance

Communications

The transfer of a patient from one hospital to another and from one care team to another requires a reliable communications system. It is essential that the referring physician provide the receiving physician with specific clinical information on the patient being referred. For a maternal patient, the following information should be included:

Reason for admission
Age
Date of last menstrual period
Estimated date of confinement
Gravida, para, and abortion
Relevant health problems
Perinatal history

Blood type
Results of amniocentesis
Reasons for transfer
Therapy administered, including drugs
Intake and output

For a neonatal patient, the following information should be included:

Gestational age and weight
Perinatal history
Temperature
Color
Hematocrit
Oxygen requirement and blood gas levels
Respiratory activity (particularly presence of apnea or need for assisted ventilation)
Blood glucose or Dextrostix
Pertinent radiologic findings
Reasons for transfer
Therapy administered, including drugs

This information allows the receiving facility to prepare for the patient's stabilization, transfer, and admission. Appendixes F and G contain sample record formats for information that can be provided conveniently by telephone. For large service areas, toll-free lines should be established by the referral center for referring physicians and families. In metropolitan areas or over short distances, direct hotlines may link referring obstetric units and nurseries to the center. These lines should be open 24 hours/day and should be well publicized throughout the service region. The liaison between the referring and the receiving centers should include telephone or radio communication during stabilization and transfer.

Appropriate historical data should accompany the patient. This information should include appropriate laboratory data and x-rays. In most neonatal transports, 10 ml clotted maternal blood to be used for cross-matching purposes should be obtained and should accompany the transport team. Cord blood and the placenta may be helpful in certain clinical situations, such as multiple gestation or intrauterine growth retardation.

Dispatching services should provide rapid coordination of vehicles and personnel, as well as communication links between referring

and receiving hospitals and the transfer team. Referring physicians should be given an estimated arrival time to allow them to arrange for laboratory studies on which to base therapy in transport and ensure their availability at the time of transport. The receiving hospital should also be given an estimated arrival time to allow the staff to prepare for the patient's arrival. When flights must connect with ground ambulances, it is desirable for a single dispatching center to coordinate the movements of all vehicles. The complexity and sophistication of the dispatching operation vary considerably with the nature of the service.

Personnel

The interhospital care team members should have the collective expertise sufficient to provide the necessary supportive care for a wide variety of emergency conditions in high-risk mothers and neonates. Team members may be drawn from appropriately trained physicians, registered nurses, respiratory therapists, and emergency medical technicians. One member should usually be a physician or registered nurse. Neonatal nurse-clinicians are often specifically identified with this role. In addition to being highly knowledgeable in care and procedures for perinatal patients, transport personnel should be thoroughly familiar with transport equipment; any malfunction en route must be managed without the assistance of hospital maintenance staff.

Equipment

Powered equipment should have "stand alone" capability, i.e., it should be battery-operated. Batteries should have sufficient power to operate the equipment for the duration of the transport if no alternative power source is available. Furthermore, critical equipment should be adaptable to 12- and 24-volt DC and 110-volt AC power for use in a hospital or ambulance.

In addition to equipment for monitoring, resuscitation, and support of both mother and neonate, a transport kit containing essential drugs and special supplies should be continuously available during stabilization and transfer of the patient. A list of equipment and drugs that should be included in a transport kit is found in Appendix H.

Transport Vehicles

The main concern during transport is to maintain optimum care. The choice of a ground or air ambulance is based on distance from one hospital to another and facilities available to support the patient during

the transfer. Ground ambulances are most useful for distances up to 80–100 miles of flat terrain in low traffic density areas. Beyond 100 miles, aircraft may be faster or less expensive, even though ground ambulances provide more direct transfer between regional centers. The pressurization of aircraft is an important consideration during management, since adequate oxygen levels of the mother and fetus or newborn must be ensured.

Helicopters are used in some areas to transport patients up to a few hundred miles or to reach patients in difficult terrain or high traffic density areas. Helicopters are not pressurized, are generally noisier and more confined, and have less range than fixed wing aircraft, however. These limitations should be considered whenever a helicopter is used.

TRANSPORT PROCEDURE

Evaluation

The patient's condition should be carefully evaluated at the referring hospital, both in regard to the primary diagnosis and the presence of complicating conditions. Steps should be taken to correct these conditions to the extent possible prior to transfer.

Stabilization

Transport of the maternal patient may require hemodynamic stabilization; the initiation of tocolytic agents, anticonvulsants, or antihypertension agents; or demonstrated arrest or diminution of active labor. Patients with active bleeding, rapidly progressive preeclampsia, and rapidly progressive labor should not be transported until appropriate medical management has been initiated and, in the opinion of the medical team, the possibility of acute crisis or delivery in transport is significantly diminished. In some situations, maternal transport may not be advisable; it may be preferable to coordinate neonate transport in such a fashion that the transport team arrives at the referring hospital immediately prior to or shortly after the birth. Transport teams may, by prior agreement between the referring physician and the dispatch center, participate in the initial stabilization at birth. In the fully stabilized neonate, temperature, blood gas levels, blood pressure, tissue perfusion, and blood glucose level are normal. Complete stabilization of a newborn is not always possible, but transport of an extremely unstable newborn is contraindicated.

Although there have been no controlled trials, experience indicates that stabilization prior to departure is probably the most critical aspect of interhospital care because it minimizes subsequent deterioration in an environment that may not permit detection or treatment of problems.

Medicolegal Concerns

There are many legal considerations in perinatal transport. Many details are not well defined, but all involved parties, including the referring hospital and personnel, the receiving hospital and personnel, and commercial ambulance and aircraft charter corporations, assume responsibilities. As spokesperson for the transport team, the physician should thoroughly explain to the patient or the parents of the newborn the patient's condition and reasons for transfer. Informed consent for transfer, admission, and care should be obtained. The newborn should be clearly identified.

Perinatal transport teams are involved in very special transport situations, and prior attention to potential legal problems is advised. In most situations, the institution that employs the team is responsible for its actions, and professional duties are performed under the direction and authority of a physician-director at the receiving hospital. Many hospitals consider neonates admitted to their institution while en route and under the care of the transport team. Physician-directors and hospital administrators should recognize the potential administrative or legal problems that may arise in certain situations, for example, when transport teams cross one or more state lines during a transport.

The referring physician preferably should remain at the hospital until the neonatal transport team arrives and should be there while the team is present in order to ensure complete communication. The patient must pass from the official care of the referring physician to that of the transport team at some point; the departure of the transport team from the physical premises of the referring hospital might be considered the official point of transfer of responsibility. Individual hospitals and regions should investigate the use of transfer agreements, which might include granting of emergency privileges to members of transport teams.

The referral center should receive a report on the patient's condition prior to departure. In the case of newborn transport, the mother and father should be offered the opportunity to see and touch the neonate before the transfer, even if the neonate is in a transport incubator or on a respirator. In addition, an instant picture of the

neonate may be taken for the family prior to transport. This has proved particularly helpful when parents and their neonates are to be separated for a long period or when the mother is recovering from a cesarean delivery and may not remember the time spent with the neonate prior to transport. The family of the patient should also receive written information about the receiving hospital, names of staff members, visiting hours, telephone numbers, and places to stay in the vicinity of the hospital. Brochures about the hospital can be helpful. A desire to breast-feed should be reinforced, and the mother should be taught how to express milk until nipple feeding becomes possible. Early attention to family needs and concerns at this critical time can reduce anxiety and ease the transition to a new medical center.

Records are essential for the continuing care of the patient and for the evaluation of the referral transport process. Records should include the following information:

- Patient's name
- Referring hospital
- Receiving hospital
- Referring physician
- Attendants' names and professional status
- Mode of transport
- Time data, including arrival at the referring hospital, departure, ground or air ambulance time, and arrival at the receiving hospital
- Patient's age, weight, gestational age, and sex
- Diagnosis and condition
- Procedures performed
- Medication administered
- Periodic vital signs
- Special comments

PATIENT CARE IN TRANSIT

A well-stabilized patient requires little or no intervention during transport. The patient should be under continuous observation, however. The key factors to be monitored in the maternal patient include blood pressure, uterine contractions, cervical dilation, fetal heart rate ultrasonography, deep tendon reflexes, infusion rate of intravenous fluids, and the administration of tocolytic agents or anticonvulsants. For the

newborn, temperature, respiration, heart rate, blood pressure, color, activity, and oxygen concentration should be monitored frequently by noninvasive means. A neutral thermal environment should be maintained. It may be necessary to monitor other parameters as well, such as the blood glucose level. Monitoring of blood gases during transport is feasible with the availability of portable transcutaneous monitoring.

The patient, attending personnel, and all equipment should be safely secured in the transport vehicle. Although it may be necessary to respond rapidly to an emergency, high-speed ground travel greatly increases the risk of accidents. In the majority of cases, there is little need for excessive speed if the patient is stabilized.

RECEIVING AND COMPLETING TRANSFER

The receiving staff should be prepared to deal with any unresolved problems or emergencies. The patient's history and clinical status, as well as all the plans for current management, should be communicated directly by the transport personnel. Therapies provided during transport should not be changed unless the transport team is consulted.

Family members are extremely anxious when a patient is transferred. If they have not been able to accompany or follow the patient, they should be called as soon as possible after the transfer and given a report on the patient's condition. The referring physician and the nursing staff at the referring hospital should also be informed about the patient's arrival at the receiving hospital and the patient's progress on a continuing basis thereafter.

The transfer is not complete until equipment on the transport vehicle has been restocked and prepared for the next call. Reusable equipment that has come into contact with the patient should be appropriately sterilized or decontaminated.

OUTREACH EDUCATION AND THE REGIONAL TRANSPORT SYSTEM

Since interhospital care of the high-risk perinatal patient requires the cooperation and coordination of many skilled persons, outreach education efforts should include discussions of the regional transport system. Outreach education can be used to reinforce that cooperation and coordination.

Outreach education related to transport should focus on the following objectives:

1. Informing perinatal care providers in the region of the specialized resources available to them through the perinatal network
2. Assisting primary physicians in developing their abilities to anticipate complications, to identify high-risk perinatal patients, and to stabilize these patients before transport
3. Facilitating effective quality assurance through the continuing education of perinatal care providers
4. Establishing 24-hour consultation and referral sources
5. Promoting a regionalized care system designed to ensure high-quality care to all patients in a cost-efficient fashion

PLANNING AND EVALUATION

The planning of the perinatal transport system requires the participation of both those who will use the service and those who will provide it. The creation of regional advisory councils with representatives from the various perinatal programs facilitates planning and evaluation, as such a group can identify and verify the particular region's needs for interhospital perinatal transport and the specific characteristics of the service that should be designed in response to those needs. The characteristics of the successful system, as described earlier, can be used as a guide for program development and subsequent evaluation. Other criteria should be considered in planning and evaluating the transport system:

1. Availability: Does the system provide all services that may be needed by the perinatal patient?
2. Accessibility: Is the capacity to "connect" the patient quickly and appropriately with the services needed ensured? Do those who will need the services know where to go to get them?
3. Responsiveness: Is there a mutual commitment from referring care providers and specialized care providers to honor and accommodate each other's special needs as they may arise?
4. Effectiveness: Are perinatal patients being given the appropriate care in the appropriate setting? Do care users, physicians and patients, and care providers regard the perinatal transport service as useful and effective?

As basic as these questions may appear, their answers are often assumed without testing. The purpose of the evaluation of the system is to collect the evidence that will confirm that the system provides high-quality care to high-risk mothers and neonates.

Questions related to Medical Need

1. Which emergency transports require a helicopter transfer?

2. What, if any, would be the effect on the well-being of a patient transported by helicopter versus helicopter and ground transport as it is presently done?

3. Are direct flights versus air/ground transports medically significant in terms of patient morbidity and mortatlity?

4. What is the additional medical advantage if any of direct helicopter services versus the current air to group transport system? Do these outweigh the costs both financial and environmental?

5. What current proportion of neonatal emergencies are now transported by helicopters?

6. What data are available regarding the number of neonatal emergencies that are likely to be generated by the population within a 100 mile radius of COHMC? What proportion of these cases should be assumed to be assigned to COHMC as opposed to other hospitals within this geographic area?

7. Do you think a review procedure could be set up that would insure that helicopter service to COHMC and University Hospitals is used for emergency purposes only? If so, what would its characteristics have to be?

8. What emergency services does COHMC offer that are unique and unavailable elsewhere?

9. Does COHMC currently meet the standards established by the American College of Surgeons Committee on Trauma? If not, what would it have to do to meet these standards to establish a trauma center?

10. Will the Airlift Northwest helicopter have to come to COHMC to get an isolette and a medical team before flying to the patient? If so, will this mean 4 flights over the neighborhood for each patient brought in?

11. Airlift Northwest has been in existence a short time. Has this transport system been evaluated by an independent peer review group as to its effectiveness?

12. What will be the effect on MAST of the Airlift Northwest helicopter service? Similarly, what will be the impact on MEDIC 1 and other ambulance companies? It is generally acknowledged that we have an unusually fine ground ambulance transportation service.

12. What will be the effect on MAST of the Airlift Northwest helicopter service? Similarly, what will be the impact on MEDIC 1 and other ambulance companies? It is generally acknowledged that we have an unusually fine ground ambulance transportation service.

Seattle
Department of Construction and Land Use

August 30, 1985

Bud Nicola, Director
Health Department
7th Floor, Yesler Building

Dear Mr. Nicola:

I am writing to ask your help.

As you know, this Department has received an application from the Children's Orthopedic Hospital to establish a helipad on hospital grounds. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

We must make a recommendation to the City Council and our report must examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas as part of the analysis.

The question of medical need is beyond our area of expertise and this is where I am asking for your Department's assistance. In the past, helicopters have made emergency landings at the Graves athletic field and patients are then transported by ambulance to either Children's Orthopedic or to the University of Washington Medical Center. This request by Children's Orthopedic would mean those patients destined for Children's would instead land on hospital grounds with those destined for the University of Washington continuing to land at Graves field. The University of Washington may subsequently apply for a permit for a helistop on the grounds of the U. W. medical campus.

You have agreed to sponsor a public hearing and to give us your opinion on the question of medical need. The questions I would like your opinion on are:

1. What are existing emergency services in Seattle and how does the service fit into the existing services?
2. What emergency services does COH offer that are unique and unavailable elsewhere?
3. Is there a medical need for emergency helicopter service to serve the hospitals in this immediate area, (Children's and University of Washington primarily)? What, if any, would be the effect on the well-being of a patient transported by helicopter versus helicopter and ground transport as it is presently done? Are direct flights versus air/ground transports medically significant in terms of patient morbity and mortality?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Is the current site at Graves athletic field adequate, or is there a medical need to locate such facilities on the hospital grounds? Or are there alternative sites? Would one such facility either at COH or U. W. be a preferred location?
5. What data are available regarding the number of emergencies that are likely to be generated by the population to be served by the helicopter services? How many landings per week will result?
6. If there is an established medical need, how would you define "occurrences involving life-threatening emergencies," as the use must be restricted to such occurrences? Are there other restrictions we should consider, based on existing medical care facilities capabilities?
7. How would you suggest we monitor the occurrences to ensure that the use is restricted to life-threatening emergencies should the use be permitted? Can we ensure that the service is used for emergency purposes only?

We have asked Children's Orthopedic Hospital for more information to support their application for the helistop (see attached). This information is necessary for your consideration of these questions. As soon as we receive it, we will send you a copy. As you know, we are happy to help with the scheduling and public notice of the hearing.

Thank you for your assistance. If you have questions, please call me at 625-2262 or Katy Chaney at 625-4274.

Sincerely,

Katy Chaney

Public Hearing
Concerning Medical Need for Proposed Helipad
John M. Neff M.D.

My name is John Neff, Medical Director of The Children's Orthopedic Hospital and Medical Center. Thank you for giving me the opportunity to share with you the reasons why it is important for The Children's Orthopedic Hospital and Medical Center to have a helipad near the Emergency Room, within a short distance of the Intensive Care Units and the operating rooms. COHMC is a major referral resource for children in the Puget Sound area, and is an integral part of the regional network that provides medical care for critically ill children. We are a 200 bed hospital. Last year we admited 7,775 patients and provided 55,983 days of hospital care. Nearly half of our patients come from outside of the King County area. Twenty-seven percent of our patients excluding King County come from the counties immediately surrounding the Puget Sound and 21 percent of our patients come from outside the Puget Sound area. These figures reflect the regional nature of COHMC as a health care resource for children. We provide a full range of pediatric care for children and adolescents up to the age of 21. We have an active staff of 1050 physicians representing all aspects of specialty care for children. Our hospital has 200 beds and 36 of these, or 18 percent, are devoted to intensive care, both for newborn infants and for older children. We are the largest full service pediatric hospital for the Pacific Northwest and we coordinate our intensive care programs for children with Harborview, which provides care for children with trauma and burns, the University Hospital which has a 23 bed newborn intensive care unit filled mostly with children delivered in their high-risk pregnancy program. There are also a group of intensive care pediatricians and nurses representing the intensive care units in the hospitals in Spokane and Mary Bridge in Tacoma, as well as hospitals in the Seattle area. These intensive care specialists meet together frequently with a goal of providing better coordinated intensive care for children for the State of Washington.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In recognition of the full range of services that COHMC has to offer for the northwest many physicians refer to COHMC their most critically ill children, including children who are difficult to handle in small, remote, rural areas which makes up a large part of the Puget Sound area.

In order to respond to this need, COHMC has joined with three other regional centers, the University, Harborview and Providence Hospitals, to form Airlift Northwest. This program was started with fixed wing transport to serve the large four-state area that represents our broader referral area. This year helicopter service was added to serve areas predominantly in the island water area of the Puget Sound which is not accessible to ground transport and often cannot be reached efficiently by fixed wing. This helicopter services has been necessary to provide a team of pediatrician and nurse intensivists to areas where it is essential to stabilize critically ill children and transport them directly to intensive care units without the additional transport from one vehicle to another. Most of these transports are used for very small, unstable and critically ill children who are connected to multiple essential life support mechanisms.

As an example, since the advent of the helicopter service from May 11 to September 17, 1985 we have transported 18 children by helicopter to COHMC, 4 of these have been newborns, 7 have been in the age group 1 day to one year, 2 have been one to two years of age, and only 5 have been over two years of age. These 18 transports represent 12 different diagnoses, all requiring intensive and full-service care. During the month of August, 1985, we transported by helicopter 6 patients to COHMC, 3 of whom were so unstable and critically ill in mid-flight that we needed to land them on an emergency basis in front of the COHMC Emergency Room.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The three cases were:

1. The first transport occurred on August 3, 1985 from Bremerton, Wash. This was a one-day-old infant who developed acute necrosis of the intestines with perforation and intestinal obstruction. The child was placed in the helicopter in Bremerton and just before the child was transported, the intestines perforated and the child went into shock. The child survived a little more than 24 hours at COHMC, requiring two operations before he died.

2. The second transport which was discussed in the video tape you saw occurred on August 20, 1985. In this instance the transport team went to Forks to pick up a 30 week premature infant who weighed a little over two pounds. While the child was being placed in the helicopter the child had a catastrophic pulmonary event which resulted in the collapse of one lung requiring immediate expansion. The child was critically ill throughout the flight, was landed at COHMC and immediately placed in the Infant Intensive Care Unit and stabilized. That child survived and is doing well as you saw on the film strip.

3. The third landing occurred on August 27, 1985. In this instance the child was a four-week-old previously healthy child from Chehalis. who within 24 hours developed an inflamation of the brain, meningitis. This became a rapid progressive illness. The transport team arrived, and when they arrived 24 hours after the onset of the illness, the child was in shock and had signs of beginning brain damage as characterized by severe brain swelling. The child in the helicopter showed signs of progressive brain damage, was landed immediately at COHMC, rushed to the Intensive Care Unit, and stablized. That child is surviving, but does have sure evidence of persistent brain damage, the extent of which is not yet clear.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. On September 12, 1985 we had a tragic experience in which the outcome for that child might well have been improved by the transportation of a helicopter. This is a child who was born with herniation of the diaphragm with the intestinal contents in the child's chest. The child was in immediate distress, was intubated in the delivery room and stabilized in the nursery with ventilation by hand. The baby was stable during the flight across the mountains but when the child was moved from the airplane to the ambulance for the ride to COHMC, shortly after being placed in the ambulance, had a marked change in response to the mechanical respiration and had a continuous fall in the tissue level of oxygen during the trip to COHMC. Unfortunately, this ambulance transfer took 25 minutes at code red at 4:30 p.m. during rush hour traffic. When the child arrived at COHMC the child was extremely blue and had an extremely low oxygen level. The child was then taken immediately to surgery, but ultimately died the next day because of the continued problem associated with not being able to maintain an adequate oxygen level in the lungs. In this instance, because a helicopter would have been able to make the trip from the air field to COHMC in under 5 minutes, rather than the 25 minutes that occurred, the child could have arrived with a much higher level of oxygen in the tissue, and this emergency situation could have been dealt with in a much more expeditious fashion than having the child caught in rush-hour traffic as occurred. Whether helicopter transport would have made the difference in the child's ultimate outcome will never be known, but we are certain, however, that all attempts should be made with these babies to avoid any period of low oxygen, since when this occurs lung damage results which is often difficult or impossible to provide adequate respiration and a adequate tissue level of oxygen.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There has been quite a bit of discussion about the issues concerning helicopter use and several concerns and questions have been raised. They are as follows:

1. This is a marketing tool.
2. Children could be transported as well by land or fixed wing.
3. It would be better to land in the soccer field at the University Graves Field and transported by ground to COHMC.
4. We could use the MAST military transport system.
5. The cost to the patient is too high.
6. The transportation has risk to the community.
7. We should wait for regional planning before instituting this service.

Let me respond to each one.

1. This is not a marketing tool. We are responding to the need of referring physicians to stabilize and transport critically ill children in the most expeditious way. We are not purchasing or contracting for our own helicopter with Children's name on it, but in fact have joined and coordinated the transport of children with three other hospitals and we do feel this service should be available to other hospitals as they might request it, thus preventing the proliferation of individual helicopters for individual hospital use.

2. In response to the comment that children could be transported as well by ambulance and fixed wing, let me speak as follows: I would concur that there are many situations where grand transport and fixed wing transport is more advantageous. These would include flights outside a radius of 100 miles, transportations from one hospital to another where the child's condition is stable and not a factor in the child's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

illness. On the other hand, in those areas where land transport and fixed wing are not available, such as the many island communities we serve, and where traffic congestion prohibits rapid transport, the helicopter is an important component in a balanced emergency transport system. Also, sometimes the most important factor in an emergency situation with a child is to send an intensive care team as rapidly as possible to the child so that stabilization and treatment can begin. Such a service in many areas of Puget Sound can be provided only by helicopter.

3. Another concern is that it would be better to land at Graves Field at the University and transport children from there by ambulance to COHMC. In some situations that might be possible, only if there is a dedicated landing space at the University playing fields. Conditions in wet weather often make a transfer from helicopter to ambulance difficult when one is moving an incubator and support mechanisms structures, which may weigh between 150-200 pounds. There is also the added cost to the patient for the ambulance, which is a minimum of $150. Finally, and more important, there is always the added risk that the child might become disconnected from the critical life support mechanisms thus diminishing the chance that that child will have for a positive outcome.

   On the other hand, if it were possible to use Graves Field to pick up the transport team and support equipment, in order to fly them to the child, I would favor this if there were a dedicated and safe landing site.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. There is a comment that we should use the MAST helicopter service, and by not using the MAST system, we undercut this excellent system that is offered to the public at no cost. My response is that the MAST helicopter is not suited to carrying small infants because it is not equipped or staffed like an infant intensive care unit. It has been designed for adult military transport and it is staffed by corpmen who are trained to handle adult emergency situations. The vibrations from the MAST system make infant monitoring almost impossible, and therefore, it is not surprising that this system has rarely been used in the past for small infant transports. COHMC has only used this system 10-14 times per year. We will still use it, when appropriate. However, using ALNW can hardly have an impact on the economic viability of this military transport system, since ALNW fills a void that was not addressed by the military Emergency Transport System.

5. The cost to the patient is too high. The answer to this remark is that the cost to the patient would be between $1000-$2000. This is not significantly different between land and fixed wing transport for comparable distances. The cost also is not much more than 1-2 days of full intensive care, and if we can improve a child's condition and decrease intensive care length of stay then we have made up the cost of the transportation by helicopter.

6. There is a concern that the transportation system would place an added risk for the community. It is not our intention to reduce one risk by increasing another. The fact is that the helicopter we plan to use is considered to be quite safe, and according to our consultants, given the number of hours of helicopter flight time, one might expect one accident in 95 years. This is far less than the ambulance going through the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

crowded streets of Seattle and surrounding areas on code red, or even at normal speed.

7. There has been a concern that COHMC should wait for a regional plan for helicopter services before we institute our helipad. My response to this is as follows: Most of the helicopter and transportation wars occur among hospitals for adult services. The need for emergency services for children is very, very small. In this region emergency services for children have been planned and well coordinated. This service also is available to other hospitals who would like to transport children with emergencies from one hospital to another. My plea to you is to not hold up the need to provide adequate emergency care for children because there are competitive situations that exist for adult care. We must stand up as advocates for the need of the child.

Finally, let me conclude by giving you a non-health care issue, concerning the helicopter and that is the relationship of COHMC to the Laurelhurst community. We are very proud of the community in which we live and do not wish in any way to degrade it. I truly do not believe that the institution of a helipad on the campus of COHMC, with the flight pattern of the helicopter coming along Sand Point Way, would degrade the community. Just the same, I commit myself as Medical Director of COHMC to monitor our use of the helicopter in order to eliminate unnecesary use.

I also hope that the community understands that COHMC is faced with emergency situations that are referred to our hospital where the best chance for a child would be to provide direct landing for the child at COHMC. We need a dedicated, well-lighted and protected space for us to provide that type of essential service.

COH Helipad - Additional Information

1. In the preliminary draft document, there were three figures. The third figure presented the locations of the noise monitoring sites. These sites are now included in Figure 2 and Figure 3 has been eliminated.

2. The kitchen garden offers a theraputic program since patients and their families can have access to some food growing and, when appropriate, help pick or select something fresh from the hospital's own garden. The hospital is not dependent upon this as a source of its food supply.

3. There currently are no constraints on the use of ambulance sirens, although ambulance drivers use some discretion in residential areas or when the sirens are unnecessary. The sound level of an ambulance siren at 50 feet is approximately 95 dBA (same as police). A helicopter is operating at about 84 dBA and drops immediately.

4. The helicopter would not be used during adverse weather conditions. According to Airlift Northwest (Gene Hill, November 15, 1985), the ceiling visibility, and wind are all criteria for safety consideration. For daytime flights, the FAA minimum standards must be met; the helicopter is not used if there is less than a 300-foot ceiling and less than one mile visibility. For nighttime flights, the company's minimum standards of less than a 500-foot ceiling and less than two-mile visibility are used. The helicopter, as a company policy, does not fly in winds above 40 knots.

NOTICE OF PUBLIC HEARING
File No. CC 84-022
(Master Use Permit No. 8402935)

The following public hearing will be held by Dr. Bud Nicola, Health Officer of the City of Seattle, to consider the medical need for the proposed helipad facility of the Children's Orthopedic Hospital at 4800 Sand Point Way N. E. in Seattle.

Hearing Date: October 24, 1985 (Thursday)
Time: 6:00 p.m. to 9:00 p.m.
Place: City Council Chambers
11th Floor, Municipal Building
600 4th Avenue, Seattle, WA 98104
(Use 5th Avenue entry after 6:00 p.m.)

This hearing will only address the question of medical justification for the helipad. Dr. Nicola will conduct a fact-finding study, including public input through a public hearing. Dr. Nicola's findings and report will form the basis of DCLU's recommendation regarding medical needs for the proposed facility.

Written representations on the medical need issues (either in support or protest) should be addressed to Dr. Nicola, Health Officer, 700 Yesler Building, Seattle, WA 98104, no later than the hearing date. For further details, please call 625-5200.

The Department of Construction and Land Use (DCLU) is responsible for the review of the Master Use Permit application for the helipad facility. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use, if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

Based on these criteria, the Department of Construction and Land Use will make a recommendation to the Hearing Examiner, who will in turn make his recommendation to City Council. Again, the hearing on October 24 will only address item (a) above. All three items will be the subject of a public hearing before the Hearing Examiner at a later date.

Date of Notice: October 10, 1985.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A PETITION
TO THE MAYOR, CITY COUNCIL AND COH BOARD OF TRUSTEES

We the undersigned, are opposed to the construction and operation of a helipad at Childrens Orthopedic Hospital because of its adverse environmental impact, particularly noise and safety, o.. area residents. Further, we believe that COH has not proven the need for this facility and that reasonable alternatives to the construction and use of this helipad already exist.

April 15, 1986

Ms. Gibb,

I have collected the names & address of people from my work & church who are in favor of the Helicopter stop at C.O.H.M.C. Everyone I asked was in favor of this proposal, there was no one who was against it. My husband and I lived in a RV in the parking lot of COH for 10 weeks. Our son was terminally ill. The helicopters that landed during that time did not bother us as the people who live in that area said it bothered them. We can't understand why hearing a helicopter for 5 or 10 minutes would matter when the life of a child could be saved landing at C.O.H. Thankyou for taking a serious look at this proposed landing at C.O.H. It is worth it.

Sincerely
Mrs Kathy Muller

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Julia Gibb
Department of Construction and Land Use
400 Municipal Building
Seattle, Wa. 98104

Dear Ms. Gibb:

We, the undersigned, are concerned parents in support of C.O.H.M.C.'s request for a conditional land use permit to build a helistop outside their emergency room.

As residents of South King County, we are especially interested in the helipad service, as it guarantees the most efficient means of transport for emergency care facilitated by C.O.H.M.C.

We understand the concerns of those who are objecting, but we want to know that if our children need to come to C.O.H.M.C. in a hurry, the helicopter can land directly at the hospital.

The route that the helicopter would use seems very direct, logical, and in the best interest of the local residents. Why, then, must we argue over what should be our #1 concern---those children whose lives can be saved? In our opinion this need far outweighs those concerns of noise and safety--hopefully they won't have to experience a tragedy first before coming to this realization.

Thank you for the opportunity to comment. Please convey our opinions to the Seattle City Council.

Sincerely,

Dear Mr. Justen:

Enclosed are petitions which express opposition to a proposal by Childrens Orthopedic Hospital for a new helipad which they plan to locate in a residential neighborhood. There will be many more petitions filed with you in the next week or two. We hope that your department will find this project to be environmentally significant and will require COH to file an environmental impact statement. We also hope that your study of alternatives as required by the major institutions code will be conducted by an experienced analyst and be carefully and thoroughly done.

The neighbors of COH feel that we must somehow contain the further expansion of COH, as it is inappropriate for a Level III hospital to be located in a residential neighborhood. Decontralization of COH facilities and services is our preferred long-range solution to this recurring problem.

Sincerely,

Jerry Schneider

Jerry B. Schneider

A PETITION
TO THE MAYOR, CITY COUNCIL AND COH BOARD OF TRUSTEES

We the undersigned, are opposed to the construction and operation of a helipad at Childrens Orthopedic Hospital because of its adverse environmental impact, particularly noise and safety, on area residents. Further, we believe that COH has not proven the need for this facility and that reasonable alternatives to the construction and use of this helipad already exist.

5003 45th N.E.
Seattle, Wash. 98105
December 5, 1984

Mr. William Justen, Director
Department of Construction and Land Use
600 4th Avenue
Seattle, Washington 98104

Dear Mr. Justen:

Enclosed are additional petitions of people who live near Childrens Orthopedic Hospital and are opposed to the placement of a helipad in the midst of a residential neighborhood. I have reviewed the application filed by COH on November 13, 1984 (CC-84-22) and am very surprised that it does not include an environmental checklist. I hope you will insure that one is added to the application so that you will have the information you need to decide that this proposal is environmentally significant.

I am particularly concerned that the scope of the DCLU study of alternatives (as required by the Major Institutions Code) include (1) the continued use of the UW Intramural field, (2) joint use of proposed helistop on top of the new wing of the UW hospital and (3) use of the Sand Point Naval Air Station. There may be other alternatives that should also be considered

Thank you for your attention to this matter.

Sincerely,

Anita Francis

A PETITION
TO THE MAYOR, CITY COUNCIL AND COH BOARD OF TRUSTEES

We the undersigned, are opposed to the construction and operation of a helipad at Childrens Orthopedic Hospital because of its adverse environmental impact, particularly noise and safety, on area residents. Further, we believe that COH has not proven the need for this facility and that reasonable alternatives to the construction and use of this helipad already exist.

Hand Delivered

RECEIVED
JAN 23 1985
Dept. of Construction & Land Use

Mr. William Justen, Director
Dept. of Construction and Land Use
600 4th Avenue
Seattle, Washington 98104

Dear Mr. Justen:

Enclosed are petitions opposing the Childrens Orthopedic Hospital helipad proposal that contain 100 names. We have so far submitted petitions that together contain about 500 names on this issue. We strongly urge you to find that this proposal is environmentally significant which would require that an Environmental Impact Statement would be prepared.

Without an Environmental Impact Statement the information needed to debate the substantive aspects of this issue will be impossible to obtain since Childrens Orthopedic Hospital has not been forthcoming in this regard.

Sincerely,

Anita Francis

Anita M. Francis
Jerry B. Schneider

A PETITION
TO THE MAYOR, CITY COUNCIL AND COH BOARD OF TRUSTEES

We, the undersigned, believe that an Environmental Impact Study should be made before there is any consideration of the building of a helipad at Children's Orthopedic Hospital.

A PETITION
TO THE MAYOR, CITY COUNCIL AND COH BOARD OF TRUSTEES

We the undersigned, are opposed to the construction and operation of a helipad at Childrens Orthopedic Hospital because of its adverse environmental impact, particularly noise and safety, on area residents. Further, we believe that COH has not proven the need for this facility and that reasonable alternatives to the construction and use of this helipad already exist.

PETITION AGAINST HELIPADS IN RESIDENTIAL NEIGHBORHOODS

1-17-92
FLL

We, the undersigned, petition the Seattle City Council to ban helicopter landings and take offs in residential neighborhoods (e.g., at Children's Hospital and Medical Center surrounded by a residential neighborhood). We further petition that a city-wide ordinance be enacted to prohibit the location of helistops in residential neighborhoods.

PETITION AGAINST HELIPADS IN RESIDENTIAL NEIGHBORHOODS

We, the undersigned, petition the Seattle City Council to ban helicopter landings and take offs in residential neighborhoods (e.g., at Children's Hospital and Medical Center surrounded by a residential neighborhood). We further petition that a city-wide ordinance be enacted to prohibit the location of helistops in residential neighborhoods.

Children's
Hospital & Medical Center

March 1990

To Our Neighbors,

As I'm sure you are all aware, the most critically ill patients admitted to Children's Hospital and Medical Center, particularly those from outside the city, are transported via the emergency medical helicopter operated by Airlift Northwest to the Emergency Room entrance at Children's.

In an effort to keep you informed about the number and types of cases landing at the hospital, we plan to send you periodic reports about medical airlift activity at the hospital. This report will indicate the date, time and origination of the airlift; the age range and admitting diagnosis of each child; where the child went within Children's; and his or her outcome. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

If you have any questions about this report of about emergency medical helicopter landings at Children's, please direct them to Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Truman Katz
President and Chief Executive Officer

*** Definition of Diagnosis**

Congenital diaphragmatic hernia: *A condition at birth in which the abdominal contents are displaced into the chest cavity causing respiratory distress and usually requiring immediate surgery.*

Epiglottitis: *Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.*

A report to the community about emergency medical helicopter landings at Children's Hospital and Medical Center: A summary of Airlift Northwest flight activity is published quarterly by the Communications Department at Children's Hospital and Medical Center, Seattle, WA. If you have comments or questions, please call Suzanne Petersen, Director of Government Affairs, at (206) 526-2530.

SEATTLE TIMES 2/13/86

Roy Scully / Seattle Times, 1985

Liz Anderson, of Citizens Concerned About Helicopter Transport, worries about an oxygen tank adjacent to the proposed site of a helipad at Children's Orthopedic Hospital.

Bill to regulate hospital copters appears stalled in committee

by Lyle Burt
Times Olympia bureau

OLYMPIA — Legislation to impose state control over helicopters used as air ambulances, which seemed to be flying high a few months ago, now appears to be grounded in the powerful House Rules Committee.

House Speaker Wayne Ehlers, D-Spanaway, said several members of the Rules Committee, including himself, are opposed to the measure, HB 1389.

"I don't like the bill; it's not good public policy," said Ehlers, chairman of the committee.

The legislation would require any hospital that proposes to lease or buy a helicopter or construct a helicopter pad to first demonstrate need for the service and obtain state approval.

Although the initial push for state control grew out of protests by residents of Seattle's Laurelhurst neighborhood against plans of Children's Orthopedic Hospital to construct a helicopter pad adjacent to the hospital, controversies also have arisen in Bellingham and Spokane.

Laurelhurst opponents have complained of the noise helicopters circulating over the residential area would cause. They contend that a new helipad is not needed, saying a facility is available a few blocks away from the hospital on University of Washington property.

In Bellingham and Spokane the conflicts center on use of helicopters by two hospitals in each city, each seeking to offset a decline in patient population.

Rep. Ken Jacobsen, D-Seattle and sponsor of the control legislation, said one of his chief concerns is the cost of helicopter service.

"It costs about $2,000 a trip to transport a patient by helicopter," Jacobsen said.

In many cases, he said, a patient can be transported just as safely and at much less cost in a regular ambulance.

"When a hospital is under contract to use the service and has made a commitment to bear the cost, we may see people on that helicopter who don't need to be there," Jacobsen said. "The patient's insurance company will pay the $2,000, and the net result will eventually be increased insurance premiums and higher hospital costs for all of us."

The only visible opponent to the bill has been Children's Orthopedic.

At a recent hearing on the bill by the House Social and Health Services Committee, a hospital representative said the opposition would be withdrawn if the bill were amended to exempt the hospital's helipad project. The committee, however, rejected a proposed amendment to that effect.

Asked what he was doing to get his bill out of the Rules Committee, Jacobsen replied, "I'm trying, I'm trying."

He said none of the committee members have told him the bill would die where it is, but added, "They don't usually tell that to bill sponsors."

Meanwhile, time is growing short. Under session rules each chamber has only until 5 p.m. Tuesday to consider its own bills.

COH HELIPAD PROPOSAL NEWS

Legislature Considers Limiting Helicopters

House Bill 1389, sponsored by Representatives Jacobsen, Appelwick, Lux and Ballard, was introduced recently at the House of Representatives. H.B. 1389 received solid bipartisan support from the House Committee on Social and Health Services, chaired by Rep. Joanne Brekke of Wallingford. The committee voted 13-0 to give the bill a "do pass" recommendation and sent it on to the House Rules Committee.

The bill requires that a statewide plan be prepared that would insure coordination between both ground and air emergency transport services. It also would set up a monitoring and periodic review procedure that would help prevent overuse of helicopters. A third provision would require all hospitals to prepare a certificate of need application before introducing any new ground or air transport service.

In testimony before the House Committee, strong support was presented by the ground transport providers, the Health Care Purchasers Association, the Montlake and Laurelhurst Community Clubs, and Airlift Northwest. The only opposition voiced at the hearing came from Children's Orthopedic Hospital. COH, operating through Representative Leonard from Renton, tried to amend the bill to exclude themselves from coverage. The amendment was soundly beaten in the Committee but will undoubtedly surface again on the House floor.

Several persons from the Laurelhurst and Montlake communities traveled to Olympia a second time to talk with several members of the House and found a great deal of support for the bill among the members of the House they spoke with. Bill Burns, President of the Montlake Community Club was especially helpful in making this lobbying effort effective. Liz Anderson presented our testimony to the House Committee and was very well received.

The bill reached the House floor on February 17 and was passed. Unfortunately, it included an amendment that exempts Children's Hospital from coverage by the bill! It now goes to the Senate where a version could be passed that would not have the amendment excluding COH from coverage. COH has used the services of lobbyists to get their amendment into the bill and so may escape the certificate of need requirement for the 3rd time.

If you wish to express your interest in this bill as it moves through the Senate, please call the (toll free) legislative hotline: 1-800-562-6000, for Senate Bill 1389.

Our very great appreciation goes to Rep. Ken Jacobsen who sponsored HB 1389 and helped move it along. Many community residents called the legislative hotline and left messages of support for the bill, also. But, we are naturally quite disappointed once again by the contrary actions of COH in this matter. Public acceptance of the helicopter service would be much more likely if the certificate of need were done.

Representative Ken Jacobsen
46th District

CITY REQUIRES COH TO PREPARE HELIPAD EIS

After revieving the issue for several months, the city's Department of Construction and Land Use, issued a declaration of significance on the application from COH for a helipad on their campus. This means that COH will now have to prepare a full Environmental Impact Statement that will involve a much more detailed study of safety, noise and vibration impacts as well as a full analysis of several alternatives to landing on their campus. COH will probably hire a consultant to prepare the EIS and it may be completed in a few months. It will be published in draft form first and circulated to all interested persons for comment. The responses to comments received will be included in the final EIS which is then used by DCLU to make their recommendation to the Hearing Examiner. This may happen as soon as June. Additional noise and vibration tests will probably be conducted to gather data for the EIS and persons interested in this part of the issue should be alert and prepared to monitor the testing activities so they will be better informed when it comes time to comment on the Draft EIS.

SEPTEMBER 5, 1986

NE

John Irwin/Chicago

Hospital helicopter accidents such as this one in Chicago in April have led experts to voice serious safety concerns.

Air rescue threatened by chopper crash rate

Hospital-based helicopters crash far more frequently than other helicopters or civil fixed wing aircraft, according to aeromedical experts at a meeting of emergency medical personnel in San Diego.

The efficacy of hospital-based helicopters also was questioned at the conference, with some expressing doubt that the popular aeromedical rescue teams are any more effective at saving lives than ground ambulance crews.

New group for EMS MDs.—page 33

"We have a long way to go in justifying the need for these programs in terms of patient outcome, cost, and, most importantly, safety," said Ronald D. Stewart, MD, the president of the conference's sponsor, the National Assn. of EMS Physicians. Dr. Stewart is also a professor at the U of Pittsburgh, and president and director of the Center for Emergency Medicine of Western Pennsylvania.

The use of hospital helicopters has grown quickly in the past 10 years. There are now 150 hospital aeromedical programs, and some predict that there will be 500 by 1996.

A stinging indictment of hospital helicopter safety came from Tom Einhorn, vice president of a recently formed association of hospital helicopter pilots, the National EMS Pilots Assn. "Hospital-based aeromedical helicopters have the worst accident rate in modern aviation history," Einhorn said.

According to the private, Columbus, Ohio-based Aviation Safety Institute, through 1985, the fatal accident rate for aeromedical flights was 6.5 lives

Pilot group calls for safety standards

Hospital chopper crash rate aviation's worst

Continued from page 1

lost per 100,000 flying hours. That is nearly triple that of commercial helicopters in general, which suffered 2.2 lost lives per 100,000 flying hours.

There have been 21 hospital helicopter accidents so far this year, including one in June near Birmingham, Ala., that killed a pilot and two flight nurses (*AMN*, June 13, 1986). "It's a miracle that more of the accidents this year didn't result in fatalities," said John B. Galipault, president of the aviation institute. Last year, 10 people were killed in hospital helicopter accidents.

Einhorn said that "the one threat to the survivability of aeromedical EMS in this country is the issue of safety." He cited several factors that have contributed to the string of accidents. They are:

Photos: Ryan Ver Berkmoes/AMN

Pilots Don Wright (pictured at right in photo at left) and Tom Einhorn head National EMS Pilots Assn., which wants standards that would improve hospital helicopter safety statistics.

● Stress and fatigue. Don Wright, president of the helicopter pilots' association, said that too many hospitals are trying to run their aeromedical program with only two pilots. This means that each pilot must work at least 12 hours a day, seven days a week, to provide around-the-clock coverage. Wright said that pilots had confessed to him that they had fallen asleep at the controls due to fatigue.

Einhorn noted that flying a helicopter requires far more pilot concentration than does flying a regular airplane. Hospital helicopter pilots also must be on the lookout for wires and obstructions, navigate with street maps, and at the same time, communicate with air traffic controllers and emergency service dispatchers, he said.

● Training. Most EMS pilots have military and commercial backgrounds that do not prepare them for the challenges of aeromedical flying, where they must frequently land by expressways, in the middle of subdivisions, or in populated areas that aren't prepared for helicopter landings. Problems are compounded when the pilot flies at night or in bad weather. A large number of crashes resulted after the helicopter struck an unseen electric or telephone wire. Presently, there are no national training standards for aeromedical pilots, and as a result, the quality of training given to pilots varies widely from program to program.

● Equipment. In order to economize, many aeromedical EMS programs operate with helicopters that have only one engine, as opposed to the preferable two, and that don't have all the instruments and equipment needed for some flights.

● Operating standards. There are no nationally accepted operating standards for aeromedical programs that would govern when conditions are suitable and unsuitable for flight. Presently, Einhorn says that all too often, a heroic "save the patient" attitude exists, causing flights to be made in conditions that are unsafe.

In addition to questions of safety, questions regarding the very need for hospital helicopters were raised. Wright said that too often a hospital starts a program for financial, and not medical reasons. "The administrators may have seen the studies that show that patients brought in by helicopter are overall better insured and tend to stay in the hospital three times longer than average patients."

In addition, Wright said that administrators may be swayed by the 150-mile radius of coverage a helicopter will give a hospital, and the vast amount of free publicity it provides. "TV news shows love shots of helicopters whisking injured patients away from accident scenes," he said, adding, "Too often a hospital in a city will start an aeromedical program, and that in turn will spark other hospitals in the area to start their own. This happens in cities that can't even support the first one."

Dr. Stewart said that data is "sparse" to support air over ground transport of patients to hospitals. "We are not certain that air transport improves patients' outcomes; preliminary data suggests that it may be detrimental."

Dr. Stewart cited a study that showed that cardiovascular patients, who make up a high percentage of those transported by helicopters, had a greater incidence of problems when transported by air instead of by ambulance. Kenneth W. Kizer, MD, the director of the California Dept. of Health Services concurred with the studies saying, "It's not surprising that art

Group aims to put 'medical' back in EMS

Seeking to increase physician involvement in emergency medical services (EMS), a new cross-specialty organization, the National Assn. of EMS Physicians, detent physician involvement and inadequate accountability in EMS systems. The recognition that both on-line EMS physicians and medical directors need to mainmeshes perfectly with the stated goals and objectives of both our sponsoring organizations."

About 150 people attended the confer-

In Los Angeles,

(6)

On page one fourth para. It is stated that 3 trees will be removed from site. On the FAA form 7480-1 COH submits that one 50'ft. Cypress is an obstruction to the flight path. Please rectify this descrepancy. Please submit as part of fonal document ~~Doc~~ ac 78 the current FAA 7480-1 that COH has submitted.

Please explain why the original prediction of 3-4 landings per month has now jumped to ten per month. What is the basis from which either of these predictions are made? ANW is described as "a Seattle vendor based at Boeing Field." Yet on the aircraft operated by ANW is clearly stated "operated by Hospital Air Transport, Inc". Who is Hosp. Air Transport, Inc. What role do they play in this proposal? Do they have guidelines or standards to which pilots must adhere. Do they carry liability insurance - if so how much - how has figure been determined and who is the provider? Who is their Contract with Seattle Jet or the four hospitals involved in the proposal?

Dr. Nicolas report predicts that over time COH could expect 15-20 flights per month as mentioned in MI/DEIS. Yet ANW records will show that for the month of August 1986, COH received 17 patients via ANW. Four came directly to the door of the ED and the remainder were delivered to Harborview, transferred to an ambulance and then transported to COH by ground. Why were these patients delivered to Harborview at all? Was the helicopter ride necessary? Where did the patients come from? What was their presenting condition? If this helipad is permitted [redacted] will these patients who are obviously stabilized come directly to COH, via ANW in the future? [redacted] If 15-20 flights per mo. was Dr. Nicolas predicted use for future than these figures need to be reassessed. To COH had 17 ANW headsports in Aug '86 than 15-20 per month is a future prediction that is grossly underestimated.

Please address in this in FEIS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pg 1 DEIS - "The majority of these flights would be performed by Airlift Northwest (ANW), a Seattle vendor based at Boeing Field; although flights could occur by other ambulance services, U.S. Army MAST helicopters, or private helicopters." It is not sufficient to merely predict that landings will occur other than ANW. The impacts of these potential landings must be weighed just as those of ANW. What other ambulance services in the area exist that might use this helipad? What types of aircraft do they fly? Will the helipad physically be capable of servicing these aircraft? What types of liability insurance do they carry? What will be the predicted frequency of MAST landings at Cort. as well as others providing this service? anything else?

Page 2 - sixth paragraph. "Impacts on patient outcome are expected to be more favorable under the proposed action ....." This is an entirely subjective statement by the proponent. There is no scientific basis for this claim. All evidence to date supports the fact that in the eleven years of landings at the soccer field there were never any problems with patient transfer other than one occasion on which the ambulance became stuck in the mud. This is a problem which is easily remedied by improving the landing site or building the proper pediatils at some point on the east campus of UW. The proponent further claim that anything "other than the proposed action could result in suffering the need for prolonged treatment, or even death." Again there is no scientific basis for this claim, please remove from DEIS. Any of these ~~p~~ could result from the patient manipulation that will be involved in landing on Cort Campus and pushing

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the patient 120 ft. on a gurney to the ER. There will be less patient manipulation involved and less exposure to the elements if the current landing situation (grass field) remains status quo.

Page 3. 2nd para. It is stated that 3/4 of patient transports are expected to occur during day time hours. How was this prediction determined? This entire paragraph should be omitted from DEIS as it is based on an inadequate noise study. See remarks from _____. noise consultant.

Page 3 The concluding remarks of paragraph two (2nd para cont) are redundans. The ambulances that approach Cox turn off their sirens [redacted] and lights as traffic permits, but once they turn onto the Cox Campus the sirens are always turned off. It is not sufficient to say that sirens are approximately as loud as a helicopter. Please provide specific comparisons. Supplemental Information Oct. 1986

Page 3. The reported statistical frequency of a helicopter accident one in every 5,459 flight or 1 every 23 years is an estimate that is based on inappropriate figures. [redacted] To determine the accident probability the proponent should have used worst case scenario which Dr. Nicola predicts to be 40 cases per month. The accuracy of this prediction is supported by the fact that Cox had seventeen patient transported by NW Aug. '86. Further the average length of flight of 48 minutes which is used in this calculation is not representative of what is reported in the ALNW actual flight logs. According to the logs

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Page 4. 1st para. Is the grassy area outside of EE does do pose public risks because the site is not secured etc. Why is Coast currently landing there? Since the City has not ordered them to cease & desist landing will the city of Seattle share in the liability in the event of an accident? Please discuss in final EIS what current landing procedure on campus is - what are problems associated with this procedure. Why this procedure will not be adequate in future as well.

Page 4 paragraph 2
In the event of a crash and fire on Coast Campus in vicinity of natural gas meter, ~~is~~ could there be an explosion? I find it hard to believe that the natural gas would simply flare until shut off. Please have remarks verified by local gas authority as well as fire department.

Page 4 para. 2 -
It is mentioned that there is possibility of traffic accidents associated with ground ambulance. There is also the potential for traffic accidents caused by the helicopter flying overhead along Sand Point Way. Further, when people get in their cars and drive there is an associated risk that ~~they~~ drivers accept. It is entirely different though to sit in your own home and have the ~~[redacted]~~ risk of a helicopter crashing on your roof because the helipad is located too close to residences. One situation involves a voluntary participation in action that could result in an accident And the other situation involves a risk that is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

totally inadvertary! These kinds of remarks (10.)
~~Also~~ should be eliminated from this discussion, because arguments such as these can be presented to the point of absurdity.

Page 4 Paragraph 2
I object to the three point rationale ~~[redacted]~~ used in maintaining that there will be no proliferation of helicopter services in Seattle.

1. The point is made that the land-use criteria used by DCLU to evaluate helistop applications limit the use of helistops to those facilities that can demonstrate that ~~[redacted]~~ it is needed to save lives. The argument is that Cort is a tertiary care facility offering specialized services to the region, and thus demonstrates the need and offers unique medical capabilities that no other hospital offers in this region. There are two problems with this logic. First the land use criteria states only that the hospital ~~[redacted]~~ must needs a helipad to save lives. Every hospital in the state of Washington faces life threatening emergencies probably every day. There is no mention in the land use criteria about those hospitals having to be tertiary care facilities or having to offer unique medical services. They must only show that ~~[redacted]~~ the helipad is needed to save lives. Secondly, Mary Bridge Hospital in Tacoma offers the same medical services that Cort does with the exception of Cardiac Surgery. Yet in many instances already ALDW has flown right over the roof of Mary Bridge in order to supposidly save someones life at Cort. Cort is not unique from that standpoint. If these people involved in transporting these patients can afford the time involved ~~[redacted]~~ to be ~~[redacted]~~ selective ~~[redacted]~~ about what hospital they are sent to then why is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a landing site at Graves field or the last Campus mat an adequate site for a helipad? Further effort has no permit and no pad and is landing anyway directly violating the land use code, why resident other hospitals do the same!

The 2nd argument is that the DSHSA has written two proposals to develop guidelines for the siting of helistops and policies having to do with the integration of such services with the statewide EMS systems. The claim is made in the DEIS that these guidelines along with those ~~[redacted]~~ being written by ~~[redacted]~~ the Wa. State Medical Association will deter proliferation & the improper use of such services.

The problem with this argument is again twofold: 1. Currently, there is nothing be done to promote the development of regional plan. So far many people ~~[redacted]~~ have given lip service to the idea but there has been no financial backing of such a proposal. According to my conversations with Dr Lothar Pinkers, Tittle. there is not even consensus on what criteria should be ~~[redacted]~~ evaluated in a regional plans. The last information that I received in this issue was that the "meat" of the plan had been gutted and as it stood now the plan called only for an inventory statewide to be taken of such services. By DCLU's own admission (a conversation with Katey Chaney) a regional plan would take years to develop.

According to a recent conversation with Dr. Lothar Pinkers the guidelines being developed ~~are to be~~ want, or thought of as "suggested guidelines". The Wa. State Medical Association does not have the authority to force compliance with such guidelines, and by DOH's own admission in this document, they will ~~only view~~ also view these recommendations as suggestions, not standards ~~to be complied~~ with which to comply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

~~By~~ Why would these guidelines carry any more weight with any other hospital than COH?

Finally, COH ~~re~~ cites the CON as being another protection against proliferation. One only has to review the history of events resulting in COH's exemption from this process to realize how ridiculous this statement is. DSHS asked COH 3 different times to go through this process and their responses included filing a lawsuit against the state. Currently, the WA is in the process of preparing a DEIS on a similar proposal and they have not obtained a certificate of need. ~~Dec~~ St. Lukes hospital in Bellingham recently (this spring) went through the C.O.N process. The CON committee voted unanimously to deny the application but the ultimate action taken by DSHS was quite contrary. They recommended that St. Lukes make a few changes in their proposal and the certificate would be granted. What kind of protection does a process like this offer the public? DCLU has only to contact legislator Ken Jacobsen or any other for that matter to verify that there is a big push by lobbyists in Olympia to get rid of the C.O.N process altogether. which leaves absolutly no protection for the public from the proliferation of helipads and helicopter services.

Please eliminate these arguments from the final EIS and state that there is no effective means to guard against proliferation and improper use

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of such services, and that OCHH will be forced to deal with these permits on an application by application basis, which does not allow for the [redacted] statewide services development of a regional plan that is so desperately needed.

Please include in final document a detailed description of what the actual problem is that generated this proposal for a helipad at CoH campus. Please document all statements regarding problems that have been experienced [redacted] under the past WAST landing situation (Grants Field.)

Page 7 para. 3 - The proponent makes statement that in summary of 84-85 [redacted] CoH cases - of 621 patients associated with Blue Cross system 64% were categorized as "unique" cases. This does not make case for CoH having unique medical capabilities in the area

Page 7 para 3 — Please include in next document - [redacted] a discussion of who has classified CoH as a tertiary care facility? Was this through a self designation process? [redacted]

They may be the largest pediatric facility in the and but they are not the only pediatric facility. Because Blue Cross designated 64% of [redacted] a summary of cases in '84-85 as unique cases, data not mean that CoHD was the only hospital that could

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

administer this care. Please include a detailed very specific discussion in mgt document of ~~what~~ COH's particular ~~regard~~ medical capabilities that no other hospital has. Please include a comparison of the capabilities and services available at COH and Mary Bridge Hospital in Tacoma. What other Childrens facilities or pediatric services are available in Idaho, Alaska, & Montana?

On page 8 para - 4 Statement is made that "Childrens is not a trauma center, as it does not meet all criteria necessary to be so designated." Yet all supportive ~~in~~ data in Dr. Nicolas report examines the transport of trauma victims. If there is no data available that suggests that neonates or other non trauma ~~pa~~ patients benefit from helicopter transport this document should state that clearly. Please include in mgt publication.
~~Dr H~~ I request that the medical need matter be remanded to Dr. Nicola for ~~further~~ further scrutiny. Dr. Nicolas mgt report should focus solely on the type of patients that COH transports.

Please discuss whether COH has plans to upgrade their capabilities so as to self designate themselves a ~~trauma~~ level a regional pediatric trauma facility? Does COH plan to Administer care in the future to pediatric trauma ~~victims~~ or burn victims. [redacted] Does COH ~~have~~ have a written or verbal agreement with HARBORVIEW ~~that calls for the treatment of the~~ as to who receives this type of patient now or who will in the future? Please include in mgt document. What sort of agreement has been signed between the involved hospitals (UW, COH, H. & Ro, transported by ALNW?) as to the division of patients?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

What would Cost have to do to become classified (city or otherwise) a trauma center.

Is there any provision in ALNW procedure for their medical team to stabilize patient at community hospital and then transport patient by ground? (e.g. how do they handle billing?) Will patients Always be transported and always by ALNW: transported to another hospital? Is there any provision for team to administer care at community or outlying hospital resulting in stabilization of patient and the option of leaving patient at referring hospital? Please discuss in next document. If answers are "no" please include explanation. Please refer to Dr. Nicola's report (pg. 3) "Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to baby's heart and lungs and check the stability of its condition."

Page 10-5 ¼ paid. There is a minimal description of the training required by paramedics. Please include in next document a complete discussion of training required for paramedics — this is pertinent to this proposal and important to include because it will be the paramedics that will be calling for ALNW in many instances. What training do they have that will enable them to decide when to call ALNW? How will they be able to distinguish what patients can be transported by ground and which require air transport? How is dispatch handled - how is sick determined for ALNW to land. — at what risk to surrounding community?

Please expand this discussion to include the background and experience of the flight physicians associated with ALNW. Some specifics to address: 1.) Are they residents?
2) " " intensivists?
3) Are they board certified?
4) What has been experience in pediatric Emergencies?
5) Are they neonatologists?

Dr Nicolas report suggests (Pg. 3) that "One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained

NOTICE. IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

medical team, the neonatologist/pediatrician and neonatal nurse to the community hospitals" to stabilize a deteriorating baby."

Page 10 para. 3 There is a reference to the guidelines being proposed by the Wa. State Medical Association The proponent suggests that "It is the opinion of the Seattle King County Dept of Public Health that Amcy recommendations be used as guidelines and not standards." This is quite contrary to what is mentioned in Dr. Nicolas report; "I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use." (pg. 4)

Please resolve this discrepancy, and include a discussion of how any guidelines proposed will be implemented by this program (if new.) Who will monitor adherence to these guidelines? Please include in next document a copy of the Patient Distribution Guide (pg. 11-2nd para) that is used by hospital medical staff in determining appropriate medical center for treating patients. When was the last time this was updated?

It is mentioned that COH + UW only offer neonatal services (pg 11. para 6) and that critically ill or injured pts. are generally referred to COH but HARBORVIEW is the only hospital with an operating room staffed twenty four hours a day. How long does it take for COH to become 'operating room ready"? How is the ER staffed at COH? How is the ICU or NICU staffed at COH?

Page 12 – 1st para – According to DEIS in 1985 - there were 2 helicopter transports ~~patients~~ to COH out of 141 patients that were served by the County EMS systems. How does this figure compare with the number of total transports

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

thus far in 1986? How do you account for the difference? (17.)

Page 12 para 2 (Item c.) "Major medical problems in a pediatric patient where time is critical for survival of the mother and/or the baby. Please be more specific, give examples of such cases. This seems like a very vague guideline for a paramedic to be using in order to determine method of transport required.

Item d. in guidelines for a paramedic "Multiple injuries that indicate bleeding of such a nature that the patient is in danger of bleeding and within minutes." This would be classified as a trauma patient and not transported to COH - but rather Harborview. [redacted].

Item f - "Major head injuries" = Trauma and would be transported to HARBORVIEW.

Please include in discussion in next document

Page 12 - 2nd para. Discussion of guidelines that paramedics use for determining mode of transport. Under item #1. examples are listed of presenting medical problems that ~~require~~ would most likely require helicopter transport. What specific data do South King City would transport these patient by helicopter rather than ground?

Page 12 - last para. "under no circumstances should there be a delay at the scene waiting for a ride from the helicopter." Please examine flights ~~to~~ regarding near drowning patients transported from Auburn. Did the paramedics ~~not in fact~~ in fact wait for HLNW to arrive at a Park and Ride lot that they had transported the patient to in order to be picked up? What

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

was the reason for this action. What was the delay in time, What effect did this have on patient condition?

page 13 - item #4 "Permission to use any helicopter by a paramedic must be ~~g~~ obtained from the mobile units base hospital physician. Please include a discussion which details the dispatch system of HLNW. What has been used to date, and what might be contracted in the future. Please verify that the paramedic must call into to units base hospital physician, who then must in turn call the dispatch person for HLNW who must in turn contact dispatch Doctor on call who must ~~in turn~~ then return call to ~~to~~ units base hospital physician, who must then return call to paramedic unit giving O.K. How much time on the average does this dispatch system ~~take~~ require?

page 13 - item #6 — Please explain the rationale used in determining that paramedics should not call to get estimated arrival times for MAST and HLNW?

page 13 - last para. ~~Please explain~~ COH describes "critically ill or injured patients as those patients who might die or become seriously damaged unless appropriate treatment is received immediately." (Neff 1986) Please explain in next document why some patients have been flown over the roofs of hospitals that could have provided sooner ~~to have patients~~ the same treatment that COH administered.

Page 14 ~~and~~ 15 & 16 Please explain how these patients were selected for this list. ~~Is this~~ Does this list represent all patients transported to COH for this time frame or have these patients been selected over others to be

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

represented in this document. If so how have these patients been selected? Are these consecutive cases that were transported to CoH? [redacted] What is the relationship between this list and [redacted] Attachment "A"

Page 13 last para. "Dr. Neff suggest that critically ~~ill~~ ill patients who have been brought to CoH include ① near drowning - Shouldn't these go to nearest hospital?
② premature children - may go to UW as well
③ severe injuries - is categorized as trauma and would go to Harborview.
④ overwhelming infection - CoH or closest hospital?
⑤ ingestion of toxic substance - Shouldn't this go to nearest hospital?

Please include more specific discussion of what type of patient will be transported to CoH and to provide explanation of how and why decision would be made? The explanation [redacted] that is provided in this paragraph does not make sense. If patients (trauma) are transported to Harborview than that is where the surgery would be done. ~~How can one determine~~

Page 17 para 5 Dr. Neff suggests that ~~the~~ if the patient is gassed in transfer there is a risk that a child will become hypothermic due to the opening of the isolette. Is it not true that the isolette would not be opened until it was placed in the ambulance? — which would consequently have little effect on the patient?

Page 18 - Table 3.
This table should be elemated from the draft. No one is suggesting that ~~pate~~ critical patients be transpalted by ambulance from

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Enumclaw – only that the helicopter transporting them land at the soccer field, in which case the difference in transit time would be ten minutes or less. In addition almost all patients from Enumclaw could be served at Mary Bridge Hospital Tacoma which is a lot closer to Enumclaw than COH/Seattle.

Please include a Table that shows the difference in transport time when comparing ~~took~~ the transport of a patient from Enumclaw to Mary Bridge and Enumclaw to COH!

Page 19 para 2 — Please include a list of physicians that Dr. Nicola spoke with both in and out of the region in gathering information for his recommendation.

Page 19 Dr. Nicolas ~~report~~ analysis and report are seriously flawed and should be reexamined. The data he uses to support his findings have to do with studies dealing with trauma patients. COH does not receive trauma patients. There is current data that has been released that relates to helicopter transports that should be included. From what bases does Dr. Nicola determine that COH may require three patient transports per month?

Pg 20 para 2
Dr Nicola suggests that some patients may be adversely affected by 3-5 min. delay in receiving treatment. Please have Dr. Nicola ~~to~~ address in next medical need analysis. ~~to~~ the issue of whether or not ~~those~~ some of these patients ~~are~~ being adversely affected by the delay in treatment which is a direct result of patients not being sent to the ~~a~~ nearest medical facility that can provide the appropriate care.

page 20 para 6 — Please clarify and expand the statement about the phase-in of Blackhawks ~~being~~ by MAST being

Our analysis, as well as many studies, are now showing that DOT's assumptions to obtain

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

altered. The reference is listed as Greenwalt, 1986. Please include in next document a detailed description which includes the physical characteristics of the Black Hawks (i.e. weight, dimensions etc.) This is important information, and pertinent to this proposal as these helicopters will land at COH once the helipad is built according to Nancy Greenwalt.

Page 21 para 4 — Proponents mention that from 1983 to date MAST transported 29 patients to COH.
- Please compare the use of MAST for transporting patients with the current use of ALNW (May '85 — Present) Please explain why there has been dramatic change in number of transports.
- Please have MAST document whether or not there were ever any problems with transfer at soccer field.
- Please explain in next document how MAST will continue to operate in region with ALNW when they are restricted from competing with private transport services.
- Please include a copy of any agreement which exists between MAST and ALNW for the division and transport of patients.

Page 22 para 2 — Please include in next document a copy of ~~contract~~ current contract ~~and~~ or proposed contract under which ALNW is or will operate in future. This information is critical in terms of analyzing this proposal as it (CONTRACT) "characterizes ~~the personnel the operational~~ the airlift program and organizational structure, the roles of support, distribution of revenues, indemnification, record-keeping, services extended to non-participating hospitals, and provisions for amendment and termination of contract." It is well documented that in many locations across the nation, the improper use and abuse of such

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

helicopter services have been the direct result of the contract signed for such services.

Further, since this Consortium was formed in ? (1984) there have been at least two different contracts, possibly three. I have been given conflicting information about ~~how this service is paid for~~ who it is that contracts with Seattle Jet, what function a Rule Hospital Air Transport, Inc serves and who carries liability insurance related to a helicopter accident. The ~~contract~~ contract which defines this ~~structure~~ (?) should be made public information.

Page 22 - There is no mention of what type of helicopter is used ~~when~~ for back-up in AGNW service. There are times when AGUSTA will be serviced or inspected by FAA which will preclude the aircraft from being used for transport. What type of aircraft will be flown in this situation. What are ~~specific features of this aircraft~~ How is it maintained? How does it compare to Agusta in terms of noise? generated and what ~~are~~ is ~~the capabilities~~? (~~is it twin engine? Turbine?~~) ~~what is seating~~ the standard medical equipment onboard?

(i.e) Dimensions, weight, engines, fuel, range, speed, seating?

~~Where~~

Is this aircraft capable of carrying a 16016. isolette unit w/ ventilator?

What is 147 gallons equivalent to in terms of measured weight? This is important information. To include in next document. At the helicopter that was used in noise test did not carry an isolette (weighing 160 165.) nor did it carry a full crew, (only

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a flight nurse and pilot.) It is my understanding that the heavier the aircraft the more noise it generates. At the time of the test the pilot told me that the full tank of fuel made up for the weight that would be experienced added with the isolette and full crew.

Please verify in next document. If this is not accurate information then noise studies are not valid.

Page 24 para 4 — Table two describes AlNW helicopter transports through mid June 1986, yet AlNW began services in May '85 — ~~=~~ please include total number of transports ~~A =~~ to COH May, June and July '85. If there were none during this time please specify.
Does Table 2 represent consecutive transport to COH - were these all the transports to COH via AlNW during this time period. What other patients did COH receive via other helicopter services during this time and what were the specifics of each case as listed in Table 2.
If this is not a complete list of consecutive flight how were these selected?

Page 25 — Table 5
Item #4 — what is basis for forecasted figures in Table 5? Please include in next document method used for these projections ~~which COH's patients transports~~
The prediction is that COH's transports will grow steadily over ten year period but as a percent of the total AlNW total transports - there is a steady ~~E~~ decline. Please explain basis for this prediction in next document.

Please verify →

It should be noted that this table also does not reflect any "return flights" as represented in Attachment "A."

Please include in next document a table that does include ~~a reflection~~ numbers that are reflective of all flight segments involved

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in the transport of patients as proposed by COH in this ~~document~~ DEIS. This would include the picking of medical team at COH, the pick up and delivery of patient, and the return of the helicopter to the base. Please include predictions ~~[redacted]~~ that allow for "return flights" as well since this is also being done and involves 2 flight segments over the community.

Accurate numbers and method for projecting these figures are critical to any analysis of this proposal, as the risk to the community must be properly assessed and mitigated in relation to the benefit that patients might receive from ~~[redacted]~~ this transport and the location of the landing site. A final EIS lacking this information would be inadequate.

Page 26 para 1 Please include an explanation in next document of why ~~specifications~~ dimensions of helipad are less than what is suggested by REMSPA. and please describe how ~~specifications~~ dimensions of COH's proposed pad compares with those suggested in FAA guidelines for construction of helipad.

Page 26 para 2
What is meant by "generally helicopters are given more latitude in their operations than fixed wing? Please explain.

Page 26 para 3 — Please include in next document a copy of current FAA form 7480-1 filed with FAA in regard to COH's proposal for helipad.

Please note that because there is little or no monitoring of this type of flight activity once approved by FAA — the burden of dealing with pilot negligence and deviation from approved flight path rests with the citizen as FAA states quite ~~clearly~~ clearly that unless complainant can prove negligence or operation of aircraft

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in unsafe manner, the FAA will generally not take any action on complaints. ~~Has~~ ~~the City~~ Is the city ready to share in the responsibility of monitoring these flight paths. What role might the city play in enforcing ~~these~~ adherence to these flight paths? What authority will city have over aeromedical pilots if this ~~permitted~~ permit is granted?

Regulation:

While the Wa. State Medical Association is developing "user guidelines" that may applicable to these services as proposed in the EIS, the proponent makes it quite clear that these will be viewed as guidelines not standards. ~~If these are not approved~~ If there are no specific criteria to which the operators of such services must adhere, ~~on what guidelines what authority will a peer review committee have?~~ from what basis will a peer review committee operate? The use of guidelines rather than standards diminishes the ~~possibility~~ ability of any group or agency having any authority over such services. What would characterize ~~a~~ inappropriate use of such services if there are no standards with which to comply, and what legal ~~[redacted]~~ support would exist for the revocation of a permit in the event of inappropriate usage? Who will assess the appropriateness of patient transfers, how often and who will empower this committee? How would the committee be selected? How can the community be assured that a such a group would ~~develop~~ report inappropriate usage. How ~~would~~ could this committee deal with the patients right to privacy and how would committee ~~[redacted]~~ view transports that were inappropriate but initiated by patient request? Dr. Copass has stated clearly

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that he is in the business of providing a service and will not deny this service to anyone. Will ALNW be held accountable for such flights if this permit is granted and conditioned with peer review? Who will be accountable COH, ALNW, Seattle Jet Hospital Air Transport, Harborview, the ~~pilot~~ referring physician? What will be the consequences of violations of the permits issued?

~~It should be~~ Will there be any formal or informal public review of the guidelines proposed by Wa. St. Med. Assoc. subcommittee before they are adopted? What can the city do to insure some citizen input to the process?

Please disclose in next document whether ALNW, Sea. Jet or Hospital Air Transport, Inc. are members of ASHBEAMS. If not please explain why. If all or one have enrolled please include in final EIS the criteria ~~they~~ to which they ~~must comply~~ have agreed to comply. Does the city have the authority to enforce compliance with such guidelines? Are ALNW pilots members of the NEMSPA?

Please include in next publication of this document an interpretation of WAC 248.18.285 as proposed by the city of Seattle legal department. Please state whether or not the city is in agreement with proponents interpretation of ordinance. If the city is not in agreement with proponent on this regard how might the use of this helipad be regulated by COH and how would city persuade COH to do so. What consequences would COH face if they did not comply?

If DCLU issued permit to COH for construction of helipad on their campus, what possible conditions ~~must~~ could be placed on the permit. How would these conditions be enforced and such service monitored over time? Who would be responsible

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

for determining such conditions? ~~It~~ Please provide a detailed discussion of possible conditions and potential for enforcement Please suggest who would be charged with responsibility of reporting violations other than the appropriateness of transport? (i.e non compliance with noise abatement procedures?)
A complete discussion of this topic must be included so as to determine whether or not the adverse impacts of such a proposal on surrounding neighborhoods might be mitigated in the event of a permit being issued.
~~that assurance be satisfactory~~ ~~concerning~~ ~~guarantees~~ ~~community~~ ~~be required~~

The conclusion that should be drawn and stated in next publication with regard to regulation of such services is that these proposed policies as well as any other of like nature are and will be totally unregulated once flight paths are approved by FAA and that no agency, whether federal, state, or city has the authority to modify, revoke, or even condition such policies. Please state so.
~~It~~ It would be irrational, irresponsible and certainly ~~succesful~~ subject to challenge in a court of law for the city to grant a permit for this proposal ~~[redacted]~~ cognizant of these facts.
~~[redacted]~~

Pg 29 PARA. 5
Please include in next document a discussion of the role the VA. State Dept of Transportation might be encouraged to play in this issue. In other States (ie Louisiana) it was this this department that orchestrated and carried out ~~a formal~~ formal studies of aeromedical and overall plan for such transport within their states. ~~Only produced~~ Does this Dept have the capability of conducting such a statewide study + plan in this state?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Has this dept. been considered in discussion of regional planning? Since the Div of Aeronautics "deals specifically with air transportation by participation in statewide transportation planning, assisting in enforcement of FAA regulations, investigation of aircraft accidents providing search and rescue support for aircraft and providing funding for public aviation facilities — it seems a natural! Please research and report results in next publication.

Page 28 Para 3
With regard to section on ~~f~~ conditional uses permitted ~~in~~ in Major Institutions zoning.

€ The proponent must show that

1a the helistop is needed to save lives.
this has not been shown by information provided in this document. Of ~~case~~ transported patients 50% Died anyway. ~~Dyed~~ It is not clear or even addressed whether the other remaining patients lives were saved ~~do~~ the helistop being located at CoH. — Please discuss how CoH plans to document that they are in compliance with this first criteria. Does the city believe that CoH has provided adequate ~~information~~ information from which they will be able to determine whether or not this proposal meets this criteria? Please discuss how city views report issued by Dr. Nicola as well.

b. the helistop is located so as to minimize impacts upon surrounding residential property.
— Have city personnel who will be responsible for making this decision visited the CoH complex and witnessed a helicopter landing? Without doing so I don't believe that one can adequately assess whether proposed site location mitigates the impacts ~~on~~ upon surrounding

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

residences. The city should conduct an independent survey of residences within [redacted] of heliport location to determine what their experiences have been to date with the helicopter landings. With particular attention to how it has changed their lives (i.e. some residents feel they must sell property and move, some has experienced personal damage due to vibration, some have experienced physical changes [illegible], and psychological changes (ie elevated blood pressure, sleeplessness, anxiety, fear, stress.)

3 block area all directions of COH

and dep. loss in prop. values.

where to put?

What type of homeowners insurance will be required of residents closest to heliport and how will premiums be effected?

[redacted] A final EIS lacking this information which is available due to the fact that COH has been landing only feet from the proposed site since May '85 — would not provide sufficient information to determine from which to determined whether or not Item b. of Conditional Use-Helistops had been ~~met~~ met. Please ~~include~~ conduct survey and include results in final EIS.

Item C. 3 Use of the helistop will be restricted to occurrences involving life threatening emergencies.

— Since this service has been operating illegally at proposed site since May 85 it seems appropriate to review all flight records to determine whether or not COH has been using helistop for only life threatening emergencies. Please form a "credible" Review panel that includes objective people, lay people as well as physicians to determine whether flights to date have been justified. Please include

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

~~[redacted]~~ criteria for evaluation and results in page 6 is. (30.)

Please see Attachment "A" as this reflects that use of helistop is not being used for life threatening cases i.e. Human Rights Etc.

(2.) "The directors report shall examine alternative locations for a helistop, including sites outside the institutions boundaries which would accomplish the purpose of the helistop with a lesser impact upon residential areas."

The purpose of the helistop according to CoH is two fold; Critical time saved and decrease in patient manipulation

Locating the helipad at an alternate site located on the East campus ~~[redacted]~~ saves ~~[redacted]~~ atl the same amount of time in transport less a few minutes. These few minutes that ~~[redacted]~~ might elapse could because of an additional transfer can be made up via some other leg of the transfer with minimal modifications. The fire HNU can do something which would allow them to take off sooner. The pediatric team might respond quicker for pick up - a possible change in flight path might make arrival at the destination sooner. Preparations at referring hospitals may expedite the transfer. Improvement in the overall dispatching system which Robo Childs, administrator of HNU describes as "archaic" could ~~[redacted]~~ easily make up for the minutes lost during a field transfer. Most people involved in planning and rescue and emergency transport will agree that it a very small percentage of cases in which minutes are critical Surgery. (Dr. Nicola) In most cases transport of patients take hours. (Flight time, stabilization time, transfer time) ~~[redacted]~~ In view of this an alternate site at the new campus would meet CoH's first objective.

The second objective is to decrease patient manipulation. In talking to people involved in doing emergency transport I have discovered

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that ~~[redacted]~~ some people think one is really "splitting hairs" in discussing whether or not there is more patient manipulation due to an additional transfer at the East campus. The reason being is that if a site is permitted at the CoH campus in the kitchen garden area the helicopter will land, unload patient on to a gurney (same procedure as field) or stretcher and then will be pushed, 120 ft ~~into the emergency room at CoH~~ or (all the while exposed to the elements) into the Emerg. room at CoH. All the while exposed to the risk of further IV becoming tangled, dislodged, disconnected At the field the ambulance pulls up to the aircraft the patient is moved into an ambulance ~~and then~~ (is not exposed to elements anywhere near as long as ~~there~~ in case of proposed action) and then is transported to emergency Room directly and unloaded. He is not subjected to the jostling ~~[redacted]~~ associated with a 120 ft ride on a gurney. The point is that neither procedure is perfect, they both have their disadvantages and one is not inherently better than the other. ~~When one weighs these facts with the ever present risks to the community in landing at CoH~~

The alternative site ~~is no better~~ offers better safeguards against hypothermia than the proposed CoH site. When one weighs these facts with the ever presents risks to community associated with landing at CoH, the prudent site selection is 'an' alternative at UW East campus, and this alternative meets CoH's criteria for decrease in patient manipulation. windchill factor from blades, and 120 ft trip

Please keep in mind that the purpose of the Major Institution Policy is to balance the need ~~[redacted]~~ for ~~protect~~ institutional growth and change with the need to protect the livability of neighborhoods.

Locating the helipad at the UW East campus area is ~~a compromise~~ not an idyllic situation. But best it is a compromise that the Eastmoreland and nonlake Community is willing to live with. Much of our

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

communities will still suffer adverse impacts from the ~~with that proposed~~ alternative site. The noise will still be a concern although to a lesser degree. The flight paths may be modified but I doubt seriously altered and the number of flights COH receives via HLNW may even escalate as a result of the use of ~~an alternate~~ the east campus area. The burden of ~~repairing~~ violations will still be on the surrounding communities. What part of compromise has COH offered to live with? They have dismissed the possibility of an alternate site saying that it does not meet their objectives. Please include in final EIS a genuine consideration of alternate sites which includes a realistic assessment of the proposed transfer at COH landing—SITE.

(Please refer to testimony of ~~Dr. Schneider~~ Dr. Jerry Schneider from public hearing held Sept 23, with regard to Draft EIS.)

(B.) what steps might be initiated by proponent and HLNW to insure that they doesn't happen in future? How might geographic area be divided so as to delineate what patient are taken to what hospital?

Page 33. para 2

(1.) The sponsors objectives are suspect due to the fact that HLNW is not attempting to deliver medical expertise available to critically ill patients in the least amount of time after adding A+B

2. They are not minimizing transport time from the place of patient pickup to [redacted] ER at COH

Please describe in detail the system which dispatches HLNW. ~~How~~ What are existing problems with this system? How might it be changed in future to expedite transfers? How does ~~total~~ complete dispatch time ~~to~~ compare to the time involved in transfer at soccer field?

(4) Please explain why many hospitals cases have been taken to HLNW when hospitals that could have adequately treatment was quickly than COH?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Proposal may not minimize or reduce additional transfer.

Please define what is meant by "ground crew" that will assist in transfer of patient to ER at COH site. Will an ambulance be used to transfer patient from COH helipad to ER door, as is the case for the hovered. If not please explain why. ~~that no potential problems~~ The proponent has not discussed what potential problems exist for the patient landed at COH and then transfered 120 ft to the ER. Please include in final EIS. Consider in discussion jostling and movement of patient, exposure to elements, (i.e rain, cold temperature, snow, [redacted], wind.) consider also the wind chill factor produced by aircraft, the risk involved in disconnection of life support lines etc, the potential problem associated with moving patient on gurney over flick surface. Please examine what potential effects these problems may have on patient stabilization as these must be weighed against the potential problems of a transfer at the soccer field.

the 4th objective, "to construct a helistop that minimizes potential environmental impacts in a manner that would not sacrifice proper patient medical treatment." This alternative locations in this section have not been adequately reviewed and discussed in order to determine that the proposed action is the action that most effectively meets this objective.

Please include in next document a comprehensive discussion of alternative sites both on and off the campus of COH. ~~It is not acceptable for~~ ~~not be adequate to the document~~ ~~to~~ merely stated that an alternative has been judged unacceptable is not an ~~adequate~~ sufficient discussion of alternatives. Who has determined that these sites are unacceptable. The discussion does not include ~~what~~ you transfer of patient would

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

be made and all the other information that is provided for in the proposed action section (i.e flight path, ~~transportation~~, transfer time, transfer methods associated transfers ~~[illegible]~~ problems.), how might the reader of this document ~~[illegible]~~ determine whether or not an alternative is even remotely feasible? One cannot, one has to rely solely on the biased opinion of the proponent in this situation. Please redo this entire section giving it as much consideration in your document as is done for the proposed action. and is required by SEPA.

In addition Please address specifically

(1.) Why would a route through the medical center be less desirable? The patient would not not be exposed to the elements ~~[illegible]~~ which results in proposed action. ~~Changing places of pad~~

(2.) Changing places is mentioned as being a disadvantage. Does the UW share this opinion? Their rooftop location will require a descent by elevator 5 floors to the emergency door. Please address.

(3.) Surrounding tall trees are not seen as a disadvantage in proposed action. They have been earmarked for removal. Would this not likewise be a solution to this problem with alternative location of pad?

(4) Please explain why flight path would change in administrative wing ~~location~~ ~~abbreviation~~. and parking surface parking lot alternative How could landing side be any closer to residences than what it is for Laurelon Terrace? Please compare distance and report

(5.) Pg. 3: para. 2 — "The significance of the safety distinctions are believed by the pilots to be negligible." The pilots referred to are

HLNW pilots whose livelihood depends on ~~acceptance of this~~ the continuation of this service
Please provide an unbiased ~~Report~~ safety
report that relates to the proposed action
as well as the alternatives on and off Campus

Pg. 39 Had all concerned parties been involved
in the scoping process there would have
been an opportunity to discuss as an
alternate site [redacted] the possibility of sharing a helipad
[redacted] on the
NOAA property (Sand Pt. Way.)
@ NAVY

This site is already paved [redacted] site [redacted]
secured. and marked with a big red H. It has adjacent parking as well
It is easily accessed from the lake without
having to fly over the homes of [redacted]
surrounding residents. There is a
paved road that leads from the site out
onto Sand Point Way (short distance) and the distance to
COH is minimal. (3 minutes by car)
Please explore this situation as a possible
alternative to a site at COH. and discuss
in final EIS. Since the pad is already
built and would eliminate a major
expense, and have minimal adverse impact
on surrounding neighborhoods, it should
be considered.

Pg 40 - Please address why the proposed helipad
~~site~~ specifications are less than those proposed by
NFMSPA for medium sized helicopters.
How do these dimensions ~~for~~ compare with
those suggested by the FAA?

Who would be responsible for turning on lights
at helipad in event of emergency? Isn't this
an additional risk to safety of community.
failure to turn on lights may result in
a catastrophic accident. Please state that
~~Future~~ an added advantage to an off site
pad is the option of leaving lights on - 24 hrs a day,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and not ~~[illegible]~~ being subject to human error. (36)

Pg 40 - Please state in not document that "future" in relation to this proposal equates to ten years, that someone ~~[illegible]~~ undertook estimate "potential for growth of this proposed service Please provide estimates for twenty year growth so that the cumulative impact over time might be properly assessed and weighed now when decision is being made.

Pg 40 - Why haven't signs been posted warning people of current helicopter activity on campus as a safety precaution?

Pg 41 — The projection for expected flights in year 1990 is not any where near accurate. COH ~~[illegible]~~ received in Aug '86, 17 flights via HNN alone. 3 or 4 came to emergency room, the remainder was transferred at Hahnemann to ground ambulance and transported. The future (10 year) projection is representative ~~of COH is [illegible]~~ of the number of flights COH is currently receiving. Please adjust figures and present more realistic predictions for future growth. Dr. Nicola estimates that the average number of flights that COH will ~~[illegible]~~ receive once helipad is located on campus is 30-40. Since the proponents refer to Dr Nicolas report ~~[illegible]~~ for support of their proposal ~~[illegible]~~ many ~~[illegible]~~ places throughout the draft, why ~~[illegible]~~ his figures ignored? Please provide realistic figures in terms of anticipated utilization both current and projected. If COH does not agree with Dr. Nicolas figures then state so and provide argument for this position.

Page 41 2nd para. The proponents ~~[illegible]~~ misinterpreted and misrepresented the findings by Dr. Nicola. He states that COH may transport 30-40 pts. to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

~~one~~ on any given month and that 3 or 4 of these patients may indeed need to be transported to the roof but likewise there needs to be some flexibility built in to the ~~allowed~~ permitted number of landings that should be allowed to land and COH should not be allowed to exceed that number.

Pg. 41 3rd para — How has proponent arrived at conclusion that COH shares 17% of ALNW total flights? Please include ~~in next~~ calculation in next document. In order to determine whether or not one can realistically predict that COH's transports will remain constant one must have some conception of what ~~COH~~ changes in capabilities might occur. While I recognize that it is difficult to determine what physicians may leave COH in future, certainly COH has an institutional plan for growth which would reveal what additional services would be made available at COH in near future that would affect the total number of transports expected. What programs and/or specialists does COH plan to add to present staff that may affect this proposal?

~~It~~ It is stated that ALNW has capability of performing 80-90 flights per month. ~~No demand~~ How does ALNW plan to meet demand for additional flights if requested? Would there be additional helicopters leased that might land at COH? How might an expansion of ALNW affect COH in terms of ~~current~~ present flight hrs and expected flights? #'s What happens to flight #'s if a hospital drops out of consortium?

Page 42 para 1 — Please include in next document any agreement reached with MAST in terms of landing and communication. If agreement had not been reached, please include a discussion

As there a weather advisor that will be stationed at CofH to report to ALNW? and incoming flights - please discuss

How does CofH see a ~~peer review panel~~ review panel functioning. Please discuss possible participatats, frequency of review, violation and enforcement, ~~[redacted]~~ confidentiality.

Please include in next document ~~[redacted]~~ copies of ~~letters~~ correspondence between Tallmen Trask and Trueman Katz as mentioned on page 50 in the DEIS Also include letter to Bob Klug, Lauelhurst Community Club President with regard to same topic (Trdeman Katz was sent a copy.) as your comments on pg 49+50 are misleading and need to be clarified.

Page 52 - The 15 minute transfer ~~da~~ may not be accurate as described. I have been told that in most cases the ambulance pulls up very close to the helicopter. consequently the right to nine minute estimate of moving patient from chopper to ambulance is an exaggeration. Please verify that in most instances the patient is not mauld across the field to the waiting ambulance. Also please clarify for readers that ~~[redacted]~~ proposed helipad alternative ~~to Tallmen Trask~~ area would be paved and have adjacent parking lot and allow for ambulance to ~~[redacted]~~ back up to aircraft.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please provide data ~~pp~~ to support Dr. Nepp's statement (1986) on pgs. 52 & 53. If no data is available please remove from this document. (43)

Page 53 – Please explain what ~~@~~ specific liability reasons would preclude COT from using proposed new rooftop helipad. Please include any documentation of this communication in final EIS. (Goetzen, 1986; Draweraft, 1986)

Argument about traffic delaying the transfer of patient from UW to COH is ridiculous. There is a ~~road that along~~ main road from Stadium through east campus area that would eliminate any problems ~~of~~ caused by congested traffic. (See Public Hearing Transcript, Dr. Jerry Schneider testimony.) Please address this point in final EIS.

Page 56 ~~I would like to Praise City of Seattle~~ ~~for departments comment on [illegible]~~ ~~made in DEIS which stated that~~

In the limited landings section. Please address in the final EIS that the possibility does exist for COH to remove tall trees so as to avoid deviation from proposed flight path. in final approach to COH.

Page 57 – ~~*~~ In final EIS please clarify that potential land problem may be eliminated by considering a landing site already paved as mentioned in Dr. Jerry Schneiders testimony, public hearing DEIS Sept 23, 1986.

Page 57 ~~para~~ paras – Please include in final EIS a copy of Section 7.70.040 of the Revised Code of Washington. and a discussion which reveals whether the City is in agreement with

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the interpretation made by the Hospital. (44)

Pg. 58 Please include in final EIS a report from Medic One which clearly reveals their policies on running their siens. Also include a discussion of agreement COH has made with Bellehurst Community and City of Seattle with regard to ambulance siens approaching their hospital — Please review past permits issued COH by City of Seattle.

Pg 58 Please remove statement about approval of proposed Action or Alternatives not having an impact on the number of Emerg. helistops constructed in this region. This is an opinion expressed by the proponent that is quite contrary to the trend across the United States that has been well-documented.

Pg 58 ~~Please provide survey population of those elementary schools located~~

An added benefit as a result of reserving implementation of the proposed action for the future is that the area school populations (which have been sadly overlooked in this DEIS) will not be subjected to noise and vibration ~~to the~~ and resulting disruption to classroom activity. In addition they will not be subjected to ~~to possibility of~~ COHs overflights in bad weather and possibility of crash on school playground that most likely would involve death and destruction. Please address in final EIS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopter Safety

(45.)

Pg. 59. Please identify recognized authorities mentioned Pg. 59 paragraph 3.
For final EIS please use unbiased sources rather than opinions of AHAW pilots. Please recognize that they may be experiencing a conflict of interest.

This discussion of "trends" in helicopter safety is not germaine to the issue. How many EMS programs were even in operation during the time frame 1975-1981? — How has that figure changed during the years '80-'85 Please focus on safety as it relates to the EMS helicopter industry from [redacted] 1982-'85. And include ~~statement~~ CONCLUSION — that it has the WORST AVIATION record in history. (EINHORN. AMA NEWS Sept 5, 1986)

— Please secure NTSB statistics for general aviation for the years 1982-85 and provide that information for final EIS.

On pg 60 the ~~increase in~~ proponent maintains that the increase in helicopter safety is due to the the increased use of turbine powered engines. But on pg. 65 Table 11 shows that in 1981 the single leading cause of ~~helicop~~ accidents among turbine powered helicopters was engine failure or malfunction.

On pg 65 proponent makes the argument that ~~[redacted]~~ pilots are crashing due to striking wires or obstacles (single greatest cause of EMS accidents 1979-1985) is because the pilots are unfamiliar with the landing area. I would like to submit that this has more to do with the inability to see wires and obstacles as a result of flying at night. The second greatest cause of EMS accidents is power loss or mechanical failure (26%) — Thirty six percent of these accidents resulted in injury or death.

(see 67 1st para ?) → flying in restricted areas

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopter Safety.

Pg. 67 It is stated that in December of 1985 ALNW refused to answer twenty calls over a two week period due to bad weather. Please investigate what happened to this patients and legal findings in final EIS. Please indicate condition of patient at time of call to ALNW - subsequent treatment administered - what hospital were patients transferred to - origin of call mode of transfer - time of transfer and patient out come.

FAA standards for flying are ~~applicable~~ written for and applicable to all aircraft There is a big difference between what conditions are acceptable for commercial jets to fly in and ~~would~~ what would be acceptable for helicopters - Please indicate this in final EIS. Please specify what FAA standards are as well as ALNW. Who establishes the ALNW criteria for flying and how do they compare with the NEMSPA. Please include NEMSPA standards in final document so that there is a means of comparison for the reader.

Pg 68 - What is good visibility?
para 1 Why doesn't ALNW fly with two pilots? (instead of 1)

para 2 - ~~Please give information on A~~ accidents that are reported

How many Agusta 109's are in operation around the country. How many are involved in EMS programs?

Pg 68 - Bane Hills comments on the reliability of turbine powered aircraft is not supported by information provided in Table 11 - 42.3% of all helicopter accidents (turbine powered) was

due to engine failure or malfunction. Please ask Ft. Hill to comment on this and provide for final document. Engine malfunction is not the only factor that constributes to helicopter safety. Please have Gene Hill or preferably ~~Ted~~ unbiased pilot comment on ~~the~~ potential outcome in the event of transmission failure or rotar problems.

Frank Benedict is not viewed as a reliable source in the discussion of EMS helicopter safety. In a conversation with Mr Benedict on Sept. 23, 1986. He told me that he was completely unaware of the current safety record held by the EMS helicopter industry. Please include in final EIS comments on the part that in 1985 1 out of 10 aeromedical helicopters suffered a reportable accident (Aviation week & Space Tech. mar. 24, 1986) Please include this article as part of final EIS.

[redacted]

Pg. 68+69 The comments made by Dr. Thomas Poulton in regard to improved EMS flight safety are not substantiated by the data presented in this document. What is meant by "early operaters" How does Dr. Poulton feel about accident rate of EMS helicopters in 1985?

Is restrictive budgets play a role in EMS helicopter safety. Please define. What is a restrictive budget. How does this compare with that of the AH-1W budget. Please provide this budget information in final EIS. Please include

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

all cost related information to the operation of ALNW (i.e salaries of personnel, expenses, (equipment leasing of craft + pilot. etc.

Please explain how participating hospitals share in expenses. both fixed + variable

Please provide information on cost to patient of such services. Billing procedures, History to date of recovery of these charges.

What ~~is~~ has been experience (since inception of service) ~~of Hoist~~ with regard to third party payors?

How does the budget of ALNW affect the judgements made in regard to which flights to take and which not.

Pg. 69. para 2. Please provide specific information and data on safety record of "major vendors" It is not sufficient to say that it is someones opinion that they have a better record. Please provide the data to support this point in final document.

Pg. 69 para. 3 — What are 'insurance companies' standards" how do they compare with FAA regulations it is not sufficient to say they are more stringent. Please provide information. Please provide ALNW standards for pilot so that reader may make comparison. Please provide individual pilot record to date for pilots flying for ALNW in final document.

Please specify [redacted] definition of "small airport"

Pg. 70 para 2 — Dr. Nicola [redacted] suggests [redacted] COH will have 30-40 flights per month not 15-20. This document is supposed to represent worst case scenario. COH had 17 transports Aug. '85 — Your figures are not realistic please adjust for final EIS.

Pg 70 - para 3 — According to our review of flight logs the average flight was not 48 minutes but 77 please address in final EIS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(49)

Please provide accident probabilities based on worst case (40 flights per mo.) Please project these probability over twenty year period allowing for growth of service. Include in final EIS

Pg 72 para 5 — Please include in final EIS Mr. Benedicts comments on which landing site would offer least safety risks in comparing proposed action with alternative sites ~~mentioned in EIS~~ In my conversation with Mr. Benedict Sept 23, 85 ~~The was~~ he was unaware that MAST had previously landed at UW soccer field and that this alternative ~~was~~ was being considered in proposal. Has Mr. Benedict physically visited ~~the proposed~~ COH campus and viewed proposed site? ~~or~~ Please include in EIS. Comments in EIS suggest that Mr. Benedict compared the COH site only to landing areas in Downtown Seattle

and includes NAVY Sand Pt.

Pg 72 — There is no discussion of proposed Medical office Bldg and it's effect on landings at COH. Please include ~~no~~ discussion in final EIS include unbiased credible sources when determining effect. Please also include what other bldgs COH has planned to erect on its property (not just vicinity of proposed site) ~~for~~ This development and proposed develop should be considered ~~in~~ in siting a helipad on campus.

Pg 72 — Please address in final EIS — Possibility of natural gas meter ~~on the Event~~ leaking undetected as a result of accident on site and possibility of subsequent explosion. Who ~~that~~ is responsible for shut off of main valve across Sand Pt Way. In the event of emergency — how long does this procedure take.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(50)

Pg. 73. Please refer to Table 12 - Helicopter Accidents by cause 1972-1985. — 31.5% Struck wires and obstacles. 22.2% flew into the ground. 16.7% — loss of control

The ~~landing~~ flight path to landing site at COH includes more wires and obstacles (trees, light standards, buildings) than ~~some~~ open area of alternatives sites. The flight path is over + schools homes, the landing site is 240 ft from ~~a~~ multi family housing. The landing site is located in a very restricted area. — loss of control could ~~be~~ have devastating results. How can you possibly conclude that the alternative sites would not be more safe from a helicopter accident frequency? — Please consider varying wind currents, ~~the~~ the influence that buildings have on wind etc.

The fact that you cannot produce any statistics ~~of~~ on ~~accidents~~ ambulance accidents involving ~~the~~ a transfer of patient such as would be required in alternatives action suggests that if a risk exists it must be very minimal — Please compare this risk to that which is experienced by locating helipad at COH. ~~[redacted]~~

Please have pilots comments on whether open, paved, lite secured area of alternative (whilst helipad on East Campus) is preferred to restricted site at COH Please have ALSO pilots comment as well as unbiased authority.

Pg. 76 - Please explain why exempt ~~[redacted]~~ sound sources can not be considered a public nuisance, and what authority puts forth this information

Pg 80 \ The discussion on health effects of Noise

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

is inadequate. Please attempt to give serious consideration to this issue. As one source of information please refer to EPA pamphlet entitled NOISE: A HEALTH PROBLEM (Enclosed)

Please refer to letter sent to Herman Hp by Dr. Anderson in reference to noise test conducted at COH — Date _____.

There is no discussion of impacts of Helicopter noise on elementary schools located in vicinity of landing site. Secondary approach departure path is over both elementary. Please give serious consideration to this ~~discussion~~ issue and present in FEIS. It is not sufficient to say that they are noise-sensitive.

Please ~~ensure~~ verify that noise measurements were actually taken at only one spot designated to be measured. Other information was extrapolated from these readings.

Pg. 81 There is not an adequate discussion of impacts of two bladed helicopters that will land at COH — please address.

With what degree of accuracy can measurements taken at HarborView with regard to Helicopter noise be applied to COH site and vicinity? Different terrain, bldgs etc. Please respond FEIS.

Pg 81 para 6 Please verify that gross vehicular weight has negligible effect on Helic. noise. Gene Hill in a pilot nat'l noise report. Provide comment by credible authority in final EIS.

Specific noise measurement should be taken. ~~required~~ — at both elementary schools doing ~~using~~ separate tests for primary and secondary flight paths. Include results in FEIS.

Pg 83 - Noise information conclusions are invalid as

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

presented in this document as the report assumed twenty patients transport or 40 round trip flights

~~impacts of 40 flights~~ transports per months or 160 round trip flights should be used as is supported by findings of Dr Nicola, 1986. Please use accurate worst case predictions in FEIS.

Pg. 84 para -2 — The flight path ~~using~~ a that incorporates a sharp turn South over parking garage is still being used. Consequently there would not be a lowering of 7-9 dBA. Delete from key for FEIS.

There have been no measurements taken for backup aircraft used by HLNW. which has landed several times at COH already. Please provide noise information for this aircraft in FEIS - Please provide noise information on BLACKHAWK helicopter - as military plans to ~~incorporate~~ replace the Huey. — [redacted] Provide for final EIS.

Please provide information on how hospital rooms at COH were determined noise-sensitive. If noise studies were done accurately [redacted] it would be shown that more than 50% of hospital would be awaken. Please discuss ~~Other~~ effects on Patients when windows are open during summer, fall, spring of year.

How did proponent determine there were no known health effects associated with the predicted helicopter sound levels for the neighborhood surrounding COH? Please discuss FEIS.

The current Helic. noise awakens more than 15-20% of closest residents. Please Poll the ~~community~~ closest line of sight residences to determine.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please address the potential impacts on residences of consecutive night flights that ~~prevents~~ prevents residences from sleeping at all. This has already been experienced at least once since landings have ~~occurred at COH~~. been taking place at COH.

Why is it that in addressing noise impacts to ~~COH~~ Intramural field helistop the proponent mentions the disruption to class lectures at the UW — but does not even acknowledge this same impact with regard to the elementary schools located in proximity of COH. This description occurs even when the school is not overflown.

Pg 87 — Please eliminate discussion of and impacts of ambulance sirens — Medic One doesn't use it sirens when approaching COH Mary Sand Pt. and other ambulance companies use sirens only if traffic requires. Everyone turns off siren as they approach vicinity COH.

Pg. 89 — The proposed flight path does not keep helicopters at "high" altitude over Sand Pt. Way. What does proponent consider high altitude?

The disturbance to residences as experienced in noise abatement approach is not minimal.

Residents to the south of hospital experience disruption to lives as a result of helic. landing at COH. Many have complained about sleep interference.

Pg. 90 - When did the UW receive CON approval for their helistop. Helen Shawcraft UW - was unaware that the institution had gone through process. See testimony Joanne Brekke hearing Sept, 1985.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

What do long range plans of Seattle area project in terms of helic pervice acquistion.

Please note: Six months prior to COH announcing it's plans to acquire helicopter service - ~~[redacted]~~ orbid. pad. hospital representatives maintained in a public community meeting that they in fact had no plans to acquire such services nor did they intend to build a helistop on their campus. — So much for your survey of Seattle area hospitals. Why would these hospitals divulge their plans to COH ~~anyway~~? institutional COH certainly does not share its plans with other hospitals. Please ~~make~~ delete your survey of hospitals it has no validity with regard to the precedent setting nature of this issuing of this permit.

Hudnell Hake, EMS helicopter program Consultant has remarked in ~~COH hearing~~ the St. Luke CON hearing (helicopter proposal Spring '86) that a consortium is the worst way to set up ~~a~~ an EMS helicopter program. Please address in final EIS. and research his "public utility model"

How can ALNW do an adequate job of providing appropriate medical services to public if it is not integrated to total EMS system and part of regional plan?

See references to CON process and helicopter service acquisition by hospitals.

Your conclusions on Pg. 91 are ~~[redacted]~~ contrary experienced to date to realistic results of CON, PSHSA Study, Guidelines Wa. St. Med. Assoc the city's land use process — see earlier discussion.

Pg 91 — What Dr. Nicola suggested as referenced in para 6 is illegal.

Please refer to comments on 1st para. in public hearing speech. Liz Anderson. 9/23/86.

Pg. 92 Please reconsider concluding paragraph on noise + vibrations when accurate noise study is complete.

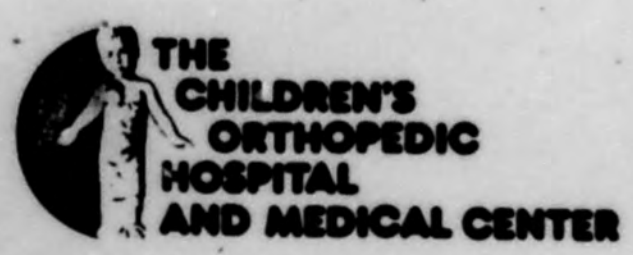
Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

I am responding to your letter of December 17, 1984 requesting that Puget Sound Health Systems Agency forward health policy guidance on the development of helicopter landing facilities at hospitals. I have asked agency staff to prepare a response to your specific questions about utilization and appropriateness of helicopter transport. This response should be available to you by February 15, 1985. Having researched the issues to some degree already we can thus provide your office and related agencies with professional opinion from a planning perspective.

However, I recognize that your letter requests our policy guidance on helicopter transport. Our current plans and policies do not directly address this service. To develop such a policy is a much more substantial task involving a committee with the relevant expertise and range of viewpoints. At the present time I cannot internally fund a project of that scale. Clearly, however, the issue of helicopter transport is becoming more significant all across the region Puget Sound Health Systems Agency serves. Consequently, I will propose such a project to the agency board for their consideration.

I hope these actions meet your immediate needs and appreciate your coordination with Puget Sound Health Systems Agency on matters of health policy.



Sincerely,

Larry A. Thompson

Mr. Frank Chestnut
Certificate of Need Unit
Office of State Health Planning
& Development, MS ET-23
Olympia, WA 98504

Dear Mr. Chestnut,

We understand that both the Certificate of Need Unit and the HSA have received inquiries from third parties relating to whether a proposed activity of COHMC is subject to Certificate of Need review.

Since at least 1971, COHMC has provided, and continues to provide, air ambulance services for critically ill or injured children in need of immediate care of COHMC. This transportation has occurred by way of fixed wing aircraft and helicopter during this continuous period.

We are now planning to construct an emergency helistop on the COHMC campus to better support this long-standing service. The helistop does not represent a change in services requiring Certificate of Need review because it is not an emergency service licensed under 18.73 RCW. Actually, the helistop construction project is precisely the same as simply repaving the driveway to an emergency room. Such activity is reviewable only if the expenditure minimum is exceeded. There are no additional staffing or equipment costs, nor is there a change in services as set forth in the regulations.

COHMC has always complied with the spirit and the letter of the Certificate of Need law, and we are simply writing to inform you of this plan, to avoid any confusion that may have been engendered regarding the scope of our proposed activity.

Sincerely,

Dorothy F. Teeter

Airport OKs Noise Rules for Copters

By PATRICIA MANISCO,
Times Staff Writer

Under mounting community pressure to lessen the noise created by low-flying helicopters, the Los Angeles Board of Airport Commissioners voted Wednesday to approve noise abatement guidelines that limit helicopter operations at Los Angeles International Airport.

Together with the guidelines, which were proposed earlier by the Federal Aviation Administration and the city Department of Airports, the airport commissioners also approved their first formal helicopter operating policy. The policy includes a ban on unscheduled nighttime helicopter flights except in cases of extreme emergency.

The guidelines will go into effect immediately and include:

- Raising flight altitudes to a minimum of 1,000 feet and a maximum of 1,500 feet. At night, helicopters along the so-called Sepulveda Corridor—which runs above Sepulveda Boulevard in Westchester—would be asked to fly at 2,000 feet, conditions permitting. Currently there are no standards regulating helicopter altitudes, and such aircraft frequently fly at less than 300 feet.
- Requiring northbound passenger helicopters, such as Airspur, always to use the same over-water departure procedures used by jet aircraft.
- Closing the airport's east heliport.
- Reassessing routes and altitudes for Coast Guard helicopter operations.
- Attempting to reduce the number of helicopter flights over beach areas.

FAA facility manager Jim Holtsclaw said the FAA would begin immediately to renegotiate its letters of agreement with helicopter pilots who use the airport, and include the changes. The FAA, he said, would revoke the airport privileges of pilots found to violate the agreement.

Airport manager Bob Quincey said the Department of Airports and the FAA will study the possibility of abolishing the Sepulveda Corridor altogether. That proposal would require helicopters that now fly on a "see-and-be-seen" basis to install expensive flight instrumentation and to fly according to the same instrument flight rules used by fixed-wing aircraft.

Charles Royer, Mayor
City of Seattle
Municipal Building
Seattle, WA 98104

Dear Mayor Royer:

Your letter of December 17, 1984 to Larry Thompson, Director of the Puget Sound Health Systems Agency, is very much appreciated. Their study should be of great help to everyone who is concerned about the potential for the increased use of helicopters by hospitals in Seattle.

I would like to cal your attention to some recent actions in Los Angeles that may be relevan to our situation. A news item (enclosed) from the LA Times describes some recently adopted noise abatement guidelines and operating policies for helicopters that may be quite appropriate for Seattle as well. I hope you will examine these materials to see how they could be applied here.

I also encourage you to seek some policy guidance from the DSHS people (Frank Chestnut) in Olympia that make "certificate of need" determinations. Enclosed is some recent correspondence on this topic for your review.

Our neighborhood group has now collected over 500 signatures on a petition that expresses our opposition to a helipad located at Children's Orthopedic Hospital. Your letter requesting policy guidance from the PSHSA is being widely circulated in our neighborhood and is receiving a very good reception. We hope you will continue to maintain an active interest in this city-wide issue.

Yours sincerely,

Jerry Schneider

Mr. Frank Chestnut
Certificate of Need Program
Dept. of Social and Health Services
MS ET-33
Olympia, Washington 98504

Dear Mr. Chestnut:

It is clear that the new helicopter services proposed by Children's Orthopedic Hospital should be subject to a certificate of need review. I request that you require that this be done. There are three main reasons for this request.

1. The cost of the helicopter service will be substantial. Enclosed is an article by Nick Gallo published in The Weekly which summarizes some cost data for helicopter services he found in his investigations. Gallo points out that:

   a. The AMA News estimates the costs for establishing and running a helicopter as over $1 million per year (See note A in The Weekly article).

   b. Dr. Jay Kranz, Chairman of the MAST (Military Assistance to Safety and Traffic) coordinating committee estimates it could cost as much as $40,000 per month to lease a helicopter, which is what Airlift Northwest is likely to do (see note B in The Weekly article).

2. The helicopter service at COH will be a new service since, as COH administrators point out, current air transport is by fixed-wing aircraft. The change to a helicopter is a new service and should have a certificate of need review.

3. The proposed service is likely to increase hospital costs in the entire region by introducing a costly new service; competition among the hospitals will force the other hospitals to acquire this service in the near future. As Dr. Copass (Director of Airlift Northwest) is quoted as saying, "There is not that much work here and competing transport could really drive up costs."(See The Weekly article, note C).

This precedent-setting move is so expensive in both the short- and long-term, that it deserves the thoroughness of review and discussion that only the certificate of need process can accomplish.

I believe you should ask COH to examine seven alternative ways of providing helicopter service to central Seattle hospitals and to estimate the probable costs and benefits of each alternative, 5 and 10 years into the future. These alternatives are as follows:

Alternative 1: Have 1 helipad in city, located at Harborview Hosp.,--to serve all area hospitals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Alternatives 2-4: Have 2 helipads in city
a. one helipad to serve Harborview, V. Mason, Swedish and Providence Hosps.--located at Harborview
b. a second helipad, to serve Univ. Hosp. and C -located at either:

(alternative 2) (1) University Hospital
(alternative 3) (2) UW intramural field (Graves' Field)
(alternative 4) (3) Sandpoint Naval Station area

Alternatives 5-7: Have 3 helipads in city
a. one helipad to serve Harborview, V. Mason, Swedish and Providence Hosps.--located at Harborview
b. second and third helipads, to serve Univ. Hosp. and COH--located at:

(alternative 5) (1) Univ. Hosp. and COH
(alternative 6) (2) Univ. Hosp. and UW intramural field
(alternative 7) (3) Univ. Hosp. and Sandpoint Naval Station area

Please keep me informed as to your decision.

Sincerely,

Anita Francis

Mr. Frank Chestnut
Certificate of Need Unit
Office of State Health Planning
& Development, MS ET-23
Olympia, WA 98504

Dear Mr. Chestnut,

We understand that both the Certificate of Need Unit and the HSA have received inquiries from third parties relating to whether a proposed activity of COHMC is subject to Certificate of Need review.

Since at least 1971, COHMC has provided, and continues to provide, air ambulance services for critically ill or injured children in need of immediate care of COHMC. This transportation has occurred by way of fixed wing aircraft and helicopter during this continuous period.

We are now planning to construct an emergency helistop on the COHMC campus to better support this long-standing service. The helistop does not represent a change in services requiring Certificate of Need review because it is not an emergency service licensed under 18.73 RCW. Actually, the helistop construction project is precisely the same as simply repaving the driveway to an emergency room. Such activity is reviewable only if the expenditure minimum is exceeded. There are no additional staffing or equipment costs, nor is there a change in services as set forth in the regulations.

COHMC has always complied with the spirit and the letter of the Certificate of Need law, and we are simply writing to inform you of this plan, to avoid any confusion that may have been engendered regarding the scope of our proposed activity.

Sincerely,

Dorothy F. Teeter

Dear Ms. Teeter:

This correspondence is in response to your letter received November 27, 1984 concerning Certificate of Need review for a helistop. Before the department can make a formal determination concerning this project, additional information is required. Please provide the department with an explanation of the current agreement for the provision of air ambulance services and a description of how these services will be provided following your proposed construction of a helio-stop. Please include copies of present contractual agreements and any proposed contractual agreements. Also, please include the cost to construct the helistop and the annual operating expense associated with the air ambulance service and the helistop.

If you have any questions regarding this matter, please feel free to contact me at (206) 753-5657.

Sincerely,

RCW 70.38.015 DECLARATION OF PUBLIC POLICY. It is declared to be the public policy of this state:

(1) That health planning to promote, maintain, and assure the health of all citizens in the state, to provide accessible health services, health manpower, health facilities, and other resources while controlling excessive increases in costs, and to recognize prevention as a high priority in health programs, is essential to the health, safety, and welfare of the people of the state. Health planning should be fostered on both a state-wide and regional basis and must maintain responsiveness to changing health and social needs and conditions. Involvement in health planning from both consumers and providers throughout the state should be encouraged. Regional health planning under this chapter and in a manner consistent with RCW 36.70-.015 is declared to be a proper public purpose for the expenditure of funds of counties or other public entities interested in local and regional health planning;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(2) That the development of health services and resources, including the construction, modernization, and conversion of health facilities, should be accomplished in a planned, orderly fashion, consistent with identified priorities and without unnecessary duplication or fragmentation;

(3) That the development and maintenance of adequate health care information, statistics and projections of need for health facilities and services is essential to effective health planning and resources development;

(4) That the development of nonregulatory approaches to health care cost containment should be considered, including the strengthening of price competition;

(5) That health planning should be concerned with financing, access, and quality, recognizing the close interrelationship of the three and emphasizing cost control of health services, including cost-effectiveness and cost-benefit analysis;

(6) That this chapter should be construed to effectuate this policy and to be consistent with requirements of the federal health planning and resources development laws. [1983 c 235 § 1; 1980 c 139 § 1; 1979 ex.s. c 161 § 1.]

RCW 70.38.025 DEFINITIONS. When used in this chapter, the terms defined in this section shall have the meanings indicated.

(1) "Board of health" means the state board of health created pursuant to chapter 43.20 RCW.

(2) "Capital expenditure" is an expenditure, including a force account expenditure (i.e., an expenditure for a construction project undertaken by a facility as its own contractor) which, under generally accepted accounting principles, is not properly chargeable as an expense of operation or maintenance. Where a person makes an acquisition under lease or comparable arrangement, or through donation, which would have required review if the acquisition had been made by purchase, such expenditure shall be deemed a capital expenditure. Capital expenditures include donations of equipment or facilities to a health care facility which if acquired directly by such facility would be subject to certificate of need review under the provisions of this chapter and transfer of equipment or facilities for less than fair market value if a transfer of the equipment or facilities at fair market value would be subject to such review. The cost of any studies, surveys, designs, plans, working drawings, specifications, and other activities essential to the acquisition, improvement, expansion, or replacement of any plant or equipment with respect to which such expenditure is made shall be included in determining the amount of the expenditure.

(3) "Council" means the state health coordinating council created in RCW 70.38.055 and described in Public Law 93-641.

(4) "Department" means the state department of social and health services.

(5) "Expenditure minimum" means, for the purposes of the certificate of need program, one million dollars adjusted by the department by rule to reflect changes in the United States department of commerce composite construction cost index; or a lesser amount required by federal law and established by the department by rule.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(6) "Federal law" means Public Law 93-641, as amended, or its successor.

(7) "Health care facility" means hospices, hospitals, psychiatric hospitals, tuberculosis hospitals, nursing homes, kidney disease treatment centers, ambulatory surgical facilities, rehabilitation facilities, and home health agencies, and includes such facilities when owned and operated by the state or by a political subdivision or instrumentality of the state and such other facilities as required by federal law and implementing regulations, but does not include Christian Science sanatoriums operated, listed, or certified by the First Church of Christ Scientist, Boston, Massachusetts. In addition, the term does not include any nonprofit hospital: (a) Which is operated exclusively to provide health care services for children; (b) which does not charge fees for such services; (c) whose rate reviews are waived by the state hospital commission; and (d) if not contrary to federal law as necessary to the receipt of federal funds by the state.

(8) "Health maintenance organization" means a public or private organization, organized under the laws of the state, which:

(a) Is a qualified health maintenance organization under Title XIII, section 1310(d) of the Public Health Services Act; or

(b) (i) Provides or otherwise makes available to enrolled participants health care services, including at least the following basic health care services: Usual physician services, hospitalization, laboratory, x-ray, emergency, and preventive services, and out-of-area coverage; (ii) is compensated (except for copayments) for the provision of the basic health care services listed in (b)(i) to enrolled participants by a payment which is paid on a periodic basis without regard to the date the health care services are provided and which is fixed without regard to the frequency, extent, or kind of health service actually provided; and (iii) provides physicians' services primarily (A) directly through physicians who are either employees or partners of such organization, or (B) through arrangements with individual physicians or one or more groups of physicians (organized on a group practice or individual practice basis).

(9) "Health services" means clinically related (i.e., preventive, diagnostic, curative, rehabilitative, or palliative) services and includes alcoholism, drug abuse, and mental health services and as defined in federal law.

(10) "Health service area" means a geographic region appropriate for effective health planning which includes a broad range of health services and a population of at least four hundred fifty thousand persons.

(11) "Institutional health services" means health services provided in or through health care facilities and entailing annual operating costs of at least five hundred thousand dollars adjusted by the department by rule to reflect changes in the United States department of commerce composite construction cost index; or a lesser amount required by federal law and established by the department by rule: *PROVIDED, That no new health care facility may be initiated as an institutional health service.

(12) "Major medical equipment" means medical equipment which is used for the provision of medical and other health services and which costs in excess of one million dollars, adjusted by the department by rule to reflect changes in the United States department of commerce

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

composite construction cost index; or a lesser amount required by federal law and established by the department by rule; except that such term does not include medical equipment acquired by or on behalf of a clinical laboratory to provide clinical laboratory services if the clinical laboratory is independent of a physician's office and a hospital and it has been determined under Title XVIII of the Social Security Act to meet the requirements of paragraphs (10) and (11) of section 1861(s) of such act;

(13) "Person" means an individual, a trust or estate, a partnership, a corporation (including associations, joint stock companies, and insurance companies), the state, or a political subdivision or instrumentality of the state, including a municipal corporation or a hospital district.

(14) "Provider" generally means a health care professional or an organization, institution, or other entity providing health care but the precise definition for this term shall be established by rule of the department, consistent with federal law.

(15) "Public health" means the level of well-being of the general population; those actions in a community necessary to preserve, protect, and promote the health of the people for which government is responsible; and the governmental system developed to guarantee the preservation of the health of the people.

(16) "Regional health council" means a public regional planning body or a private nonprofit corporation which is organized and operated in a manner that is consistent with the laws of the state and which is capable of performing each of the functions described in RCW 70.38.085. A regional health council shall have a governing body for health planning which is composed of a majority (but not more than sixty percent of the members) of persons who are residents of the health service area served by the entity; who are consumers of health care; who are broadly representative of the social, economic, linguistic, and racial populations, and geographic areas of the health service area, and major purchasers of health care; and who are not, nor within the twelve months preceding appointment have been, providers of health care. The remainder of the members shall be residents of the health service area served by the agency who are providers of health care.

(17) "Regional health plan" means a document which provides at least a statement of health goals and priorities for the health service area. In addition, it sets forth the number, type, and distribution of health facilities, services, and manpower needed within the health service area to meet the goals of the plan.

(18) "State health plan" means a document developed in accordance with RCW 70.38.065. [1983 1st ex.s. c 41 { 43; 1983 c 235 { 2; 1982 c 119 { 1; 1980 c 139 { 2; 1979 ex.s. c 161 { 2.]

NOTES:

*Reviser's note: This proviso was originally added to RCW 70.38-.025 in Senate Bill No. 4204 [1983 c 235]. Reengrossed Substitute Senate Bill No. 3660 [1983 1st ex.s. c 41] amended RCW 70.38.025 as it existed after its amendment by Senate Bill No. 4204. The governor vetoed the proviso in Senate Bill No. 4204 but not in Reengrossed Substitute Senate Bill No. 3660.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Severability--1983 1st ex.s. c 41: See note following RCW 26.09.060.

RCW 70.38.035 STATE HEALTH PLANNING AND DEVELOPMENT AGENCY--DESIGNATION. The department is designated as the state health planning and development agency. The department is designated as the agency of this state to accept, receive, retain, and administer federal funds made available for health planning and the certificate of need program. Nothing in this chapter shall be construed to affect the authority of the state hospital commission pursuant to chapter 70.39 RCW. [1983 c 235 { 3; 1979 ex.s. c 161 { 3.]

RCW 70.38.045 DEPARTMENT PLANNING AND DEVELOPMENT DUTIES AND POWERS. The department is authorized and empowered to:

(1) Exercise such duties and powers as are prescribed for state health planning and development agencies in federal law, consistent with the policy of this chapter;

(2) Assist the state health coordinating council in determining state-wide needs and conducting health planning activities, review the state health plan as developed by the council and submit the plans and recommendations as to approval or modification to the governor, and implement the state health plan as approved by the governor. In implementing the state health plan, the department shall be assisted by such other agencies of state government as the governor may designate;

(3) Consider recommendations from the council and assign, subject to the continuing approval of the council, an executive director, who shall be exempt from chapter 41.06 RCW, and provide such additional dedicated staffing assistance as necessary for the performance of its functions to work under the direction and supervision of the director;

(4) Serve as the designated planning agency of the state for the purposes of section 1122 of the Social Security Act, if the department maintains an agreement with the secretary, United States department of health and human services pursuant to section 1122 of Public Law 92-603, and administer a state certificate of need program as provided in RCW 70.38.105, 70.38.115, and 70.38.125;

(5) After consideration of recommendations, if any, submitted by the designated regional health councils respecting proposed undertakings which are subject to certificate of need review under the provisions of this chapter, making findings as to the need for such undertakings;

(6) Coordinate and consult in the conduct of its authorized activities with the Washington state hospital commission, the council, designated regional health councils, and other state agencies designated by the governor;

(7) Consider the recommendations of the council, designated regional health councils, and the state health plan in development of its biennial budget; and

(8) Approve and deny applications for certificates of need. [1983 c 235 { 4; 1980 c 139 { 3; 1979 ex.s. c 161 { 4.]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

RCW 70.38.055 HEALTH COORDINATING COUNCIL. (1) There is established a state health coordinating council.

(2) The council shall be composed of members who shall be appointed by the governor in accordance with the provisions of Public Law 93-641 and shall be considered appointed officials for whom compliance with section 1, chapter 104, Laws of 1975-'76 2nd ex. sess., (Ref. Bill No. 36), RCW 42.17.240, is required.

(3) The council shall, in addition to the appointed members, include as nonvoting, ex officio members the chairpersons of the house and senate committees on social and health services, the secretary of the department, the chairman of the hospital commission, or their designees, and an individual whom the chief medical director of the veterans administration shall have designated as a representative of the veterans administration.

(4) The council shall have a chairperson designated by the governor by and with the consent of the senate from among the members of the council who shall serve a one-year term.

(5) The council shall conduct all of its business meetings in public pursuant to the "Open Public Meetings Act of 1971", chapter 42.30 RCW, and shall meet at least once in each calendar quarter of a year. Books and records of the council shall be subject to public disclosure in accordance with RCW 42.17.250 through 42.17.340.

(6) Members of the council shall serve without pay, but shall be entitled to reimbursement for travel expenses incurred as provided in RCW 43.03.050 and 43.03.060.

(7) The governor shall have the power to stagger the terms of the members so that one-third thereof may be appointed for an original term of one year, one-third for an original term of two years, and one-third for an original term of three years, with all subsequent appointments to be for terms of three years. [1980 c 139 { 4; 1979 ex.s. c 161 { 5.]

NOTES:

Executive director of health coordinating council to serve on technical advisory committee to hospital commission: RCW 70.39.070.

RCW 70.38.065 COUNCIL DUTIES AND POWERS. The council is authorized and empowered to

(1) Exercise such duties and powers as are required for state-wide health coordinating councils in federal law.

(2) Establish, in consultation with the designated regional health councils, requirements for a uniform format and content for materials to be submitted by regional health councils to assist in development of the state health plan, and develop at least biennially the state health plan.

(3) Submit the council-adopted health plan to the secretary for review and comment and submission to the governor for adoption as the state health plan for the state. The governor may disapprove or modify the plan. The governor, in disapproving or modifying a state health plan, shall make public a written explanation of the actions taken. As approved by the governor, the plan shall be the state health plan. [1983 c 235 { 5; 1980 c 139 { 5; 1979 ex.s. c 161 { 6.]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTES:

Applicants for regulation of health professions--Review of written reports by council: RCW 18.120.040.

RCW 70.38.085 REGIONAL HEALTH COUNCILS--AREAS--FUNCTIONS. The council shall establish health service areas within the state and designate regional health councils organized, composed, and established in accordance with this chapter and criteria established by the council, considering the resources available for such purpose.

Each designated regional health council shall have as its primary responsibility the provision of effective health planning for its health service area and the promotion of health services, manpower, and facilities which meet identified needs and reduce documented inefficiencies. To meet its primary responsibility, a designated regional health council shall carry out the following functions:

(1) Exercise such duties, powers, and responsibilities as are prescribed for health systems agencies in federal law, consistent with the policy of this chapter.

(2) Identify local health problems and concerns and assemble and analyze health data and information consistent with the requirements of the board;

(3) Develop, consistent with the criteria established by the council, other materials of assistance to the council in preparation of the state health plan;

(4) Review and make recommendations to the council respecting the need for health services in the health service area of the council;

(5) Seek the assistance of individuals and public and private entities in the health service area, to the extent practicable; and

(6) Exercise such other duties and functions as may be established by the council or department to fulfill the intent and purposes of this chapter, which may include review, analysis, and recommendations on applications for certificates of need.

In addition, the regional health councils may establish, biennially review, and amend as necessary a regional health plan which provides at least a statement of health goals and priorities for the health service area and sets forth the number, type, and distribution of health facilities, services, and manpower needed within the health service area to meet the goals of the plan. [1983 c 235 { 6; 1980 c 139 { 6; 1979 ex.s. c 161 { 8.]

RCW 70.38.095 PUBLIC DISCLOSURE. Public accessibility to records shall be accorded by health systems agencies pursuant to Public Law 93-641 and RCW 42.17.250 through 42.17.340. A health systems agency shall be considered a "public agency" for the sole purpose of complying with the "Open Public Meetings Act of 1971", chapter 42.30 RCW. [1979 ex.s. c 161 { 9.]

RCW 70.38.105 HEALTH SERVICES AND FACILITIES REQUIRING CERTIFICATE OF NEED. (1) The department is authorized and directed to implement the certificate of need program in this state pursuant to the provisions of this chapter.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(2) There shall be a state certificate of need program which is administered consistent with the requirements of federal law as necessary to the receipt of federal funds by the state.

(3) No person shall engage in any undertaking which is subject to certificate of need review under subsection (4) of this section without first having received from the department either a certificate of need or an exception granted in accordance with this chapter.

(4) The following shall be subject to certificate of need review under this chapter:

(a) The construction, development, or other establishment of a new health care facility;

(b) The sale, purchase, or lease of part or all of any existing hospital as defined in RCW 70.39.020;

(c) Any capital expenditure by or on behalf of a health care facility which substantially changes the services of the facility after January 1, 1981, provided that the substantial changes in services are specified by the department in rule;

(d) Any capital expenditure by or on behalf of a health care facility which exceeds the expenditure minimum as defined by RCW 70.38.025. However, a capital expenditure which is not subject to certificate of need review under (a), (b), (c), (e), (f), or (g) of this subsection and which is solely for any one or more of the following is not subject to certificate of need review except to the extent required by the federal government as a condition to receipt of federal assistance and does not substantially affect patient charges:

(i) Communications and parking facilities;

(ii) Mechanical, electrical, ventilation, heating, and air conditioning systems;

(iii) Energy conservation systems;

(iv) Repairs to, or the correction of, deficiencies in existing physical plant facilities which are necessary to maintain state licensure;

(v) Acquisition of equipment, including data processing equipment, which is not or will not be used in the direct provision of health services;

(vi) Construction which involves physical plant facilities, including administrative and support facilities, which are not or will not be used for the provision of health services;

(vii) Acquisition of land; and

(viii) Refinancing of existing debt;

(e) A change in bed capacity of a health care facility which increases the total number of licensed beds or redistributes beds among facility and service categories of acute care, skilled nursing, intermediate care, and boarding home care if the bed redistribution is to be effective for a period in excess of six months;

(f) Acquisition of major medical equipment:

(i) If the equipment will be owned by or located in a health care facility; or

(ii) If, after January 1, 1981, the equipment is not to be owned by or located in a health care facility, the department finds consistent with federal regulations the equipment will be used to provide services for hospital inpatients, or the person acquiring such equipment did not notify the department of the intent to acquire such equipment at least thirty days before entering into contractual arrangements for such acquisition;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(g) Any new institutional health services which are offered in or through a health care facility, and which were not offered on a regular basis by, in, or through such health care facility within the twelve-month period prior to the time such services would be offered; and

(h) Any expenditure by or on behalf of a health care facility in excess of the expenditure minimum made in preparation for any undertaking under subsection (4) of this section and any arrangement or commitment made for financing such undertaking. Expenditures of preparation shall include expenditures for architectural designs, plans, working drawings, and specifications. The department may issue certificates of need permitting predevelopment expenditures, only, without authorizing any subsequent undertaking with respect to which such predevelopment expenditures are made.

(5) No person may divide a project in order to avoid review requirements under any of the thresholds specified in this section. [1984 c 288 § 21; 1983 c 235 § 7; 1982 c 119 § 2; 1980 c 139 § 7; 1979 ex.s. c 161 § 10.]

NOTES:

Severability--1984 c 288: See note following RCW 70.39.010.

Effective date--1980 c 139: See RCW 70.38.916.

Effective dates--1979 ex.s. c 161: See RCW 70.38.915.

RCW 70.38.111 CERTIFICATES OF NEED--EXEMPTIONS. (1) The department shall not require a certificate of need for the offering of an inpatient institutional health service or the acquisition of major medical equipment for the provision of an inpatient institutional health service or the obligation of a capital expenditure for the provision of an inpatient institutional health service by--

(a) a health maintenance organization or a combination of health maintenance organizations if (i) the organization or combination of organizations has, in the service area of the organization or the service areas of the organizations in the combination, an enrollment of at least fifty thousand individuals, (ii) the facility in which the service will be provided is or will be geographically located so that the service will be reasonably accessible to such enrolled individuals, and (iii) at least seventy-five percent of the patients who can reasonably be expected to receive the institutional health service will be individuals enrolled with such organization or organizations in the combination,

(b) a health care facility if (i) the facility primarily provides or will provide inpatient health services, (ii) the facility is or will be controlled, directly or indirectly, by a health maintenance organization or a combination of health maintenance organizations which has, in the service area of the organization or service areas of the organizations in the combination, an enrollment of at least fifty thousand individuals, (iii) the facility is or will be geographically located so that the service will be reasonably accessible to such enrolled individuals, and (iv) at least seventy-five percent of the patients who can reasonably be expected to receive the institutional

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

health service will be individuals enrolled with such organization or organizations in the combination, or

(c) a health care facility (or portion thereof) if (i) the facility is or will be leased by a health maintenance organization or combination of health maintenance organizations which has, in the service area of the organization or the service areas of the organizations in the combination, an enrollment of at least fifty thousand individuals and, on the date the application is submitted under subsection (2) of this section, at least fifteen years remain in the term of the lease, (ii) the facility is or will be geographically located so that the service will be reasonably accessible to such enrolled individuals, and (iii) at least seventy-five percent of the patients who can reasonably be expected to receive the institutional health service will be individuals enrolled with such organization,

if, with respect to such offering, acquisition, or obligation, the department has, upon application under subsection (2) of this section, granted an exemption from such requirement to the organization, combination of organizations, or facility.

(2) A health maintenance organization, combination of health maintenance organizations, or health care facility shall not be exempt under subsection (1) of this section from obtaining a certificate of need before offering an institutional health service, acquiring major medical equipment, or obligating capital expenditures unless--

(a) it has submitted at least thirty days prior to the offering of an institutional health service, acquiring major medical equipment, or obligating capital expenditures in excess of the expenditure minimum an application for such exemption, and

(b) the application contains such information respecting the organization, combination, or facility and the proposed offering, acquisition, or obligation as the department may require to determine if the organization or combination meets the requirements of subsection (1) of this section or the facility meets or will meet such requirements, and

(c) the department approves such application. The department shall approve or disapprove an application for exemption within thirty days of receipt of a completed application. In the case of a proposed health care facility (or portion thereof) which has not begun to provide institutional health services on the date an application is submitted under this subsection with respect to such facility (or portion), the facility (or portion) shall meet the applicable requirements of subsection (1) of this section when the facility first provides such services. The department shall approve an application submitted under this subsection if it determines that the applicable requirements of subsection (1) of this section are met.

(3) A health care facility (or any part thereof) or medical equipment with respect to which an exemption was granted under subsection (1) of this section may not be sold or leased and a controlling interest in such facility or equipment or in a lease of such facility or equipment may not be acquired and a health care facility described in (1)(c) which was granted an exemption under subsection (1) of this section may not be used by any person other than the lessee described in (1)(c) unless--

(a) the department issues a certificate of need approving the sale, lease, acquisition, or use, or

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(b) the department determines, upon application, that (i) the entity to which the facility or equipment is proposed to be sold or leased, which intends to acquire the controlling interest, or which intends to use the facility is a health maintenance organization or a combination of health maintenance organizations which meets the requirements of (1)(a) (i), and (ii) with respect to such facility or equipment, meets the requirements of (1)(a) (ii) or (iii) or the requirements of (1)(b) (i) and (ii).

(4) In the case of a health maintenance organization, an ambulatory care facility, or a health care facility, which ambulatory or health care facility is controlled, directly or indirectly, by a health maintenance organization or a combination of health maintenance organizations, the department may under the program apply its certificate of need requirements only to the offering of inpatient institutional health services and the acquisition of major medical equipment and the obligation of capital expenditures for the offering of inpatient institutional health services, and then only to the extent that such offering, acquisition, or obligation is not exempt under the provisions of this section. [1982 c 119 { 3; 1980 c 139 { 9.]

RCW 70.38.115 CERTIFICATES OF NEED--PROCEDURES--RULES--CRITERIA FOR REVIEW--CONDITIONAL CERTIFICATES OF NEED--CONCURRENT REVIEW--REVIEW PERIODS--HEARING--ADMINISTRATIVE REVIEW--AMENDED CERTIFICATES OF NEED. (1) Certificates of need shall be issued, denied, suspended, or revoked by the designee of the secretary of the department in accord with the provisions of this chapter and rules of the department which establish review procedures and criteria for the certificate of need program.

(2) Criteria for the review of certificate of need applications, except as provided in subsection (3) of this section for health maintenance organizations, shall include but not be limited to consideration of the following:

(a) The relationship of the health services being reviewed to the applicable health plans;

(b) The need that the population served or to be served by such services has for such services;

(c) The availability of less costly or more effective alternative methods of providing such services;

(d) The financial feasibility and the probable impact of the proposal on the cost of and charges for providing health services in the community to be served, including findings and recommendations of the Washington state hospital commission in the case of applications submitted by hospitals. An application by a hospital shall be denied if the state hospital commission does not recommend approval, unless the secretary provides the commission with a written statement setting forth the reason or reasons, and citing the applicable subsection or subsections of this section, for approving an application that the commission has determined to be not feasible;

(e) In the case of health services to be provided, (i) the availability of alternative uses of project resources for the provision of other health services, (ii) the extent to which such proposed services will be accessible to all residents of the area to be served, and (iii) the need for and the availability in the community of services and facilities for osteopathic and allopathic physicians and their

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

patients. The department shall consider the application in terms of its impact on existing and proposed institutional training programs for doctors of osteopathy and medicine at the student, internship, and residency training levels;

(f) In the case of a construction project, the costs and methods of the proposed construction, including the cost and methods of energy provision, and the probable impact of the construction project reviewed (i) on the cost of providing health services by the person proposing such construction project and (ii) on the cost and charges to the public of providing health services by other persons;

(g) The special needs and circumstances of osteopathic hospitals, nonallopathic services and children's hospitals;

(h) Improvements or innovations in the financing and delivery of health services which foster cost containment and serve to promote quality assurance and cost-effectiveness;

(i) In the case of health services proposed to be provided, the efficiency and appropriateness of the use of existing services and facilities similar to those proposed;

(j) In the case of existing services or facilities, the quality of care provided by such services or facilities in the past; and

(k) In the case of hospital certificate of need applications, whether the hospital meets or exceeds the regional average level of charity care, as determined by the hospital commission.

(3) A certificate of need application of a health maintenance organization or a health care facility which is controlled, directly or indirectly, by a health maintenance organization, shall be approved by the department if the department finds:

(a) Approval of such application is required to meet the needs of the members of the health maintenance organization and of the new members which such organization can reasonably be expected to enroll; and

(b) The health maintenance organization is unable to provide, through services or facilities which can reasonably be expected to be available to the organization, its institutional health services in a reasonable and cost-effective manner which is consistent with the basic method of operation of the organization and which makes such services available on a long-term basis through physicians and other health professionals associated with it.

A health care facility (or any part thereof) or medical equipment with respect to which a certificate of need was issued under this subsection may not be sold or leased and a controlling interest in such facility or equipment or in a lease of such facility or equipment may not be acquired unless the department issues a certificate of need approving the sale, acquisition, or lease.

(4) The decision of the department on a certificate of need application shall be consistent with the state health plan in effect, except in emergency circumstances which pose a threat to the public health. The department in making its final decision may issue a conditional certificate of need if it finds that the project is justified only under specific circumstances. The conditions shall directly relate to the project being reviewed. The conditions may be released if it can be substantiated that the conditions are no longer valid and the release of such conditions would be consistent with the purposes of this chapter.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(5) Criteria adopted for review in accordance with subsection (2) of this section may vary according to the purpose for which the particular review is being conducted or the type of health service reviewed.

(6) The department shall specify information to be required for certificate of need applications. Within fifteen days of receipt of the application, the department shall request additional information considered necessary to the application or start the review process. Applicants may decline to submit requested information through written notice to the department, in which case review starts on the date of receipt of the notice. Applications may be denied or limited because of failure to submit required and necessary information.

(7) Concurrent review is for the purpose of comparative analysis and evaluation of competing or similar projects in order to determine which of the projects may best meet identified needs. Categories of projects subject to concurrent review include at least new health care facilities, new services, and expansion of existing health care facilities. The department shall specify time periods for the submission of applications for certificates of need subject to concurrent review, which shall not exceed ninety days. Review of concurrent applications shall start fifteen days after the conclusion of the time period for submission of applications subject to concurrent review. Concurrent review periods shall be limited to one hundred fifty days, except as provided for in rules adopted by the department authorizing and limiting amendment during the course of the review, or for an unresolved pivotal issue declared by the department.

(8) Review periods for certificate of need applications other than those subject to concurrent review shall be limited to ninety days. Review periods may be extended up to thirty days if needed by a review agency, and for unresolved pivotal issues the department may extend up to an additional thirty days. A review may be extended in any case if the applicant agrees to the extension.

(9) The department or a designated regional health council shall conduct a public hearing on a certificate of need application if requested unless the review is expedited or subject to emergency review. The department by rule shall specify the period of time within which a public hearing must be requested and requirements related to public notice of the hearing, procedures, recordkeeping and related matters.

(10) Any applicant denied a certificate of need or whose certificate of need has been suspended or revoked shall be afforded an opportunity for administrative review in accordance with chapter 34.04 RCW and a hearing shall be held within one hundred twenty days of a request therefor. An administrative law judge shall review the decision of the secretary's designee and render a proposed decision for consideration by the secretary in accordance with chapter 34.12 RCW or remand the matter to the secretary's designee for further consideration. The secretary's final decision is subject to review by the superior court as provided in chapter 34.04 RCW.

(11) The department may establish procedures and criteria for reconsideration of decisions.

(12) An amended certificate of need shall be required for the following modifications of an approved project:

(a) A new service;

(b) An expansion of a service beyond that originally approved;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(c) An increase in bed capacity;

(d) A significant reduction in the scope of a project without a commensurate reduction in the cost of the project, or a cost increase (as represented in bids on a construction project or final cost estimates acceptable to the person to whom the certificate of need was issued) if the total of such increases exceeds twelve percent or fifty thousand dollars, whichever is greater, over the maximum capital expenditure approved. The review of reductions or cost increases shall be restricted to the continued conformance of the project with the review criteria pertaining to financial feasibility and cost containment.

(13) An application for a certificate of need for a capital expenditure which is determined by the department to be required to eliminate or prevent imminent safety hazards or correct violations of applicable licensure and accreditation standards shall be approved. [1984 c 288 § 22; 1983 c 235 § 8; 1980 c 139 § 8; 1979 ex.s. c 161 § 11.]

NOTES:

Severability--1984 c 288: See note following RCW 70.39.010.

Effective date--1980 c 139: See RCW 70.38.916.

Effective dates--1979 ex.s. c 161: See RCW 70.38.915.

RCW 70.38.125 CERTIFICATES OF NEED--ISSUANCE--DURATION--PENALTIES FOR VIOLATIONS. (1) A certificate of need shall be valid for two years: PROVIDED, That one six-month extension may be made if it can be substantiated that substantial and continuing progress toward commencement of the project has been made as defined by regulations to be adopted pursuant to this chapter.

(2) A project for which a certificate of need has been issued shall be commenced during the validity period for the certificate of need.

(3) The department, in cooperation with the regional health councils, and the hospital commission in the case of hospital projects, shall monitor the costs and components of approved projects to assure conformance with certificates of need that have been issued. Rules and regulations adopted shall specify when changes in the cost or components of a project require reevaluation of the project. The department may require applicants to submit periodic progress reports on approved projects or other information as may be necessary to effectuate its monitoring responsibilities.

(4) The secretary of the department, in the case of a new health facility, shall not issue any license unless and until a prior certificate of need shall have been issued by the department for the offering or development of such new health facility.

(5) Any person who engages in any undertaking which requires certificate of need review without first having received from the department either a certificate of need or an exception granted in accordance with this chapter shall be liable to the state in an amount

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

not to exceed one hundred dollars a day for each day of such unauthorized offering or development. Such amounts of money shall be recoverable in an action brought by the attorney general on behalf of the state in the superior court of any county in which the unauthorized undertaking occurred. Any amounts of money so recovered by the attorney general shall be deposited in the state general fund.

(6) The department may bring any action to enjoin a violation or the threatened violation of the provisions of this chapter or any rules and regulations adopted pursuant to this chapter, or may bring any legal proceeding authorized by law, including but not limited to the special proceedings authorized in Title 7 RCW, in the superior court in the county in which such violation occurs or is about to occur, or in the superior court of Thurston county. [1983 c 235 § 9; 1980 c 139 § 10; 1979 ex.s. c 161 § 12.]

NOTES:

Effective date--1980 c 139: See RCW 70.38.916.

Effective date--1979 ex.s. c 161: See RCW 70.38.915.

RCW 70.38.135 DEPARTMENT SERVICES AND SURVEYS--RULES. The secretary of the department shall have authority to:

(1) Provide when needed temporary or intermittent services of experts or consultants or organizations thereof, by contract, when such services are to be performed on a part time or fee-for-service basis;

(2) Make or cause to be made such on-site surveys of health care or medical facilities as may be necessary to the development of the state health plan and the administration of the certificate of need program;

(3) Upon review of recommendations, if any, from the board of health:

(a) Promulgate rules under which health care facilities providers doing business within the state shall submit to the department such data related to health and health care as the department finds necessary to the performance of its functions under this chapter;

(b) Promulgate rules pertaining to the maintenance and operation of medical facilities which receive federal assistance under the provisions of Title XVI;

(c) Promulgate rules in implementation of the provisions of this chapter, including the establishment of procedures for public hearings for predecisions and post-decisions on applications for certificate of need;

(d) Promulgate rules providing circumstances and procedures of expedited certificate of need review if:

(i) An application is found consistent with the state health plan; and

(ii) There has not been a significant change in existing health facilities of the same type or in the need for such health facilities and services;

(4) Grant allocated state funds to regional health councils to fund not more than seventy-five percent of the costs of regional planning activities, excluding costs related to review of applications for

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

certificates of need, provided for in this chapter or approved by the council; and

(5) Contract with and provide reasonable reimbursement for designated regional health councils to assist in determinations of certificates of need. [1983 c 235 { 10; 1979 ex.s. c 161 { 13.]

RCW 70.38.145 LONG-RANGE HEALTH FACILITY PLANS. (1) Long-range health facility plans shall be filed with the appropriate health systems agency effective January 1, 1984. In order to ensure a streamlined planning process with the minimum of duplication, a common form for such plan shall be developed by the department, in cooperation with the health systems agencies and the Washington state hospital commission, which shall also be utilized as the three-year capital expenditure plan required by the hospital commission.

(2) The health systems agency shall review all such health facility plans in its area, identify any significant inconsistencies with the health systems plan for that area, and assist hospitals to cooperatively resolve inconsistencies among their plans and the health systems plan.

(3) An expedited certificate of need review shall be conducted by the department when:

(a) Long-range health facility plans have been developed in accordance with the requirements of this section; and

(b) When an application for a certificate of need has been found to be consistent with the applicant's long-range health facility plan and the applicable health systems plan, annual implementation plan, state health plan, and state medical facilities plan; and

(c) When there has not been a significant change, since the long-range health facility plan was approved, in existing health facilities of the same type or in the need for such health facilities and services. [1979 ex.s. c 161 { 14.]

RCW 70.38.155 CERTIFICATES OF NEED--SAVINGS CLAUSE. The enactment of this chapter shall not have the effect of terminating, or in any way modifying the validity of any certificate of need which shall already have been issued prior to *the effective date of this act. [1979 ex.s. c 161 { 15.]

NOTES:

*Reviser's note: "the effective date of this act", see RCW 70.38.915.

RCW 70.38.156 CERTIFICATES OF NEED--SAVINGS. The enactment of this chapter as amended shall not have the effect of terminating, or in any way modifying the validity of any certificate of need which shall already have been issued prior to *the effective date of this 1980 act. [1980 c 139 { 11.]

Office Of The Mayor
City of Seattle

Charles Royer, Mayor

December 17, 1984

RECEIVED
DEC 21 1984
Dept. of Construction & Land Use

Larry Thompson
Executive Director
Puget Sound Health Systems
Agency
601 Valley Street
Seattle, Washington 98109

Dear Mr. Thompson:

I am writing to seek the policy guidance of your agency with regard to the development of emergency helicopter landing facilities at hospitals in the City of Seattle.

I am concerned that without guidance from the health planning system, these facilities are likely to proliferate in response to the competitive pressures at work within the health care industry in our region. This trend could put additional upward pressure on the costs of health services and create severe environmental problems for neighborhoods with medical facilities nearby.

The City of Seattle has the responsibility to address the land use implications of hospital helipads, but we wish to do so in the context of sound health policy. Therefore, we would appreciate the agency's response to the following questions:

- In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?
- How frequently is this means of emergency transport required?
- How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?
- Which Seattle hospitals are best suited to meet the identified need?
- What alternatives are available for transporting patients, and what are the medical implications?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I recognize that the Health Systems Agency may not yet have formal policies on this issue, but I believe your board will reflect the range of concerns held by the general public. It will be very important that we have your guidance as we weigh the human and environmental impact of our decisions.

I very much appreciate your willingness to consider this issue.

Sincerely,

Charles Royer

Charles Royer

December 17, 1984

Larry Thompson
Executive Director
Puget Sound Health Systems
Agency
601 Valley Street
Seattle, Washington 98109

Dear Mr. Thompson:

I am writing to seek the policy guidance of your agency with regard to the development of emergency helicopter landing facilities at hospitals in the City of Seattle.

I am concerned that without guidance from the health planning system, these facilities are likely to proliferate in response to the competitive pressures at work within the health care industry in our region. This trend could put additional upward pressure on the costs of health services and create severe environmental problems for neighborhoods with medical facilities nearby.

The City of Seattle has the responsibility to address the land use implications of hospital helipads, but we wish to do so in the context of sound health policy. Therefore, we would appreciate the agency's response to the following questions:

- In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?
- How frequently is this means of emergency transport required?
- How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?
- Which Seattle hospitals are best suited to meet the identified need?
- What alternatives are available for transporting patients, and what are the medical implications?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I recognize that the Health Systems Agency may not yet have formal policies on this issue, but I believe your board will reflect the range of concerns held by the general public. It will be very important that we have your guidance as we weigh the human and environmental impact of our decisions.

I very much appreciate your willingness to consider this issue.

Sincerely,

Charles Royer

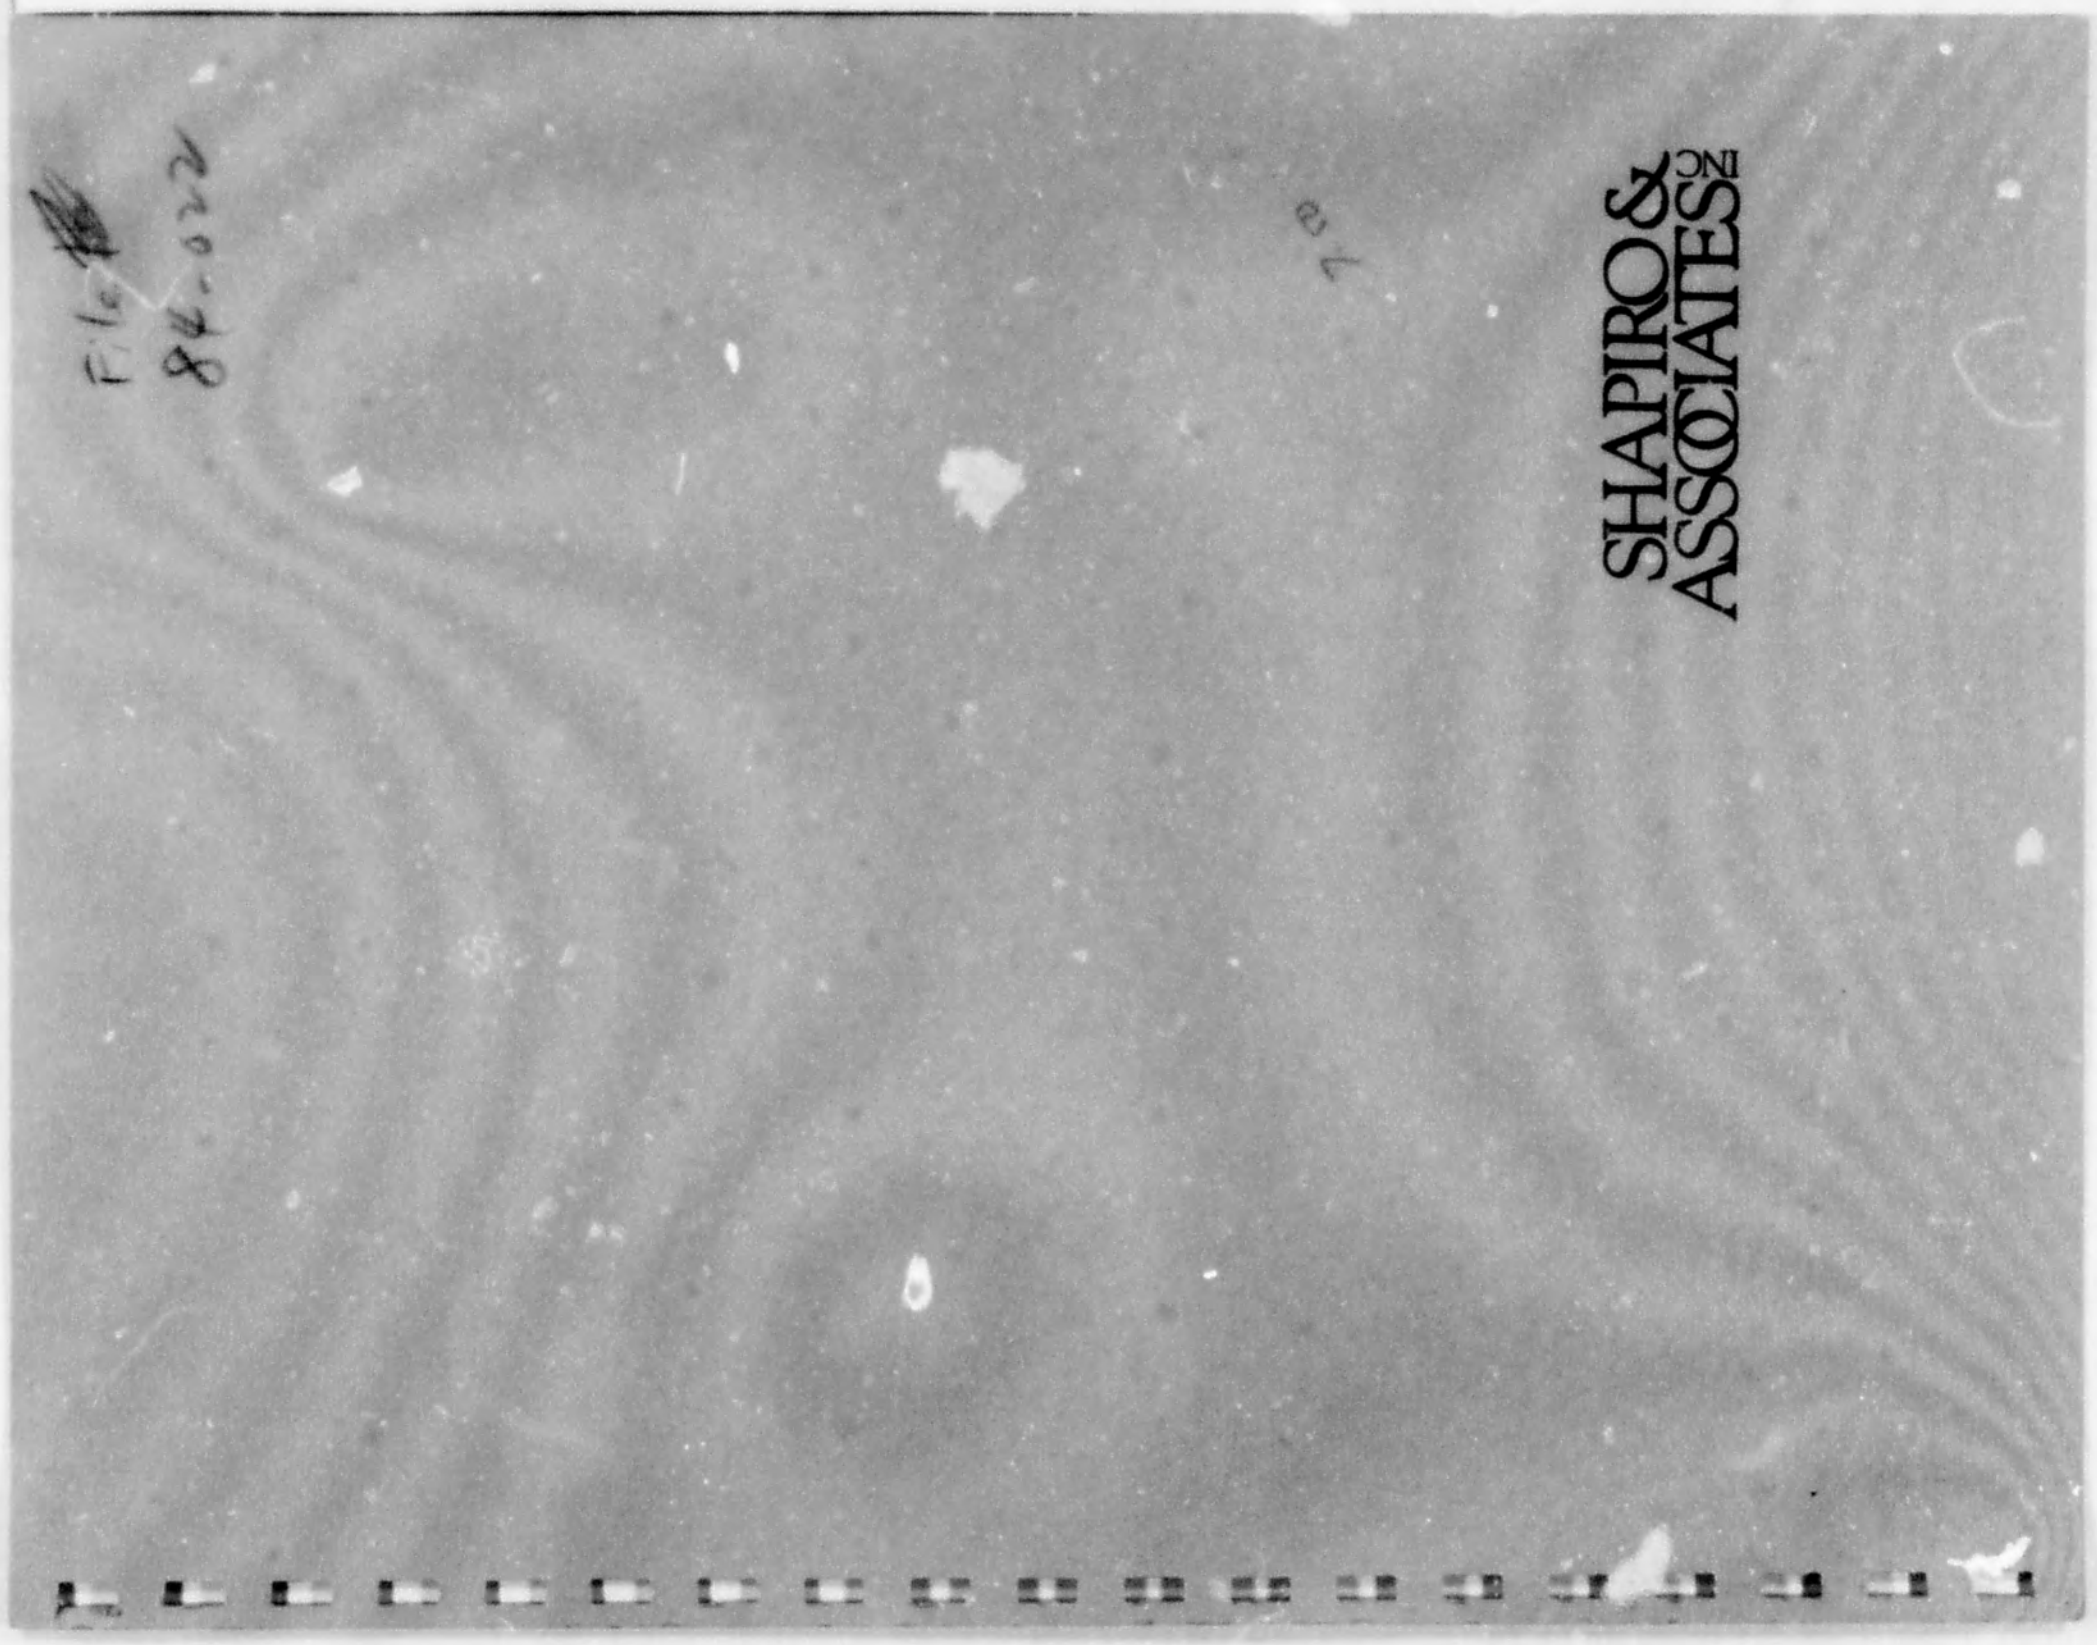
From: Craig Jackson

Re: INFANT TRANSPORTS: AIR VS. GROUND



While on call for the Hotline, I have been asked to arrange the transport of high risk infants to Seattle from hospitals that are outside the usual driving range of the CHMC-UW infant transport service, such as Bellingham (89 miles). I have found that the quickest way to move the patient to Seattle is for the referring hospital to assemble their own transport team (usually a nurse and respiratory therapist). Occasionally this is not possible and a ground or air transport team from Seattle is required. In the attached analysis, I have compared three modes of infant transport by compiling data from Sue Engman, Lori Kitchin, and some phone calls of my own. The total elapsed time required is given first. The second column is relevant when the patient requires stabilization by the Seattle team prior to leaving the referring hospital. The third column is relevant if the time "in transit" (outside either hospital) must be kept as brief as possible. Costs are included in the last column.

It is my hope that these data will help others who often wonder, "how long does it take?" and "how much does it cost?"

IT IS DUE TO THE QUALITY OF THE DOCUMENT.

25.05.960 ENVIRONMENTAL CHECKLIST.

ENVIRONMENTAL CHECKLIST

Purpose of Checklist.

The State Environmental Policy Act (SEPA), chapter 43.21 RCW, requires all governmental agencies to consider the environmental impacts of a proposal before making decisions. An environmental impact statement (EIS) must be prepared for all proposals with probable significant adverse impacts on the quality of the environment. The purpose of this checklist is to provide information to help you and the agency identify impacts from your proposal (and to reduce or avoid impacts from the proposal, if it can be done) and to help the agency decide whether an EIS is required.

Instructions for Applicants.

This environmental checklist asks you to describe some basic information about your proposal. Governmental agencies use this checklist to determine whether the environmental impacts of your proposal are significant, requiring preparation of an EIS. Answer the questions briefly, with the most precise information known, or give the best description you can.

You must answer each question accurately and carefully, to the best of your knowledge. In most cases you should be able to answer the questions from your own observations or project plans without the need to hire experts. If you really do not know the answer, or if a question does not apply to your proposal, write "do no know" or "does not apply." Complete answers to the questions now may avoid unnecessary delays later.

Some questions ask about governmental regulations, such as zoning, shoreline, and landmark designations. Answer these questions if you can. If you have problems, the governmental agencies can assist you.

The checklist questions apply to all parts of your proposal, even if you plan to do them over a period of time or on different parcels of land. Attach any additional information that will help describe your proposal or its environmental effects. The agency to which you submit this checklist may ask you to explain your answers or provide additional information reasonably related to determining if there may be significant adverse impact.

Use of Checklist for Nonproject Proposals.

Complete this checklist for nonproject proposals, even though questions may be answered "does not apply." IN ADDITION, complete the SUPPLEMENTAL SHEET FOR NONPROJECT ACTIONS (part D).

For nonproject actions, the references in the checklist to the words "project," "applicant," and "property or site" should be read as "proposal," "proposer," and "affected geographic area," respectively.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A. BACKGROUND

1. Name of proposed project, if applicable:
   Emergency Helistop for Children's Orthopedic Hospital and Medical Center

2. Name of applicant:
   Children's Orthopedic Hospital and Medical Center

3. Address and phone number of applicant and contact person:
   4800 Sand Point Way N.E.
   Seattle, WA 98105
   Contact: Dorothy Teeter
   (206) 526-2004

4. Date checklist prepared: October 16, 1985

5. Agency requesting checklist: City of Seattle, Department of Construction and Land Use

6. Proposed timing or schedule (including phasing, if applicable):

   Construct immediately after receiving all necessary approvals.

7. Do you have any plans for future additions, expansion, or further activity related to or connected with this proposal? If yes, explain.

   No.

8. List any environmental information you know about that has been prepared, or will be prepared, directly related to this proposal.

   Children's Orthopedic Hospital and Medical Center submitted an earlier environmental checklist. This submission provides additional information requested by DCLU, and outlines COHMC's Mitigation Program.

9. Do you know whether applications are pending for governmental approvals of other proposals directly affecting the property covered by your proposal? If yes, explain.

   Yes. Expansion of short stay unit to include a 720 square foot waiting room. Remodeling Third Floor, C Wing. Expansion of oxygen storage facility from 5,000 cubic yards to 9,000 cubic yards.

10. List any government approvals or permits that will be needed for your proposal, if known.

    City of Seattle Conditional Use Permit, Master Use Permit.
    City of Seattle Building Permit
    FAA Approval

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. Give brief, complete description of your proposal, including the proposed uses and the site of the project and site. There are several questions later in this checklist that ask you to describe certain aspects of your proposal. You do not need to repeat those answers on this page. (Lead agencies may modify this form to include additional specific information on project description.)

Refer to Attachment A.

12. Location of the proposal. Give sufficient information for a person to understand the precise location of your proposed project, including a street address, if any, and section, township, and range, if known. If a proposal would occur over a range of area, provide the range our boundaries of the site(s). Provide a legal description, site plan, vicinity map, and topographic map, if reasonably available. While you should submit any plans required by the agency, you are not required to duplicate maps or detailed plans submitted with any permit applications related to this checklist.

The proposed helistop is located at Children's Orthopedic Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, in Section 15, Township 25 North, Range 4 East. Within the hospital grounds, the site of the proposed helistop is 85 feet due north of the existing COHMC emergency room.

Refer to Figures 1, 2 and 3.

TO BE COMPLETED BY APPLICANT: EVALUATION FOR AGENCY USE ONLY

B. ENVIRONMENTAL ELEMENTS

1. Earth

a. General description of the site (circle one): Flat, (rolling), hilly, steep slopes, mountainous, other: _____.

b. What is the steepest slope on the site (approximate percent slope)?

10%

c. What general types of soils are found on the site (for example, clay, sand, gravel, peat, muck)? If you know the classification of agricultural soils, specify them and note any prime farmland.

Glacial till

d. Are there surface indications or history of unstable soils in the immediate vicinity? If so, describe.

No. The hillslope at the proposed site appears stable with an existing retaining wall on the western periphery. There are no indications of landslides.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

e. Describe the purpose, type, and approximate quantities of any filling or grading proposed. Indicate source of fill.

Refer to Attachment A.

f. Could erosion occur as a result of clearing, construction, or use? If so, generally describe.

Refer to Attachment A.

g. About what percent of the site will be covered with impervious surfaces after project construction (for example, asphalt or buildings)?
18.7% of the fenced helistop site and walkway would be covered with concrete after project construction.

h. Proposed measures to reduce or control erosion, or other impacts to the earth, if any:

Refer to Attachment A.

2. Air

a. What type of emissions to the air would result from the proposal (i.e., dust, automobile, odors, industrial wood smoke) during construction and when the project is completed? If any, generally describe and give approximate quantities if known.

Refer to Attachment A.

b. Are there any off-site sources of emissions or odor that may affect your proposal? If so, generally describe.

No.

c. Proposed measures to reduce or control emissions or other impacts to air, if any:

Refer to Attachment A.

3. Water

a. Surface:

1) Is there any surface water body on or in the immediate vicinity of the site (including year-round and seasonal streams, saltwater, lakes, ponds, wetlands)? If yes, describe type and provide names. If appropriate, state what stream or river it flows into.

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

2) Will the project require any work over, in, or adjacent to (within 200 feet) the described waters? If yes, please describe and attach available plans.

No

3) Estimate the amount of fill and dredge material that would be placed in or removed from surface water or wetlands and indicate the area of the site that would be affected. Indicate the source of fill material.

Does not apply.

4) Will the proposal require surface water withdrawals or diversions? Give general description, purpose, and approximate quantities if known.

No

5) Does the proposal lie within a 100-year floodplain? If so, note location on the site plan.

No

6) Does the proposal involve any discharges of waste materials to surface waters? If so, describe the type of waste and anticipated volume of discharge.

No

b. Ground:

1) Will ground water be withdrawn, or will water be discharged to ground water? Give general description, purpose, and approximate quantities if known.

No

2) Describe waste material that will be discharged into the ground from septic tanks or other sources, if any (for example: Domestic sewage; industrial, containing the following chemicals ...; agricultural; etc.). Describe the general size of the system, the number of such systems, the number of houses to be served (if applicable), or the number of animals or humans the system(s) are expected to serve.

Does not apply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

c. Water Runoff (including storm water):

1) Describe the source of runoff (including storm water) and method of collection and disposal, if any (include quantities, if known). Where will this water flow? Will this water flow into other waters? If so, describe.

Refer to Attachment A.

2) Could waste materials enter ground or surface waters? If so, generally describe.

No

d. Proposed measures to reduce or control surface, ground, or runoff water impacts, if any:

Refer to Attachment A.

4. Plants

a. Check or circle types of vegetation found on the site:

X deciduous tree: alder, maple, aspen, (other)
X evergreen tree: fir, (cedar), pine, other
X shrubs
X grass
__ pasture
X crop or grain (COHMC kitchen garden)
__ wet soil plants: cattail, buttercup, bullrush, skunk cabbage, other
__ water plants: water lily, eelgrass, milfoil, other
__ other types of vegetation

b. What kind and amount of vegetation will be removed or altered?

Refer to Attachment A.

c. List threatened or endangered species known to be on or near the site.

None

d. Proposed landscaping, use of native plants, or other measures to preserve or enhance vegetation on the site, if any:

Refer to Attachment A.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR
AGENCY USE ONLY

5. Animals

a. Circle any birds and animals that have been observed on or near the site or are known to be on or near the site:

birds: hawk, heron, eagle, (songbirds,) other: _____

mammals: deer, bear, elk, beaver, other: _____

fish: bass, salmon, trout, herring, shellfish, other: _____

b. List any threatened or endangered species known to be on or near the site.
None

c. is the site part of a migration route? If so, explain.
See Attachment A.

d. Proposed measures to preserve or enhance wildlife, if any:
Not applicable

6. Energy and Natural Resources

a. What kinds of energy (electric, natural gas, oil, wood stove, solar) will be used to meet the completed project's energy needs? Describe whether it will be used for heating, manufacturing, etc.

Refer to Attachment A.

b. Would your project affect the potential use of solar energy by adjacent properties? If so, generally describe.

No

c. What kinds of energy conservation features are included in the plans of this proposal? List other proposed measures to reduce or control energy impacts, if any:

Refer to Attachment A.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

7. Environmental Health

a. Are there any environmental health hazards, including exposure to toxic chemicals, risk of fire and explosion, spill, or hazardous waste, that could occur as a result of this proposal? If so, describe.

Refer to Attachment A.

1) Describe special emergency services that might be required.

Refer to Attachment A.

2) Proposed measures to reduce or control environmental health hazards, if any:

Refer to Attachment A.

b. Noise

1) What types of noise exist in the area which may affect your project (for example: traffic, equipment operation, other)?

Refer to Attachment B.

2) What types and levels of noise would be created by or associated with the project on a short-term or a long-term basis (for example: traffic, construction, operation, other)? Indicate what hours noise would come from site?

Refer to Attachment B.

3) Proposed measures to reduce or control noise impacts, if any:

Refer to Attachment B.

8. Land and Shoreline Use

a. What is the current use of the site and adjacent properties?

Refer to Attachment A.

b. Has the site been used for agriculture? If so, describe.

Refer to Attachment A.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR
AGENCY USE ONLY

c. Describe any structures on the site.

None

d. Will any structures be demolished? If so, what?

No

e. What is the current zoning classification of the site?

I-3

f. What is the current comprehensive plan designation of the site?

Hospital

g. If applicable, what is the current shoreline master program designation of the site?

Not applicable

h. Has any part of the site been classified as an "environmentally sensitive" area? If so, specify.

No

i. Approximately how many people would reside or work in the completed project?

None

j. Approximately how many people would the completed project displace?

None

k. Proposed measures to avoid or reduce displacement impacts, if any;

Not applicable

l. Proposed measures to ensure the proposal is compatible with existing and project land uses and plans, if any:

Refer to Attachment A.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR
AGENCY USE ONLY

9. Housing

a. Approximately how many units would be provided, if any? Indicate whether high, middle, or low-income housing?

Not applicable

b. Approximately how many units, if any, would be eliminated? Indicate whether high, middle, or low-income housing?

Not applicable

c. Proposed measures to reduce or control housing impacts, if any:

Not applicable

10. Aesthetics

a. What is the tallest height of any proposed structure(s), not including antennas; what is the principal exterior building material(s) proposed?

Refer to Attachment A.

b. What views in the immediate vicinity would be altered or obstructed?

Refer to Attachment A.

c. Proposed measures to reduce or control aesthetic impacts, if any:

Refer to Attachment A.

11. Light and Glare

a. What type of light or glare will the proposal produce? What time of day would it mainly occur?

Refer to Attachment A.

b. Could light or glare from the finished project be a safety hazard or interfere with views?

No

c. What existing off-site sources of light or glare may affect your proposal?

None

d. Proposed measures to reduce or control light and glare impacts, if any:

Refer to Attachment A.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR
AGENCY USE ONLY

12. Recreation

a. What designated and informal recreational opportunities are in the immediate vicinity?
Laurelhurst playfield, school playground several blocks away. (Refer to Figure 1)

b. Would the proposed project displace any existing recreational uses? If so, describe.
No

c. Proposed measures to reduce or control impacts on recreation, including recreation opportunities to be provided by the project or applicant, if any:

Not necessary

13. Historic and Cultural Preservation

a. Are there any places or objects listed on, or proposed for, national, state, or local preservation registers known to be on or next to the site? If so, generally describe.

No

b. Generally describe any landmarks or evidence of historic, archaelogical, scientific, or cultural importance known to be on or next to the site.

None on or next to the site.

c. Proposed measures to reduce or control impacts, if any:

Not applicable

14. Transportation

a. Identify public streets and highways serving the site, and describe the proposed access to the existing street system. Show on site plans, if any.

Refer to Attachment A.

b. Is site currently served by public transit? If not, what is the approximate distance to the nearest transit stop.

Refer to Attachment A.

c. How many parking spaces would the completed project have? How many would the project eliminate?

The project would not add or eliminate any parking spaces.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

d. Will the proposal require any new roads or streets, or improvements to existing roads or streets, not including driveways? If so, generally describe (indicate whether public or private).

No

e. Will the project use (or occur in the immediate vicinity of) water, rail, or air transportation? If so, generally describe.

Refer to Attachment A.

f. How many vehicular trips per day would be generated by the completed project? If known, indicate when peak volumes would occur.

Not applicable. Refer to Attachment A, Sections B.14.a and B.14.e.

g. Proposed measures to reduce or control transportation impacts, if any.

Refer to Attachment A.

15. Public Services

a. Would the project result in an increased need for public services (for example: fire protection, police protection, health care, schools, other)? If so, generally describe.

No ,existing fire protection serving COHMC would be adequate.

b. Proposed measures to reduce or control direct impacts on public services, if any.

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR
AGENCY USE ONLY

16. Utilities

a. Circle utilities currently available at the site:
(electricity), (natural gas), (water), (refuse service),
(telephone), (sanitary sewer), septic system, other.

b. Describe the utilities that are proposed for the project, the utility providing the service, and the general construction activities on the site or in the immediate vicinity which might be needed.

Electricity for emergency lighting would be provided by Seattle City Light.
Extending service lines at COHMC.

C. Signature

The above answers are true and complete to the best of my knowledge. I understand the lead agency is relying on them to make its decision.

Signature: Jeanne Kalk, C.E.O.

Date submitted: Oct 22, 1985

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A.11 Children's Orthopedic Hospital and Medical Center (COHMC) proposes to construct a helistop on its campus. The helistop would be located 85 feet due north of the emergency room entrance on 9,552 square feet of landscaped property. The use of the helistop will be limited to the transportation of critically ill or seriously injured infants, children and adolescents. Based on COHMC projections, the number of patients brought to COHMC would average between 15 to 20 per month. Each trip would include a pick up of COHMC personnel to accompany the patient and a return trip with the patient to COHMC.

COHMC's Role as a Regional Health Care Provider

COHMC is a regional, tertiary care children's hospital serving the specialized medical needs of infants, children and adolescents. Because of the unique services offered at COHMC, it receives for treatment infants, children and adolescents who are critically ill or severely injured. These patients originate from a four-state region: Washington, Montana, Alaska and Idaho. They are admitted either directly or through referral from other hospitals and community physician.

Medical Situations Warranting Emergency Helicopter Transportation

The use of the helistop would be consistent with restrictions contained in the City of Seattle Code; that is, it will be used only for emergency helicopter transportation. The use of the helicopter would be limited to severely ill or injured children requiring transport. As a regional, tertiary care pediatric hospital, COHMC is, in many cases, the only hospital in the region with the facilities and equipment to provide the necessary care to avoid severe and permanent disability or death. This is a medical emergency identified by a physician at an outlying area, and helicopter transportation is agreed to by the Medical Director for Airlift Northwest. The need for an on-site helistop is substantially related to the increasing sophistication of medical care over the past several years. Delay in providing the most sophisticated care can mean the difference between successful recovery and death.

Examples of emergencies that could require helicopter transport are:

. Near drowning, in which time is of the essence to attempt to save the patient's life and to preserve the best chance to restore the patient to his or her capacities;

. Severed arteries, causing severe bleeding where delay in treatment could result in death;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. Hypoplastic heart and lungs or other congenital anomalies;

. Premature and other births at outlying hospitals where transport is necessary for the survival of the infant;

. Overwhelming infection;

. Ingestion of toxic substances.

Howard Farley, Chief of the State Emergency Medical Services section, has stated that:

> "...he would like to see Airlift Northwest have full use of its helicopter ambulance, including a helipad at Children's. 'It makes good sense in terms of patient care to have it there,' he said. 'It would mostly be a rural to urban service, bringing patients from outlying areas into the city hospitals.'"
>
> Seattle Post-Intelligencer, July 24, 1985, page A6.

Existing Helicopter Transport/Landing Practice

Under the current system, helicopters land at the University of Washington soccer field and the patient is transferred from the helicopter to an ambulance for final transport to COHMC. This system is medically inferior and it substantially increases the patients' risk of death or injury. Preparing a critically ill or injured infant, child or adolescent for transport over any distance, such as that between the University of Washington soccer field and the COHMC emergency room, is a time-consuming procedure involving the following tasks:

. any of the various life-support and monitoring systems that were connected in the helicopter may have to be disconnected;

. the patient must be transferred into the ambulance and reconnected to the life support and other systems in the ambulance;

. the patient may require stabilization before the ambulance can leave the soccer field;

. and the patient's life support systems must again be disconnected at the hospital for final transfer to the emergency room.

Because this process is time consuming, it increases the potential for exacerbating the patient's life-threatening condition by delaying treatment. If stabilization is required before the ambulance can leave from the soccer field for COHMC, then the time delay before treatment can begin may increase. Depending on the time of day and the amount of traffic, the travel time between the soccer field and COHMC may be longer than at other times. Total

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

travel time from helicopter landing at the soccer field to the patients' entry of the emergency room door is 20-30 minutes.

The University of Washington soccer field does not have sufficient lighting for safe helicopter operations at night or during inclement weather, thereby increasing the risk, not only to the patient, but to the pilot and transport team. The soccer field is not paved and is sometimes muddy, which has prevented the ambulance from driving onto the field. Such conditions require the patient to be unloaded and hand-carried to the waiting ambulance across the muddy and slippery field. This field has been so muddy, at times, that ambulances have been stuck in it.

Rationale for Proposed Helicopter Transport Landing Practice

By permitting helicopters to land on the COHMC campus at the proposed helistop location, the patient can be transferred directly from the helicopter to the emergency room without delay. The proposed helistop is located close enough to the emergency room entrance to preclude the need for patient transfer in and out of the ambulance, thereby averting the need for connecting the patient with ambulance support systems and/or stabilization; the patient can be brought directly from the helicpoter into the emergency room. The additional flight time between the soccer field and the proposed helistop is expected to be two minutes, with one to two minutes required for patient transfer from helicopter to emergency room. This three to four minute total is comparable to a minimum transfer time from the soccer field of 20 to 30 minutes. By allowing the helicopters to land at the proposed helistop location, the patient would be served by full emergency room staff and equipment 15 to 25 minutes sooner than if the helicopter lands at the soccer field. The reduced transport time reduces the risk of permanent disability or death.

Alternative Helistop Locations

In developing alternative site locations that could be considered for locating a helistop, both on-campus and off-campus sites were nominated. The alternative sites considered were: the continued use of the University of Washington soccer field, establishment of the helistop on the roof of the COHMC medical building, establishment of the helistop on the roof of the parking garage, and establishment of the helistop at the proposed location outside the emergency room.

As described above, the University of Washington soccer field site and any other off-campus sites were determined to be unsuitable because of the additional patient transfer time involved. The roof of COHMC, which is an on-campus alternative, lacks the structural integrity and rooftop elevator necessary for a helistop. The establishment of the helistop on the roof of the parking garage would require additional patient transfer time, structural improvements to the garage, interfere with traffic circulation and be more environmentally intrusive. The additional patient move-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ment would warrant the use of an ambulance, which negates much of the advantage of establishing a new helistop. Other alternative sites, at grade, on the COHMC campus were examined. The area closest to the emergency room (COHMC's proposed site) was considered most suitable because of the short transfer distance. This site will not interfere with existing on-campus traffic circulation or parking on campus and does not have any existing structures.

Helistop Characteristics

The helistop would be less than one foot above grade. The landing pad would cover 1,600 square feet, and be constructed of alternating squares of concrete and turf. A new retaining wall would be built east of the existing wall. The concrete center of the pad would be marked with a red "H," 4'x7.5', to visibly designate the helistop from the air. The site also would include an obstacle-free peripheral area, 85 feet in diameter with the landing pad in the center. Existing walkways would be used for patient transfer. The helistop site would be enclosed by a fence with a locked gate. The fence would be 2.5 feet tall on the west and 3.5 feet tall on the remaining three sides. The kitchen garden and other vegetation would be moved to the periphery of the site. The remainder of the site would be landscaped to provide for visual screening.

The helistop would have ground lights that would be turned on at night for emergency landings. These lights would meet minimum FAA standards and would not have any light spillage off-site. The lighting would be occasionally visible from some houses adjacent to COHMC on the east. Any additional requirements for fire safety equipment measures, such as emergency foam, would be incorporated into the project.

Helicopter Operations

The helistop will be primarily used by a helicopter flown by Airlift Northwest, a consortium of hospitals, which includes COHMC. The helicopter that Airlift Northwest uses for emergency transport is an AGUSTA A 109A MARK 2, one of the quietest helicopters available on the market. The helicopter is a modern, fully enclosed twin-engine helicopter with a four-blade propeller and retractable landing gear. The helicopter has a velocity not to exceed (VNE) of 169 knots, indicated air speed (IAS), and a normal cruising speed of 160 knots IAS. As noted above, there will be approximately 15 to 20 patients brought to COHMC by helicopter per month. Each flight into and out of COHMC would last approximately 5-8 minutes. The helicopter transport would be limited to infants, children or adolescents who are critically ill or injured and who must be transported by air because delay in transport to a tertiary care hospital would result in permanent disability or death.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Delivering a single patient by helicopter to the COHMC would require two trips. Upon contact, Airlift Northwest would dispatch the helicopter to COHMC to pick up the medical crew; the helicopter would then go to the patient's location, pick him/her up and return to the COHMC helistop.

The proposed flightpath would be along N.E. 45th Street and Sand Point Way N.E. from the west (under current operations, the helicopter flies over Union Bay and lands at the University of Washington soccer field), with a sharp turn to the southeast at the hospital entrance (Penny Lane) and then south to the helistop. The helicopter would fly at the highest altitude possible (no lower than 500 feet) along the route prior to its descent at COHMC. The helicopter, once unloaded, would leave COHMC at once.

B.1.e Approximately 410 cubic yards of earth would be used as fill for the proposed helistop site. This fill would be placed along the western portion of the site to bring the site nearly level as required for the placement of the helistop surface. A new retaining wall would be placed at the western edge of the project to provide stability prior to the placement of the fill. Excess soil would be removed from other parts of the COHMC grounds to provide sufficient fill. The helistop site, including the landscaped periphery, would cover approximately 9,552 square feet and create 1,788 square feet of impervious surface.

B.1.f The potential for wind or water erosion of soils to increase on the site would be limited to the two month construction period. This would occur in the early construction phase as the retaining wall is built prior to the addition of the fill. Following the construction of the helistop landing pad, the site would be landscaped with grass and shrubbery. Thus, there would not be any long-term erosion impacts. COHMC will require the helistop construction contractors to implement standard erosion control measures (such as filter fence, hay bales, plastic sheeting, etc.) in order to minimize construction-related erosion. No additional mitigation measures would be necessary.

B.1.h The early construction of a new retaining wall upland from the existing wall would reduce any potential erosion during the remainder of construction and mitigate any potential long-term impacts. Landscaping would also be placed at the site as early as possible during construction to help prevent any long-term erosion. Implementation of construction erosion control measures would reduce minor erosion impacts during the short construction period (see B.1.f., above). No additional mitigation would be necessary.

B.2.a The primary air quality concerns in the Puget Sound region are carbon monoxide and suspended particulates (From: PSAPCA, 1984 Air Quality Data Summary).

The monitoring station closest to the COHMC campus is located at 5701 8th Avenue N.E. This station monitors suspended particu-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

lates. Total suspended particulates (TSP) is a general term for particles composed of dust, soot, organic matter, and compounds containing sulfur, nitrogen and metals. Particulates are released from auto and truck traffic, and from other sources. The highest concentrations of particulates are generally found in the more heavily industrialized areas. The area around COHMC is not in violation of the standards (conversation with Stephen Fry, PSAPCA, May 23, 1985).

The carbon monoxide (CO) content of ambient air in the area is constantly monitored at Children's Orthopedic Hospital and Medical Center. Carbon monoxide, the pollutant of most concern in the nearby University District study, is attributed primarily to the operation of motor vehicles.

Temporary minor impacts on air quality could occur during construction. Grading and filling the site and construction vehicle traffic could generate dust (suspended particulates). As necessary, the proponent would sprinkle water on exposed soils to minimize any wind-blown dust during construction.

The long-term impact of any helicopter emissions in the Puget Sound region from COHMC's proposal would be insignificant for several reasons:

1. The additional emissions from helicopter flights would be minimal. Helicopter transports to COHMC exist currently. The use of the proposed helistop would add a distance of one mile (one-half of a mile in each direction) of helicopter flight while decreasing the number of ground ambulance trips. Therefore, a small increase in potential helicopter emissions would be offset, in part, by the discontinuance of use of an ambulance for trips to COHMC from the University of Washington soccer field.

2. Airlift Northwest maintains its helicopters for maximum operating efficiency. The proper maintenance of the engines by Airlift Northwest reduces potential emissions.

3. Any potential helicopter carbon monoxide concentrations will occur where there are a number of sources, such as cars, in a congested area. Emissions would be a single mobile source and some distance away from any sensitive receptors.

No additional mitigation would be necessary.

B.2.c Refer to Section B.2.a.

B.3.c.1 The rate and volume of surface water runoff primarily due to rainwater from the developed site would be slightly greater than the existing site due to an increase in the impervious surface. The impervious surface on the site would increase by 1,788 square feet or 18.7%. A grass and concrete surface was selected to add only the minimal amount of concrete/impervious surface necessary

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

to delineate the pad and provide stable support for the helicopter. A majority of the runoff would infiltrate the lawn much as it does currently and subsequently enter the stormwater drainage system. The City of Seattle Engineering Department drainage inspector for the area of COHMC, Don Smith, indicated there is adequate capacity of the existing system to handle projected runoff (conversation, May 16, 1985). No additional mitigation would be necessary or are proposed.

Although the project would not be subject to the City of Seattle Drainage Control Ordinance (No. 108080) because it would have less than 2,000 square feet of impervious surface, a catch basin could be provided to regulate drainage of the helistop surface and to prevent oil from entering the storm water system. It should be also noted there is minimal oil expected from the helicopter because of continuous off-site aircraft maintenance and short ground time at COHMC.

B.3.d Refer to Section B.3.c.1.

B.4.b All of the existing vegetation, including three trees, shrubbery, grass and the kitchen garden, would be removed from the site during construction. The kitchen garden offers a unique therapeutic program and is not considered a significant food resource for COHMC. COHMC, however, maintains an active planting and landscaping program on its campus. As a part of this comprehensive program, a majority of the plants and shrubbery, including the kitchen garden, would be transplanted to the periphery of the site or other locations on the COHMC campus.

B.4.d To the maximum extent possible, vegetation would be removed prior to construction and replanted at the periphery of the site. In addition to these relocated plants and shrubs, COHMC would plant other vegetation to enhance the site (see Section 10 below). This vegetation would provide visual screening of the helistop and reduce the potential for soil erosion. The kitchen garden would continue to provide a therapeutic experience and provide a very small portion of food for the hospital. The fenced area would contain minimum amounts of impervious surface for a helistop, and would be planted with grass (81%).

B.5.c The site of the proposed helistop is not part of a migration route. The additional helicopter travel between the soccer field and COHMC would also not affect any migration routes. The helicopter would maintain an altitude above 500 feet as it approaches Union Bay and the soccer field.

B.6.a Currently there is no energy consumed on the helistop site; however, petroleum is consumed when transporting critically ill or injured children to COHMC via helicopter to the University of Washington soccer field and via ambulance from the soccer field to COHMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Energy would be used in the mining, manufacturing, and delivery of raw materials and for assembly during construction. When completed, the project's energy needs would be met by petroleum and electricity.

The energy impacts resulting from the completed project can be separated into two categories: (1) petroleum consumed in the transportation of critically ill or injured children, and (2) electrical energy used during the nighttime operation of the helistop.

(1) Transportation. Petroleum would continue to be used by the helicopter for the transportation of patients directly to COHMC. The helicopter would continue its flight path from the vicinity of the soccer field (see Figure 1) directly to COHMC. The small increase in petroleum consumption by the helicopter traveling the additional half mile would be offset by the energy savings realized from the reduced ambulance trips/transfers at the soccer field. Helicopter engines would be maintained to optimize efficiency. No additional mitigation would be necessary.

(2) Operation. A minimal amount of electricity would be consumed during the occasional night operation of the helistop. The lighting would be designed according to Federal Aeronautics Administration (FAA) standards to be clearly visible to the helicopter pilot. It would not produce additional light of such intensity as to spill off site. The lighting operations would be limited to flights. No additional mitigation (energy saving) measures.

B.6.c Refer to Section B.6.a.

B.7.a There are no environmental health hazards, including exposure to toxic chemicals, spill, or hazardous waste that could occur as a result of this proposal. Any risk of fire and explosion is limited to the unlikely event of a helicopter accident. No toxic substances would be released into the environment and jet fuel would not be stored at or near the COHMC site.

Although the risk of explosion due to a helicopter crash is highly unlikely, the flight path has been selected to minimize potential obstacles and avoid densely populated areas. The most recent statistics available from the National Transportation Safety Board (NTSB) for all turbine-powered rotorcraft show the accident rate to be 5.48 per 100,000 aircraft hours flown (Annual Review of Aircraft Accidents Data, U.S. General Aviation, 1981 [page 84, Table 95]. According to Gene Hill (Airlift Northwest, September 12, 1985), the average total flight time to serve COHMC has been 48 minutes. Assuming this accident rate, flight time and numbers of flights, one can conclude that the probability of a helicopter accident related to the service to the hospital would be approximately one every 95 years. It should be noted that such a mishap could occur at any point in the trip. Because data kept since 1975 shows the accident rate decreasing by more than half

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

over a seven-year period, one could project that the probability of an accident would be even lower.

A natural gas meter house is located 48 feet north of the site. Conversation with representatives of Washington Natural Gas (Joe Jainga, May 22, 1985), discloses that the current protection of the meter with a fence and a concrete structure is considered, by Washington Natural Gas, reasonable and adequate to prevent a fire in the unlikely event of a mishap. In the event of a major accident, from whatever source, Washington Natural Gas would shut off the main valve across from COHMC on Sand Point Way.

The site is located 85 feet north of the COHMC emergency room and a 5,000-gallon oxygen tank is located 30 feet west of the site below grade. In conversations with representatives of the Fire Department (A.J. Fenstermaker, February 22, 1985), the proximity of the oxygen tank to the proposed helistop site was discussed. There are no regulations or standards in the National Fire Protection Association or Uniform Fire Code directly related to the proposed helistop and design mitigation. As a mitigation measure, however, the tank will be "hardened" to specifications agreed to between COHMC and the Fire Department. Hardening refers to improved protection surrounding the tank. This is advisable, particularly on the east side, to cover the exposed portion of the tank and reduce the impact of any potential accidents.

Any additional requirements for fire safety equipment measures, such as emergency foam, would be incorporated into the project.

A fence with a locked gate would permanently surround the site. During the construction period, the site would be barricaded for safety, as well as security. Signage would clearly mark the site, and entrance would be strictly limited to authorized personnel. The fenced area will be greater than the span of the helicopter blade and will allow a sufficient margin to prevent accidents while the helicopter is moving.

B.7.a.1 Refer to Section B.7.a.

B.7.a.2 Refer to Section B.7.a.

B.7.b.1 The primary source of noise associated with the helistop would be the helicopter. The consulting engineering firm of Seton, Johnson and Odell was retained to prepare a noise report on the helistop. The technical report on which the following analysis is based is available for review at the Department of Construction and Land Use. Existing conditions were profiled and the noise impacts were measured and evaluated as part of this project.

Background

The Maximum Permissible Sound Levels (25.08.410) within the City of Seattle are:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

District of Sound Source	District of Receiving Property Within the City of Seattle		
	Residential	Commercial	Industrial
Rural	52 dBA	55 dBA	57 dBA
Residential	55 dBA	57 dBA	60 dBA
Commercial	57 dBA	60 dBA	65 dBA
Industrial	60 dBA	65 dBA	70 dBA

However, these regulations do not affect licensed transportation vehicles or apply to emergency vehicles, such as the subject helicopter.

No other federal, state, or local regulations were found to address helistop noise.

Five sites were selected as noise measurement sites and noise levels were measured between May 12 and May 15, 1985. These sites were selected by the consultant's consideration of the flight path, land use, topography and discussions with Curt Horner, the Noise Program Coordinator, King County Health Department. Final determinations were made by Hermia Ip, Land Use Technician with the Department of Construction and Land Use. The sites, shown in Figure 2, are:

Site 1: The east side of 44th Avenue N.E. between N.E. 47th Street and N.E. 50th Street

Site 2: The east side of 45th Avenue N.E. between N.E. 45th Street and N.E. 47th Street

Site 3: North of Sand Point Way, in a parking lot adjacent and to the west of a high rise residential condominium

Site 4: A low rise multiple family duplex located adjacent to the west of the hospital property on 41st Aven : N.R. just southeast of Sand Point Way N.E.

Site 5: The west side of 41st Avenue N.E. northwest of Sand Poin: Way N.E.

Each site was monitored intermittently at four different periods on one weekend day and one weekday: 9-10 a.m., 4-6 p.m., 10 p.m. to midnight, and 2-4 a.m. Additionally, a flyover, landing and take-off by an AGUSTA helicopter was performed during the noise monitoring in order to measure actual noise levels.

Existing Conditions

The approximated day-night sound level (DNL - average sound levels over a 24-hour period) at each site is as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Site	DNL (dBA)
1	52
2	53
3	68
4	55
5	63

These levels are slightly lower than the actual values, because they do not include the increased noise from traffic occurring during wet road periods. Thus, they establish noise levels that create a conservative basis for evaluating helicopter noise effects.

The helicopter to be used is an AGUSTA A-109-A Mark 2, selected, in part, because it is one of the quietest helicopters available. The flight path was chosen to fly over the highest background noise areas. The selected flightpath goes along N.E. 45th Street and Sand Point Way from the west, with a sharp turn to the southeast at the hospital entrance and then into the helistop. In addition, a "noise abatement approach" would be used to minimize noise: decreasing cruise speed and a gradual descent to reach 300 feet at the hospital entrance from Sand Point Way N.E. At this point, the speed would be decreased further, a turn would be executed and a steeper descent along with further speed reduction would begin down to the helistop.

The high noise levels are brief, with the highest levels occurring with take-off and landing. Each flight into and out of COHMC would last approximately 5-8 minutes. The maximum noise levels due to the helicopter expected at any measurement are not higher than the noise levels that are occasionally experienced by most suburban residents, although they are greater than the highest underlying background noise levels measured. The maximum level of noise expected to occur at the highest measuring site from the helicopter will not exceed the base level for a heavy truck or bus passing at a distance of 50 feet and traveling at 40 to 50 miles per hour (84 to 86 dBA). For flights during daytime hours, fly-over maximum levels are within 10 dBA of the highest existing level sampled, and below the highest levels at Sites 2 and 3.

Based on the criteria for noise-induced vibration perceivable structural vibrations are possible at all sites and probable at sites 1 and 4.

In summary, it can be concluded that (1) though helicopter noise will be noticeable, it should not cause significant impact during daytime hours due to infrequency and brief (less than five minute) duration of operation; (2) during sleeping periods, helicopter operation could cause sleep arousal of varying degrees for 15-20% of the closest line of sight residents, though frequency of occurrance would be low; (3) the impact of the average helicopter noise exposure (DNL) relative to existing noise environment will not be significant; (4) structural vibration will not be significant.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Mitigating Measures

The methods of noise abatement and mitigation incorporated into the project and considered for the helistop include: (1) using quiet helicopters; (2) orienting flight path for minimum noise impact; (3) controlling flight pace to maintain highest altitude for the longest period of time and maintain lowest throttle settings practicable and minimize ground time; (4) locating the helistop to take advantage of shieldings by existing structures; (5) if possible, not pickup the medical crew at the helistop during the period from 10 p.m. to 6 a.m. COHMC has agreed to ensure that these measures are incorporated into project design, operations and contracts. Installation of noise barriers would have a negligible effect on noise exposure and maximum noise levels. No additional mitigating measures could be applied to reduce impacts.

B.7.b.2 Refer to Section B.7.a.1.

B.7.b.3 Refer to Section B.7.a.

B.8.a The proposed site of the helistop is currently used as a landscaped green space and kitchen garden. It is located 85 feet north of the emergency room on the COHMC grounds. The proposed site is zoned I-3. The surrounding land (refer to Figure 2) is zoned for single family, residential duplex, multiple family residential and community business. A group of multiple family dwellings are located to the west and northwest. Single family dwellings are located to the south, east and northeast. Also, there are other large institutional land uses in the neighborhood, including Battelle Research Institute, Laurelhurst school and playfield and several churches. Retail businesses and offices (e.g., finance, insurance, real estate) are located along Sand Point Way N.E. approximately two blocks west of the site.

B.8.b A small portion of the proposed site is used for the kitchen garden. The purpose of the garden is therapeutic not agricultural. Currently the garden vegetables include small amounts of onions, strawberries, artichokes, broccoli, rhubarb, and herbs. The garden does not provide a significant portion of the food supply for COHMC. The garden would be moved to the periphery of the helistop, outside the fenced area. No additional mitigation measures would be necessary.

B.8.1 To reduce impacts on the surrounding residential areas, the use of the helicopter is restricted to emergencies. To further reduce noise impacts on the neighborhood, the "quietest" model helicopter, the AUGUST A 109 Mark 2, will be used. In addition, a flight path over an existing transportation corridor, Sand Point Way, will be used to reduce potential noise impacts on residential properties.

The portion of COHMC's property on which the helistop is located is within the major institution boundary. This property has been

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the site of a children's hospital since 1953 and is projected for continued hospital use. The use of emergency helicopter transport for severely ill or injured children is a hospital-related use of this mode of transportation.

B.10.a The three large trees on the site would be removed and the existing shrubbery would be replaced by the helistop and additional grass surrounded by the fence and new landscaping. Due to the low height of the helistop above grade (less than one foot) and the fence (2.5 feet on the west and 3.5 feet on the remaining sides), there would be minimal visual impact. These are the only structures included in the project. The most obvious impact would be the absence of the trees and, until the shrubbery reaches maturity, the fence would be partially visible.

The views from residences directly west of the site across Sand Point Way N.E. would experience some visual change. The homes to the east on 44th Avenue N.E. and in the vicinity of the corner of 45th Avenue N.E. and N.E. 47th Street would have some visual change. Occasionally, at night, the lights would be visible for short periods of time. The pad and the red "H" would not be clearly visible off-site, but would be visible from the helicopter and possibly from the upper floors of COHMC due to the view angle. The visual appearance of the helistop would be mitigated by the placement of shrubbery to screen the fence.

B.10.b Refer to Section B.10.a.

B.10.c Refer to Section B.10.a.

B.11.a The proposal would produce light from two sources: the helistop and the helicopter. There are existing pole-mounted street lights along Sand Point Way N.E. and Penny Lane, and surface lighting in the parking lot. Additional lighting also comes from the hospital building and vehicles.

Helistop lighting would be designed to comply with the minimum FAA standards for helistop. It would be necessary to turn on the lights for occasional night landings at the site. The proposed helistop lighting would not produce any horizontal throw, therefore, there would be no lighting effects off-site. The shrubbery placed around the periphery of the site would prevent any light source being visible to the neighbors to the east. The elevation (uphill) would prevent any helistop light visibility from the west. COHMC structures obscure any views of the helipad from the north and south.

The helicopter is equipped with standard aviation lights: two small strobe lights, two side lights, two landing lights and a searchlight for use in unlighted areas. The helicopter pilot has indicated that a minimal amount of lighting would be used by the helicopter, especially at night, because of the existing lighting at COHMC (conversation with Gene Hill, Airlift Northwest, May 3, 1985). The helicopter would not produce light spillage onto the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

residential properties. No further mitigation measures would be necessary. There would not be any glare produced as a result of the project.

B.11.d Refer to Section B.11.a.

B.14.a Sand Point Way N.E. (also SR 513) is the major four-lane arterial serving the site from the west. This street is the main north-south route for the neighborhoods of Laurelhurst, Ravenna, View Ridge, and Windermere. The streets to the east, north and south are residential two-way streets.

During construction, vehicles would access the site from Sand Point Way N.E. Since the construction is minimal and the duration very short, the slight traffic increase would be insignificant relative to existing volumes.

The project would not result in any long-term impacts to the road system since there would not be any new traffic generated by ground vehicles. The project would, in fact, reduce (insignificantly) the number of ambulances currently traveling on surface streets to COH since an ambulance would no longer transport patients from the soccer field to the hospital. No mitigation measures would be necessary.

B.14.b COHMC is served by Metro routes 30 and 32 on N.E. 45th Street, providing direct access to the University District and downtown Seattle. Metro route 8, running along Sand Point Way, also provides service to downtown Seattle, University District, Sand Point and Lake City areas.

The project would not affect bus service. No mitigation measures would be necessary or are proposed.

B.14.e The project would use air transportation, specifically helicopter transportation, for critically ill and injured children. The helicopter would fly directly to COHMC instead of the current practice, which is to land and transfer the patient at the U.W. soccer field (one-half mile from the site). An average of 30-40 helicopter trips would be generated per month along this additional distance.

The flight path would be defined to minimize impacts on residential properties. The helicopter would approach the soccer field using the same flight plan as today only continue east (still above 500 feet) along Sand Point Way, turning into COHMC at the Penny Lane access and beginning the descent at that point (see Figure 1).

Helicopter transportation would not be considered the best method of transport to COHMC in the case of unsafe flight conditions, as defined by FAA guidelines for extreme winds or fog. The helicopter would not be used to land at COHMC under those conditions.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Airlift Northwest would use an AGUSTA A 109 A Mark 2 to serve the COHMC helistop. This is a quieter and more efficient helicopter than many alternative helicopters for use in flying in the vicinity of residential areas. The helicopter would be based at the Seattle Jet Center, Boeing Field. No maintenance, cleaning or fueling would occur on the site.

The use of the helicopter would be limited to very seriously ill or injured children requiring transport.

No further mitigation would be necessary.

1.0 INTRODUCTION

This report summarizes measurements and evaluations of noise effects of a new emergency helipad proposed for installation and use at Children's Orthopedic Hospital in Seattle, Washington. The helipad will be located on the north side of the facility, near the emergency entrance at parking lot level. Use of the helipad is predicted at 20 to 40 flights per month.

Topics addressed in this report include existing ambient noise conditions, helicopter and helipad noise characteristics, helipad noise impact, and noise mitigation strategies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2.0 RELATED NOISE LEVEL CRITERIA

2.1 Community Noise

The common measure for noise is the sound pressure level in decibels (dB). The decibel scale relates the ratio of a given sound pressure to a reference pressure (20 micro Pascals). The scale is logarithmic. Therefore, decibel levels cannot be directly added or subtracted from each other.

Sound pressure levels in decibels according to the A-weighting scale (dB(A)) are commonly used as an environmental noise measure. The A-scale corrects for the varying sensitivity of the human ear with frequency. When A-weighted readings are described, the term "sound pressure level" is often shortened to "sound level." The remainder of this report will use this convention.

Subjectively, an increase in sound level of 1 dB(A) would be judged insignificant, an increase of 3 dB(A) would be perceptible by most people, and an increase of 10 dB(A) would generally be judged as twice as loud and having significant impact.

The Leq (equivalent energy continuous level, or average sound level) in dB(A) for a given hour is often used to determine the Day-Night Sound Level (DNL). The DNL is a representation of the 24-hour average sound level with an extra 10 dB(A) added to levels between 10 p.m. and 7 a.m. before averaging to account for greater potential annoyance of sound during sleeping hours. The DNL of 55 dB(A) was recommended in 1974 by the Environmental Protection Agency as a base for evaluating speech interference and annoyance of outdoor noise levels (2). The DNL is the standard metric for evaluating overall community noise impact of aircraft (3).

Table 1 presents average sound levels of common sounds.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TABLE 1

SOUND LEVELS OF COMMON SOURCES

Sound Pressure (Pa)	Sound Pressure Level (dBA)	Sound Source
200	140	Jet Aircraft, Artillery
63	130	Threshold of Pain
6.3	110	Orchestra Fortissimo (peak)
0.63	90	Orchestra; loud street noise
0.063	70	Inside auto at high speed
0.02	60	Normal conservation
0.006	50	General office
0.002	40	Quiet home; private office
0.0002	20	Rustling leaves, empty theatre
0.000063	10	Threshold of good hearing
0.00002	0	Threshold of excellent youthful hearing

Regulations governing environmental noise have been established by Washington State, King County, and The City of Seattle. The quantitative limits in regulations of these agencies are the same. No other federal, state, or local regulations were found to address helipad noise.

The pertinent regulations of the City of Seattle noise code are:

25.08.400 Unlawful Sounds

It is unlawful for any person to cause sound, or for any person in possession of property to permit sound originating from such property, to intrude into the real property of another person whenever such sound exceeds the maximum permissible sound levels established by this subchapter.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

25.08.410 Maximum Permissible Sound Levels

For sound sources located within the city or King County, the maximum permissible sound levels are as follows:

District of Sound Source	District of Receiving Property Within the City of Seattle		
	Residental	Commercial	Industrial
Rural	52 dB(A)	55 dB(A)	57 dB(A)
Residential	55 dB(A)	57 dB(A)	60 dB(A)
Commercial	57 dB(A)	60 dB(A)	65 dB(A)
Industrial	60 dB(A)	65 dB(A)	70 dB(A)

25.08.420 Modifications to Maximum Permissible Sound Levels

The maximum permissible sound levels established by this subchapter shall be reduced or increased by the sum of the following:

A. Between the hours of 10 p.m. and 7 a.m. during weekdays, and between the hours of 10 p.m. and 9 a.m. on weekends, the levels established by section 25.08.410 are reduced by 10 dB(A) where the receiving property lies within a residential district of the city.

B. For any source of sound which is periodic, which has a pure tone component, or which is impulsive and is not measured with an impulse sound level meter, the levels established by this subchapter shall be reduced by 5 dBA; provided, however, that

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

this 5 dB(A) penalty for the emission of sound having a pure tone component shall not be imposed on any electrical substation, whether existing or new.

C. For any source of noise which is of short duration, the levels established by this subchapter are increased by:

1. 5 dB(A) for a total of 15 minutes in any one-hour period; or

2. 10 dB(A) for a total of 5 minutes in any one-hour period; or

3. 15 dB(A) for a total of 1.5 minutes in any one-hour period.

These regulations do not affect licensed transportation vehicles or apply to emergency vehicles, including helicopters. However, they are useful in indicating the local acceptance of community noise sources. It is important to note that the indicated sound level maximums apply to each source property and not to the combination of all sound source properties affecting a specific location.

No other federal, state, or local regulations were found to address helipad noise.

2.2 Noise-Induced Structural Vibration

Structural vibration and "buzz" or rattle in building floors, walls and windows may be induced by sound of sufficiently high level at frequencies below 100 Hz. These frequencies correspond to the various resonant frequencies of building

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

components and substructures. Based on a review of available literature, (2), (3), (6), (7), the following criteria, as suggested by the American Society of Heating, Refrigerating, and Air Conditioning Engineers, are appropriate indicators of the potential for noise to induce vibration in structural components:

	Sound Level (dB) of Octave Band with Center Frequency (Hz)		
	16	31.5	63
Noise source vibration in lightweight walls may be detectable by touch, slight possibility of rattles in light fixtures, windows, etc.	65	65	70
Noise source vibration in lightweight walls probably detectable by touch; audible rattles and windows probable.	75	75	80

Actual structural damage would not begin to occur until much higher levels were reached, such as those which may occur during sonic booms (110+ dB peak levels), (4) (8).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3.0 EXISTING CONDITIONS

The hospital is situated on a site which slopes upward toward the southeast from approximately 80 feet above sea level at Sand Point Way to 155 feet above sea level at 44th Ave N.E. and N.E. 49th St. The helipad is proposed to be constructed at ground level on the north side of the hospital near the current emergency entrance (See Figure 1). Residential properties surround the area.

N.E. Sand Point Way is a heavily traveled, 4-lane arterial. Traffic noise from this arterial dominates the background noise of adjacent residential areas.

3.1 Noise Measurement Sites

The existing noise environment was measured between May 12 and 15, 1985 at the five sites described below and indicated on Figure 1. These measurement sites were chosen to be representative of noise sensitive properties which would receive the greatest potential impacts of helipad-related noise. They were selected with consideration for helicopter flight path, review of land use, local topography, and after discussions with Kurt Horner of the Seattle/King County Health Department. Final determinations were made by Hermia Ip, land use technician with City of Seattle Department of Construction and Land Use.

Site 1: The parking strip on the east side of 44th Ave. N.E. between N.E. 47th Street and N.E. 50th Street. The location was between the adjacent residences at 4724 and 4720 44th Ave. N.E. Shrubbery adjacent to the west of 44th Ave. and the slope of the hill provided a limited visual barrier from the hospital campus. The grade rises from 122 feet at the helipad to 150 feet along 44th Ave. N.E. The area to the east and north is predominantly single-family residences.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Site 2: The parking strip on the east side of 45th Ave. N.E. between N.E. 45th Street and N.E. 47th Street. The address location was 4530 45th Ave. N.E. This site was at a slightly higher altitude than Site 1. The view toward the helipad location is partially obscured by hospital parking lot landscaping. This area is also single-family residential.

Site 3: North of Sand Point Way, in a parking lot adjacent and to the west of a high rise residential condominium. This area directly adjacent to Sand Point Way is predominantly commercial in use.

Site 4: A low-rise, multi-family complex located adjacent to the west of the hospital property on 41st Ave. N.E. just southeast of Sand Point Way. The grade slopes steeply upward from 55 feet at this site to 92 feet at the edge of the hospital property and then gradually to the 122 foot level of the proposed helipad. This complex includes a high percentage of elderly residents.

Site 5: The west side of 41st Ave. N.E. northwest of Sand Point Way. The location address was 4757 41st Ave. N.E. This location is the east edge of a mixed, single and multi-family residential area directly northwest of Sand Point Way and opposite the hospital campus entrance.

3.2 Instrumentation and Procedure

The noise measurement instrumentation included a Bruel and Kjaer Model 2209 Sound Level Meter with Bruel and Kjaer Model 4165 1/2-inch random incidence microphone meeting ANSI S1.4-1971 (R1976) requirements for a Type I (Precision) sound level meter. A windscreen was positioned on the microphone for

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

all measurements. The measurement set was field calibrated immediately prior to each measurement period with a Bruel and Kjaer Model 4230 Sound Level Calibrator.

Each site was monitored on one weekend day and one weekday. For a given day, each site was monitored for 10 to 15 minutes during four different time periods: 9-10 a.m., 4-6 p.m., 10 p.m.-12 midnight, and 2-4 a.m. These periods, though short and infrequent, were chosen to provide sufficient indication of maximum and minimum sound levels along with general trends at each site.

The instrumentation was used to sample the instantaneous A-weighted sound level at each site at 10-second intervals over a period of 10 to 15 minutes. The data assembled was then used to determine Leq (equivalent energy continuous level, or average level) for the site and measurement period. Additional statistical levels that were determined included the L90 (sound level equaled or exceeded 90% of the time), the L50 (sound level equaled or exceeded 50% of the time), and the L10 (sound level equaled or exceeded 10% of the time). The standard deviation of levels measured during the sample period was also determined. This data is summarized in Table 2. (The complete data analysis is compiled in the appendix.)

The Leq data were used along with a typical 24-hour pattern of noise fluctuation for sites not located near airports or freeways (presented in reference (3)) to approximate a monthly DNL for each site.

3.3 Analysis

For all measurement sites, traffic was the dominant noise source. However, at Sites 1 and 2 and to some extent Site 5, the lowest noise levels were controlled by hospital building equipment noise.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Superimposed over all daytime measurements was distant light aircraft and commercial jet noise that dominated noise levels when present. These events averaged one light plane and one jet per measurement per site. Site-specific results are detailed below:

Site 1: The barrier action of the hospital parking structure to the west effectively reduced traffic noise from Sand Point Way at Site 1. This explains the small difference in minimum to maximum measured Leq levels. Hospital traffic noise, however, was a contributor to ambient levels. The lowest noise levels were controlled by hospital building equipment noise and remained relatively constant day and night. Minimum Leq: 41; Maximum Leq: 49.

Site 2: The noise character at Site 2 was similar to that at Site 1. Although this site was sufficiently barriered from the distant Sand Point Way, the noise levels were dominated by traffic on the arterial N.E. 45th Street and the hospital parking lot directly across 45th Ave. N.E. Again, minimum noise levels were from hospital equipment noise. Minimum Leq: 40; Maximum Leq: 54.

Site 3: All noise levels at Site 3 were dominated by traffic noise from Sand Point Way. The fluctuation in levels was significant and is indicated by the high values of standard deviation. Minimum Leq: 44; Maximum Leq: 67

Site 4: The noise levels at Site 4 were dominated by traffic noise from nearby Sand Point Way. Minimum Leq: 40; Maximum Leq: 54

Site 5: Site 5 was adjacent to Sand Point Way, as was Site 3, and experienced noise levels dominated at all times by traffic noise. Minimum Leq: 40; Maximum Leq: 65

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The approximated monthly Day-Night Sound Level (DNL) at each site, calculated as previously described, is presented in Table 3 below.

TABLE 3
EXISTING BACKGROUND NOISE
MONTHLY, DAY-NIGHT LEVEL (DNL
(Dry Conditions Only)

Site	DNL (dBA)
1	52
2	53
3	68
4	55
5	63

These levels are lower than the actual values, because they do not include the increased noise from traffic ocurring during wet road periods. Thus, they establish a conservative reference for evaluating helicopter impacts.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4.0 HELICOPTER AND HELIPAD NOISE

The helicopter to be used for flights to the hospital helipad is an Agusta Model A-109-A-Mk2 based at the Seattle Jet Center, which would be under contract to Airlift Northwest. This helicopter is a modern, fully-enclosed design with 4-blade propeller and retractable landing gear. It has a Velocity Not to Exceed (VNE) of 169 knots Indicated Air Speed (IAS) and a normal cruise speed of 160 knots IAS. The Agusta A-109 represents near-current low-noise helicopter design.

A minimum-noise approach path for a helipad would require the helicopter to fly over the highest background noise areas in order to keep the increase in background noise to a minimum. The proposed flight path was therefore selected to be along N.E. 45th Street and Sand Point Way from the west, with a sharp turn to the southeast at the hospital entrance and then in to the helipad (See Figure 2). Noise impact will also be minimized by maintaining the highest altitude possible for the longest time period possible, subject to requirements of aircraft and patient safety. In this case, a "Noise Abatement Approach" would include decreasing cruise speed to 120 knots IAS and a gradual descent to reach 300 feet at the hospital entrance from Sand Point Way. At this point, speed would be decreased to 60 knots, a turn would be executed to the south, and a steeper descent along with further speed reduction would follow until touchdown at the helipad.

During the ambient noise measurement period, the specific helicopter proposed for use at the hospital executed a flyby followed by a landing and takeoff at the site of the proposed helipad. The helicopter, with pilot and nurse aboard, used the proposed flight path and procedures described above. (Sound levels of the helicopter with an additional one or two passengers should be nearly the same as this measured condition.) Sound level measurements of the helicopter were made from Site 1, which would be expected to experience the highest levels of helicopter noise.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

During the flyby, at an altitude of 500 feet above Sand Point Way and a speed of 160 knots IAS, the maximum noise level measured was 73 dB(A). For the same distance from the helicopter, noise levels were lower from the tail aspect than from the front aspect. Levels increased gradually to the peak as the helicopter approached and decreased rapidly after passby.

During the approach and landing, the noise level increased gradually up to 70 dB(A) when the helicopter was over Sand Point Way at the hospital entrance. After the helicopter turned and began its descent to the helipad, the noise level increased up to a peak of 80 dB(A) experienced with the helicopter directly opposite the measurement site and approximately 50 feet above the hospital parking lot structure. This highest level occurred as additional power was applied to decrease descent rate prior to landing. The noise level then decreased slowly until the helicopter passed below the visual edge of the parking structure and touched down. (The helicopter was visible from Site 1 while it was on the ground.) From a level of 67 dB(A) at touchdown, the noise level decreased further to 60 dB(A) at idle before shutoff. Approximate time durations of these approach and landing events were:

1.	Duration of detectable helicopter noise during approach over N.E. 45th Street and Sand Point Way up to the turn at the hospital entrance	60 seconds
2.	Descent to position of peak noise level opposite measurement Site 1	10 seconds
3.	Descent to landing	25 seconds

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4.	Throttle back to idle	15 seconds
5.	Idle before shutoff	20 seconds

On takeoff, initial noise level after start-up was 58 dB(A). During takeoff preparation, the noise level rose gradually to 70 dB(A), at which point the helicopter cleared the ground. As the helicopter rose into full view, the noise level rose rapidly to 84 dB(A). At this point, the helicopter hovered with a slightly lower noise level (77-80 dB(A)), executed a clockwise turn to the west, and departed with a quite rapid decrease in noise level to 55 dB(A). Approximate durations of takeoff events were:

1.	Time between start-up and liftoff	70 seconds
2.	Rise to maximum level	10 seconds
3.	Hover	40 seconds
4.	Turn and depart	10 seconds

Using the data from these measurements and extrapolating via standard distance attenuation methods to other sites relative to Site 1, an estimate was made of maximum sound levels that would be experienced by each site during: 1) Flyover, 2) Landing of the helicopter, and 3) Takeoff of the helicopter. Finally, using the sound level versus time data taken for the approach/departure and flyover, an estimate was made of the monthly DNL for the helipad. For this calculation, 40 flights per month were assumed, 29 uring daytime hours (7 a.m. to 10 p.m.), and 11 during nighttime hours (10 p.m. to 7 a.m.). (The resultant data must be carefully viewed as only approximate since it is based on limited data from one flight measurement.)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The estimated maximum helicopter noise levels for overflight, approach and takeoff are presented in Table 4. Also, for comparison, background noise levels at each site are summarized. Background DNL and helipad DNL approximations are presented in Table 5.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5.0 HELIPAD NOISE IMPACT

The maximum noise levels due to the helicopter, expected at any measurement site, are higher than the highest background noise levels measured and significantly so at Sites 1, 2 and 4. However, they are not higher than levels occasionally experienced by most suburban residents. In comparison to more familiar transportation sources, based on the source levels used in the Federal Highway Administration Highway Noise Prediction Model (4), the base level for a heavy truck or bus passing at a distance of 50 feet and traveling at 40 to 50 miles per hour is 84-86 dB(A), the same level as the maximum expected to occur at the most impacted site. For flights during the daytime hours, flyover maximum levels are within 10 dB(A) of the highest existing levels sampled, and below these highest levels at Sites 2 and 3.

Regarding sleep arousal, the maximum noise levels expected during landing and takeoff are sufficient to cause awakening from sleep. Assuming an exterior level of 80 dB(A) and a building noise reduction factor of 25 dB(A), the resultant interior level of 55 dB(A) would awaken 15% of a normal population sample (2). Additionally, susceptibility to sleep arousal varies with depth of the sleep, with the lighter sleeper tending to be aroused the easiest. Since elderly persons sleep lighter on the average, they are more susceptible to sleep arousal (2).

The monthly DNL estimate for helicopter operation is not substantial relative to ambient DNL due to the small number of flights predicted. In all cases, the helicopter DNL is comparable to or below the estimated background DNL. (Note that the background DNL will actually be higher than the estimate due to substantial increases in traffic noise when roads are wet.) Based on the estimated background noise and helicopter DNL's, the net effect of averaged helicopter noise would be the increases indicated in Table 5.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Sound level measurements by frequency of the Agusta helicopter were not possible in the limited measurement period. Review of sound level measurements of other similarly-configured helicopters suggests that the sound level of the Agusta may be expected to be 0 to 10 dB less in the 31.5 Hz ocatave band than the overall A-weighting. Based on this approximation of expected helicopter sound levels, the potential sound levels at 31.5 Hz for the measurement sites are:

Site	Potential Maximum Sound Level at 31.5 Hz (dB)
1	74-84
2	68-78
3	64-74
4	74-84
5	69-79

Based on the criteria for noise-induced vibration of Section 2, perceivable structural vibrations are possible at all sites and probable at Sites 1 and 4. However, any noticeable vibration should be of short duration and not cause any damage.

Impact Summary

Based on the preceding analysis, the following conclusions can be drawn:

1. Though the helicopter noise will be noticeable, it should not cause significant impact during daytime hours due to its infrequent short-term nature.

2. During sleeping periods, helicopter operation may cause sleep arousal of varying degrees to 15-20% of the closest, line-of-sight residents.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. The impact of the average helicopter noise exposure (DNL) relative to existing noise environment will not be significant, although the existing backbround noise DNL in some locations may increase by up to 5dB (A).

4. Structural vibrations will not be significant.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6.0 NOISE ABATEMENT AND MITIGATION

Methods of noise abatement and mitigation considered for application to the helipad include: 1) Use quietest type of helicopter, 2) Orient flight path for minimum noise impact, 3) Control flight pace to maintain highest altitude for longest period of time, and maintain lowest throttle settings possible, 4) Locate helipad to take advantage of shieldings by existing structures, and 5) Construct noise barriers in appropriate locations around helipad. Specific evaluations of these measures are as follows:

1. The helicopter to be used for flights into the helipad was chosen because it is a modern design, multi-blade unit, and represents near-current low-noise technology.

2. Minimum-noise impact results when the increase in noise level above normal background noise is minimized. The flight path causing least noise impact would be over the highest background noise areas. The proposed path along N.E. 45th street and Sand Point Way until reaching hospital property meets the goal. (This path was flown during helicopter noise measurement on May 14, 1985.)

3. The helicopter flight plan should include, a "Minimum Noise Approach" plan which maintains highest altitude possible for as long as possible. (This procedure was followed during helicopter noise measurements.) The helicopter should execute a clockwise turn (south to west) on takeoff to the degree required.

4. The helipad is to be located adjacent to the hospital building to the north. The building will shield helicopter noise to the south while the helicopter is on the ground. This location is closest to the highest noise, Sand Point Way corridor, and will minimize background noise increases.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. Concrete wall noise barriers up to a height slightly above the engine level could be placed around the helipad. However, since the maximum noise levels were measured with the helicopter hovering approximately 30 feet above ground, these levels would not be reduced. The site already provides some shielding by land contours and the parking structures. Any additional noise barrier would provide 0-5 dB additional noise reduction of on-ground levels. Since these levels represent a small contribution to the overall sound exposure experienced by any site, the mitigative effect of the barrier would be small. In addition, the extra care required for a pilot to land clear of a barrier would increase the exposure time to higher noise levels.

Guidelines for Perinatal Care, American Academy of Pediatrics and American College of Obstetricians and Gynecologists, 1983.

chapter 8

Interhospital Care of the Perinatal Patient

The transport of pregnant women, mothers, and neonates between hospitals is a recognized and essential component of modern perinatal care. As noted in Chapter 1, transportation is one of the systems approaches to obstetric and newborn care. There are three types of patient transport: maternal-fetal, neonatal, and return.

Maternal-fetal transports involve pregnant women who are to be admitted for delivery, unlike obstetric consultations, which involve ambulatory evaluation without admission. Neonatal transports usually employ a team to evaluate and stabilize the neonate's condition, as well as to provide care when indicated. Return transports take patients back to their original or local hospital for further care when the problems that required transport have been resolved. Return transports should be recognized as an important benefit to the individual patient and system.

The Committee on the Fetus and Newborn of the American Academy of Pediatrics has established a policy on Level II neonatal units, stating that "Level II neonatal units must have ongoing liaison with a Level III neonatal intensive care unit." That firm support for a network can logically be extended to all perinatal services. The referral of high-risk mothers, as well as sick newborns, to regional centers for care has a positive impact on local perinatal care and makes it necessary to set guidelines for regional perinatal networks. The rising costs of care, the ascending expectations of consumers, and the constraints on spending are relevant considerations in a movement toward firmer guidelines for interhospital care of the perinatal patient.

Interhospital transport and care of high-risk perinatal patients make it reasonable to expect that every patient in a region will be cared for in an appropriate manner. A successful program of interhospital care should incorporate the following components:

1. Risk identification, which includes active anticipation of needs that will require the movement of patients in order to provide optimum care
2. Recognition that patient care is a continuous process
3. Local physicians who know the resources that are available and how to gain access to them
4. Physicians at all levels who have the knowledge and skills needed to identify the high-risk patient, to evaluate the patient's condition, and to stabilize and prepare the patient for transfer
5. An organized, appropriate, and available interhospital transport service
6. A political and economic environment that provides support for the interhospital transport system
7. Data collection and analysis for purposes of monitoring and evaluating the program

From the moment a perinatal problem is recognized, to the point of its resolution and follow-up, there should be a continuum of care. Because disease processes do not become static while a patient is being transferred, management is necessary during transport. The objective of interhospital care thus becomes the provision of the maximum degree of care possible within the constraints imposed by a moving ambulance, its restricted space, and its lack of support facilities (e.g., laboratory, blood bank, and radiology services).

INDICATIONS FOR TRANSPORT

The circumstances in which patients are transported vary according to the distribution of care facilities in each region. The decision should be made by the initial physician and a consultant, both of whom should be well-informed of the resources at each center. In general, transport should be considered when the resources immediately available to the maternal, fetal, or neonatal patient are not adequate to deal with the patient's actual or predicted medical or surgical complications.

The following patient conditions require more specialized care and may require patient transfer. The specific values are to be considered guidelines only. They will vary with individual patient needs or institutional capabilities.

I. Maternal Conditions
   A. Obstetric complications
      1. Premature rupture of membranes (at less than 34 weeks' gestation or less than 2000 g expected birth weight)
      2. Premature labor (at less than 34 weeks' gestation or less than 2000 g expected birth weight)
      3. Any condition creating the probability of birth at less than 34 weeks' gestation or less than 2000 g expected birth weight
         a. Severe preeclampsia or other hypertensive complication
         b. Multiple gestation
         c. Intrauterine growth retardation
         d. Third trimester bleeding
         e. Rh isoimmunization
         f. Premature dilation of the cervix
   B. Medical complications
      1. Infections in which the degree or nature of maternal illness may result in premature birth
         a. Hepatitis
         b. Pyelonephritis
         c. Influenza
         d. Pneumonia
         e. Other febrile or hypermetabolic conditions
      2. Severe organic heart disease, functional class III or IV
      3. Poorly controlled diabetes mellitus
      4. Thyrotoxicosis
      5. Renal disease with deteriorating function or increased hypertension
      6. Drug overdose
      7. Miscellaneous severe illnesses
   C. Surgical complications
      1. Trauma requiring intensive care or surgical correction beyond the capabilities of local facilities or where the procedure may result in the onset of premature labor
      2. Acute abdominal emergencies at less than 34 weeks' gestation or with a fetus weighing less than 2000 g
      3. Thoracic emergencies requiring intensive care or surgical correction

II. Neonatal Conditions
   A. Gestation less than 34 weeks or weight less than 2000 g
   B. Neonatal sepsis or infection

C. Respiratory distress and metabolic acidosis persisting after 2 hours of age
D. Neonatal blood loss
E. Hypoglycemia
F. Hemolytic disease of the newborn
G. Neonates of mothers taking hazardous drugs
H. Neonates of diabetic mothers
I. Neonatal seizures
J. Sepsis or meningitis
K. Congenital malformations requiring surgical care or observation
L. Shock or asphyxia persisting beyond 2 hours
M. Neonatal cardiac disorders with persisting cyanosis
N. Progressive, increasing respiratory distress syndrome
O. Any neonatal condition requiring ventilatory support for more than 1 hour
P. Neonates needing more than routine observation or care

THE ORGANIZED APPROACH TO TRANSPORT

The provision of adequate life support during the transport of critically ill mothers and neonates requires considerable knowledge, skill, experience, and specialized equipment not readily available in all hospitals. Many perinatal centers that provide Level III services have developed transport systems for their service regions because only experience with a large number of patients can maintain the skills required for care during transport. The referring staff can help the mother and neonate most by calling for assistance as soon as the need for transport becomes apparent and by using the time before transport to stabilize the patients and prepare for transport. This practice ameliorates the immediate problems and reduces the time that the transport team must be in the referring hospital.

In certain circumstances, it is reasonable for the referring physician to manage the transfer personally. Maternal-fetal transports are frequently conducted in this fashion. The procedure whereby transport originates at the referring hospital, frequently termed one-way transport, functions effectively in some locations; however, two-way transport systems, which operate from a base at the center, are more common. Any transport procedure is acceptable if the guidelines given here are utilized and its goals and objectives are attained.

Informal, poorly organized interhospital care is hazardous. In order to avoid compromising the patient, to ensure a predictable response for transportation requests, and to provide the highest quality of care, the approach to transport must be logical and organized. When the number of patients who require interhospital care is small, efforts to monitor and maintain the skill levels of the team become even more important. It is advisable in such instances to consider the consolidation of care programs.

An interhospital care system has five identifiable components: (1) organization, (2) communications, (3) personnel, (4) equipment, and (5) transport vehicles.

Organization

Interhospital care should be available 24 hours/day, in a program with defined response time and minimum capabilities of personnel. The director should be a specialist in maternal-fetal medicine or neonatal medicine, or a board-certified pediatrician or obstetrician with a special interest in these subspecialty areas. The director's responsibilities are:

1. Quality control of patient care through regular case review
2. Personnel training and supervision
3. Development and utilization of patient care protocols
4. Development and utilization of record-keeping systems and subsequent collation and evaluation of data for analysis
5. Review of operational aspects, e.g., response times, effectiveness of communications, and equipment maintenance

Communications

The transfer of a patient from one hospital to another and from one care team to another requires a reliable communications system. It is essential that the referring physician provide the receiving physician with specific clinical information on the patient being referred. For a maternal patient, the following information should be included:

Reason for admission
Age
Date of last menstrual period
Estimated date of confinement
Gravida, para, and abortion
Relevant health problems
Perinatal history

Blood type
Results of amniocentesis
Reasons for transfer
Therapy administered, including drugs
Intake and output

For a neonatal patient, the following information should be included:

Gestational age and weight
Perinatal history
Temperature
Color
Hematocrit
Oxygen requirement and blood gas levels
Respiratory activity (particularly presence of apnea or need for assisted ventilation)
Blood glucose or Dextrostix
Pertinent radiologic findings
Reasons for transfer
Therapy administered, including drugs

This information allows the receiving facility to prepare for the patient's stabilization, transfer, and admission. Appendixes F and G contain sample record formats for information that can be provided conveniently by telephone. For large service areas, toll-free lines should be established by the referral center for referring physicians and families. In metropolitan areas or over short distances, direct hotlines may link referring obstetric units and nurseries to the center. These lines should be open 24 hours/day and should be well publicized throughout the service region. The liaison between the referring and the receiving centers should include telephone or radio communication during stabilization and transfer.

Appropriate historical data should accompany the patient. This information should include appropriate laboratory data and x-rays. In most neonatal transports, 10 ml clotted maternal blood to be used for cross-matching purposes should be obtained and should accompany the transport team. Cord blood and the placenta may be helpful in certain clinical situations, such as multiple gestation or intrauterine growth retardation.

Dispatching services should provide rapid coordination of vehicles and personnel, as well as communication links between referring

and receiving hospitals and the transfer team. Referring physicians should be given an estimated arrival time to allow them to arrange for laboratory studies on which to base therapy in transport and ensure their availability at the time of transport. The receiving hospital should also be given an estimated arrival time to allow the staff to prepare for the patient's arrival. When flights must connect with ground ambulances, it is desirable for a single dispatching center to coordinate the movements of all vehicles. The complexity and sophistication of the dispatching operation vary considerably with the nature of the service.

Personnel

The interhospital care team members should have the collective expertise sufficient to provide the necessary supportive care for a wide variety of emergency conditions in high-risk mothers and neonates. Team members may be drawn from appropriately trained physicians, registered nurses, respiratory therapists, and emergency medical technicians. One member should usually be a physician or registered nurse. Neonatal nurse clinicians are often specifically identified with this role. In addition to being highly knowledgeable in care and procedures for perinatal patients, transport personnel should be thoroughly familiar with transport equipment; any malfunction en route must be managed without the assistance of hospital maintenance staff.

Equipment

Powered equipment should have "stand alone" capability, i.e., it should be battery-operated. Batteries should have sufficient power to operate the equipment for the duration of the transport if no alternative power source is available. Furthermore, critical equipment should be adaptable to 12- and 24-volt DC and 110-volt AC power for use in a hospital or ambulance.

In addition to equipment for monitoring, resuscitation, and support of both mother and neonate, a transport kit containing essential drugs and special supplies should be continuously available during stabilization and transfer of the patient. A list of equipment and drugs that should be included in a transport kit is found in Appendix H.

Transport Vehicles

The main concern during transport is to maintain optimum care. The choice of a ground or air ambulance is based on distance from one hospital to another and facilities available to support the patient during

the transfer. Ground ambulances are most useful for distances up to 80–100 miles of flat terrain in low traffic density areas. Beyond 100 miles, aircraft may be faster or less expensive, even though ground ambulances provide more direct transfer between regional centers. The pressurization of aircraft is an important consideration during management, since adequate oxygen levels of the mother and fetus or newborn must be ensured.

Helicopters are used in some areas to transport patients up to a few hundred miles or to reach patients in difficult terrain or high traffic density areas. Helicopters are not pressurized, are generally noisier and more confined, and have less range than fixed wing aircraft, however. These limitations should be considered whenever a helicopter is used.

TRANSPORT PROCEDURE

Evaluation

The patient's condition should be carefully evaluated at the referring hospital, both in regard to the primary diagnosis and the presence of complicating conditions. Steps should be taken to correct these conditions to the extent possible prior to transfer.

Stabilization

Transport of the maternal patient may require hemodynamic stabilization; the initiation of tocolytic agents, anticonvulsants, or antihypertension agents; or demonstrated arrest or diminution of active labor. Patients with active bleeding, rapidly progressive preeclampsia, and rapidly progressive labor should not be transported until appropriate medical management has been initiated and, in the opinion of the medical team, the possibility of acute crisis or delivery in transport is significantly diminished. In some situations, maternal transport may not be advisable; it may be preferable to coordinate neonate transport in such a fashion that the transport team arrives at the referring hospital immediately prior to or shortly after the birth. Transport teams may, by prior agreement between the referring physician and the dispatch center, participate in the initial stabilization at birth. In the fully stabilized neonate, temperature, blood gas levels, blood pressure, tissue perfusion, and blood glucose level are normal. Complete stabilization of a newborn is not always possible, but transport of an extremely unstable newborn is contraindicated.

Although there have been no controlled trials, experience indicates that stabilization prior to departure is probably the most critical aspect of interhospital care because it minimizes subsequent deterioration in an environment that may not permit detection or treatment of problems.

Medicolegal Concerns

There are many legal considerations in perinatal transport. Many details are not well defined, but all involved parties, including the referring hospital and personnel, the receiving hospital and personnel, and commercial ambulance and aircraft charter corporations, assume responsibilities. As spokesperson for the transport team, the physician should thoroughly explain to the patient or the parents of the newborn the patient's condition and reasons for transfer. Informed consent for transfer, admission, and care should be obtained. The newborn should be clearly identified.

Perinatal transport teams are involved in very special transport situations, and prior attention to potential legal problems is advised. In most situations, the institution that employs the team is responsible for its actions, and professional duties are performed under the direction and authority of a physician-director at the receiving hospital. Many hospitals consider neonates admitted to their institution while en route and under the care of the transport team. Physician-directors and hospital administrators should recognize the potential administrative or legal problems that may arise in certain situations, for example, when transport teams cross one or more state lines during a transport.

The referring physician preferably should remain at the hospital until the neonatal transport team arrives and should be there while the team is present in order to ensure complete communication. The patient must pass from the official care of the referring physician to that of the transport team at some point; the departure of the transport team from the physical premises of the referring hospital might be considered the official point of transfer of responsibility. Individual hospitals and regions should investigate the use of transfer agreements, which might include granting of emergency privileges to members of transport teams.

The referral center should receive a report on the patient's condition prior to departure. In the case of newborn transport, the mother and father should be offered the opportunity to see and touch the neonate before the transfer, even if the neonate is in a transport incubator or on a respirator. In addition, an instant picture of the

neonate may be taken for the family prior to transport. This has proved particularly helpful when parents and their neonates are to be separated for a long period or when the mother is recovering from a cesarean delivery and may not remember the time spent with the neonate prior to transport. The family of the patient should also receive written information about the receiving hospital, names of staff members, visiting hours, telephone numbers, and places to stay in the vicinity of the hospital. Brochures about the hospital can be helpful. A desire to breast-feed should be reinforced, and the mother should be taught how to express milk until nipple feeding becomes possible. Early attention to family needs and concerns at this critical time can reduce anxiety and ease the transition to a new medical center.

Records are essential for the continuing care of the patient and for the evaluation of the referral transport process. Records should include the following information:

- Patient's name
- Referring hospital
- Receiving hospital
- Referring physician
- Attendants' names and professional status
- Mode of transport
- Time data, including arrival at the referring hospital, departure, ground or air ambulance time, and arrival at the receiving hospital
- Patient's age, weight, gestational age, and sex
- Diagnosis and condition
- Procedures performed
- Medication administered
- Periodic vital signs
- Special comments

PATIENT CARE IN TRANSIT

A well-stabilized patient requires little or no intervention during transport. The patient should be under continuous observation, however. The key factors to be monitored in the maternal patient include blood pressure, uterine contractions, cervical dilation, fetal heart rate ultrasonography, deep tendon reflexes, infusion rate of intravenous fluids, and the administration of tocolytic agents or anticonvulsants. For the

newborn, temperature, respiration, heart rate, blood pressure, color, activity, and oxygen concentration should be monitored frequently by noninvasive means. A neutral thermal environment should be maintained. It may be necessary to monitor other parameters as well, such as the blood glucose level. Monitoring of blood gases during transport is feasible with the availability of portable transcutaneous monitoring.

The patient, attending personnel, and all equipment should be safely secured in the transport vehicle. Although it may be necessary to respond rapidly to an emergency, high-speed ground travel greatly increases the risk of accidents. In the majority of cases, there is little need for excessive speed if the patient is stabilized.

RECEIVING AND COMPLETING TRANSFER

The receiving staff should be prepared to deal with any unresolved problems or emergencies. The patient's history and clinical status, as well as all the plans for current management, should be communicated directly by the transport personnel. Therapies provided during transport should not be changed unless the transport team is consulted.

Family members are extremely anxious when a patient is transferred. If they have not been able to accompany or follow the patient, they should be called as soon as possible after the transfer and given a report on the patient's condition. The referring physician and the nursing staff at the referring hospital should also be informed about the patient's arrival at the receiving hospital and the patient's progress on a continuing basis thereafter.

The transfer is not complete until equipment on the transport vehicle has been restocked and prepared for the next call. Reusable equipment that has come into contact with the patient should be appropriately sterilized or decontaminated.

OUTREACH EDUCATION AND THE REGIONAL TRANSPORT SYSTEM

Since interhospital care of the high-risk perinatal patient requires the cooperation and coordination of many skilled persons, outreach education efforts should include discussions of the regional transport system. Outreach education can be used to reinforce that cooperation and coordination.

Outreach education related to transport should focus on the following objectives:

1. Informing perinatal care providers in the region of the specialized resources available to them through the perinatal network
2. Assisting primary physicians in developing their abilities to anticipate complications, to identify high-risk perinatal patients, and to stabilize these patients before transport
3. Facilitating effective quality assurance through the continuing education of perinatal care providers
4. Establishing 24-hour consultation and referral sources
5. Promoting a regionalized care system designed to ensure high-quality care to all patients in a cost-efficient fashion

PLANNING AND EVALUATION

The planning of the perinatal transport system requires the participation of both those who will use the service and those who will provide it. The creation of regional advisory councils with representatives from the various perinatal programs facilitates planning and evaluation, as such a group can identify and verify the particular region's needs for interhospital perinatal transport and the specific characteristics of the service that should be designed in response to those needs. The characteristics of the successful system, as described earlier, can be used as a guide for program development and subsequent evaluation. Other criteria should be considered in planning and evaluating the transport system:

1. Availability: Does the system provide all services that may be needed by the perinatal patient?
2. Accessibility: Is the capacity to "connect" the patient quickly and appropriately with the services needed ensured? Do those who will need the services know where to go to get them?
3. Responsiveness: Is there a mutual commitment from referring care providers and specialized care providers to honor and accommodate each other's special needs as they may arise?
4. Effectiveness: Are perinatal patients being given the appropriate care in the appropriate setting? Do care users, physicians and patients, and care providers regard the perinatal transport service as useful and effective?

As basic as these questions may appear, their answers are often assumed without testing. The purpose of the evaluation of the system is to collect the evidence that will confirm that the system provides high-quality care to high-risk mothers and neonates.

Sir:

I live immediately ajacent to the helipoint used by Jefferson General Hospital, its a busy helipoint, probably twice a day or more the Medic Evac chopper uses this landing pad.

We have grown accustomed to what noise this chopper makes, plus we are well aware that those evacuated by chopper are generally desperately ill patients, we do resonate critically for children to Childrens Orthopedic Hospital, new born infants are the most commonly sent there.

I would hope those whom complain the loudest would give some thought to the many lives saved by the opportune available of C & H.

I would ask you to approve this helipoint and save many dangerously ill infants.

Sincerely
Gerald K. Sandquist

Re: NEFRN's Post-Hearing Statement on CHMC Helistop; CF File 297288 and 298740

Dear Hearing Examiner Alexis:

After submittal of NEFRN's Post-Hearing Statement to the Hearing Examiner yesterday, we found that Condition No. 6 was not revised in the final document as intended. As described in the discussion section following Condition No. 6 in NEFRN's Post-Hearing Statement, the condition was to have been revised to eliminate the automatic requirement for an Environmental Impact Statement and to establish an alternative public review process for any substitute helicopters.

We have enclosed a replacement page 6 that contains NEFRN's intended revised Condition No. 6, which is consistent with the discussion that follows on page 7 of the Post-Hearing Statement. Please substitute this page 6 for that which was submitted yesterday in NEFRN's Post-Hearing Statement.

Sincerely,

PETER J. EGLICK & ASSOCIATES

Carol Eychaner
Land Use Planner

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Since the hearing, NEFRN has once again reviewed EIS, DCLU and community information regarding the average and maximum number of landings that have so far occurred on the CHMC campus. It has also closely reviewed the proposal and projected landings as described in the EIS and the DCLU analysis. Based on this more recent review, NEFRN proposes to revise its Condition No. 5 in an effort to balance the community's need for certainty (which is based on CHMC's and DCLU's representations regarding the number of landings that will occur at the Kitchen Garden site) with CHMC's need for flexibility. The Condition as revised now allows an average of 9 landings per month, with a maximum limit of 18 landings during any given month. This represents a 50% increase over the 1991 actual monthly average (which, at 6.33 landings per month, was the most ever recorded on the CHMC campus), and the maximum number of landings that have occurred during any given month (twelve, in May 1990). It also exceeds by 50% or more the projections reported in the EIS and DCLU analysis and recommendation for the average monthly landings.

(For a more detailed discussion regarding this Condition, and for potential findings and conclusions, see pages 7-9 of NEFRN's June 24 Statement.)

Condition No. 6:

Only Augusta 109 helicopters, with a four-bladed rotor, shall be permitted to land at the CHMC campus helistop, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area. Two-bladed rotor helicopters, such as but not limited to the Huey helicopters typically used by the Military Assistance to Safety and Traffic (MAST), Coast Guard, and Navy, are prohibited from landing at the CHMC campus.

Should Airlift Northwest or another aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Augusta 109 studied in the EIS, supplemental environmental review (including an expert noise analysis based on actual field measurements of helicopter noise) must first be prepared to evaluate the noise impacts of the new equipment. After receipt of the noise analysis, DCLU shall provide public notice, and solicit and consider public comment, on the new helicopter proposal and noise analysis. Public notice shall include written notification of the Laurelhurst Community Club and surrounding residential community. If requested, DCLU shall conduct a public hearing on the proposal. Any helicopter that exceeds the noise generated by the Augusta 109 shall be prohibited on the CHMC campus.

OFFICE OF
HEARING EXAMINER

Ruperta Alexis
Deputy Hearing Examiner
Room 1320 Alaska Building
618 Second Avenue
Seattle, Washington 98104

To the Hearing Examiner:

I am writing on behalf of NEFRN, North East Families for Residential Neighborhoods, a group of families living in the vicinity of CHMC who have recently formed because of our concern about the impact of CHMC on the surrounding community. These remarks reflect the position of NEFRN, a group that is now supported by a large proportion of the families living in close proximity to Children's Hospital and Medical Center.

Our name speaks for itself. We are convinced that Seattle as a city will only survive if it maintains and protects its residential neighborhoods. We are concerned that the continual increase in activities and scale of CHMC on its Laurelhurst Campus will destroy the residential quality of housing surrounding the hospital, and provide a precedent for other Seattle hospitals to do the same in other city neighborhoods. The city of Seattle has a clear and present interest in protecting its residential neighborhoods from activities that harm residential values and reduce the already-threatened quality of life for neighborhood residents. Seattle's neighborhoods--like those of most large, central cities--are under siege. High housing costs, taxes, crime, deteriorating schools, noise, and pollution have driven residents from the city in droves. For this reason most Puget Sound families live in suburbs outside Seattle. Planners keep railing against urban sprawl, and Mayor Rice has recently suggested that Seattle absorb more residential density to combat this sprawl, but unless the City of Seattle gives present residents the protection they need to live peaceful, productive lives in their present neighborhoods, no one is going to stay. Sprawl will continue to increase, along with the taxes, crime, deteriorating schools, noise and pollution that have driven residents from cities like Detroit, Philadelphia, and St. Louis.

<u>Reasons that NEFRN has opposed a heliport at CHMC:</u>

Regarding the heliport proposed for CHMC's Laurelhurst campus, it is important to focus on the main issue. The issue is <u>not</u> one of appropriate care for children, but <u>is</u> one of appropriate land use. This does not seem to be widely understood outside the community of neighbors of CHMC. As an example of the way the issue has been addressed among the media who have never bothered to find out the basis of community opposition to CHMC's heliport plan I cite Brian Basset's cartoon on the editorial page of last Sunday's <u>Seattle Times</u>. It shows two gentlemen standing in front of a baronial fireplace above which a helicopter is mounted as if it were a hunting trophy. Above it is captioned "Meanwhile in Laurelhurst . . ." and below one of the gentlemen is saying, "Bagged this baby on a lifeflight to Children's Hospital." Although the Sunday <u>Times</u> made no mention of today's hearing or any of the issues involved, the message is clear: Opposition to CHMC's plans is a plot of the super rich--everyone knows that everybody in Laurelhurst is super rich--trying to maintain their exclusive lifestyle.

What's the reality? Although there are some super rich residents of Laurelhurst, those people who live near CHMC are not. The homes around CHMC threatened by low-flying helicopters are not million dollar view homes, but primarily modest, middle-income houses, multifamily apartments, and senior housing. Nobody in our group has deep pockets. We barely eke by on contributions of $20-$30 made by a large number of citizens who are concerned about CHMC's lack of consideration for the neighborhood in which they are

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

located. We do not have the resources that CHMC has to hire one of the largest corporate law firms in town, or get an editorial in the newspaper with a phone call from our PR Office.

I cite this unfortunate example of mud-slinging to illustrate the level of hysteria generated by CHMC's supporters on this issue. Rather than deal with the issue on its land use merits, they attack the messenger. As a result, many people are afraid to speak out. I would not expect a parent of a child who has been critically ill to be able to make a rational analysis of the issues involved in this case. A parent rightly wants their child saved, and can't be expected to worry about whether others are endangered or harassed in the process. I would feel the same way in the same situation and don't hold it against them. This does not mean, however, that an analysis of the issue based on such emotions will lead to the best solution. And it is cynical for a large institution such as CHMC, that has a financial interest in the outcome of a land use issue, to manipulate natural parental feelings in the media in order to avoid addressing legitimate land use concerns of some Seattle citizens.

It shouldn't be necessary to say this, but it is NEFRN's hope that the issue of CHMC's heliport will be decided on the basis of reason and facts. NEFRN--composed primarily of families with children--obviously is not, and never has been, opposed to children receiving the best and most timely care available for all their illnesses. We acknowledge that swift means of getting children to proper care facilities are sometimes required. We are well aware that CHMC has on staff fine physicians and other health care workers that have provided many children and their families with superior medical care. We recognize also, however, that children getting good medical care is not synonymous with centralization of care at the Laurelhurst Campus of CHMC, and that the desires of CHMC as an institution in competition with other medical institutions in the Seattle Area are not synonymous with the welfare of children in general. CHMC is a wealthy and powerful institution that exercises planning and makes choices about where among the numerous properties owned by it and its affiliates to locate its various medical programs. It makes choices about the other hospitals in the Seattle area with whom it chooses to cooperate. It has never been the case that if a particular medical program is not located at CHMC's Laurelhurst campus, the children of Seattle will thereby necessarily be deprived of needed medical services, although CHMC has often implied that this is true. It is within CHMC's power to make land use decisions that will provide good medical care for children and recognize the legitimate right of residents near the hospital to live in peace and security. That they have not chosen to do so is an institutional, rather than medical, problem.

It is NEFRN's position that, in making choices about what programs and services to locate on their Laurelhurst Campus, CHMC must be flexible and take into account the fact that their Laurelhurst campus is located in a residential neighborhood under severe developmental pressure--not simply from CHMC, but also from nearby University of Washington. We believe CHMC should recognize that all programs they may wish to implement are not appropriate for a residential location, and that in cases where planned activity is not appropriate for a residential location--such as in the case of the heliport--CHMC has the resources and ability to locate those facilities more appropriately, either through cooperation with other hospitals in the area or through the use of alternative sites for activities that adversely affect the surrounding residents.

We have been opposed to granting a conditional use permit for the construction of a heliport at CHMC's Laurelhurst campus because we believe its location endangers the residents of the neighborhood, creates noise at unpredictable hours, and damages property values in the vicinity of the hospital. Though CHMC deems the risk to the neighborhood of low-level helicopter flights to be 'acceptable', that risk remains. Neither CHMC or any other institution can guarantee that a helicopter won't crash down on a family in the supposed

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

safety of their home. The proposed flight path down Sand Point way, and even more the proposed secondary flight path from the east, involves inevitable low-level overflight of residences. When the large 'Huey' helicopters come by, all the houses near the proposed heliport sight shudder perceptibly. Particularly heavy impact is experienced by the residents of the Laurelon Terrace condominiums on Sand Point Way down the hill from the hospital and also the multiple family units located along NE 50th Street who regularly experience low-level overflights. The residents of these condominiums are primarily senior citizens--a group of people that the EIS notes is particularly susceptible to sleep disturbance from noise (Vol I:108). A proportion of these senior citizens are in extremely poor health, making overflights that much more disturbing. A heliport under such conditions is simply a nail in the coffin of a Seattle residential neighborhood.

We believe that less dangerous and disruptive alternatives that will provide equivalent levels of protection for children exist. NEFRN is not convinced, however, that CHMC has ever made a good faith attempt to consider the alternatives with less impact on the neighborhood than locating emergency helicopter service on their Laurelhurst Campus. We are in particular disappointed that CHMC has not taken seriously the option of cooperating with Harborview Hospital--a hospital located on the edge of downtown near Interstate 5 with an existing heliport that already takes some pediatric emergencies. Although CHMC supposedly addressed this option in their EIS, they in fact only considered using the Harborview heliport with direct ground transport to CHMC. They did not consider the option of admitting patients to Harborview and stabilizing them until it is safe to transport them by ground to CHMC. (see EIS volume I:70-71). CHMC has never identified in any specific way the equipment necessary for emergency treatment of children, or whether any of that equipment already exists at Harborview. They have never explored in any specific way whether rotating some of their staff through Harborview might be feasible, and whether such a rotation might in fact provide an opportunity for improving emergency care for all children of Seattle, not simply those sent to CHMC. We believe the reasons CHMC has been inflexible and not chosen to explore these options have more to do with concerns for market share and rivalry with other medical institutions than with the welfare and treatment of children.

NEFRN believes that heliports do not belong <u>in any residential neighborhood in Seattle</u>. They are a frightening, dangerous, noisy assault on those citizens unfortunate enough to live nearby. Heliports for emergency medical use may be used at any time of day or night--with noise levels high enough to wake nearby residents, particularly if they should be so rash as to leave their windows open on a balmy night. The heliport proposed by CHMC for their Laurelhurst campus will be the first heliport in a residential area of Seattle. If approved, it will assuredly not be the last. Another heliport proposal has been made in the Delridge area of Seattle. Contrary to what is asserted in the draft recommendation of DCLU (page 15 par 3), all full members of the Airlift Northwest consortium will not have established heliport operations on their respective campuses if CHMC establishes a heliport. Providence Hospital, another hospital located in a residential area of Seattle, is a full member of the Airlift Northwest consortium that does not yet have a heliport on their campus. They have not sought one, but this may change if the CHMC heliport is approved. The issues of the CHMC heliport, then, are not confined to the Laurelhurst neighborhood, but apply to all residential neighborhoods in the city that also have a hospital. A short list of potentially threatened neighborhoods, then, would include the Central Area, Capital Hill, and Beacon Hill. Whether or not any of the hospitals in these areas presently have plans for a heliport or not, the CHMC heliport will be a precedent for all of them.

When CHMC moved to its present Laurelhurst site from Queen Anne Hill in 1953, the land on which they moved--as is all the surrounding land--was zoned for single family residential use. As CHMC well knows, the underlying zoning of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CHMC is still residential. Each time CHMC has expanded and provided new services, they have assured the neighborhood that they will design them in such a way as to preserve the residential quality of the neighborhood. What began as a small neighborhood hospital, however, is now a behemoth institution. It is unlikely that the city would even permit CHMC as it is currently developed to locate at its present residentially zoned and developed site. However, though incremental expansion, such as the medical office space and now the heliport, CHMC has been allowed to create cumulative and significant impacts on the surrounding neighborhood. CHMC has recently begun the master plan process for yet another expansion--a 45% expansion in size that will only further increase the pressure for more and more overflights into CHMC.

We believe that CHMC will continue to expand and increase the range of services they offer on their Laurelhurst Campus, and that the already considerable impact of the hospital--an impact that is reflected in lowered property values and increased difficulty in selling houses in the vicinity of CHMC--will only increase. Between January 1991 and June 1992, houses adjacent to CHMC took an average of 198.3 days to sell (and several were taken off the market without selling) at a time when houses in close-in areas of Northeast Seattle sold in an average of 41 days. We give this data not because property values are our primary concern--we bought in this area because we want to live here. Some of us were here long before CHMC came to the neighborhood, and most of us will be living here long after the current CHMC administration has retired or taken jobs elsewhere. The data on house sales (or the lack thereof), however, is evidence that the impact of CHMC on adjacent residential areas is real and recognized by potential new residents to the community.

NEFRN's Response to the DCLU May 14, 1992 Recommendation on the CHMC Heliport

We recognize that DCLU has accepted CHMC's heliport EIS, and has recommended that CHMC be granted a conditional use permit to build a heliport at the Laurelhurst campus. We also recognize that DCLU has tried to make a good faith effort to limit the conditional use permit so that the impact on nearby residents of helicopter overflights is somewhat mitigated. Given the importance of the CHMC heliport as a possible precedent for other heliports in residential neighborhoods in the City of Seattle, however, NEFRN believes the conditions proposed by DCLU are less than the bare minimum level of reasonable protection for the neighborhood. If the heliport is approved, the conditions must be strengthened. The specifics of our proposed minimum conditions will be presented by our attorney after NEFRN has had an opportunity to hear CHMC's position on the heliport and the DCLU-proposed conditions. Here I will highlight the positions NEFRN has taken at a meeting of its board of directors.

If a heliport is to be built at CHMC's Laurelhurst campus, it should only be built at the Kitchen Garden site as described in the EIS. The present master-plan proposal indicates that CHMC intends to ask for a zoning change in the kitchen garden site for future expansion. This makes us wonder if CHMC really plans to use the Kitchen Garden site for a heliport at all. As the information in the EIS and DCLU recommendation is predicated on the use of the Kitchen Garden site we believe that no substitute sites should be allowed without CHMC having to prepare another EIS and obtain another conditional use permit.

Because CHMC is presently preparing a master plan for very significant expansion, we wonder about the relationship of the heliport to this expansion. Presently the heliport is not included in the master plan process. We think it should be so included. We therefore recommend that a Conditional Use Permit, if granted, should be temporary until the full twenty year master plan for CHMC is completed and the heliport has been considered in conjunction with CHMC's plans for expansion. The final decision regarding the heliport must be addressed in the CHMC Master Plan and in the context of CHMC's additional

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

proposed development.

(1) We support DCLU recommendation No. 1 that helicopters, including MAST helicopters, should be allowed to land at the intermural field site. If a heliport is allowed at CHMC, only critically ill patients should ever be directly landed on the Laurelhurst campus of CHMC. We think this position, which is the same as that the DCLU, meets the need for critically ill children while minimizing the impact on the neighborhood.

No one can guarantee that a medical helicopter will not crash at take-off or approach to CHMC--and possibly even take a neighborhood family with it. The EIS finding of sufficient 'safety' is a statistical one--that is, given the number of flights involved, the odds of a medical helicopter crashing and harming neighborhood residents are low enough to constitute 'acceptable risk.' Even if the odds for any particular flight crashing are low, however, the possibility of a crash actually happening at the CHMC site goes up with each take off and landing. 'Acceptable risk' must be confined to the number of flights actually assumed in the EIS, and an absolute ceiling on the number of flights must be imposed.

(2) We agree with DCLU recommendation No. 2 that the 'Huey' helicopters used by MAST, Coast Guard, and the Navy should not be permitted to land at CHMC. We believe that this regulation as written, however, is unenforceable. MAST have only Huey helicopters and requires military personnel and dependents to use them. While they have told us they are willing to abide by this regulation, they have also told us they will land at CHMC if the medical officer on board the helicopter deems it necessary. We see no reason in principle why bureaucratic rigidity in the military should prevent the use of smaller helicopters for transports to CHMC by military personnel as well as civilian. The only realistic way to prevent regular landing of Huey helicopters with their frightening noise and vibration is to require the heliport be no larger than 20' by 20'. This size will safely accommodate the smaller Augusta helicopters of Airlift Northwest while discouraging Hueys from landing (EIS Volume III: Table B-1).

(3) We generally agree with the DCLU recommendation No. 3 that a medical review committee be established to monitor compliance of CHMC with the DCLU recommendations. We believe the composition, frequency of reporting, responsibility, and duration of the committee should be modified, however, and that concrete sanctions for non-compliance should be adopted. The Committee should be co-chaired by an appointee of CHMC and Laurelhurst Community Club, respectively, and two primary (not tertiary) care physicians with no professional ties to CHMC be added that are acceptable both to CHMC and Laurelhurst Community Club.

(a) The composition of that committee should be altered to more fairly and even-handedly represent the diversity of views of the medical and residential communities. The proposed review committee consists primarily of physicians with close ties to CHMC. This is putting the fox in charge of the henhouse! Pediatric tertiary care physicians, while no doubt fine persons as individuals, are a tightly knit community of specialists who must work with CHMC and each other. They have no material interest in keeping helicopter transports to a minimum except to avoid community pressure, and are subject to social pressure from each other to avoid criticism. In addition such specialists necessarily must work through CHMC, an institution that in the past ten years has not hesitated to freeze out physicians who disagree with its administration.

(b) The committee should meet and report quarterly. Less frequent reporting will make the time lead between possible non-compliance and notice of non-compliance too long for effective action to take place.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(c) The committee should remain in existence so long as CHMC continues using the heliport. CHMC through its present master plan proposals has put the community on notice that they intend to continue to expand. The conflict of interest between a community that wants to protect its safety and peace, and a hospital whose material interest lies in expanding and increasing its services will not go away in two, three or a dozen years. Rather, as the Seattle area grows, the pressure for more intensive use of the heliport will increase. There is thus no justification for discontinuing the oversight committee even if CHMC exhibits perfect compliance for two or three years.

(5) We agree with DCLU recommendation No. 5 that medical staff should not be picked up at the CHMC campus, since staff could get to the IMA site as quickly as a helicopter could. Pick up or delivery of medical equipment, or organs for transplant should also be prohibited at the CHMC campus.

(6) DCLU recommended condition No. 6 should be revised so that DCLU has a defined ability to enforce the provisions of the Conditional Use Permit based on the findings of the monitoring committee report. Since the purpose of the committee is to monitor the compliance of CHMC with the conditions of their permit, this compliance can only be guaranteed if concrete sanctions for non-compliance are imposed. We believe the review mechanism proposed by DCLU is too weak to be capable of effective enforcement.

(7) We agree with DCLU recommendation No. 7 that only helicopters with four-bladed rotors should be permitted to land at the CHMC campus helistop. To ensure this is the case, the size of the pad should be limited to 20' by 20' as proposed in (2) above.

(8) We do not believe it is possible to sufficiently avoid residences in the built up area around CHMC no matter what flight plan is used to the CHMC campus. However any flight plan used must completely avoid Laurelhurst School and Laurelhurst Playfield. Helicopters have crashed in schoolyards more than once in this country. We therefore believe that only the primary approach as outlined in the EIS page 57 should be allowed for normal flight conditions. The secondary approach which involves low flights directly over homes uphill from the proposed heliport should be allowed only when weather conditions require its use.

Sincerely,

Clark W. Sorensen

Re: CF File No. 297288 and No. 298740; CHMC's July 7, 1992 Comments on NEFRN-Proposed Conditions

Dear Hearing Examiner Alexis:

We received by fax yesterday after the close of business hours a copy of a July 7 letter to you from CHMC's legal counsel objecting to NEFRN's proposed conditions that were detailed in our Post Hearing Statement.

It is our understanding, based on the schedule announced to the public, that the record on this matter is closed. Thus, it would be inappropriate to reopen the record to allow the applicant the opportunity for additional comment, as suggested by the CHMC letter, but not provide the same opportunity (with sufficient notice) for the general public and for specifically interested parties such as NEFRN. If CHMC objects to the Hearing Examiner's recommended decision and/or conditions for the helistop, it will have the same opportunity as the other interested parties to request City Council reconsideration of the Hearing Examiner recommendations, and can detail any objections to conditions at that time (SMC 23.76.054).

We will assume that the record before the Hearing Examiner will remain closed and that no additional CHMC comments will be accepted at this time. However, please inform us if any decision to the contrary is made.

Sincerely,

PETER J. EGLICK & ASSOCIATES

Dear Sirs:

As a practicing Pediatrician in the Olympia area and past chairman of the Pediatrics Department at St. Peter Hospital, I was interested to learn of the possibility of helistop outside the emergency room of Childrens Hospital and Medical Center. I feel that the ability to land directly at the facility for all transport cases would greatly enhance patient care. I understand that only the most critical patients can land there currently. However, most patients who are transferred to Childrens by helicopter are quite ill. I would be very much in support of this helistop. As with most seriously ill patients, time is of the essence and I personally feel that the transport time involved in landing at another facility and being transported by ground through Seattle is unacceptable for optimum patient care. As Childrens Hospital is the regional referral center for the entire state for critically ill and injured children, the presence of helistop at the hospital would enhance patient care state-wide for these children. I am speaking on behalf of my colleagues in the Olympia area in support of this request for a helistop.

Sincerely,

Sheila B Brown MD

Dear Madam or Sir:

At their meeting last week, members of the Washington Ambulance Association asked me to write to you expressing our support for the construction of a helistop next to Children's Hospital and Medical Center.

It is our feeling that a considerable amount of thought and compromise has brought about the proposal from CHMC and others, and that it is now time to build this much-needed landing pad. Its limited use should bring about the necessary rapid care for the most critically ill or injured children without excessive hardship for others in the community.

We hope that you and the Seattle City Council will concur with our position. If we can be of assistance in any way, please don't hesitate to let us know.

Sincerely,

Susie Tracy

OFFICE OF
HEARING EXAMINER

Office of the Hearing Examiner
1320 Alaska Building
618 Second Avenue
Seattle WA 98104

Dear Sirs:

Please Help! We at Auburn General Hospital deal with a significant amount of very sick children through our Emergency Department on a daily basis. It unfortunately becomes a regular occurrence when these children are too sick to go home and often times need emergency transportation from our facility to Childrens Orthopedic Hospital for their definitive pediatric care.

Given the problems with traffic, ground transportation can sometimes take an hour and a half, to an hour and 45 minutes for transportation of a sick child or infant from the Auburn General Hospital Emergency Room to Children's Orthopedic Hospital. This often times makes Airlift Northwest Transport a necessity. Sometimes in these cases every second can make a difference to a child's life. To us, it is absolutely imperative that the most efficient manner to getting the children from our facility to Children's Orthopedic Hospital be explored and intervened. Of late, I know of some specific transportations that have been delayed simply due to the logistics problems associated with the ground transportation once the helicopter has been in the region of Children's Hospital.

It seems very obvious to us on the transporting end of this scenario that a helipad at Children's Hospital would markedly improve this glitch in the system. We therefore strongly support the building of a helipad at Children's Hospital for immediate landing and transportation of the children from the Air Evacuation Helicopter into the emergency facility at Children's. We strongly therefore urge that everyone who has any concern about overall pediatric care in the King County area support this as well. Both myself, as the Assistant Director of the Emergency Services Department at Auburn General Hospital, and all of my colleagues in the Emergency

Department feel as strongly as I do about this. We would be happy to supply any further emphasis that might be needed in order to see to the construction of this.

If you have any further questions please call us at Auburn General Hospital. In the meantime, we will continue to keep our fingers crossed with every transportation that we make - that no scenario develop en-route that could cause a delay therefore a complication to a child's health. Thank you.

Very Sincerely,

Re: NEFRN's Post-Hearing Statement on CHMC Helistop; CF File 297288 and 298740

Dear Hearing Examiner Alexis:

After submittal of NEFRN's Post-Hearing Statement to the Hearing Examiner yesterday, we found that Condition No. 6 was not revised in the final document as intended. As described in the discussion section following Condition No. 6 in NEFRN's Post-Hearing Statement, the condition was to have been revised to eliminate the automatic requirement for an Environmental Impact Statement and to establish an alternative public review process for any substitute helicopters.

We have enclosed a replacement page 6 that contains NEFRN's intended revised Condition No. 6, which is consistent with the discussion that follows on page 7 of the Post-Hearing Statement. Please substitute this page 6 for that which was submitted yesterday in NEFRN's Post-Hearing Statement.

Sincerely,

PETER J. EGLICK & ASSOCIATES

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Since the hearing, NEFRN has once again reviewed EIS, DCLU and community information regarding the average and maximum number of landings that have so far occurred on the CHMC campus. It has also closely reviewed the proposal and projected landings as described in the EIS and the DCLU analysis. Based on this more recent review, NEFRN proposes to revise its Condition No. 5 in an effort to balance the community's need for certainty (which is based on CHMC's and DCLU's representations regarding the number of landings that will occur at the Kitchen Garden site) with CHMC's need for flexibility. The Condition as revised now allows an average of 9 landings per month, with a maximum limit of 18 landings during any given month. This represents a 50% increase over the 1991 actual monthly average (which, at 6.33 landings per month, was the most ever recorded on the CHMC campus), and the maximum number of landings that have occurred during any given month (twelve, in May 1990). It also exceeds by 50% or more the projections reported in the EIS and DCLU analysis and recommendation for the average monthly landings.

(For a more detailed discussion regarding this Condition, and for potential findings and conclusions, see pages 7-9 of NEFRN's June 24 Statement.)

Condition No. 6:

Only Augusta 109 helicopters, with a four-bladed rotor, shall be permitted to land at the CHMC campus helistop, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area. Two-bladed rotor helicopters, such as but not limited to the Huey helicopters typically used by the Military Assistance to Safety and Traffic (MAST), Coast Guard, and Navy, are prohibited from landing at the CHMC campus.

Should Airlift Northwest or another aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Augusta 109 studied in the EIS, supplemental environmental review (including an expert noise analysis based on actual field measurements of helicopter noise) must first be prepared to evaluate the noise impacts of the new equipment. After receipt of the noise analysis, DCLU shall provide public notice, and solicit and consider public comment, on the new helicopter proposal and noise analysis. Public notice shall include written notification of the Laurelhurst Community Club and surrounding residential community. If requested, DCLU shall conduct a public hearing on the proposal. Any helicopter that exceeds the noise generated by the Augusta 109 shall be prohibited on the CHMC campus.

Dear Ms. Alexis:

We are writing about the current request from Children's Hospital (CHMC) for helipad facilties. We support all of the conditions proposed by NEFRN and hope that you will adopt them without major change.

There are two issues that need some further thinking. One deals with Revised DCLU Condition #3 (NEFRN #7). We think that strong consideration should be given to finding a way to provide medical expertise to the review panel without having to appoint pediatric practitioners to the panel directly. Perhaps pediatric practitioners who are retired and not currently practicing could fulfill this role adequately.

A second issue has to do with determining what parties should be required to carry what kind of insurance to cover a possible helicopter crash. We can think of several situations that need to be covered:

1. A crash into one or more homes or apartments near the hospital,
2. A crash into Laurelhurst Elementary School, which is near CHMC,
3. A crash at the helipad at Childrens Hospital or Graves Field,
4. A crash into an open area (street, park, etc.).

In each case, people aboard the helicopter may be killed or injured as may people on the ground. Who may be held responsible? Might the City of Seattle be liable because it issued the permit for helipads? Or, would only Airlift Northwest and/or CHMC be liable? What type and amount of insurance is currently carried by the City, Airlift NW and CHMC? Is it adequate? If not, we believe that one or more conditions should be added to those proposed by NEFRN that requires all potentially liable parties to carry an appropirate type and amount of insurance to cover any one of the crash types noted above.

Again, we urge you to include all of the conditions proposed by NEFRN in your recommendation to the City Council. We believe them to represent a reasonable compromise that deals fairly with this complex issue.

Yours sincerely,

6/23/92

My name is Marvin O. Christman, my home address is 4350 53rd NE, in the Laurelhurst community which is immediately adjacent to two plus sides of Childrens Hospital.

I am representing the eight story LAURELHURST WEST Condominium at 4545 Sandpoint Way NE having two and three bedroom homes, with 54 seperate families. This neighborhood residence has a DIRECT line of sight with the Hospital. As a condoninium owner there and a member of the Board of Directors I speak for them that we DO NOT want and adamantly oppose the building of and use of a HELIPORT AND PAD at Childrens Hospital.

Childrens Hospital was dedicated in the late '40's at which time and on many occasions since, the NE communities have been told, " This is a small building we are constructing and it will continue to enhance the neighboring communities with our services." Therefore, every year the facility continues to grow higher and wider with increases in traffic and congestion.

My earliest recollection of Helicopter landings at the Hospital is 1981 when my Mother moved into the Laurelon Terrace Condominium, immediately adjacent to the Hospital on the South Side. There are approximately 120 Units there, with many ownerships by retired Northeast citizens. At this time the noise and vibration caused by Helicopter landings, which we were told by the FAA and others to be illegal, but done in the interest to SAVE A LIFE, OCCURED on a regular 2-3 per month.

We knew, since my Mother being very hard of hearing, she would feel the vibration of the landing helicopter and many times she would ask me to replace her wall pictures that had fallen from the wall to the floor.

Additionally, on the North side of Childrens. home residences are immediately adjacent to the street, adjacent to their property line. There is very little open space to accomodate Childrens Hospital from the the surrounding neighborhood...especially during the night ..when landings are definately an intrusion to their privacy. The situation is almost to the point where the City will have to pay the close-by neighbors to move, as has happened at SEA-TAC Airport. This would not only reduce an excellent city tax base but lower the value of the rest of the NE homes affected by the Hospitals encroachment of quiet Airspace.

Over Please

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

This community, as one of Seattles finest residental communities deserves more.....we pay above average residental tax revenues.....we are proud of our homes, we tolerate the enlargement of the Hospital...even though we are constantly at odds with the Hospitals administration and the various City Officals.

We do not want to move or to have out residences de-valuated because of the dangers due to congestion, helicopter traffic or plant size facility in the center of our community homes.

For ten years the NE community has defended this position... no helicopter pad or landings at Childrens Hospital.....and have <u>had the support</u> of City Officals and the present LAW. We sincerely request your continued consideration of our interests.

June 24, 1992

Ms. Ruperta Alexis:

As a lifelong resident of Laurelhurst I watched with dismay for many years as the Laurelhurst Community Club became a mouthpiece for a handful of residents who oppose any and all change or growth no matter how helpful or progressive it may be.

For too long I stood by silently as this group pretended that most residents of Laurelhurst share their narrow, xenophobic views. I did not speak out when the Community Club used scare tactics in an attempt to turn the people of Laurelhurst against the Battelle Institute. The time has come to set the record straight: the Laurelhurst Community Club does not represent the views of the majority of Laurelhurst residents. It is time for the silent majority of Laurelhurst citizens to be silent no longer.

The issue of a helicopter landing pad at Children's Orthopedic Hospital has moved me to action. I am a student at Duke University, this past year my residence hall was directly across the street from Duke Hospital and its helipad, which serves as a Life-Flight Center for all of Central and Eastern North Carolina. Two to three life-saving flights a day were routine. It took me just about a week to adjust to the flight noise. After that, my sleep was never interrupted by helicopter noise. Each time a daytime flight went overhead I thanked God that I lived so close to such a fine medical institution. After the first week the noise never interfered with my studying, sleeping or socializing. Not once ever.

When I was growing up I was rushed several times to COH for treatment of various ailments. I have always considered Children's to be a major asset to the Laurelhurst Community. It is indeed ironic that the very same NIMBY's who oppose a helipad also reap the considerable benefits of living within a one minute drive of a world-class medical facility. If one of their children fell ill they would not think twice before rushing them to the emergency room which is so close by.

It is only when a sick or injured child from a poor or rural area needs to be flown in for life-saving treatment that these residents protest. Such conduct is selfish and meanspirited. I urge in the strongest terms, as a resident of Laurelhurst and one who has lived across the street from a helipad, that the COH Master Plan be approved. Don't sacrifice critically ill children to appease a handful of overprivileged zealots.

Sincerely,

Mark C. Lamb

RE: Hearing on DCLU's recommendations on the final environ-
impact statement for a helipad at Children's Hospital

My name is Patricia Ann Wood.
I reside at 4036 NE 45th Street, Seattle in Laurelon Terrace, a condominium. I have lived in Laurelon Terrace, at two different locations, since 1955 (from 1978 at the present address).

I have attended many discussions on the helipadissue and have attended every public hearing on the matter, including the morning session on June 23.

I strongly support NEFRN-proposed conditions numbers 2-4, 6-9 and 11-13/. I philosophically support #10, as I WANT a continuing DCLU overview of these activities. But since I feel #5 is rather unworkable, I would support #10 only if #5 is stricken. I am in sympathy with the concept in #5, but emergency landings do not lend themselves to 'averages' an more than do helicopter saftey records---i.e. 'statistics of medical helicopter safety translate into "only" one crash every 69 years'!!

I understand by some happenstance the records of the 1986 hearing were lost! Thus I am taking the opportunity to enclose materials I submitted for the record at that meeting. I still strongly support a main helipad at Gravs Field, used by both Children's and the University, with an 'emergency only' pad at Childrens.

I was most gratified to hear, from the personreporting for DCLU on June 23, that it is unlikely any other hospitals in the city will be requesting helipads in the near future.

Sincerely
Patricia Ann Wood

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

PUBLIC HEARING
KING COUNTY BOARD OF HEALTH
KING COUNTY COUNCIL CHAMBERS
DECEMBER 2, 1986

My name is Patricia Ann Wood.
I reside at 4036 N.E. 45th Street, Seattle, 98105 in Laurelon Terrace.

Laurelon Terrace is a condominium of 136 townhouse style units nestled just below Children's Hospital, sharing a three-block boundary with the hospital on our eastern perimeter.

I have lived in Laurelon since 1955 and have witnessed the growth of the hospital from a small institution that chose to relocate into the midst of a residential area to the expanded campus that now exists. I share with most of Seattle, and, indeed, the region, an appreciation of the fine care that is given at the hospital and recognize it as an asset to our community.

At the same time, I am very concerned about the safety factors involved in creating a permanent and authorized helipad in the midst of this densely populated residential area. I have attended every public hearing on this matter during the several years that the hospital has been seeking permission for a helipad. I have also met, in a smaller group, with a member of the hospital's administration. Thus I have heard eloquent presentations from various points of view.

I am not convinced that a helipad just outside the hospital door is truly necessary, nor that the statistics for medical helicopter safety translate into "only" one crash every 69 years. Accidents do not happen on predictable timetables---and newer evidence continues to support the fact that medical helicopter flights have higher accident rates than commercial helicopter service.

I can speak for many of my neighbors in Laurelon in endorsing an alternative plan eloquently and completely presented by Mr. Jerry Schneider at the public hearing on the DEIS on September 23, 1986 at the Laurelhurst School. The alternative plan----preparing a permanent, paved, well-lighted, well-secured helipad on a portion of the UW soccer field area would provide good service to both CHMC and University Hospital. It would answer our safety concerns without transferring our fears to any other neighborhood, as the helicopters would be able to approach and leave over water, not over heavily populated residential areas.

I covet your serious consideration of this alternative.

Patricia Ann Wood

Resubmitted 6/29/92 as partial replacement of documents lost from the 1986 hearing

RE: Helipad, 4800 Sandpoint Way N.E. PROJ #8495870/Kroll

I have lived in Laurelon Terrace (at two different addresses) since 1955. I am a Medical Technologist (recently retired) and have worked at the University of Washington in medical research for 25 years, followed by 10½ years as supervisor of a division in the clinical laboratory. Thus I have some background, knowledge and understanding of: (1.) the development and past changes in the residential area surrounding Children's Orthopedic Hospital and (2.) the changing patterns and pressures of health care and health care delivery.

I have attended every meeting regarding the helipad issue for the past two years and, though I feel well informed on the pros and cons of the issue, I do still have some concerns:

Laurelon Terrace is a condominium of 136 units covering a three block area immediately west of COH. The buildings were built in the late 1940's (prior to COH's move into the area) and converted to a condominium in 1978, well in advance of any public knowledge that a helipad might be in the picture.

The enclosed map shows the 19 buildings that comprise Laurelon Terrace and demonstrate its proximity to the hospital. Also, the complex is downgrade from the hospital (separated only by a firelane) so that the helicopter approach to the proposed pad has a significant bearing on the noise level, vibration and safety hazard to various homeowners.

There have been at least seven unauthorized landings at COH since November. Instead of the helicopter following the prescribed flight path---which we understand to be over Sandpoint Way NE and up the COH drive to the 'Kitchen Garden"---it has been coming in LOW at an agle over buildings 13, 14, 9, 10 and 18. Again, because of the topography, when the helicopter comes in so low it is not only much more dangerous to us, but the reverberations are intensified! From talking with some people at the hospital we understand: (1.) the new helicopter does not have to circle; it can come in high and drop straight down to the pad; (2.) there is no reason for the pilot not to take the prescribed route over Sandpoint Way rather than over residences.

Resubmitted 6/29/92 as partial ~~copy~~ replacement of hearing document lost in 1984.
Patricia Ann Wood

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The items we feel should be addressed in the Environmental Impact Statement are:

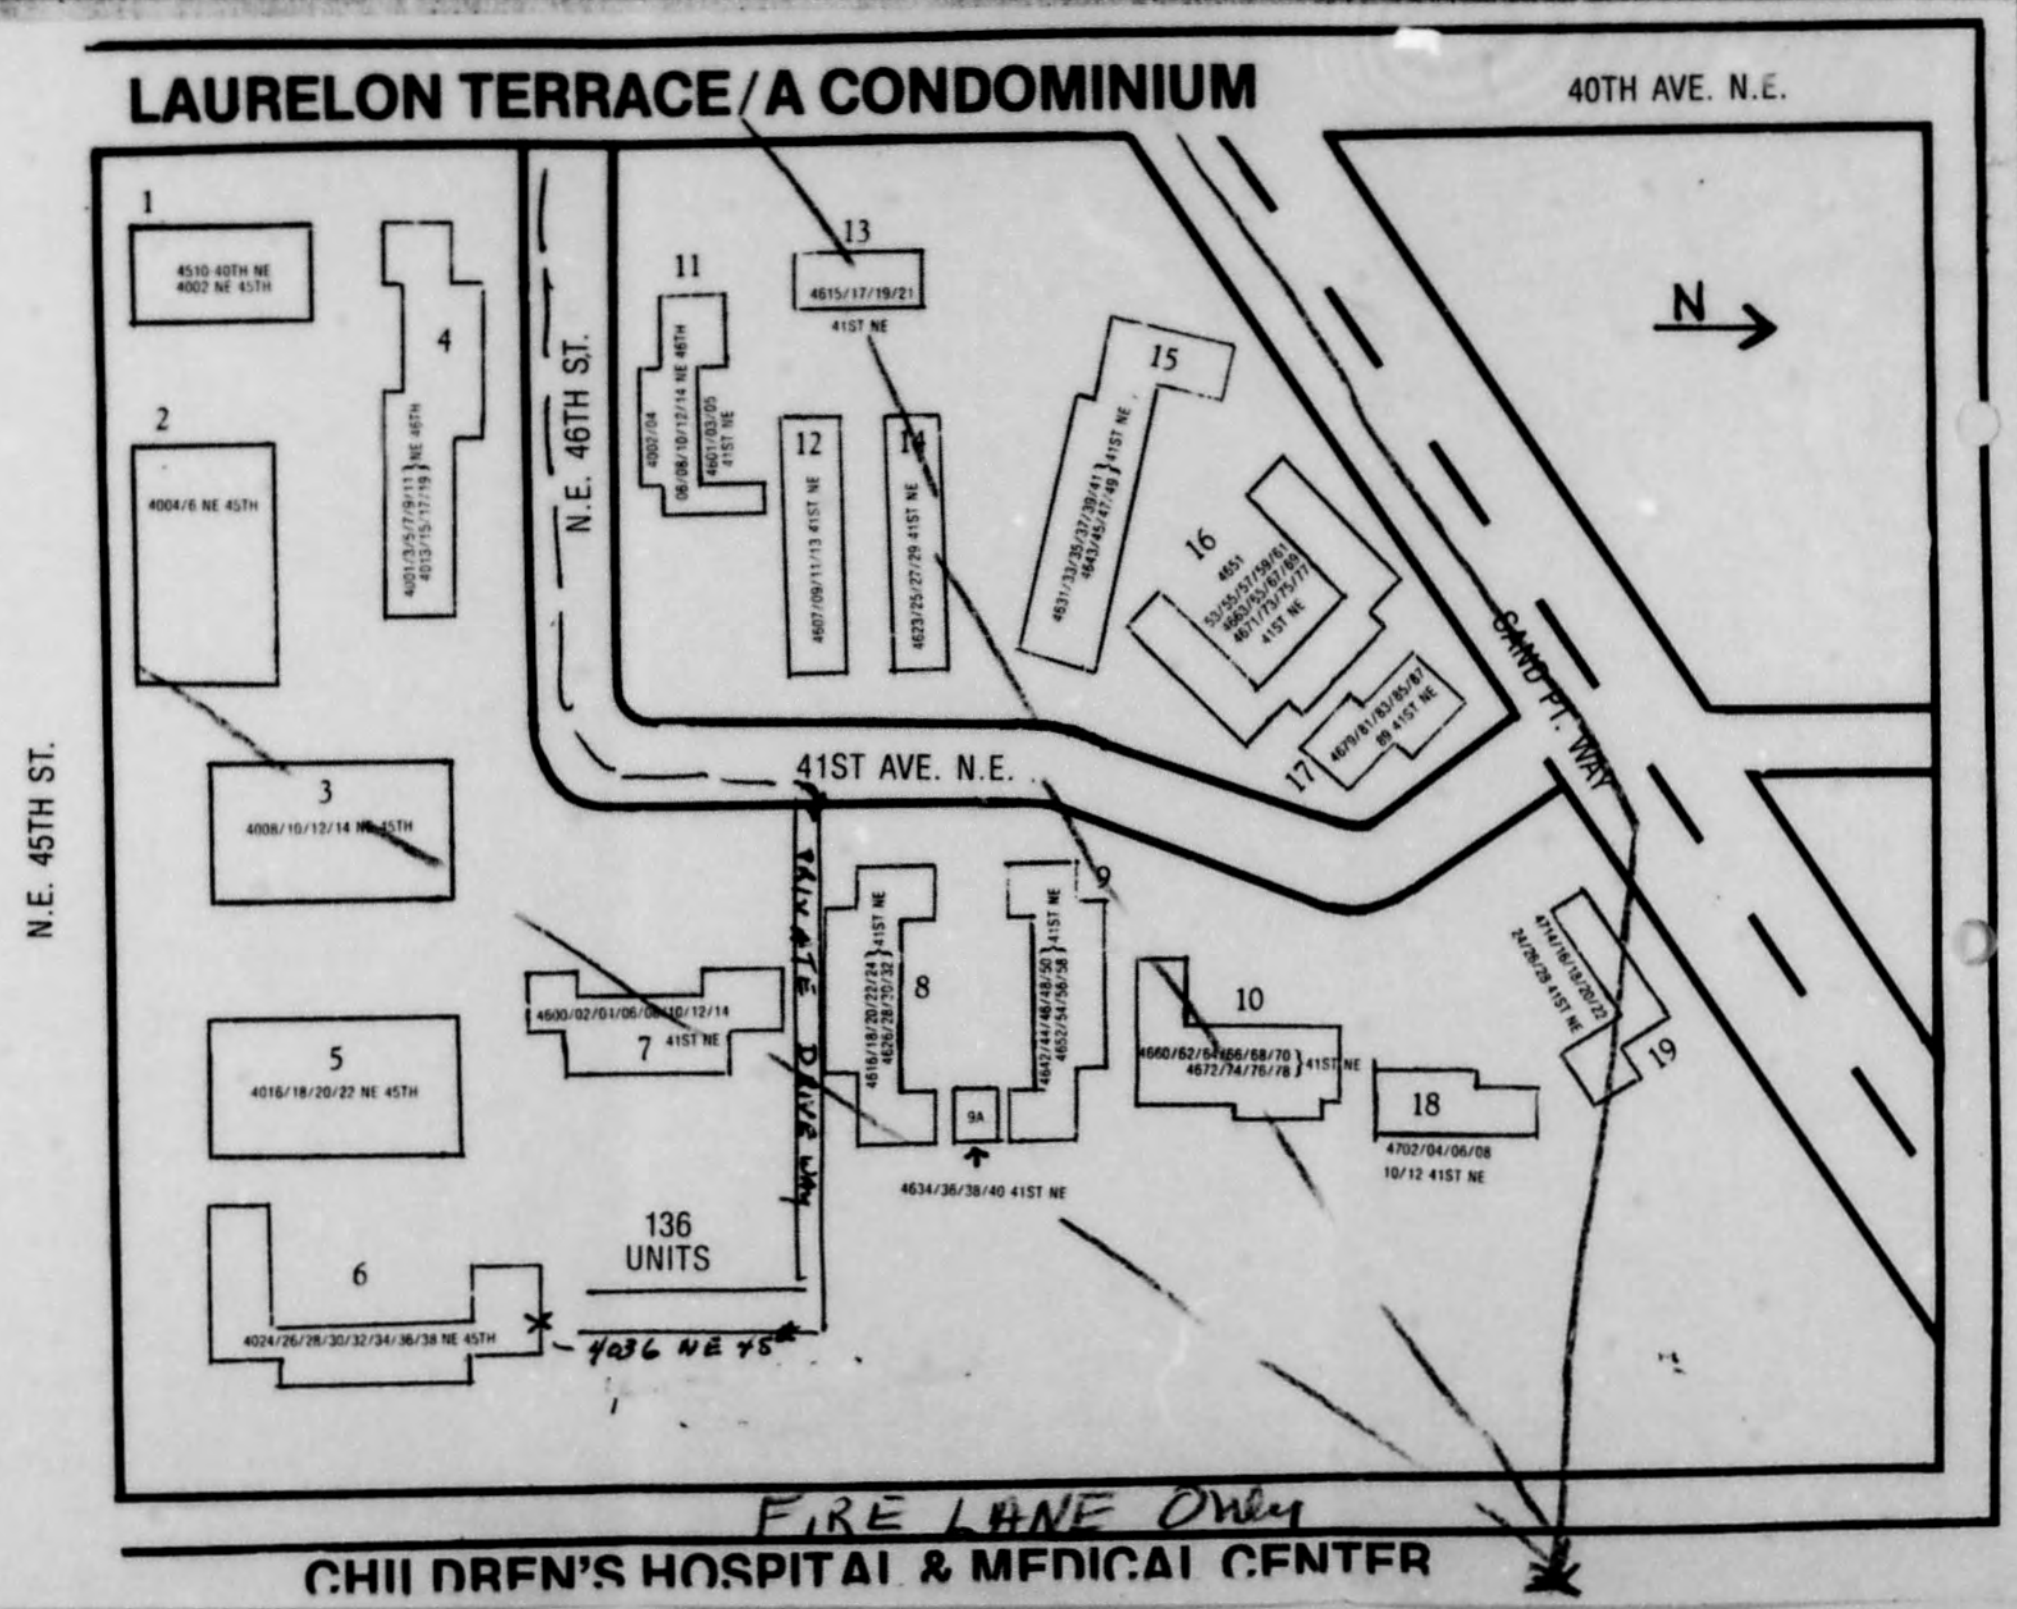
1. NEED. If the community could be assured that the helicopter would be used only for truly critcal cases, we would live with that. At the same time, if the pad permit is granted we request that there be a workable, effective and timely process to assure the helicopter is not being misused. There should be knowledgeable community representatives included in any such "Peer Review" committee.

2. FREQUENCY: This is an adjunct of 'Need'. One can predict that if there are 15 flights the first year, the number of flights in subsequent years will increase even if the tool is not abused, simply because of increasing advances in technology. This expected growth underlines the importance of only one flight per patient, having the medical crew picked up either at the 'soccer field' or at Harborview (rather than the possible two flights per case into COH).

3. FLIGHT PATH: We strongly urge the pilots be instructed to adhere to the prescribed flight path, and come in high rather than almost level with our roofs which has happened on several recent occasions. The solid red line on the enclosed map indicates the presecribed flight path; the broken red line denotes the path taken by 5 of the last 7 flights. We realize that adhering to the Sandpoint Way route may impact other neighbors. We have no desire to better our situation at the expense of others. The chosen route should take all residents' situations into account. We do feel, however, that our topography makes it mandatory that the helicopter come in high!

4. SAFETY: Helicopters, unfortunately, do crash. The hospital assures us that the statistics indicate there would be only one crash in 64 years. Please note the recent crash of a medical emergency helicopter (in another state) 5 minutes from its landing. Who is going to pay for this insurance? Even without helicopter hazards the current state of insurance premiums is a disaster in itself! Another strong point, we think, for restricted flights and controlled flight paths.

5. VIABLE ALTERNATIVES: The UW 'soccer field' has served for some years as an emergency landing field for both UW and COH. Here the approach can be over water, marsh, parking lots---not homes. Rather than say the field is too soggy, a decent, lighted helipad could be constructed here to serve both institutions. Helipads should be looked at as regional facilities--- no matter what the future medical technology, can we afford to have the service at every hospital?



Sincerely

Patricia Ann Wood

Dear Ruperta Alexis,

I am writing to urge you to support all of the DCLU and North East Families for Residential Neighborhoods [NEFREN] conditions that were proposed at the hearing for the Children's Hospital helipad.on June 23 and 24, 1992.

It is vitally important that these conditions be adopted as part of the final recommendation.

These decisions will not only make an impact on the quality of life in our neighborhood, but will set precedents for all neighborhoods in this city for the years to come. Make your recommendations with the thought in mind, that what happens here, will be where the next major institution development will begin. Make your decision so that there will be protection for our neighborhoods to continue to be a place where families want to live.

Children's Hospital has a past record of not living by the rules. If they are given an inch they will take a mile.They are a major institution that wants to continue to grow, no matter what impact it has on the community around them. Please look at this matter as a business decision and leave the emotions out of it. Just as they arbitrarily moved the temporary helipad during their current construction without informing anyone, they will continue to do as they please unless the city is willing to make rules and to enforce them.

Please support all of the proposed conditions made by the DCLU and NEFREN.

Sincerely,

Kay Stimson

Dear Ms. Alexis:

I write to voice my agreement and support of the NEFRN Proposed Conditions for a helistop at Children's Hospital & Medical Center (CHMC), with the following exceptions:

#5. Total landings per month reduced to 4 (approximately 1 per week).

#7. Paragraph 8 - I completely disapprove of paying individuals for monitoring CHMC flights. Might this even encourage the number of flights?

#11. The flight pattern mentioned (N.E. 45th & Sand Point Way) is not followed. Flights in turn over N.E. 50th (residential) and flights out turn and fly diagonally over Laurelon Terrace Condominiums. Instead, all flights (in and out) should follow CHMC main entrance; i.e., over Sand Point Way, turn at Sand Point entrance to CHMC, and follow CHMC road to helistop.

Thank you.

Sincerely,

Helen Newman

Office of Hearing Examiner
1320 Alaska Bldg.
618 Second Ave.
Seattle, WA 98104

Dear Sir:

I, an individual, totally object to a helistop on the campus of Children's Hospital & Medical Center (CHMC). I live nearby. Each flight in and out makes a low-flying turn right over my roof. The whole house vibrates. The dishes clink. My nerves are shattered. I never know whether the plane will make the turn or crash (this any time during day or night).

Our lives are endangered, our health is endangered, our property is at risk.

I find it completely unnecessary to have two helistops within a mile location. The University of Washington intramural field is adequate and accessible in open space whereas the CHMC campus is surrounded by residential areas.

We the taxpayers have not been given fair consideration. Our rights to a safe neighborhood have been totally disregarded.

Please stop this helistop plan and construction on the campus of CHMC. Thank you.

Sincerely,

Helen Newman

Re: COHMC Heliport

Dear Ms Alexis:

I am writing about the proposed helicopter landing proposal for Children's Hospital Medical Center. I urge the attachment of the NEFRN-proposed mitigating safeguards and restrictions to the DCLU recommendation. They are important to prevent excessive use. The use of the COHMC site should be restricted to life-threatening emergencies and to times when travel from the University landing site would introduce serious delay. In 1991, half of the COHMC landings took place after seven p.m. and before the morning rush hour. At these times the travel time from the Graves Field site is five minutes or less. The majority of 1991 flights were at times outside the peak traffic times for 45th Street and Sandpoint Way.

Continued review of the use of the heliport is needed in order to ensure its appropriate use only for true emergencies.

Sincerely yours,

Richard B. Counts

Richard B. Counts

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

June 16, 1992.

To whom it may concern:

I am writing concerning th
proposal. My husband and I
go on record as being in full
of the emergency helistop. O
daughter, Abigail Rachel Kauff
transferred June 29, 1991 by helicopter
to Children's Hospital at 24m. She was
a surprise breech at homebirth. She
was born dead after being without air
for 20 minutes. Abigail is a miracle
case as she has retained no problems
due to her birth. The quick medical
attention given her was a tremendous
advantage. Abigail is our fourth child
and a joy. We can't imagine life
without her.

We would like to ask you to consider
the helistop as a tremendous life
saving tool our technology has provided.
There is a tremendous value to human
life. Too often, we don't pay attention to
its value until we face the death of
our own loved ones. The greatest
gift we can give all our children is life.
It is both our responsibility and privilege.
Often it must be with great inconvenience;
but with sacrifice comes tremendous joy
and reward. Abigail and all our children
have been ours. We ask you to consider
the true values involved in this issue

Re: Children's Hospital and Medical Center
Application Number: 8405870, 9106441
C.F. No. 297288 and 298740

Dear Ms. Alexis,

I have been a resident of Laurelhurst for many years, and I am concerned about the proposed helipad at Children's Hospital.

I strongly urge that the IMA field site be approved as it is a superior and safer landing site. I trust you will agree after your on-site visit to Children's.

After two days of hearings on June 23, and June 24, 1992 and listening to a lot of testimony I still feel that the IMA site should be used. If you do approve the Children's site for landings in extreme emergencies please ensure that the conditions imposed for the landings are similiar to those proposed by Mr. Peter Eglick.

Please place my name on your mailing list for matters concerning this permit process.

Yours sincerely,

Barbara H. Davis

Re: Proposed helistop at Children's Hospital & Medical Center (CHMC)

Dear Ms Alexis:

As a long-time resident near CHMC, I have become dismayed then alarmed then angry over the institutional expansion of CHMC in a residential neighborhood. I have been and remain actively opposed to a helistop on CHMC campus.

Enclosed is copy of my letter to Office of Hearing Examiner, dated May 16, 1992. Please refer to item #7. Update: On June 21, 1992 an air ambulance crashed in Connecticut (reported on CNN news on KING 1090).

I have read the NEFRN-proposed conditions on the helistop at CHMC. Please note the following observations:

#5. "Landings...shall not exceed an average of 6 landings per month...shall not exceed 15 landings in any given month. Additional landings...due to catastrophic events shall not be subject to the above limitations."

a. Consider that each landing involves two overflights (in & out). Each overflight poses endangerment of lives. An average of 12 overflights, a number of 30 overflights in any given month is too many. In extreme emergency, these numbers would escalate per the DCLU Condition No. 1, item #5. These numbers need to be reduced. Safety is the prime factor.

#7. Medical Review Committee - I find the suggested make-up of this committee equitable and operational. If flights are to be allowed, stringent monitoring by other-than CHMC must be followed. [NOTE: I have a complete log of all flights with dates, times, comments beginning on 10-15-85 through 6-20-92.]

I am concerned about a monetary compensation of service on this committee. However, if this could work toward curtailment of number of flights, it would be a positive factor. CHMC must be made more aware of its responsibilities to the surrounding residential neighborhood where it chose to locate. Furthermore, CHMC must be made accountable for its choices and actions.

Thank you for your consideration of the above comments and of the enclosed letter.

Sincerely,

Maryann E. Spangler

Re: Helistop at Children's Hospital & Medical Center, #'s 8405870 and 9106441. (CHMC)

I have received the Notification of the Conditional Use Recommendation of the above project. I object and appeal the recommendation.

A helistop at CHMC is unsafe, unwise, unnecessary as follows:

1. CHMC is co-financing and using helistop with University of Washington at the Intramural Field. (UW)
2. UW helistop at the Intramural Field is less than a mile from CHMC. This site has been used prior to helicopters at CHMC for many, many years with no loss of patient lives as acknowledged by CHMC.
3. Clear approach to UW helistop at the field site.
4. Approach over dense residential neighborhood at CHMC campus.
5. Low-flying and turning on both in and out flights at CHMC over homes and condos pose extreme danger to residents. CHMC personnel and patients also at risk.
6. Endangerment of innocent, individual citizens' lives is being disregarded.
7. Documented history of helicopter malfunction and crashes, including medical helicopters. Most crashes occur at time of take off or landing. As recently as March, 1992, 3 medical helicopters crashed--March 5, 6, 7. These crashes occurred in Arizona, Michigan, Alaska. SEE news articles in the Seattle Times.
8. Planned expansion (45% of present buildings) at CHMC--both vertical and horizontal--lessens maneuverability space for helicopter landings, turning, take off at CHMC.
9. The expanded building at CHMC is basically for research labs and doctor offices. Patient beds are becoming secondary as CHMC becomes an adjunct of UW Hospital & Medical Center & School.
10. Harborview Hospital already has a helistop in place and a well-developed trauma center and pediatric department.
11. Noise pollution and vibration is high and at any time of day or night.
12. Institutional encroachment in a residential neighborhood destroys the quality of life for the neighborhood.
13. In the FEIS it is stated CHMC cannot refuse any helicopter landings, even the Army MAST planes, which are clearly oversize for residential neighborhood landings and for size of proposed helistop site at CHMC.
14. The estimated average of 15 to 21 patients per month landing at CHMC, meaning 30 to 42 overflights (in & out), could be exceeded as competing helicopter service occurs, according to the FEIS.
15. Omitted in the FEIS are clear, exact criteria/guidelines for helicopter usage, decision-making process as to who determines when and where and which hospital the helicopter uses.
16. Airlift Northwest and CHMC will keep a log of flights but should not be allowed to monitor their own work/decisions. Who will monitor the flights and landings?
17. We who live near and/or contiguous to CHMC property are alarmed over the expansion, including the helistop, at CHMC. In 1952 the hospital outgrew its site on Queen Anne. It has now outgrown its site at Sand Point and Laurelhurst residential area. It is time this property revert to its original residential status.

PLEASE STOP A TRAGEDY FROM HAPPENING (CRASH AND/OR CONFLAGRATION) IN A RESIDENTIAL NEIGHBORHOOD BEFORE IT OCCURS.

Ms. Ruperta Alexis
Deputy Hearing Examiner
Room 1320 Alaska Building
618 Second Ave.
Seattle, WA 98104

Dear Ms. Alexis:

I am writing to support all of the conditions NEFRN has proposed for the CHMC helistop. As a biomedical researcher I certainly believe that truly life threatening conditions require direct transport to the hospital. However, as a concerned citizen and nearby resident I wish to be sure that the facility is not abused by CHMC. Having been a neighbor of CHMC for 3 1/2 years I have no confidence that CHMC will not abuse the helistop.

For this reason it is essential that there be a permanent oversight board composed of people independent of CHMC. There is a clear and obvious conflict of interest in having people associated with CHMC composing a majority of the board. It is inconceivable that they would ever challenge the hospital management. The citizens of Seattle are not well served by a rubber stamp board. If CHMC truly complies with the DCLU conditions they would have nothing to fear from a truly independent and impartial oversight board.

For these reasons I most strongly support all of the conditions NEFRN has proposed.

Sincerely,

Gary L. Schieven, Ph.D.

Dear Ms. Alexis:

I should like to go on record that I feel a helistop atop Childrens Hospital Center would be a great mistake. The area is just too congested and residential to take the risks inherent to helicopter traffic.

Furthermore there is the already viable Graves Field site.

If the helistop proposal must go through then I do support all NEFRN's proposed conditions.

Sincerely
Barbara C. Peterson

Dear Sirs:

I would like to add my "voice" to those who support the helicopter landing pad proposed for Children's Hospital and Medical Center. It would seem to me that a few moments of inconvenience in the form of noise is well worth the saving of a child's life. The staff at the hospital has done an admirable job of informing the people in our neighborhood (Laurelhurst) about the use of the helicopter to bring patients to the hospital. Very few patients seem to be brought in this way but I feel that it is important to have this facility available when it is needed.

Thank you for your consideration of this matter and I hope that your decision will be in favor of Children's Hospital.

Sincerely,

Rosemary H. Newell

Dear Office of Hearing Examiner:

This letter is in support of the application by Children's Hospital and Medical Center for a permit to build a helicopter landing pad.

It amazes me that the people of the neighborhood around the Hospital do not realize the work that the Hospital performs and the lives that can be saved by the rapid transport to the Children's Hospital. Only a helicopter can effect many of these transports, and I think it selfish, with the constraints the Hospital is willing to impose on itself, that people would object to the few flights a month that need to land at the Hospital.

The inclusion of Children's in the State EMS and Trauma System is very important as one of the few hospitals effective in handling such critically ill children. Helicopter capability is crucial, and landing areas in remote sites from the Hospital can unnecessarily delay lifesaving treatments.

All my colleagues in the Emergency Department at Capital Medical Center endorse and support the application submitted by Children's Hospital & Medical Center. I hope the City of Seattle will have the foresight to look to the greater need of the children of Washington.

Seattle, WA 98104

Dear Sir:

On behalf of the Board of Commissioners of Stevens Memorial Hospital, Public Hospital District No. 2 of Snohomish County, I would like to indicate that we are in support of Children's Hospital building a helicopter landing pad, a helistop, outside the Emergency Room on the Children's Hospital campus.

Children's Hospital and Medical Center provides a valuable resource to this suburban community hospital and we periodically are required to transport critically ill and/or injured children by air to Children's Emergency Department. This does not occur frequently; however, we are all aware of the emotional impact associated with pediatric emergencies. It is in the Pacific Northwest's best interest to have this type of emergency capacity located at the region's childrens' hospital.

Thank you for the opportunity to comment on this project.

Respectfully,

Steve C. McCary
Administrator/CEO

Seattle, WA 98104

To the Hearing Examiner:

I am writing to voice my strong support of Children's Hospital and Medical Center's petition for construction of a helicopter landing pad on their Laurelhurst campus. As a child advocate, I find it hard to believe that this debate is taking place.

I am a pediatric emergency physician, the director of the Washington Emergency Medical Services for Children demonstration project, a member of the Seattle-King County EMS and Trauma Care Council, a member of the the Washington State EMS and Trauma Steering Committee, and the Chair of its Pediatric Techical Advisory Committee. Perhaps most importantly, I am a parent. In all of those capacities, I recognize the tremendous advantage conferred on a critically ill or injured child by rapid transport to a definitive care setting.

I have worked long and hard to revise Washington Administrative Code to better address the emergency medical service needs of the children of our state. My crusade has been not to afford children special privileges, but to improve pediatric emergency care so that children receive the same benefits of early stabilization and transport as do their adult counterparts. To date, this has not been the case. The fact that there has been no secure landing zone for medical helicopters delivering the very sickest children to the regional pediatric specialty center is a sad reflection of our inattention to the needs of a group that cannot speak for itself.

We all respect the rights to privacy and a noise-free environment for property owners. However, the right of critically ill children to receive expert, expeditious and life-saving care must not be undervalued. Children requiring emergency landing at Children's constitute a small fraction of the patients served by the institution, but are among the most vulnerable. I believe that Children's Hospital can work with the surrounding community to develop a plan for helicopter transport which will minimally impact the neighborhood, and maximally impact the outcome for our most

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

precious resource, our children.

I urge you to approve the helicopter landing zone at Children's Hospital. It is a critical part of the emergency medical system, and will allow that institution to better serve the children in Western Washington.

Sincerely,

Dena Brownstein MD

Seattle WA 98104

Dear Sirs:

As the Administrator of St. Peter Hospital, a regional referral hospital in Southwest Washington, I wish to express my support and that of St. Peter Hospital on behalf of the request from Children's Hospital and Medical Center for a permit to build a helistop outside the Emergency Room on the Laurelhurst campus. It is my understanding that only the most critically ill or injured patients land at Children's Hospital and that other patients are transported by ambulance to Children's from other helistops in the Seattle community.

The request from Children's Hospital appears very consistent with 1990 legislation adopted by our State Legislature, authorizing the creation of a State-wide trauma network. Children's Hospital and Medical Center is certainly a very important part of that network and the availability of a helistop at the Hospital site would appear to be of critical value to the Hospital's mission with regard to trauma care.

Our own helipad is located just outside our Emergency Department, and has proven to be a distinct asset in the timely transport of critically ill or injured patients. In as much as Children's Hospital serves our area as well as other areas of the State, I want you to be aware of our support for their request.

Sincerely,

Seattle, Washington 98104

Dear Sir:

I was pleased to hear of Children's Hospital plan to build a helipad at their facility. Children's has had an important role of leadership in the critical care of children in Washington State for many years. Their example and the teaching programs and projects that have been generated by their staff have no doubt improved the quality of pediatric care throughout Washington State.

Air transport is a critical element in a comprehensive system of emergency care. The ability to send and receive patients and to utilize an expertly trained staff is absolutely essential to providing optimal care for critically ill children. I was quite surprised to learn that they do not yet have a formal landing zone in proximity to their facility. It is an important issue regarding safety as well as reducing the time to arrival at their facility. All major facilities receiving critical patients via helicopter need to have a formal designation landing zone.

It is quite common that initiating the development of a landing zone is met with community concerns regarding noise and safety factors. This has been the case with many programs as they have developed in our state and across the nation. However, these concerns must truly be of secondary importance when compared to the life saving mission of critical care teams and their air transport vehicles. I have no doubt that your community, given the facts, will embrace this proposal for it will benefit children, our most precious patients, for many years to come.

Sincerely,

James M. Nania M.D.

To whom it may concern:

We, the undersigned professional employees of Jefferson General Hospital, strongly support the building of a permanent helipad at Children's Orthopedic Hospital. As a rural hospital, we depend on the ability to airlift critically ill or injured patients to Seattle hospitals. It is imperative that Children's Orthopedic Hospital be one of these resources. These kids don't often have the extra time it takes to off load, on load and transport by ground vehicle. We urge you to hear our voices, and understand the need for this invaluable asset.

TO WHOM IT MAY CONCERN:

I am a physician specializing in the areas of general and vascular surgery and my practice location is Olympia, Washington. Although we have a relatively sophisticated medical community and the appropriate support services in our area, we do have some deficiencies in the category of pediatric care. There are certainly occasional complicated surgical emergencies that arise in which it is definitely in the child's best interest to be transferred to a tertiary care center.

In my practice, I would certainly consider Children's Hospital in Seattle to be one of the tertiary care referral centers that I would utilize. I feel that it is critically important that we have quick access to that hospital and this access is in part dependent on having air transport via helicopter. I strongly support Children's Hospital and Medical Center's application to build a helicopter landing pad outside the emergency room on their Laurelhurst Campus. The presence of such a landing pad might well be responsible for saving a child's life in the future.

Thank you for your attention to this matter.

Hello:

As a resident of Laurelhurst, I am writing my support of the helistop for Children's Hospital which we are pleased to have within our neighborhood. I feel the adequate and safe delivery of emergency medical services to children in the region is vital and we are very luckly to have people at the hospital with the vision to look into the future. Personally, it would be a comfort to know if my children became ill or seriously injured while on an outing in the Northwest that they could be airlifted to Children's.

Please do not be swayed by the objectioners in the neighborhood. There is a powerful group of people that support no change, no progress, no future, and lobby against Children's, University of Washington, Batelle Northwest, Retirement Homes, new houses, and remodels. They do not believe in the future and are very narrow minded.

I look forward to the long range plans Children's Hospital has made to provide our community with top medical care for our children.

Thank you.

Sincerely,

Phyllis K. Odell

Re: Helistop at Children's Hospital

Dear Hearing Examiner:

I support the establishment of a helistop at Children's Hospital so critically injured children may be airlifted directly to the best available medical care.

In August 1989 we moved to Laurelhurst (3717 N.E. 44th Street) just a few blocks from Children's Hospital. Even before that time my wife and I were aware of the protest of neighbors of Children's regarding helicopter landings at Children's Hospital. Prior to moving to Laurelhurst we were in favor of helicopter access to Children's Hospital, and our view has not changed even though we now live in the community just a few blocks from Children's.

In an ideal world hospitals would be located in convenient locations far from residential areas and close to population centers where the sound of ambulances and helicopters would not affect local residents. However, this is not an ideal world, and Children's Hospital has long been a part of the Laurelhurst community. That is not going to change.

It is impossible to provide the same level of pediatric services at any other hospital in the Northwest. Children's is uniquely qualified to provide the best care in an emergency setting. There is no question that if my daughter were hurt, I would want her taken to Children's Hospital. I am aware that they not only have an outstanding in-house staff but many private physicians live close to Children's so they can be there in case of an emergency.

1420 Fifth Ave. Suite 4100 Seattle, WA 98101-2338 (206) 223-7000

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We occasionally hear helicopters bringing critically injured children for emergency treatment at Children's. While our home is close to Children's (six blocks), I am sure the noise level at our house does not equal that of neighbors immediately adjacent to Children's. Nonetheless, this relatively infrequent inconvenience seems a small price to pay for the immediate availability of superb medical care for the children of our community. Friends of mine have had their children airlifted to Children's and were thankful that was an option.

It is not a viable solution to ask that all emergency care be delivered at another institution. That is simply not practicable, nor would such a move be cost efficient. Additionally, I am not persuaded by any claims regarding safety of neighbors due to a helicopter crash; that does not seem to be a realistic concern.

My perspective on the situation has not changed since before I moved to Laurelhurst. The convenience of a few neighbors of Children's is far outweighed by the need to provide emergency medical care to critically injured children who cannot safely be transported from the alternative helicopter site at the University of Washington intramural field. Under circumstances when minutes make a difference, we all wish to have the best immediate medical care available to our children, which in the Northwest is best provided at Children's Hospital.

Very truly yours,

Reed Schifferman

To Whom It May Concern,

It has recently come to my attention that Children's Hospital Medical Center is seeking a permit from the City of Seattle to build a helicopter landing pad outside the emergency room of the lower hospital campus. I would just like you to be aware of the fact that this would be a very valuable asset to our pediatric emergency medical network. I am a pediatrician that works at St. Peter Hospital in Olympia, and some of our complex and surgical emergencies are transported by helicopter to Children's. In the situation where a neonate or child is critically ill, a matter of minutes can make a difference in their survival. I think that having a helicopter landing pad at Children's would be a big asset to the health care of children in our state.

Respectfully yours,

Dana M. Petersen, M.D.

Greetings:

This is to urge you to approve the construction of a helistop at Children's Hospital in order that emergency medical care may be provided to sick or injured children with no delay. A few seconds can be an eternity to one in pain or danger. There is no excuse for interrupting and traumatizing these patients en route to care.

I have lived within a block of Children's Hospital for over seven years and have never been disturbed by the helicopter. Even if I had been, I would consider it a small sacrifice to assure the timely delivery of care to a sick or hurting child.

I do not believe the helicopter poses any more danger to me by falling out of the sky than do various other aircraft which I observe overhead.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I have no patience nor sympathy for those in the community who would place their own comfort above that of a sick or injured child.

Please approve the construction without further delay.

Sincerely,

Jane A. Dahm

Dear Sir or Madam:

I am writing in regards to the Children's Hospital and Medical Center's request for a heli-port near the emergency room of the hospital. I am a family physician working in Forks, Washington, a rural community out on the coast, and we routinely have to fly very sick or injured infants and children to Children's Hospital for specialized treatment. On at least three occasions in the last two to three years, I have had children that were in such severe condition that any unnecessary handling or transfer of the child by ambulance would have been very detrimental or possibly fatal to the child. I understand that one of the concerns of the Laurel Hearst Community is the noise that the helicopters do produce. I can tell you from personal experience here in Forks that one of the more welcome sounds we ever hear when we are having a battle for some child or adult's life is the sound of the helicopter coming overhead. I beseech the Laurel Hearst Community and the Seattle Planning Committee to allow Children's Hospital to have a heli-port at the emergency room of the hospital.

Sincerely,

Rick Dickson, M.D.

To Whom It May Concern:

It is our understanding that Children's Hospital is seeking a permit from the city of Seattle to build a helicopter landing pad outside the COH Emergency Department to facilitate the timely receipt of critical children. For this reason, we are writing to formally support Children's request for a helipad.

In November 1988 our 22 month old daughter developed a "rapid onset" form of Haemophilus influenza B meningitis. Within 12 hours from the beginning of a fever and vomiting she was unresponsive and nearly comatose. After the decision to transport her to Children's was finalized, she began deteriorating so fast that the ground transport team from Children's was canceled enroute and the Airlift NW team dispatched. Enroute to Children's from Valley Medical Center, Rae-Ann's blood pressure disappeared and she respiratory and cardiac arrested. Her little body turned a deep purple as the full brunt of the profound septic shock took effect. She began concurrently bleeding from every orifice and producing dangerous blood clots due to a condition called Disseminated Intravascular Coagulation . It is my understanding that the cerebral spinal fluid that bathes the spinal cord and brain was so thick it resembled what you call pus. (Normally CSF is a thin, clear, light amber fluid.) A mid-air decision was made to land the helicopter outside Children's Emergency Department as the Flight Nurse and resident physician were barely able to keep Rae-Ann alive throughout the transport.

When my husband and I arrived at Children's an hour later we were told to begin preparing and accepting that Rae-Ann would die by morning due to the extreme pressure inside her head, the profound septic shock that her vital organs were enduring and the bleeding/clotting problem. It was stated, that on the outside chance she survived the night, she would remain in a permanent vegetative state. You can surely imagine the pain and sorrow shared by a mommy and daddy as we watched that sweet baby girl slipping away.

Thankfully, the Intensive Care staff did not stop fighting for Rae-Ann's life even though they were certain she was dying. After more crises and much work, Rae-Ann became one of Children's "miracle" children. Two weeks after this ordeal began, she was discharged home. Today, at 5 and a half, she is without any residual affects. We all know that every minute that was saved and every opportunity seized contributed to the remarkable recovery of our daughter. We appreciate so much the willingness of the Airlift team to make an unpopular decision and do what, in their professional opinion, was most likely to give our daughter a chance.

Please, please consider the long term impact of your decision on the lives of the children and their families who are critical enough for direct transport to COH. Your decision has life saving potential! Thank you.

Most Sincerely Yours,

Jeffrey W. Mitchell

To Whom It May Concern:

We are a group of obstetrical and neonatal nurses working at Olympic Memorial Hospital in Port Angeles, Washington.

We are dependent on Children's Hospital to provide newborn emergency services, long-term life support, and surgical services unavailable on the Olympic Peninsula. Each one of us has been involved in the resuscitation of sick newborns and the subsequent transfer by helicopter to Children's Hospital. We have seen, firsthand, the need for prompt, intensive treatment, where the delay of even a few minutes can be life threatening to an infant. We know from experience how difficult transporting sick newborns can be, and how each additional movement (i.e., from a helicopter to an ambulance) can complicate the care and delay treatment. Keeping an IV and an ET tube properly placed in a sick newborn is difficult enough in the nursery let alone through several stages of transport!

Our families deserve the best care possible--we urge you to approve the building of the helistop pad at Children's Hospital.

Kitsap County Fire District #1 would like to voice its support for construction of a helistop at Children's Hospital and Medical Center. Due to the unavailability of a pediatric medical facility on the Kitsap Peninsula, the need for rapid access to one geared for critically ill or injured kids is paramount to we here in Kitsap County.

Helicopter transport saves an ambulance trip by road or ferry of over an hour. This time frame drastically reduces a critically injured child's chance of survival and recovery.

Kitsap County Fire District #1 encourages the city of Seattle to maintain its leadership role in emergency health care in the United States by accomodating rapid access to its own medical facilities. Any disadvantage or minor inconvenience caused by this helispot is surely miniscule in comparison to the potential number of children's lives saved. Please help us do our jobs on behalf of those kids.

Thank you for your consideration and approval.

Sincerely,

Gary Eddings

To Whom It May Concern:

The value of helicopters in treating and transporting critical patients has clearly been established. Since a plan to minimize environmental impacts on surrounding areas is already in place, the installation of a helistop would serve to ensure the safe transport of the children who critically need to be sent directly to Childrens.

Affiliated Health Services utilizes both Airlift Northwest and Med Flight from Bellingham depending on certain variables. This helistop would be valuable for the helicopter transports from AHS, the Islands and surrounding Puget Sound area.

We applaud your endeavor and extend our support.

RE: Children's Hospital Helicopter Landing Pad

King County Fire District #2 Volunteers wish to express our support for the helicopter landing pad outside the emergency room on the Laurelhurst campus.

As a group that provides emergency aid to many individuals, we realize how important it is to have rapid transport to advanced medical services. Since Children's Hospital provides such specialized medical services to such an important and precious segment of our society, we feel that it is vitally important to approve the landing pad.

It is our understanding that the landing pad would only used in most critical cases when the time savings are important. When helicopters are used in this manner, it should result in minimal disruption and impact to the surrounding areas. The extra time involved in existing transfer at the University of Washington, the extra transport crew combined with additional hazards of one extra run would be eliminated.

The landing pad could also be an advantage in the event traffic is at a standstill or in the event of a natural disaster.

Thank you for your consideration,

Michael M. Fitz
Secretary, Volunteers of King County Fire District #2.

Dear Members of the Hearing Examiners Office:

This letter is being written in support of the Helipad at Children's Hospital and Medical Center. This letter represents my second input in support of this effort, as I have already spoken before members of the Seattle City Council at the Council Chambers several years ago, on behalf of the Children's Hospital and we, rural practitioners, who use the facility regularly. For the first ten of the twenty-two years that I have lived in Port Angeles, we were personally escorting our sick newborns and other critically ill patients to Children's Hospital by Coast Guard helicopter. These transports were risky at best. I can recall at least two critically ill newborns who died while enroute to Children's Hospital, and one who died enroute from the football practise field to the Hospital in the ambulance. Having experienced these traumatic events, I can appreciate the need for the critical few minutes that are saved by direct transport to the Hospital. One extremely important point that I would like to make is that Children's Hospital has been in its present location for approximately forty years. One reason that the hospital was relocated in that place was that it was much less densely populated than in its former location. This means that probably the majority of those persons who live in the adjacent area have moved there subsequent to its arrival. The importance of this fact is that the Hospital should be given top priority in allowing it to update its facilities and services, which include its availability to critically ill patients. It would seem that the relative infrequency with which the proposed flights would arrive at this Helipad, would be a small inconvenience to the adjacent residents when compared to the life-saving nature of the event. Yet another factor to be considered into the formula, is the fact that the additional costs of landing at the football field and transferring the patients to an ambulance are not trivial.

In conclusion, I would think that it would be quite ludicrous to deny the Hospital this facility under the circumstances, and would ask that you think of the critical nature of the service, and give your whole hearted endorsement to this endeavor. I speak not only for myself, but

1320 Alaska Building
618 Second Avenue
Seattle, Wa 98104

Dear Hearing Examiner:

I am writing this letter to speak in favor of Children's Application for a helicopter landing pad on the Laurelhurst campus. There is a definite need for this helistop. Time is one of the major factors working against a trauma victim as well as victims of medical illness and burns. For a child from Neah Bay who faces a wait of forty-five minutes for the helicopter to fly from Seattle to Neah Bay and then another forty-five minute flight back to Children's a few minute delay can mean the difference not only between life and death but, also possibly a life of disability.

The delay of landing else where and ground transporting an individual may not be a factor to those living in the Seattle area. But, to those living in the remote areas of the State every delay is another strike against them. The common response to this statement is that people choose where they live. There are children from Seattle who become injured in the remote areas of the State and they are then flown to Children's. They then face the same delays that the child from Neah Bay faces.

With emotions set aside it still makes sense to put the efforts into that which has the highest return, with a survival rate of 73% those children flown to Children's are a valuable resource. Therefore the request from Children's is one we of rural EMS firmly support and urge you to find in favor of Children's.

If you have any questions or desire any additional information please call me at (206)-479-5631 thank you for reviewing my letter.

Sincerely,

Mark Bowes

Seattle, WA 98104

To Whom It May Concern:

I am writing this letter in support of Children's Hospital and Medical Center's request to build a helicopter landing pad outside of their emergency room on the Laurelhurst Campus. I am a pediatrician who has been in private practice in Port Angeles on the Olympic Peninsula for the past eight years. During that time, I have had many occasions to refer critically ill or injured children to Children's Hospital. It is my understanding that Children's Hospital will land only the most critically ill or injured children at this proposed helipad, but there have been occasions where literally minutes will make a difference between life and death for a child who is in this critical condition.

I hope you will remember the children of the Olympic Peninsula when considering this permit.

Thank you very much for your attention to this matter.

Sincerely yours,

Madeline Harrington MD

To the Attention of The Hearing Examiner:

Those of us who work at Grays Harbor Community Hospital know how important Children's Hospital & Medical Center has become as the leader in the Northwest for services to the most critically ill and injured children throughout the region.

We strongly support the approval of a permit from the City of Seattle to build a helicopter landing pad, or helistop, outside the Emergency Room on the Laurelhurst campus. Everything that can be done to ensure the approval of this permit needs your serious attention. We at Grays Harbor Community Hospital endorse and support the development of this landing pad and the very important work of Children's Hospital & Medical Center.

Sincerely,

Michael Madden

RE: Children's Hospital & Medical Center/Helicopter Landing Pads

Dear Sirs:

On behalf of the King County Fire Chiefs' Association, we would like to express our support for the building of a helicopter landing pad outside the emergency room at Children's Hospital Laurelhurst Campus and the improvements to the helistop located at the University of Washington Intramural Field.

After reviewing this issue, there is simply no compromise when this type of transport is necessary to save the critical time that is needed in life and death incidents or critically ill or injured children. This time is saved only if the landing sites are strategically located next to an emergency room.

The compromise proposal that has been ironed out between the citizens of Laurelhurst and Children's Hospital to minimize the adverse effects of emergency helicopter transport addresses the community's concerns about noise, safety and frequency of flights yet still provides for the rapid transportation of critically ill or injured children. We feel strongly that this proposal will improve the level of critical care available to the children living or visiting in the Puget Sound area and Olympic Peninsula and increase their chances of survival. We highly support this proposal

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Members of the King County Fire Chiefs' Association strongly urge you to approve the permit requests for these helistop sites.

We appreciate your careful consideration of this matter.

Sincerely,

James X. Davis, President
King County Fire Chiefs' Assoc.

James Davis, Chief
King County Fire District #42
P.O. Box 2324
Woodinville, WA 98072

Dear Chief Davis:

We need your help! Children's Hospital and Medical Center is seeking a permit from the City of Seattle to build a helicopter landing pad, or helistop, outside the Emergency Room on the Laurelhurst campus. City officials are nearing key decisions about our request. We are writing to ask for your support.

Since the early 1970's, some critically ill and injured children have required transport by helicopter to Children's Hospital in emergencies. Most requests for emergency helicopter transport of patients to Children's come from community hospitals and physicians in the Puget Sound area or Olympic Peninsula. Air transport by helicopter is one very important component of the regional emergency medical care response system. Complex surgical emergencies, overwhelming infections, and near drownings represent a few of the conditions where every moment lost increases the risk of death to a child.

In order to minimize the impacts of the community, only the most critically ill or injured patients land at Children's Other patients determined able to withstand delay and movement are landed at the University of Washington Intramural Field and are transported by ambulance to Children's. Please refer to the enclosed fact sheet for further information on the need for the helistop at Children's.

If you have reason to support the need for Children's to construct a helistop to ensure the adequate and safe delivery of emergency medical services to children in the region, please write a letter of support and send it by June 23, 1992 to:

Children's
Hospital & Medical Center

Helistop Proposal
Facts in Brief

CHILDREN'S HOSPITAL IS SEEKING A PERMIT FROM THE CITY OF SEATTLE TO BUILD A HELICOPTER LANDING PAD, A HELISTOP, OUTSIDE THE EMERGENCY ROOM ON THE HOSPITAL CAMPUS.

History
The permit was applied for in 1984. The City Department of Construction and Land Use (DCLU) required the preparation of an Environmental Impact Statement (EIS) to evaluate the noise and safety issues associated with construction and operation of the proposed helistop. The Draft Environmental Impact Statement was published in 1986; comments on and revisions to the draft followed. The final EIS was published in April 1991.

During preparation of the EIS, emergency helicopter landings, which began occurring at Children's in the 1970s, have continued on a grass plot just outside the Emergency Room.

Landing Sites
Several helicopter landing locations were examined in the EIS as alternatives. Although the best alternative from a patient care perspective would be to land all critically ill or injured children destined for Children's Hospital by helicopter directly at the Hospital, a compromise has been implemented.

In order to minimize impacts on the local community, only the most critically ill or injured children are brought by helicopter to Children's campus. Other critically ill or injured children, determined by the medical transport team to be able to withstand the time delay and ground ambulance transport to Children's, are brought by helicopter to the University of Washington Intramural Field, Harborview, or Boeing Field. A permit application for an improved helistop at the University of Washington Intramural Field has been submitted.

Frequency of Landings
Through 1995, an estimated average of 15 to 21 children each month may need emergency transport to Children's Hospital by helicopter. It is estimated that each month an average of 3 to 5 of these 15 to 21 children will need to land directly at the helistop at Children's.

Need
Helicopter transport directly to Children's Hospital can be life saving in the most critical cases because it reduces transport time to the Hospital and the number of times a patient must be moved. Complex surgical emergencies, overwhelming infections and near drownings are examples of conditions where immediate advanced medical care can make the difference between life and death.

Airlift Northwest is a regional air ambulance service, founded by Seattle hospitals including Children's. Airlift Northwest operates medically equipped airplanes and helicopters staffed by flight teams specially trained to provide critical care aboard aircraft. Most requests for helicopter transport are from paramedics in the field or community hospitals in the Puget Sound area and the Olympic Peninsula.

Outcome
Review of the cases of critically ill or injured children transported by helicopter directly to Children's Hospital shows that their survival rate has improved over the past several years. Of the 141 patients flown to Children's between August 1985 and March 1989, in 60 percent of the cases the emergency condition was successfully treated and the child was discharged from Children's Hospital. In 40 percent of the cases, the child died. However, of the 166 patients transported to Children's between June 1989 and December 1991, 73 percent survived and 27 percent died.

Enclosure: Facts in Brief

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopter Transport and Landing Decisions
The decision to transport a patient by helicopter to Children's Hospital, or any other hospital, is made by the referring hospital physician or by the paramedic responding at an accident site.

The decision to land a child destined for Children's Hospital directly on the Hospital campus, or at one of the alternate locations, is made by the Airlift Northwest medical team aboard the helicopter. The decision is made according to each child's medical needs.

Cost
Helicopter transport is generally more expensive than ground ambulance, but it is sometimes necessary to save time, and, therefore, lives. Insurance companies and Medicaid reimburse for emergency helicopter transport.

Safety
Based on national helicopter accident statistics, in the worst case scenario an accident would be expected to occur once for every 14,184 transports to Children's Hospital, or once every 59.1 years. Airlift Northwest has an outstanding patient care and flight safety record. Properly constructed helistops at Children's and the UW Intramural Field are needed to provide for maximum safety.

Noise
Noise and vibration from helicopter landings at Children's has been evaluated for the EIS and found to be within regulatory limits. The highest outdoor maximum sound level of a helicopter was found to be 84 decibels at the closest residential location. Typical outdoor sound levels in urban residential areas are between 75 to 85 decibels due to vehicles such as trucks or buses. At night, when less than 25 percent of the estimated average 3 to 5 monthly landings are expected to occur, residents closest to the hospital and patients in the hospital could be awakened by the helicopter noise.

Noise from emergency equipment necessary to protect the health, safety or welfare of the community is exempt from the Seattle Noise Ordinance.

Mitigation Efforts
In order to minimize potential adverse environmental impacts on the surrounding neighborhoods and accommodate safe, effective helicopter transport, Children's Hospital has:

- Implemented the compromise proposal to land only the most critically ill or injured children directly at the Hospital campus;
- Agreed to the creation of a medical review panel to monitor landings at the on-campus helistop;
- Developed with Airlift Northwest flight paths and approach, landing, and departure procedures to minimize noise and maximize safety;
- Monitored Airlift Northwest safety programs and developed procedures for providing security at the proposed helistop and responding in the case of an accident.

Footnote: Most information in this Facts in Brief is contained in the Final Environmental Impact Statement.

Dear Hearing Examiner:

We reside in Laurelhurst, near Children's Hospital. We have followed fairly closely the dispute over the request by Children's for authority to build a helipad, and the reports of the use of the existing facilities. We are satisfied that the current use of facilities is reasonable and prudent, and not an unreasonable intrusion into the surrounding neighborhood. We support the city granting a permit to Childrens's for constuction of a helipad at the hospital, subject to the current restrictions limiting landings at the hospital to those in which the most critically ill patients are taken directly to the hospital and less critical patients are landed at other facilities for transfer to Children's.

Very truly yours,

D.W. Jackson
6826 - 32nd NE
Seattle, WA 98115

Dear D.W.:

Thank you for your letter regarding the proposed helicopter landing at Children's Hospital.

Because the City Council functions like a judge rather than a legislative body on many land use issues, Councilmembers are governed by the Appearance of Fairness Doctrine. This legal requirement precludes them from reading letters, responding to telephone calls or being lobbied on individual projects. If they do, they risk prejudicing themselves before all relevant facts are determined and losing the right to vote on the project if it comes before the council.

This issue will appear before the Hearing Examiner on either the 23rd or 24th of June. I have forward a copy of your letter to the Hearing Examiner so that your input will be entered into the record.

Since this project is currently under administrative review with the possibility of future appeal to the Council, these rules apply. Therefore, I am responding for Councilmember Donaldson, as well as the other Councilmembers, to your letter and will try to keep you apprised as to the status of this issue.

Please feel free to call me at 684-8806 if you have any questions.

Sincerely,

Paula Hoff

[redacted]

Seattle City Council
600 4th Ave.
Seattle, WA. 98104

ALL COUNCIL MEMBERS
RECEIVED THIS MATERIAL

This letter raises an objection to the DCLU recommendation for approval of helicopter landings at Children's Hospital.

Public opinion has been previously expressed on this issue which was one of overwhelming disapproval. Media hype at that time which has been reborn failed to overcome the public desire for no further noise polution and for safety of the neighborhood from possible aircraft failure as well as other adverse affects.

Present landing arrangements have been adequate so far as I know. I am not aware of any deaths or serious results directly caused by lack of a helistop atop the hospital.

The question arises of who would determine that point of need where the hospital landing would be selected over the UofW helistop. How many other hospitals will require this addition?

DCLU, according to a recent report, has been ineffective of zoning regulations at the expense of the homeowner. The answer to the problem is to change the regulations.How would misuse of the proposed heliport be handled?

This letter requests your involvement in this public issue and your recommendation against the proposal. Noise polution, interruption for hospital patients, distraction for medical personnel and disruption for public in general must be considered for doubtful gain.

Sincerely,

D.W.Jackson

Seattle, WA 98104

Dear Ms. Getches:

I am writing in regards to the Director's recommendation on the conditional approval of Council Conditional Use of the emergency helistop at the Children's Hospital and Medical Center Campus. I applaud many of the recommendations made in the Director's Report regarding this matter. However, I also feel that some issues remain to be addressed. Of specific concern to me are the following:

The Director's Report has not considered other options such as use of the landing pad at Harborview and the trauma center which already exists there. It has also not examined what sort of precedent is being set for the low-income neighborhood surrounding Providence Hospital - the only other hospital which is a member of the Airlift NW consortium which doesn't have a helistop, and the only other hospital in this consortium which is located in a residential neighborhood.

The Citizen Oversight Panel is a wonderful idea. As it is currently constituted in the Director's Report, however, it would be composed only of staff from Children's Hospital. This panel needs to be composed equally of CHMC staff members and impacted citizens. Among the non-CHMC members of the staff need to be outside physicians whose financial well-being is not controlled by CHMC. This panel also needs to be kept in effect as long as the helipad is in operation, and needs to meet more frequently than twice a year. This is especially essential in light of the fact that neighborhood monitorings of current helicopter landings shows a discrepancy with the figures used by CHMC, with CHMC appearing to under-report the number of landings made per month.

Serious consideration needs to be given to the siting of the proposed helipad. The current helipad location will become obsolete once the Master Plan for the CHMC campus is enacted. I suggest that the helipad be approved on a conditional basis until the Master Plan is finalized and approved.

Two other items that do not appear to have been taken into consideration when the Director's Report was written are 1) No test take-offs and landings were conducted to verify the actual noise level and impact on the surrounding neighborhood and schools. 2) Once approved, the City of Seattle will have no air-right controls over the helipad and will thus lose all control over the helipad to the FAA. Is the City of Seattle willing to relinquish this control?

I will be out of state on June 23 and 24 when your Office

Dear Sir or Madame:

I strongly support the Children's Hospital Medical Center plan to construct a helicopter landing pad outside their Emergency Room.

As a pediatrician practicing in the Olympia area, I have had patients that have required emergent transport by helicopter to the Children's Hospital. One child, who had a brain tumor, I am convinced would not be alive today if it were not for the prompt response made possible by this service.

I, therefore, strongly support approval for the permit to build a helicopter landing pad at Children's Medical Center.

Respectfully submitted,

Carl A. Lindgren

Seattle Department of Construction and Land Use
Project numbers: 8405870 and 9106441
Addresses: 4800 Sand Point Way N.E. and 2501 N.E. 45th Street

Laura Gilbert, Acting Director:

Several years ago I attended an evening public hearing at a school in the Windermere neighborhood. Recently when I received information that Children's Hospital and Medical Center is still trying to be allowed an emergency helistrop on the CHMC campus and a second, primary helistop on the U. of W. intramural fields I could hardly believe that the issue hadn't been settled years ago and been in use.

I have lived in the same neighborhood since 1952. When the U.S. Naval Air Station on Sandpoint Way was still active, every Friday and Saturday nights "Weekend Warriors" practiced landings and takeoffs on Lake Washington opposite our house. It interfered with our sleep but the Navy never asked whether or not we objected. Often I could hardly force myself to go to work Saturday and Sunday mornings.

Sea planes still land and take off at Kenmore as they wish. In the past year I hear jets from California turn around over Lake Washington and land at Seatac coming from the North. I sometimes wish I were deaf.

I do hope the permits requested for these projects are given and all helicopters carrying patients to the Children's Hospital can land on the CHMC campus without any delay and the extra expense of requiring an ambulance from the U. of W. campus.

Please send me a notice of the Hearing Examiners recommendation.

Sincerely,
Nancy Lawrence

Dear Sir or Madam:

On November 21, 1991, our then 13-month old son was airlifted from Federal Way directly to Children's Hospital in Seattle. He had a near-drowning in our home bathtub after being left unsupervised for only a minute or two. He had stopped breathing and begun to turn blue. Every minute, every <u>second</u> saved in reviving him and getting him to the hospital made the difference between the perfectly normal, healthy 19-month old child we have today and the possibilities of brain damage or even death that we faced on that day with agony in our hearts.

We most strongly support and recommend the construction of a helistop directly at Children's Hospital without further delay. In cases of a real emergency nature where there is not a moment to lose, a helistop at Children's Hospital should be considered by the City of Seattle to be not an option, but a necessity.

No one <u>ever</u> expects it to happen to them. Tragically, it does. The lives of our children are at stake. Please do everything in your power to ensure the helistop is allowed to be built. <u>Soon</u>. For your children and mine, <u>thank you</u>.

Sincerely,

Mrs. Dennis D. (Cindy) Kurtz

Seattle, WA 98104

Gentlemen:

As an active member of the Cottage Lake Auxiliary of Children's Hospital and Medical Center and as a person who cares for the best help available for any child whose life is in danger I urge you to approve the petition for construction of the emergency helistop and the second primary helistop.

Any minor inconvenience to the public in these areas will be more than offset by the efficiency of the care which the patients will receive when their lives are in danger.

Thank you for your favorable consideration of this matter.

Please send me a notice of the Hearing Examiner's recommendation.

Sincerely yours,

Viola N. Meredith

Hearing Examiner,

A permit to build a helistop at Childrens's Hospital is very neccessary and long over due.

I would hope that anyone awaken by a helicopter would say a prayer for the child being brought in instead of fussing about the noise as I do when the aid car or fire truck goes by my house.

Thank You
Frances Jarrett

Dear Sir:

May I, on behalf of the Retired Seattle Police Officers Association support Children's Hospital and Medical Center request to build a helicopter landing pad, or helistop, outside the Emergency Room on the Laurelhurst campus.

Air transport by helicopter is one very important component of the regional emergency medical care response system. We realize how important time is when an emergency exists and fully support Children's request to construct a helistop to ensure the adequate and safe delivery of emergency medical services to children in the region.

Helicopter transport directly to Children's Hospital can be life saving in the most critical cases because it reduces transport time to the Hospital and the number of times a patient must be moved.

LIFE IS PRECIOUS - Lets not hesitate on this important request for a permit from the City of Seattle to build this pad.

Respectfully,

S.A. McLaughlin

S.A. McLaughlin, Secretary/Treasurer

Re: Council Conditional Use Permit
Project Nos. 8405870 & 9106441

Dear Ms. Alexis,

I am in complete support of the proposed emergency heliport at Children's Hospital.

Three years ago, my daughter Karen was killed in a tragic sledding accident in Magnolia. Emergency efforts to save her life included an evacuation by helicopter to Harborview Medical Center. In the middle of winter, with the city in the grips of a snowfall, the helicopter was the only option available.

Children's Hospital is an institution that we are all proud of. Its mission is to save the precious lives of sick and injured children, but it cannot fulfill that mission without the ability to receive critically injured children transported by helicopter. In many cases, the speed of helicopter transport can make the difference between life and death for an injured child.

I urge the quick approval of the Children's Hospital heliport.

Sincerely,

NORM MALENG
King County Prosecuting Attorney

Ms. Ruperta Alexis, Deputy Hearing Examiner
Room 1320, Alaska Building
618 Second Avenue, Seattle Wash. 98104

Dear Ms. Alexis,

We strongly urge that the heliport be denied or severely restricted. The items of concern are listed below:

1. We are extremely concerned about safety issues regarding the COH helipad. Coming into a helistop is not like coming into an airport runway where air/surface conditions are carefully monitored. Components could fail and the helicopter could fall on a house or school. Though such failures are rare, they can and do happen. Homes and families adjacent to COH and children at Laurelhurst Elementary are potentially at risk.

2. A number of times HELICOPTERS HAVE DESCENDED OFF THE PRESCRIBED FLIGHT PATTERN, above and very close to residential homes, including ours.

3. Of special concern are heavy weight helicopters. They HAVE serviced COH. Once a helistop has been approved, more of these flights can be expected, even though they are admittedly unplanned.

4. We are also worried about the possible future location of a helipad on one of the COH garages across the street from our home. We would have no objection to locating a helipad on one of the new buildings currently undergoing approval.

5. In conclusion: The growth plans of COH can do nothing but increase the number of flights, thereby exacerbating the danger to the surrounding neighborhood.

We request that you either deny or severely restrict construction of a permanent helipad. If you approve the helistop, at least impose a monitoring restriction, MONITORED BY SOMEONE OTHER THAN COH for compliance.

Sincerely,

Helen and Dave Belvin

My name is Cheryl Kitchin.
My address is 4702 44th Ave. N.E. Seattle, Washington.

I am the mother of 3 children.

I am a C.P.A. and an Administrator at Shoreline Community College.

I grew up in Northeast Seattle and love its friendly neighborhoods.

The facilities available for children in our neighborhood are the best, this includes a beautiful park, and gymnasium in which we have enjoyed many an exciting baseball and basketball game.

My home is on the corner of 44th Ave NE and NE 47th. My home is the closest house to the proposed helipad. Our front door is approximately 100 yards away form the helipad. We purchased our home 19 years ago when our Son was two years old. He was seriously ill and often required help in the middle of the night at the Emergency Room. Walking was our means of transportation. I am aware of the fear and exhaustion parents feel when they bring sick children to the hospital.

For the last six years the Hospital has been landing helicopters in front of my house. Yes, I worry about the safety of my children. But I have never objected to its use as long as I am certain that its use is only for the most serious of circumstances.

I simply wish to ask that the City of Seattle not allow our neighborhood be destroyed by the Hospital. Its growth in the last ten years has been incredible. The Hospital is proposing a 45% increase in building size in the next 15 years. How can we stop the flight of young families from our neighborhood if the safety of that neighborhood is questioned. The helipad will cause this to happen. The impact of the Hospital helipad will become a greater impact with each passing day if their is no control of its use.

The creation of an oversight committee is an excellent suggestion by the Department of Land Use. I wish that the existence of that committee be made permanent by the City of Seattle and that those on the committee live on the streets most affected by the helipad. I need to be assured that the risk to our safety each time a helicopter flies very low over our home is worthy of the need. I need to know that <u>EACH</u> flight is necessary in the most basic way, that is, to save a life. I can not accept future flights which will bring equipment or staff to the hospital by helicopter. Without an oversight committee to check into this possibility, I am sure this will begin to happen.

I am a concerned and responsible parent who happens to live very near Children's Hospital. I am asking that my concerns be viewed with understanding.

Cheryl F. Kitchin

I wish to take issue with your ruling recommending the so-called Emergency Helistop on the CHMC campus. I realize that I am, of course, automatically branded a bad guy when I oppose anything that the CHMC may wish to do. I can only comment regarding the disruption and dangers of the helicopter flights in a restricted residential area. We personally do not live directly under the flight path of the helicopters landing at the CHMC, but are close enough to still be subjected to the noise. We own a condominium at Laurelon Terrace, however, and our tenant there has complained of the terrible noise generated -- not to mention the danger that these low flights create in this residential area. I realize there is the need for emergency flights to aid stricken children. However, there are alternatives to handling such situations. It has been recommended that CHMC should develop an emergency pediatric care facility at Harborview. With the use of this existing helipad, there certainly would not be the same dangers to the populace as to a helipad in a residential area. Once the emergency conditions are alleviated, the child could then be moved to CHMC by ambulance. The existing use of the University of Washington's field poses no flight path threat and certainly keeps the noise away from the residential area. I am terribly concerned that the helipad adoption is only the first step in the constant erosion of our neighborhood by the CHMC. It is my understanding that the next encroachment is to apply for a zoning change which would permit a 105 foot height limit. I guess I have to ask, "when will these constant attempts by CHMC to add more and more buildings with the resultant congestion and increased traffic stop?" I can only compare the

received in hearing

CHMC actions to the land developer who will eventually wear down the opposition and get his way! I wish to go on record as opposing the helipad at CHMC and dearly hope that the other options be explored with an open mind.

OK hospital's helicopter pad

Transporting critically ill or injured children to Children's Hospital and Medical Center's emergency room by helicopter would seem to be an eminently sensible procedure, yet it has been fought for eight years by some residents of the surrounding Laurelhurst neighborhood.

Now, after preparation of exhaustive environmental impact statements and prolonged negotiations that have produced a number of compromises, the hospital's application for a permanent helicopter pad on the hospital grounds is about to receive official city review. It will be considered Tuesday by a city hearing examiner who will make a recommendation to the City Council.

The application deserves full approval.

The proposal, which has the blessing of the city's Department of Construction and Land Use, would permit construction of a helipad for the "most critically ill" emergency patients. They are defined as those who have an inability to breathe, no blood flow from the heart, inability to maintain adequate blood flow to the head and a lack of vital signs.

In other words, those children who are in imminent danger of death.

This conforms to a practice that has been in place on a temporary basis for some time. The most critically ill have been landed on a grassy area at the hospital while the majority have been flown to nearby University of Washington intramural athletic fields, then transported to the hospital by ambulance.

Hospital officials note that loading and unloading patients during emergency transport operations involves two major risk — life support systems may become dislodged and body temperature may be lowered. The new helipad will minimize such risks for those in the most critical conditions.

The hospital estimates that from three to five of the 15 to 21 children brought by helicopter each month will require landings on the proposed new, concrete hospital helipad. The others will continue to be shuttled from the UW fields by ambulance.

Arguments by those who may continue to resist the helipad project because of occasional noise a few times a month should be summarily dismissed — concern over a little infrequent and brief noise carries no weight in relation to concern over the survival of critically ill and injured children.

EMOTIONAL DEBATE REOPENS

Yes to helicopter pad at Children's Hospital

DEBATE over an emergency helicopter pad at Children's Hospital and Medical Center has gone on too long. A permanent landing should be built as soon as possible.

Saving lives of children takes precedence over out-of-proportion objections by some Laurelhurst residents to noise that is, at worst, infrequent.

Since the early '70s, some critically ill and injured children have required emergency helicopter transport to the hospital. In 1984, the hospital applied for a permanent landing pad. Opposition tied up the plan. Helicopter landings have continued on a grass plot just outside the emergency room.

Helicopter noise at the nearest residence measures about the same amount of decibels as an ambulance siren from 500 feet.

An environmental-impact statement has been completed, and the city's Department of Construction and Land Use has recommended the hospital be granted a permit for a permanent landing pad.

Tomorrow, at 9 a.m. in the Alaska Building, the city's hearing examiner will take public comment on the recommendation. City Council consideration is expected in late summer.

Very vocal opposition by some neighbors is expected to be renewed. It has less merit now than before.

As a compromise to minimize noise, the proposal calls for landing only the most critically ill or injured children at the hospital. Other emergency cases that can withstand the time delay will continue to be brought by helicopter to the University of Washington intramural field. They will be relayed the remaining short distance by ambulance.

Helicopter noise at the nearest residence measures about the same amount of decibels as an ambulance siren from 500 feet. The chopper noise is short-term and infrequent.

The hospital estimates that through 1995 an average of 15 to 21 children a month may need emergency helicopter transport. Under one alternative compromise, only 3 to 5 of that number would be taken directly to the hospital. The rest would be landed at the UW intramural field.

This is not a huge neighborhood inconvenience for what is at stake: precious moments that could mean life or death for a child.

RE: Council Conditional Use Permit Requested for Helistop
CF# 297288 and 298740

RECEIVED BY
92 JUN 23 PM 4:25
OFFICE OF
HEARING EXAMINER

Dear Councilmembers and Hearing Examiner,

Please clarify that the "full scale" helistop recommended by DCLU for Graves Field will be limited by SMC 23.69.012C to life threatening emergencies only. Interhospital transfers of stabilized patients should land at Boeing Field or Harborview for transport by ground ambulance. The Harborview and airport locations are sited by the freeway. Landings and overflights of the University and residential areas are avoided by use of these locations. While I don't think it is DCLU's intent to recommend a general use helistop on the UW campus, the limitation to emergency, life-threatening medical use should be clear in the legislation.

If helicopter landings are allowed as a legal use on the Children's campus as recommended by DCLU, I request further conditioning to limit the physical change to accommodate emergency landings to a grass or grass-crete landing pad. A 40 X 40 concrete pad is neither necessary nor desirable. As noted in the report, helicopters have been landing without incident, albeit illegally, for eight years on a completely unimproved site. The esthetic and environmental advantages of grass or grass-crete are obvious. Furthermore, I believe the restriction to grass would be a significant deterrent to potential misuse of a helistop permit. The review panel is one deterrent, but a very weak one.

I disagree with the recommendation to permit landings on the hospital campus. Providence is a tertiary care hospital and relies on ambulance transfers from Harborview. Harborview has a significant transfer by ambulance required from the landing site to the emergency room. The University will also rely on ambulance transfer to its hospital.

Perhaps we'd all be safer if we lived at the emergency room, but a compromise is necessary. I believe landing true emergencies at Graves Field for transfer to Children's is a reasonable compromise.

Sincerely,

Kate W. Hemer

To whom it may concern:

On behalf of the City of Bellevue Fire Department, I would like to take the opportunity to express support for approval of a helistop/landing pad outside the emergency room on the Children's Hospital Laurelhurst campus. As Bellevue Medic One celebrates it's twentieth year of operation, we can certainly see the need for this critical operation. From the Eastside it has become increasingly difficult to access the Lake Washington bridges during peak rush hour traffic. Since the Bellevue Fire Department is a major EMS provider in the area, our Department provides treatment and transport to many critically ill pediatric patients. I would like to remind the hearing examiner that there is currently no specialized pediatric medical facility on the Eastside at this time. Ground transport to COH is not always appropriate due to extended transport times of over 20 minutes. Children's Hospital is the facility of choice for treatment of critically ill children. To refuse access to COH with an on-site helipad for emergency prehospital air transports is a decision which undoubtedly compromises the health and well-being of these young patients. Denying pediatric patients sophisticated air ambulance transports with direct access to the COH emergency room is not ethical when the delays of alternative transport modes are considered. This helipad is of the utmost priority, an issue which impacts childrens lives throughout the entire Puget Sound area.

Sincerely,

Ron Profit lgh

Dear City Hearing Examiner,

I urge you to recommend that the City Council approve the construction of a helistop for the safe delivery of the most critically ill children to Children's Hospital + Medical Center.

I have been a neighbor of Children's (4875 Terrace Drive N.E.) for several years and am proud that Seattle has what is probably the finest Childrens hospital in the United States.

Children's sends out regular reports to better inform the community about its highly technical methods, fine professional staff and most importantly about its' brave little patients. As one who believes that children should be societies first priority, I wont to support this fine healing institution. I would gladly undergo

To Whom It May Concern:

It has come to my attention that Children's Hospital and Medical Center is seeking a permit from the City of Seattle to build a helicopter landing pad outside the Emergency Room on the Laurelhurst campus. I wish to express my strong support for their request.

Those of us in a community such as Centralia and Chehalis have a strong reliance on the services provided by Children's. They can make a critical difference in a young child's life at a very difficult time. At Providence, we have a busy emergency room but cannot maintain the intensity of services that are needed when we have a child come to us in need of special care. Children's fills that role. From our own experience with our own helispot, we find it can make an important difference in dealing with a patient's problem to have a helispot readily available.

I hope that the City of Seattle will look favorably upon their request.

Sincerely,

Sister Maureen Comer, OP

Re: The Helistop Landing & Children's Hospital

As a Laurelhurst resident, I would like to state my unequivocal and enthusiastic support for the construction of the helistop at Children's and for any and all helicopter landings on Children's Laurelhurst campus.

I have had the unfortunate and harrowing experience of driving a critically ill child to Children's and have experienced the fear that our child would not survive the commute due to the many stops at traffic lights on N.E. 45th Street and Sandpoint Way before arriving at Children's. Due to a severe case of viral pneumonia our child was barely breathing when we returned to Seattle from a vacation and rushed him by car to Children's. Each red light stood in the way of his tenuous survival. Yet these are the same traffic signals ambulances must slow for as they transport critically ill children from the Univereity of Washington's intramural field. The seconds and minutes lost in this method of transport DO make a difference between life and death.

I strongly believe it is unethical to deny any child immediate access to Children's life-saving staff and technology. A few helicopter landings in Laurelhurst is a small, small price to pay for a child's life. The existence of Children's is testimony to our city's vision and commitment to provide the best medical care available to children. Any opposition to providing such care to the children with the greatest need is truly immoral.

Claims by some residents of Laurelhurst about excessive helicopter noise are equally unqualified and facile. We experience 10-20 float plane take offs and landings each day over our house and the amount of noise these small planes generate as they fly over is deafening. When we are outside we must cease talking because the noise completely drowns out our conversations. When we are asleep, the float planes' noise is so loud we are awakened. Yet, there is no organized neighborhood opposition to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

planes flying very low over our homes and they create much more noise than helicopters. Additionally, whon I lived in Baltimore ALL residents in that city were subjected to the constant presence of helicopters since they were (and still are) used by the Baltimore police as a form of police surveillance. No neighborhood was exempt from low-flying police helicopters daily patrolling the city. Given the great number of helicopters always in flight over Baltimore, I cannot recall any accidents: or any opposition to their use.

It is in everyone's interest that Children's maintain its position as our region's preeminent children's medical institution. I owe my child's life to the comprehensive capabilities so expertly administered at Children's. My only hope would be that all children could experience the expertise of Children's, particularly the critically ill. I, for one, welcome each and every helicopter landing at Childrens's.

Message:

I, Peter E. Johanson, having lived at the below listed address in **Montlake** for 19 years do **hereby** give limited **support** to the effort by **COH** to build a permanent **Helicopter Landing Pad** outside their Emergency Room.

I give this support on the condition that this new heliport be used only for the transportation of the most serious life threatening cases. Those other critically ill or injured children who could stand the delay, should be brought by ground ambulance or if needed by helicopter first to an intermediate site such as UW and then transported by ground vehicle to COH

Helicopters are just one more source of unwanted noise pollution making life in our city more difficult. Their use should be limited to the transportation of the most critically injured or ill person who might die without said effort.

Re: Council Conditional Use Permit
Project Nos. 8405870 & 9106441

Dear Ms. Alexis:

Our firm is counsel for Children's Hospital & Medical Center, the applicant for the above Council Conditional Use Permits

First, your office has confirmed that no appeal of the SEPA determination has been filed and that the hearing will be limited to consideration of the Council Conditional Use Permit applications for the helistops on the Children's campus and at the University of Washington intramural field.

Second, we understand that the morning of the hearing on June 23, 1992, has been scheduled for presentations by DCLU and Children's. This is fine, and we will be prepared to use our share of that three hours for presentations by Children's witnesses. Starting after the lunch break, the Examiner will take testimony from members of the public, probably for the remainder of the day.

In addition to the presentation which will be made the morning of June 23, Children's has approximately 12 additional witnesses to offer in support of the applications and to respond to questions raised by the public and the Examiner. The testimony of these witnesses will require approximately 4-5 hours. We will be prepared

TO WHOM IT MAY CONCERN:

I am writing in support of the helicopter landing pad to be built outside Children's Hospital and Medical Center. I am a practicing pediatrician in an outlying area (Olympia) who, on an occasional basis, needs to send critically ill children and babies to Children's Hospital. In many cases an ambulance transport is appropriate, but there are those few cases when a child is critically ill and time is of the essence. Therefore, a helicopter transport is essential to these critically ill children. Landing at the University of Washington and making another transfer of critically ill children could complicate their care. Therefore, I support the occasional use of a helistop at the Children's Hospital site. Every time a patient is transferred, precious moments are lost.

We as community physicians appreciate Children's Hospital's excellent care of our area's children and support them in their efforts to continually improve this care. Please give the approval of the helistop every consideration.

Sincerely,

L O'Leary

Re: C.O.H. Helipad

Dear Examiners,

I am writing in support of the helipad being located and operated at Children's Hospital. I am a nurse at Jefferson General Hospital in Port Townsend. I work with newborn infants and their families. Our hospital is small with an average of two births a week. We have no pediatricians in this county. Occasionally an infant is born with serious health problems and requires emergent transfer to Children's Hospital. Fortunately we do have a helipad right beside the hospital. With a critically ill newborn every minute is crucial. When transported, these infants are utilizing many different pieces of medical equipment such as heart monitors, umbilical artery lines, ventilators, and medication pumps. In addition to the time and effort involved in moving all this equipment, the infant needs to be observed and treated. To optimize the infant's chances of health and survival, the transport must be rapid and smooth. To land at a distant site and put the infant through one more transfer is unconscionable. Some years ago an infant being transported from Jefferson General Hospital was landed at the soccer field site. Before the infant was transferred to the ambulance, his heart stopped. He could not be saved. We will never know but will always wonder whether he could have been saved by the immediate availability of Children's. When an infant's heart and breathing have stopped, those wasted minutes spent transferring to an ambulance and driving through traffic can make a crucial difference.

When we have a critically ill infant and are awaiting transport, the sound of the approaching helicopter is wonderful. It signals the arrival of the needed advanced medical support that a small community hospital like Jefferson General can not provide.

There have been no complaints from our community about the noise associated with the helicopter landings. This community recognizes that the noise is a necessary part of being able to save lives. I live under the flight path o the helicopter. When I hear them it is a signal to me to send out my prayers, knowing that someone is in grave danger.

I hope that the neighbors of Children's Hospital

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

realize that when they leave Seattle to enjoy the rural and wilderness areas, they are then potential users of the helicopter service. People who live near multiple medical facilities take for granted rapid access to advanced medical care. Those who live away from the city recognize that our lifeline is the helicopter.

Sincerely,

Vicki Stuart

To Whom it may concern;

I'm writing concerning the helistop proposal at Children's Hospital.

My child was transported by Northwest Airlift last year from Ketchikan to Children's Hospital. He was on oxygen, in a coma. He needed to go directly to the hospital. Tranferring him was hard on him, took more time and was riskier.

I am convinced that the helistop would save lives. The noise factor I feel is a minor issue compared to a child's life.

Ambulance, police and fire sirens all make noise, as does traffic. A helicoptor would make noise for a short amount of time on the occasions it landed. That's a small price to pay for a life and is just a short blurb in every day city noise.

Seeing for myself where Children's Hospital is located on a busy street, with such a large area taken up by the hospital,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

it wouldn't be like the helicopter would be in someone's back yard.

Nobody complains about the helicopter pad at Ketchikan Hospital, which was used to bring my injured husband in from a logging camp.

I am convinced that this helistop at Childrens is necessary. There is no price on a life. I hope my letter helps.

Sincerely,

Debbie Blake

Fire District 5 is in full support of the construction of a helicopter landing pad outside of the Emergency Room on the Laurelhurst Campus of Childrens' Hospital.

In the past we have called upon Airlift Northwest for care and transport of sick and injured children. Airlift is usually called because the nature of the illness or trauma is so severe that immediate transport to a an appropriate critical care center is needed. Their response time is very impressive and this, along with the expert care the patients receive, makes the emergency medical system work.

Air transportation is a vital link to patient care. The addition of a landing site is necessary to ensure adequate and safe delivery of emergency medical services to children in the region.

Sincerely,

R.A. Knight
Chief

Re: The Helistop Landing & Children's Hospital

As a Laurelhurst resident, I would like to state my unequivocal and enthusiastic support for the construction of the helistop at Children's and for any and all helicopter landings on Children's Laurelhurst campus.

I have had the unfortunate and harrowing experience of driving a critically ill child to Children's and have experienced the fear that our child would not survive the commute due to the many stops at traffic lights on N.E. 45th Street and Sandpoint Way before arriving at Children's. Due to a severe case of viral pneumonia our child was barely breathing when we returned to Seattle from a vacation and rushed him by car to Children's. Each red light stood in the way of his tenuous survival. Yet these are the same traffic signals ambulances must slow for as they transport critically ill children from the University of Washington's intramural field. The seconds and minutes lost in this method of transport DO make a difference between life and death.

I strongly believe it is unethical to deny any child immediate access to Children's life-saving staff and technology. A few helicopter landings in Laurelhurst is a small, small price to pay for a child's life. The existence of Children's is testimony to our city's vision and commitment to provide the best medical care available to children. Any opposition to providing such care to the children with the greatest need is truly immoral.

Claims by some residents of Laurelhurst about excessive helicopter noise are equally unqualified and facile. We experience 10-20 float plane take offs and landings each day over our house and the amount of noise these small planes generate as they fly over is deafening. When we are outside we must cease talking because the noise completely drowns out our conversations. When we are asleep, the float planes' noise is so loud we are awakened. Yet, there is no organized neighborhood opposition to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

planes flying very low over our homes and they create much more noise than helicopters. Additionally, when I lived in Baltimore ALL residents in that city were subjected to the constant presence of helicopters since they were (and still are) used by the Baltimore police as a form of police surveillance. No neighborhood was exempt from low-flying police helicopters daily patrolling the city. Given the great number of helicopters always in flight over Baltimore, I cannot recall any accidents: or any opposition to their use.

It is in everyone's interest that Children's maintain its position as our region's preeminent children's medical institution. I owe my child's life to the comprehensive capabilities so expertly administered at Children's. My only hope would be that all children could experience the expertise of Children's, particularly the critically ill. I, for one, welcome each and every helicopter landing at Children's.

Sincerely,

Elizabeth Szombathy

June 22, 1992

Dear Sirs,

As Registered Nurses in the Emergency Department of Jefferson General Hospital in Port Townsend, Washington, we would like to voice our whole-hearted support for the placement of a helipad adjacent to the Emergency Department at Children's Hospital.

We rely on Children's as a definitive care site for the acutely ill or injured child from our community. There is no Pediatrician or Pediatrics floor in our hospital, and as both parents and professionals we strongly feel that having timely transportation to a definitive care setting can make the difference in a positive outcome versus a tragedy.

Having read the background information, we feel that Children's is acting responsibly and in the best interests of the pediatric patients in requesting a more immediate access to the Emergency Department for helicopters. Having worked with critically injured children, we are aware of how quickly children can deteriorate. The Nurses with Airlift Northwest are some of the best, and we have no doubt about their abilities to triage these patients and, when condition allows, land at an alternate (less obtrusive) site, as proposed. But when push comes to shove and the physical reserves are used up and that child is going down the tubes fast, we would like the option of the fastest route to the most highly trained people to be available.

We understand the problems with public safety and noise, but as proposed, the utilization of this helipad will be minimal, and the disruption of the community will be outweighed by better outcomes for these patients. In this case, the needs of the few (the critically ill and injured children of Washington State) outweigh the needs of the many. Please support Children's Hospital & Medical Center in their quest for approval of an on-site helipad near the Emergency Department.

Seattle, WA 98104

Dear Sirs,

This letter is written to strongly urge that helicopters be allowed to transport ill children directly to the helipad at Children's Orthopedic Hospital in Seattle.

I am a general surgeon in practice in Port Townsend, Washington, I have been here for 17 years. Prior to that, I trained at Virginia Mason and also to an extent at Children's Orthopedic Hospital. I have had personal experience at the receiving end of it at Children's Orthopedic and I have had experience as a surgeon, helping to transport critically ill children from Port Townsend to Seattle. Prior to Airlift Northwest, I personally accompanied many of these children and the hassle of landing at the University of Washington playing field, ambulance transfer with it's attendant increased risk, exposure to cold, etc., was extremely traumatic to these vulnerable and already highly compromised infants.

When one is working in emergency situations with one of these children, the sound of an incoming helicopter can indeed be a welcome sound and I just wish that some of the people who object to the sound of helicopter bearing a sick infant could experience for a moment the heart wrenching sight of a critically injured or sick infant, either at the site of origin in a small hospital such as our own, or at the receiving end at Children's. Perhaps they would then better understand how critically injured and ill these children are and how vital minutes and even seconds are to the care of these children.

Please put the health of lives and limbs of these little children ahead of other less important considerations.

Yours sincerely,

James P. McCarron, M.D., Chief of Surgery
Jefferson General Hospital

Gentlemen:

The Naval Hospital, Oak Harbor, has used Children's Hospital and Medical Center on 35 occasions in the past year when the scope of illness or injury to its pediatric beneficiaries was beyond this facility's capabilities. The presence of a helicopter landing pad at this referral center would greatly enhance its ability to receive critical patients in a timely manner. Additionally, the helopad would ease the burden of the Naval Air Station search and rescue helicopter and decrease the cost to the patients' families and the state and federal governments by eliminating the need for secondary ambulance transportation.

The Naval Hospital, Oak Harbor supports the need for a helicopter landing pad at Children's Hospital and Medical Center.

Sincerely,

M. K. MURPHY
Captain, Medical Corps
United States Navy
Commanding Officer

d Genes "C"
6/1-7/92 am/pm radio/tv

Announcer: If founder genes are going into our tomatoes, tell us. Here's Ken Schram.

Ken Schram: No pronunciation preferences were apparent last week when the Bush administration gave the green light to the sale of genetically altered fruits, vegetables and grains, without the Food and Drug Administration having to do any testing first.

The new policy does not affect biotech research involving meat, poultry, fish or dairy products. It only deals with plants whose new properties can be found in other plants considered edible.

What this comes down to is that some 70 different crops, everything from cucumbers to cantaloupes to tomatoes, can be made more disease-resistant, offer more nutrition, and be made to taste better. Fruit can be left to ripen and shipped without concern of spoiling. In the end, we're promised a safer, more abundant food supply.

We have no reason to doubt that, no reason to take exception with the policy that allows it. The only problem we have is that there is no requirement that any of the new genetically altered products have to be labeled. As consumers, we have the right to know such information and as a government agency whose responsibility includes protecting us, the FDA should see to it that we indeed get that information. I'm Ker Schram.

Helped "B"
6/1-7/92 am/pm radio/tv

Announcer: Children's Hospital sho the helped it needs. Here's Ken Schram.

Ken Schram: Right now, if a critical injured child is rushed to Children's Hospita helicopter, this is where the chopper often l [illegible] ofa field about 1/2 a mile from t [illegible], the child has to be tak ambulance, [illegible] precious minutes before emergency care can be administered.

The hospital's been trying to get a h built up by its emergency room for almost a but some people around here have manage keep that from happening.

Seems there are residents here in Laurelhurst who don't want to deal with the helicopters that help provide children with th medical attention. Rather than have their tra disturbed, people in the area have fought the hospital's efforts at every turn. At one point, residents objected to any and all medical flig overhead, but have now amended that to wri feel landings should be restricted to only the serious emergency cases.

On the 23rd of this month, the City C Seattle will take public comment on the helipo issue. If all goes well, the city Council will tak issue under consideration later in the Summe

Announcer: If flounder genes are going into matoes, tell us. Here's chram.

Ken Schram: No pronunciation preferences pparent last week when the Bush istration gave the green light to the sale of cally altered fruits, vegetables and grains, t the Food and Drug Administration having to testing first.

The new policy does not affect biotech ch involving meat, poultry, fish or dairy cts. It only deals with plants whose new ties can be found in other plants considered

What this comes down to is that some 70 nt crops, everything from cucumbers to oupes to tomatoes, can be made more e-resistant, offer more nutrition, and be made better. Fruit can be left to ripen and d without concern of spoiling. In the end, promised a safer, more abundant food supply.

We have no reason to doubt that, no reason exception with the policy that allows it. The roblem we have is that there is no requirement ny of the new genetically altered products have labeled. As consumers, we have the right to such information and as a government agency responsibility includes protecting us, the FDA see to it that we indeed get that information. n Schram.

Heliped "B"
6/1-7/92 am/pm radio/tv

Announcer: Children's Hospital should get the helipad it needs. Here's Ken Schram.

Ken Schram: Right now, if a critically ill or injured child is rushed to Children's Hospital by helicopter, this is where the chopper often lands: in the middle ofa field about 1/2 a mile from the hospital. From here, the child has to be taken by ambulance, losing precious minutes before emergency care can be administered.

The hospital's been trying to get a helipad built up by its emergency room for almost a decade but some people around here have managed to keep that from happening.

Seems there are residents here in Laurelhurst who don't want to deal with the noise of helicopters that help provide children with the fastest medical attention. Rather than have their tranquility disturbed, people in the area have fought the hospital's efforts at every turn. At one point, residents objected to any and all medical flights overhead, but have now amended that to where they feel landings should be restricted to only the most serious emergency cases.

On the 23rd of this month, the City of Seattle will take public comment on the helipad issue. If all goes well, the city Council will take the issue under consideration later in the Summer.

Building the helipad has been stymied and stalled far too long. In situations where minutes, even seconds can literally mean the difference between life or death, a few moments of noise is a small price to pay.

If it were your child, what would you want the city to decide? Since it could be your child, you should let your feelings be known. I'm Ken Schram.

OFFICE OF
HEARING EXAMINER

Ms. Ruperta Alexis, Deputy Hearing Examiner
Room 1320, Alaska Building
618 Second Avenue, Seattle Wash. 98104

Dear Ms. Alexis,

We strongly urge that the heliport be denied or severely restricted. The items of concern are listed below:

1. We are extremely concerned about safety issues regarding the COH helipad. Coming into a helistop is not like coming into an airport runway where air/surface conditions are carefully monitored. Components could fail and the helicopter could fall on a house or school. Though such failures are rare, they can and do happen. Homes and families adjacent to COH and children at Laurelhurst Elementary are potentially at risk.

2. A number of times HELICOPTERS HAVE DESCENDED OFF THE PRESCRIBED FLIGHT PATTERN, above and very close to residential homes, including ours.

3. Of special concern are heavy weight helicopters. They HAVE serviced COH. Once a helistop has been approved, more of these flights can be expected, even though they are admittedly unplanned.

4. We are also worried about the possible future location of a helipad on one of the COH garages across the street from our home. We would have no objection to locating a helipad on one of the new buildings currently undergoing approval.

5. In conclusion: The growth plans of COH can do nothing but increase the number of flights, thereby exacerbating the danger to the surrounding neighborhood.

We request that you either deny or severely restrict construction of a permanent helipad. If you approve the helistop, at least impose a monitoring restriction, MONITORED BY SOMEONE OTHER THAN COH for compliance.

Sincerely,

Helen and David Belvin

Dear Gentleperson,

I am writing this letter to support Children's Hospital and Medical Center's request to build a helicopter landing pad outside their Emergency Department on the Laurelhurst campus.

Critically ill and injured children from our community are transferred by helicopter to Children's Hospital. Helicopter transport directly to Children's Hospital can be life saving in the most critical cases because it reduces transport time to the hospital and the number of times a patient must be moved.

To ensure the delivery of safe and adequate emergency medical services to children in the region, I urge your support of a helipad at Children's Hospital.

Sincerely,

Mitzi VandeWege
Assistant Administrator

6/23/92

My name is Marvin O. Christman, my home address is 4350 53rd NE, in the Laurelhurst community which is immediately adjacent to two plus sides of Childrens Hospital.

I am representing the eight story LAURELHURST WEST Condominium at 4545 Sandpoint Way NE having two and three bedroom homes, with 54 seperate families. This neighborhood residence has a DIRECT line of sight with the Hospital. As a condoninium owner there and a member of the Board of Directors I speak for them that we DO NOT want and adamantly oppose the building of and use of a HELIPORT AND PAD at Childrens Hospital.

Childrens Hospital was dedicated in the late '40's at which time and on many occasions since, the NE communities have been told, " This is a small building we are constructing and it will continue to enhance the neighboring communities with our services." Therefore, every year the facility continues to grow higher and wider with increases in traffic and congestion.

My earliest recollection of Helicopter landings at the Hospital is 1981 when my Mother moved into the Laurelon Terrace Condominium, immediately adjacent to the Hospital on the South Side. There are approximately 120 Units there, with many ownerships by retired Northeast citizens. At this time the noise and vibration caused by Helicopter landings, which we were told by the FAA and others to be illegal, but done in the interest to SAVE A LIFE, OCCURED on a regular 2-3 per month.

We knew, since my Mother being very hard of hearing, she would feel the vibration of the landing helicopter and many times she would ask me to replace her wall pictures that had fallen from the wall to the floor.

Additionally, on the North side of Childrens. home residences are immediately adjacent to the street, adjacent to their property line. There is very little open space to accomodate Childrens Hospital from the the surrounding neighborhood...especially during the night ..when landings are definately an intrusion to their privacy. The situation is almost to the point where the City will have to pay the close-by neighbors to move, as has happened at SEA-TAC Airport. This would not only reduce an excellent city tax base but lower the value of the rest of the NE homes affected by the Hospitals encroachment of quiet Airspace.

Over Please

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

This community, as one of Seattles finest residental communities deserves more.....we pay above average residental tax revenues.....we are proud of our homes, we tolerate the enlargement of the Hospital...even though we are constantly at odds with the Hospitals administration and the various City Officals.

We do not want to move or to have out residences de-valuated because of the dangers due to congestion, helicopter traffic or plant size facility in the center of our community homes.

For ten years the NE community has defended this position... no helicopter pad or landings at Childrens Hospital....and have had the support of City Officals and the present LAW. We sincerely request your continued consideration of our interests.

Dear Ms. Eychaner:

Thank you for showing me the documents from D.C.L.U. about the proposed heliport at Children's Hospital.

In general, I am concerned that use of air ambulances will be subject to overuse in the way many other technologies have been. It is partly an internal matter if C.H.M.C. wants to spend money on ineffective technology, but it is also a matter of concern for all taxpayers. One has only to look at the amount of uncompensated care given by C.H.M.C. to realize that the hospital also provides a lot of care paid for by the public. If C.H.M.C. can provide data that air transport is more cost-effective than ground trnasport, that would help ally concerns that the technology is being used inappropriately. I have previously suggested a randomized trial to the former director of the Seattle-King County Health Department, Dr. Bud Nicola. I doubt that a randomized trial will be done for political and logistical reasons.

The next alternative to determining cost-effectiveness would be a case-control study. This would be much cheaper and might give some useful information.

Beyond the medical considerations, there are of course political considerations. Namely, whose rights are more important, the neighborhoods' or the hospital's? I suspect that the final decision wil be more political than scientific, so I would like to offer some comments about the D.C.L.U. proposal.

The composition of the committee is heavily weighted towards vested interests. The Seattle-King County Health Department has strong ties with the University of Washington. Good academic policy, not necessarily good politics. Pediatricians will probably beinclined to sympathizsize with C.H.M.C. because they will think that they may need to use theair ambulance service for their own patients. Most local neonatologists and intensivists

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

trained at or have some ties with U.W. or C.H.M.C. I think that a committee that is asked to serve without compensation will be plagued by absences of its members. If C.H.M.C. is seeking a variance from public regulations, it is reasonable for them to pay for the privilege. This could be in the form of landing fees, just as commercial air carriers pay. These fees could be used to support the regulation, a common practice in public health. I find the proposed committee's role--advisory--to be almost risible. Whom shall they advise? If C.H.M.C. chooses to violate the restrictions, who is to enforce them? I find the dichotomous penaly (license/no license) to be impractical. This is analogous to the death penalty for a traffic violation. "Let the penalty suit the crime." Each infraction should be fined at a rate commensurate to the imposition on the community and the cost of investigating and prosecuting it. Penalties should be civil rather than criminal because the county prosecutor is unlikely to ever prosecute for such a petty criminal offense.

C.H.M.C. should be required to have navigational aids to the helicopter pilots.

The more incentives to discourage use of air transport, the better. This will reduce the need for external regulation. I do not mean that air transport should be unduly burdensome, but it should be used in a context of choice among alternatives. The current system encourages the use of air transport because there is profit for the carriers, good public relations for them and the hospital (except with the neighbors), and lacks penalites against abuses. The incentives should be such as to encourage use of ground transport.

All of this must also be viewed in the context of the hospital's long-range development plans. They have already shown a "stone soup" approach to land use restrictions ("We already have this much, so how about a little bit more.") They have plans for a major expansion of their Seattle campus and have bought a large tract in Issaquah, where they will again face a conflict between residential use and their own. I am willing to have my peace and quiet disturbed and safety threatened for truly important reasons, but I think that I deserve an explanation and some protection against abuse by neighboring institutions.

Sincerely,

Thomas A. Bell

Ladies and Gentleman:

I am a practicing pediatrician in the Olympia area and have been associated with Children's Hospital since 1975. Currently I am the chairman of the Department of Pediatrics at St. Peter Hospital in Olympia. Over the years I have had the opportunity to transfer some critically ill children to Children's Hospital. In emergency type situations when both time and level of care are critical to the survival of the patient, I have been somewhat frustrated by the fact that whomever I refer there, has to land first, usually at the local intramural field and then have to be transported to Children's via ambulance.

The time delay and sometimes even more importantly, the hassles to the patient and danger to the patient in changing modes of transportation can represent real risk to the health of the patient. Such risk would be obviated by a helistop at Children's Hospital from where the patient can be directly admitted to Children's Hospital. I think such a facility is a much needed one and would save both valuable time and obviate transport difficulties to the critically ill or injured patients that I refer to Children's Hospital.

Thus, I would support the construction of a helistop to provide adequate and safe delivery of emergency medical services to children in the region.

Sincerely,

Gentlemen:

This letter is written in support of Children's Hospital & Medical Center's requested permit for a helistop. From time to time critical newborn and pediatric patients from Valley Medical Center require emergency transportation, via helicopter, to Children's Hospital & Medical Center.

A child's life cannot be compromised due to lack of immediate aerial transportation.

Thank you for adding this letter to the others in support of the permit.

Sincerely,

Richard D. Roodman

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Other conditions discussed in the EIS analysis include prohibition of staff pickup at CHMC by helicopters, continuation of the quarterly public newsletter reporting on helicopter landings, establishing a regular training schedule to familiarize pilots with the specific characteristics of the helistops, and limiting landings at CHMC to helicopters no noisier than the Agusta 109.

These conditions, as set forth below, should be imposed based on Council authority under the conditional use provisions of the Land Use Code and on the City SEPA noise and transportation policies.

DECISION - SEPA

The Department concludes the Environmental Impact Statement for the CHMC helistop proposal adequately discloses and analyzes expected impacts from the proposal and from reasonable alternatives. The Department finds the proposal can be expected to result in significant adverse noise impacts which cannot be mitigated. However, the Department also finds that the benefits of the proposal, as defined in the Preferred Alternative, outweigh the adverse impacts. The Department recommends mitigation to the extent possible of noise and safety impacts as set forth in the Conditions section based on substantive authority found in sections 25.05.675 L and R, Noise and Transportation.

RECOMMENDATION - COUNCIL CONDITIONAL USE

The Department recommends the proposal for an emergency helistop at the Kitchen Garden site at CHMC and a second, full service helistop at the University of Washington IMA/Graves Field site be approved, with conditions to mitigate impacts to the public safety and welfare. The recommended conditions, based on Council authority to mitigate averse impacts including that set forth in the Land Use Code and the Noise and Transportation policies of Seattle's SEPA Ordinance, are set forth below.

RECOMMENDED CONDITIONS

1. Only the most critical and life-threatening medical emergencies shall be allowed to land at CHMC. All other patients shall land at the Intramural Activities field site. The initial decision whether to land at the Kitchen Garden site or the IMA field is to be made by the referring physician and/or attending medical team. For patients whose condition deteriorates in flight, the medical team on board

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the helicopter may decide to land at CHMC. The following conditions indicate a landing at CHMC is appropriate:

a. unstable airway;
b. inability to ventilate/oxygenate;
c. inability to maintain adequate cardiac output;
d. inability to maintain adequate cerebral bloodflow; or
e. the persistence of unstable vital signs despite heroic attempts to control them.

2. Military Assistance to Safety and Traffic (MAST)~~, Coast Guard, and Navy~~ **HUEY** helicopters shall not be permitted to land at CHMC, but shall land at the IMA field or at Harborview, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area. **Other helicopters, military or civilian, shall be permitted to land at CHMC only if they demonstrate a noise profile equal to or less than the Agusta 109 and meet FAA ~~noise~~ guidelines for the CHMC helipad.**

3. A Medical Review Committee shall be established to review compliance with Condition 1 above, allowing only the most critically ill patients to land at CHMC. The Committee shall consist of the following five members:

1) The Director of the Seattle-King County Department of Public Health, or the Director's appointee, who will serve as Committee chair;

2) A representative of CHMC selected by the Chief Executive Officer;

3) A physician representative of the Washington State Medical Association (WSMA), selected by the President of the Association. The representative must be a qualified neonatologist, pediatric intensivist, or pediatric emergency physician;

4) A physician representative of the Washington State Society of Pediatrics (WSSP), selected by the President of the Society. The representative must be a board certified pediatrician.

5) A citizen, residing in one of the neighborhoods in the area of CHMC, to be nominated by the Department of Neighborhoods and confirmed by the City Council.

Committee members will be appointed for terms not to exceed three years, with replacements to be made by the original appointing authority. The role of the Committee is advisory only. The Committee shall meet at least twice per year to review and evaluate helicopter transports to CHMC. The

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Committee shall submit a report after each review meeting to DCLU, the Chief Executive Officer of CHMC, the Airlift Northwest Executive Committee and Medical Director, and the Citizens' Advisory Committee for CHMC Master Plan. Committee members will receive no compensation or other remuneration for their service on the Committee. The Committee shall adopt rules and procedures as necessary to ensure compliance with laws and administrative rules governing confidentiality of patient medical records, while also providing for public input and review of the Committee's work.

CHMC shall provide administrative and staff support needed by the Committee. The necessity for, and performance of, the Committee shall be evaluated by DCLU after two years and a recommendation shall be made to the City Council regarding whether to continue, reorganize, or discontinue the Committee's work.

4. CHMC shall continue to report on a quarterly basis to the community regarding the number and nature of transports to the campus. The report shall also include the number of helicopter landings at the IMA/Graves Field site for the given quarter.

5. Helicopters shall not be allowed to land at CHMC to pick up medical staff prior to patient transport.

6. DCLU shall review the quarterly reports of CHMC and the reports of the Medical Review Committee. If it appears that inappropriate or non-medically necessary landings have occurred, DCLU shall work with CHMC, the Public Health Director, the Medical Review Committee and ALNW to revise guidelines or procedures to ensure compliance with the limited landings requirement stated in condition one (1). Failure to demonstrate clear improvement in implementation of the limited landings criteria may result in suspension of the permit for landings and shall be subject to enforcement action pursuant to Chapter 23.90 of the Land Use Code.

(7.) ~~Only helicopters with a four bladed rotor shall be permitted to land at the CHMC campus helistop.~~ Should Airlift Northwest or other aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Agusta 109 studied in the EIS, a showing must be made to DCLU proving the noise impacts of the alternative equipment are no greater than for the Agusta 109. **Technological features (twin engines, navigation equipment,etc) must equal or exceed the Agusta 109.** DCLU must give approval of the new equipment prior to its regular use for flights to CHMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

8. The flight paths for approach and departure to the CHMC and IMA/Graves Field helistops shall be strictly maintained as described in the Final EIS and shall to the greatest extent possible avoid residential areas. Airlift Northwest and any other regular carrier shall establish a training program to introduce all pilots to the approved flight paths. ALNW or other regular carrier shall confirm in writing to DCLU its commitment to the training program and to ensuring the approved flight paths are followed.

9. Prior to beginning regular use of the Kitchen Garden helistop, all ALNW pilots shall make at least one test landing and take-off at the site. CHMC and ALNW shall schedule the training/test flights for a weekday between the hours of noon and 3:00 p.m. Advance notice of at least ten days shall be given to the surrounding communities of the test/training time, date, and expected number of flights. The number of flights shall be held to the minimum necessary to provide adequate training.

10. New pilots shall make at least one landing at CHMC under supervision of a pilot experienced in landing at CHMC prior to unsupervised patient transport landings. Non-patient transport training flights, if desired, may be scheduled no more than twice per year without approval from DCLU. Notice shall be provided to surrounding communities as stated in Condition ~~10~~ 9.

To Whom It May Concern:

We strongly agree with the implementing of a permanent helipad at Children's Orthopedic Hospital. This will greatly help in providing needed, safe, emergency critical care service. Community Memorial Hospital would definitely use this service.

Sincerely,

Dennis K. Fopp

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

June 24, 1992

Ruperta Alexis
Deputy Hearing Examiner
Room 1320 Alaska Building
618 Second Avenue
Seattle, WA 98104

To the Hearing Examiner:

Gee, I never thought of myself as a baby killer or someone who would ask that a child's life be traded for my comfort. I'm the mother of 2 children who attend Laurelhurst Elementary. My husband are both teachers, my husband for 21 years and myself for 10 years. I'm writing this in response to some things I heard yesterday at the hearing and also because I just need to get some things off my chest.

Yesterday as I sat and listened to two mothers talk about the near deaths of their children, I felt very uneasy. These mothers either came on their own or were asked by CHMC to come before us, total strangers, and tell the gutrenching experiences of having a child near death and almost losing that child. I think it took alot of courage on their parts to do that. Both broke down and cried. Both wondered how anyone (meaning my neighbors and myself) could deny life to a child. They came here because of what they had heard from the hospital about us and fe.t obliged to support CHMC no matter how agonizing it was to retell their stories. When the neighborhood people began testimony, I started feeling very embarrassed for those mothers who had just testified. I'm sure it became very apparent to them that these families living around the hospital are people just like them, parents who are concerned about the safety and wellbeing of their children, parents who are asking, "Are there better alternatives to landing a helicopter at CHMC for everyone's safety, both the ill child's and and those living in the flight path. And if there aren't, how can the families around the hospital secure the safety of their own children and homes?" I just can't help but think that those two mothers who testified on behalf of CHMC, left yesterday feeling a little bit tricked and taken

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

advantage of by CHMC! They gave alot yesterday and it wasn't really necessary.

It was surprising and disheartening yesterday when 4 Laurelhurst residents came forward to testify in favor of CHMC. One of these residents is on the CHMC Master Plan Advisory Committee who meets twice monthly at the hospital to discuss the hospital's massive expansion plans. These meetings are open to the public. I have attended many. I have never seen the other 3 Laurelhurst residents. Just for the record, I have not seen one of those 3 at a Master Plan Advisory meeting. To understand what is happening in our neighborhood and how powerful and scary this hospital is, you have to attend these meetings. I'm a member of NEFREN, the North East Families for Residential Neighborhoods. None of these 3 people have ever approached us or asked to attend one of our meetings to find out what we're about or what the real issues are. These testimonies were purely reactionary.

When I ~~saw~~ Brian Basset's cartoon in the Sunday Seattle Times, it took ~~me~~ about 2 hours to get over it. In fact, it ruined a good part of our Father's Day breakfast. I live in Laurelhurst, so I guess that's me he's depicting. But, that's not the way I live or what my views represent. I called Brian Basset on Monday and asked what prompted him to draw such a cartoon. He said it was because of the hearing on Monday and he had been following this issue for 10 years, and he was in favor of the hospital. Following the issue, I think, means calling CHMC periodically to dind out what's going on. In this case, however, because of the timing, I think it's save to say CHMC contacted the Times. Gee, I wish Brian had phoned us too. Obviously he didn't. In Brian Basset's defense, however, I must say he's a very good listener. He did listen to me for about 10 minutes as I gave a side to the hospital's expansion I think he was totally unaware of.

This helipad is just a part of CHMC's plans for a 45% building expansion at the Laurelhurst site. Can you imagine an expansion that large? This huge institution, my neighbor across the street, keeps asking for more and more. They're asking for a rezoning. The 45% expansion they plan, I have no doubt will destroy my neighborhood as we know it. I think it's time the City of Seattle does some serious questioning and probing where this hospital is concerned. A good place to begin is with the helipad. CHMC has made promises to the community and broken them. CHMC says one thing and does another.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The recommendations made by Clark Sorenson yesterday represent the North East Families for Residential Neighborhoods of which I am a member. I ask that the Hearing Examiner take these recommendations into serious considerations. They are all legitimate recommendations that obviously have been given alot of thought. I want to refer specifically to the heliport being built only on the Kitchen Garden site. Since CHMC is asking for a zoning change on that site for future expansion, we need to guard against this institution once again "pulling the wool over our eyes". I also strongly recommend a review committee be formed to monitor CHMC's compliance and that this committee stay in place as stated by NEFREN.

Life in this neighborhood has become very stressful. I know that as long as I live in my home, I will be fighting this institution's never ending greed to be the biggesst and best no matter what the cost. I'm tired already. I will never get used to helpicopters flying over my home and landing across the street. I remember the first flight. I was terrified and thought to myself, "This is what Viet Nam must have sounded like." If I am forced to live with helicopters flying over my home at all hours, then let ~~it be~~ be it. But, I am asking the Hearing Examiner to please see us as a neighborhood who have rights too. We have tried time and again to be good neighbors to this hospital. We have tried to be understanding of their needs, but continue to be walked on. This institition is going to get its way, regardless of the cost to the community.* I am making a personal request and plea to you right now. I'm asking for your protection.

Sincerely,

Vicki Young

Ed Johnson
WA State Fire Fighters' Assoc.
P.O. Box 48253
Seattle, WA 98148-0253

Dear Mr. Johnson:

We need your help! Children's Hospital and Medical Center is seeking a permit from the City of Seattle to build a helicopter landing pad, or helistop, outside the Emergency Room on the Laurelhurst campus. City officials are nearing key decisions about our request. We are writing to ask for your support.

Since the early 1970's, some critically ill and injured children have required transport by helicopter to Children's Hospital in emergencies. Most requests for emergency helicopter transport of patients to Children's come from community hospitals and physicians in the Puget Sound area or Olympic Peninsula. Air transport by helicopter is one very important component of the regional emergency medical care response system. Complex surgical emergencies, overwhelming infections, and near drownings represent a few of the conditions where every moment lost increases the risk of death to a child.

In order to minimize the impacts of the community, only the most critically ill or injured patients land at Children's Other patients determined able to withstand delay and movement are landed at the University of Washington Intramural Field and are transported by ambulance to Children's. Please refer to the enclosed fact sheet for further information on the need for the helistop at Children's.

If you have reason to support the need for Children's to construct a helistop to ensure the adequate and safe delivery of emergency medical services to children in the region, <u>please write a letter of support and send it by June 23, 1992 to</u>:

I strongly oppose increased Helicopter flights to Children's Hospital.

I do not live in Laurelhurst. Laurel Crest Condominums are located west of Sand Point Way and 40th Avenue NE.

EVERY HELICOPTER GOING IN AND OUT OF CHILDREN'S HOSPITAL GOES DIRECTLY OVER THE ROOF OF MY BUILDING ON A DECENDING ROUTE. THERE ARE ELECTRIC LINES, PHONE LINES AND CABLE TV LINES ALL OVER THE PLACE. I FEEL THAT MY SAFETY AND THE SAFETY OF THE OTHER 12 OCCUPANTS OF THIS BUILDING IS BEING IGNORED. ARE WE WORTHLESS???? THERE HAVE BEEN SIX FATAL HELICOPTER CRASHES IN OUR AREA OF THE COUNTRY IN THE LAST YEAR.

WE ARE IN DANGER AND NOBODY CARES!!!!!!!

Sincerely,

Elizabeth Spaethe

B.C. helicopter crash kills one

Associated Press

BELLA COOLA, B.C. – One serviceman was killed when a military helicopter slammed into a mountain on the central British Columbia coast.

Nine others were injured.

The Labrador helicopter was taking part in a search Thursday for two missing hikers in mountains 25 miles southeast of Bella Coola, the Rescue Coordination Center said.

The dead man was identified as Cpl. Phil Young, 29, of Sydney, Nova Scotia.

The injured were taken to a hospital by a second helicopter involved in the search.

The crashed helicopter was from Canadian Forces Base Comox on Vancouver Island.

RE: Children's Hospital Helistop

Dear Sir;

I am writing to you to urge that Seattle allow Children's Hospital to build a helistop on the Hospital grounds. I live two blocks south of Children's Hospital and have a view of both the Hospital and the approach of any helicopter that comes from the west or south. The noise is minimal compared to the benefits of having quick access to medical care for very sick children. I have often watch helicopters make that run to the Hospital and have said a silent prayer for each child.

I frankly can't imagine living in a community where the noise of the helicopter would preclude quick and speedy medical care for anyone, let alone children.

I urge you to allow Children's Hospital to build their helistop. They are good neighbors and should be allowed to provide the best medical care possible for the community.

Sincerely yours,

Seattle WA 98104

Ladies and Gentleman:

I am a practicing pediatrician in the Olympia area and have been associated with Children's Hospital since 1975. Currently I am the chairman of the Department of Pediatrics at St. Peter Hospital in Olympia. Over the years I have had the opportunity to transfer some critically ill children to Children's Hospital. In emergency type situations when both time and level of care are critical to the survival of the patient, I have been somewhat frustrated by the fact that whomever I refer there, has to land first, usually at the local intramural field and then have to be transported to Children's via ambulance.

The time delay and sometimes even more importantly, the hassles to the patient and danger to the patient in changing modes of transportation can represent real risk to the health of the patient. Such risk would be obviated by a helistop at Children's Hospital from where the patient can be directly admitted to Children's Hospital. I think such a facility is a much needed one and would save both valuable time and obviate transport difficulties to the critically ill or injured patients that I refer to Children's Hospital.

Thus, I would support the construction of a helistop to provide adequate and safety delivery of emergency medical services to children in the region.

Sincerely,

This is written to urge you to permit Children's Hospital and Medical Center to construct a helicopter landing pad adjacent to the hospital emergency room for the purpose of transporting critically ill and injured children.

It is not often that we can take a concrete step toward preserving the lives of children. It would be a tragedy if one were life lost or one permanent injury sustained because of our failure to take this opportunity to act on behalf of children.

I encourage you to approve the permit application.

Seattle, WA 98105
June 21, 1992

To Whom It May Concern:

If you choose to live in an urban environment you accept the fact that silence will be broken by sirens, alarms, horns, traffic and airplane noise. If you choose to live near a public building such as a school, church or hospital you understand that noise and traffic will be part of your environment.

As a neighbor of Children's Hospital I see and hear the medical helicopters. They are not disturbing but rather reassuring. I know when I hear that sound that a child is being given the best emergency care possible.

Children's Hospital sends its neighbors a quarterly log of emergency flights to let us know why our silence was broken. When I read it I am amazed at the number of positive results arising from critical and often tragic situations. Without the helistop the results could be very different.

I ask you to approve the helistop to affirm the work of this hospital. No parent or child should have to live with an outcome that a few extra minutes could have altered.

Sincerely,
Elizabeth C. Wheeler

Re: Children's Hospital Helipad
Project Numbers: 8405870 and 9106441
Addresses: 4800 Sand Point Way and 2501 N. E. 45th Street.
CF Numbers 297288 and 298740

If a child's life or quality of life is dependent on getting to the hospital in the shortest possible amount of time, then that trip should take precedence over all else. The helicopter provides the quickest, safest and most efficient method of transport and should be permitted to land directly on the hospital site when such emergencies arise.

Although the helicopter is a noisy unit, the duration of this noise is about a minute to land, about the same to take off and considerably less as it passes above the neighborhood. These helicopters pass above our house from time to time en route to the hospital and represent a trivial, insignificant issue, bearing no concern whatever. One of my neighbors wasn't aware that the helicopters are flying over our area. I have noticed three in the past month, only because attention has been drawn to this issue. Although the people living next to, or very near the hospital are slightly more affected by the noise, this cannot be, or shouldn't be, any more than a minor annoyance to them. Three to five trips a month represents less than ten minutes of noise per month or about two minutes a week.

We urge you to approve this permit and place the most importance on saving a dying child's life. We'll happily live with the very small amount of noise attributed to this operation just knowing that it may mean the difference of a child's survival.

RE: Children's Hospital Helistop Hearings
Project # 9106441 # 9405870

To the Hearing Examiner and City Council:

Seattle has a well-established tradition of community input and involvement in public policy decisions.

This has served the City well in many instances.

However, we urge you to consider that well-organized opposition to a particular proposal, while it may represent the majority opinion of a particular community group or group of residents, does not necessarily represent the views of the majority of the total residents.

We own our residence at 4402 NE 50th St., located less than 1000 feet from the proposed Helipad. We have recently made extensive improvements to our house, and have every intention of remaining here for many years.

In our two years here, we have heard a number of helicopter landings at Children's. Earlier this very day, with our doors and windows all open, the noise from a landing made it impossible for us to carry on a conversation with guests --- for approximately ten to fifteen seconds. We found this to be an inconvenience. But, to put it in perspective, we find the helicopter noise to be an inconvenience:

- on a par with the frequent sounds of fire engine sirens coming down the hill on NE 55th St. or emergency vehicle sirens on Sandpoint Way.

- infinitely less disturbing that the screeching of the local crow population as they noisily rouse the neighborhood at the first light of dawn each morning.

It is interesting to consider the power that the phenomenon of "NIMBY-ism" and of the "we" (defenseless individuals) vs: "they" (a large institution) mindset has on people's reactions. While many individuals have gone to a great deal of effort to oppose the approval of this helicopter facility in spite of the nature of its service to other humans, it's interesting to note that:

- there is no discussion of limiting emergency vehicle sirens in this neighborhood. (We accept it as part of living in the "city".)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

- to our knowledge, no one is proposing to dispense of the crows. (We don't wish to even consider the ramifications of such a discussion)

We are committed to our community. We believe changes must be carefully considered, but choose to look forward to the potential benefits of those changes and accept a reasonable degree of personal inconvenience that may result.

We believe that Children's Hospital's heliport proposal, as conditioned and indicated in the Final Environmental Impact Statement (FEIS) has adequate safeguards on frequency and control of use such that we are willing to extend a level of trust to the Hospital to use the facilities within those guidlines.

Finally, we urge you to consider the good of the overall community — i.e. neighborhood, city, state and region — in this decision.

We urge you to approve this application.

To whom it may concern:

We have been notified that the Children's Orthopedic Hospital's (COH) helipad is the subject of a hearing scheduled for late June.

Our concern is that our accessibility to a skilled pediatric facility able to care for significantly compromised children will be severely limited. This in turn, will compromise the infant's survival.

Another factor which we hope will be considered is the extra expense to the family. We have heard much of the high cost of health care lately, a decision to close down the helipad would only serve to increase the cost of care for these infants and their families as well as their employers.

We wonder, if the people who have signed the complaints have stopped to consider whether the extra noise is worth the life of their own child, should their child be involved in a life threatening accident or medical situation in a rural area of this State. It is accepted knowledge, by the providers of emergency medical care, that there is an hour space of time in which survivability is enhanced, if a patient with critical injuries can be delivered to an appropriate medical facility. To re-route incoming helicopters to an airport, and then take the time and risk to transfer from vehicle to vehicle and care-taker to care-taker is absolutely unacceptable in a State which is praised for its care of critical patients.

Dear Sir:

I am writing this letter to you to indicate the support of General Hospital Medical Center, Everett for the application by Children's Hospital and Medical Center to build a helicopter landing pad adjacent to their emergency facilities.

Every day, ill and injured children are transported to hospitals throughout western Washington for emergency treatment. Although most of these children can be appropriately treated at these hospitals, the most critically ill or injured require transport to Children's Hospital and Medical Center, our region's only tertiary level facility dedicated to the treatment of children. Helicopter transport is sometimes the only alternative when time is critical, particularly given the increasing congestion on our freeways and roads.

It is unthinkable to deny the construction of the helistop at Children's Hospital and Medical Center. The noise or other inconvenience to the neighborhood due to a small number of helicopter landings is a very small "price" to pay compared to the documented benefits in saving the lives of children.

Many community hospitals in residential neighborhoods, such as our own, are equipped with helistops that are used in emergency situations by helicopters that bring search and rescue patients to our emergency department and helicopters that transport critically ill patients to Children's Hospital and Medical Center or other facilities. As the final recourse for many sick or injured children, it is appropriate that the helistop be approved for Children's Hospital and Medical Center.

I urge you to approve the helistop permit application submitted by Children's Hospital and Medical Center.

Sincerely,

DANIEL G PACE
Senior Vice President

14th and Colby, P.O. Box 1147, Everett, Washington 98206-1147, (206) 258-6300

This letter is being written on behalf of the Redmond Fire Department in support of Children's Hospital and Medical Center requesting a permit to build a helicopter landing pad, or helistop, outside the emergency room on the Laurelhurst campus.

We have seen the results gained by having Airlift Northwest transport our patients, i.e.: trauma, burn, and pediatric, etc., to Harborview Hospital and the specialized hospitals in the Seattle area. This service has proven to be a wonderful life saving benefit to the public. The approval and addition of another helistop will only improve this vital service which is provided to the public in the Puget Sound area.

Again, the Redmond Fire Department supports the helistop at Children's Hospital and recommends your approval.

Sincerely,

Randy Coggan
Fire Chief

To Whom It May Concern:

This letter is written in support of a request by Children's Hospital and Medical Center for a permit from the City of Seattle to build a helicopter landing pad outside the Emergency Department on the Laurelhurst campus.

Frequently, critical patients arrive at our facility in Everett and require transport to Children's Hospital. Because of the nature of their injuries and illnesses these transports are critical to the survival and well-being of the patients. We would like to support their request to build a helipad which would minimize the delays following helicopter transport from Everett to Seattle.

Thank you very much for your consideration of this request.

Sincerely,

Dear Sirs;

I am writing to urge you to grant a permit for Children's Hospital & Medical Center to build a helistop adjacent to the Emergency Room at its Laurelhurst site.

My interest in this matter stems from four facts: I am a neighbor; I do volunteer work in the Emergency Room at Children's; I am a member of the Master Plan Advisory Committee for Children's; and my wife and I, having reared three boys, are keenly aware of the importance of prompt top-quality medical care.

As a neighbor I am naturally concerned about the noise that a helicopter makes. My home is about a mile from the Hospital, and occasionally I am awakened at night when a Helicopter lands. However, my wife and I agree that this is a small price to pay when a human life is at stake. I realize that the noise level from a mile away is considerably less than from a block away, but the hospital can't be moved and a human life is not measured in decibels.

Working in the Emergency Room has made me cognizant of the need to improve the safety of the existing landing arrangement. I have witnessed several landings at which I was keenly aware of the shortcomings of the present temporary helistop. With all due respect to the skill of the pilots, the distance between the landing and the entrance to the Emergency Room is too short. The proposed location of the new helistop, while not perfect, is a considerable improvement.

I am aware that the helistop is not a part of the master plan for the hospital, but as a member of the Master Plan Advisory Committee I have been approached by neighbors who have expressed considerable concern about the safety and the noise impact of the helicopters. It is my belief that the delicate balance proposed among need, safety, noise, frequency of landings and mitigation efforts is a very rational approach to satisfy all the various interests.

Sincerely yours,

Ray Meuse

June 16, 1992

Attention Hearing Examiner:
City of Seattle
Dear Sir,

I am writing in support of a helicopter landing pad to be built outside the emergency room on the Laurelhurst campus.

Our five year old son, Gregory, became ill suddenly two days after Christmas of 91'. He couldn't breath and doctors thought he would go into Cardic arrest.

We live forty-five miles South of Seattle and had to drive that distance in all of the holiday traffic. I am very thankful that Gregory was flying in a helicopter avoiding mass traffic and getting quicker medical attention.

Please allow this Helistop to be built. Having our son flown directly to the wonderful medical staff at Children's saved his life, the outcome could have been much different - He could have been one of the 27% that died.

Save a life!
Build a Helistop right
at the Hospital.
Sincerly,
Karen Fuhl and Gregory

To Whom it May Concern:

The purpose of this letter is to support Children's Hospital and Medical Center's request for permission to build a helicopter landing pad.

Like other hospitals in the Seattle area as well as regionally, we depend on Children's to provide tertiary care for the Pediatric patients and high risk new borns we serve.

Transfers from our facilitate as others to Children's are primarily due to high risk illness or injuries. In these cases, time can be a critical factor in successful outcomes. For this reason, we endorse Children's proposed landing pad.

Gentlemen:

As the administrator of a community hospital 100 miles from Children's Hospital and Medical Center in Seattle, I am aware of the need to rapidly transport critically ill children to a tertiary care facility. St. Joseph Hospital does not have a Level III nursery nor pediatric intensive care and thus, transports critically ill children to Children's Hospital by helicopter. We do have a helipad adjacent to our facility and would like to know that these children could be taken directly to Children's Hospital when their recovery depends on a rapid arrival

St. Joseph Hospital supports the development of a helistop outside the emergency room of Children's Hospital to ensure our patients do not have any additional delay reaching tertiary care when they have a critical medical emergency.

Sincerely,

John Hayward

To Whom it concerns,

We wish to write and give our full support for the need to construct a helistop or landing pad to ensure the adequate and safe delivery of emergency medical service to children in the region. We are so very, very thankful that our baby was allowed to land directly at the hospital. The time difference that would have been lost had she been forced to land at the Intramural Field may have been just enough to save her little life and for that we are so thankful to the medical team who were allowed to make that critical decision.

Please grant Children's Hospital the permit needed to build this much needed landing pad outside the emergency room on the hospital campus. Where the safety of our children who are already at such tremendous risk is at stake, nothing should be barred from seeking to make it as safe as possible.

Sincerely,
Peggy Teffeteller &

Dear Sir:

I am writing this letter in support of the application by Children's Hospital & Medical Center for a permit to build a helipad at Children's Hospital. The need for this is paramount. As the Medical Director, for the last eight years, for MedFlight Aviation, an air medical program based at St. Joseph Hospital in Bellingham, Washington, we have had numerous occasions to fly critical children to Children's Hospital & Medical Center. During these flights it has often been necessary to land these critically ill patients at the soccer field numerous blocks away from the hospital. This then necessitates an additional transfer of the child to Shepard Ambulance, and then subsequent transfer to the Emergency Department. While on many occasions this may not be a detriment to the patient's care, in some it is. When life and death hang in the balance, time is the biggest enemy. In order to facilitate the saving of these children's lives, the many minutes lost in transferring the patient from the soccer field, to the ambulance, and then subsequently to the Emergency Department may make the difference between life and death. A helipad or helistop based directly at the Emergency Department would obviate this delay.

I appreciate the concerns that the neighbors have expressed, but having experienced those same concerns in Bellingham, we have been able to mutually agree on flight paths and usages that have been in the patients' best interest as well as the neighbors. I believe with the development of a helipad at Children's Hospital Emergency Department and with the development of appropriate flight paths and agreements, children can be safely brought to Children's without adversely affecting the neighborhood.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Remember, every one of us has the potential to become a user of these emergency care systems. It is very easy to say, "Not in my back yard," until it is our own child who is the one in need of the system. I think that this type of attitude needs to be taken by everyone involved in order to better serve the community. I, therefore, wish to go on record as formally recommending the development of a helipad at Children's Emergency Department.

If there is any additional information I could provide, or assistance, I would be happy to do so.

Thank you for your consideration of Children's request. I hope you will act favorably upon it.

Sincerely yours,

Marvin A. Wayne, M.D.

To Whom It May Concern:

I've been employed for the last sixteen (16) years as a Firefighter/Paramedic with the Shoreline Fire Department. For the last five (5) years I've functioned as the Medical Services Officer. It is with both a personal and professional interest that I am writing about the Helopad at Children's Orthopedic Hospital.

Without fail, events involving critical ill children put the greatest demands on the health care professionals working in Emergency Medical Service. The demand in individuals is both technical and emotional. Even more frustrating than the event itself can be the failure of the system to provide the greatest opportunity for a child to be saved. These events are tramatic enough without the added burden of knowing that something more which might have made the difference wasn't accomplished simply because some one person or group of persons, who must be isolated from the reality of such an event, is making a decision which is contrary to the best interest of our children.

Often an individual parent or relative does not know that the service being provided is more or less than what could have been done. However, the chain works backwards from those Health Care Professionals who render care and do know how the system can and should work. If I as an individual Paramedic in the field have confidence in the system and I display without reservation, that confidence to the other persons involved then everyone benefits from that more. However, when I know that less is being done that can be done, I'm certain that my frustration shows through from time to time. It is not a burden I wish or need to carry alone.

As Medical Services Officer for the Shoreline/Kenmore Paramedic Program and a King County Government employee, my job is to serve the needs of the citizens of Shoreline and Kenmore as well as the employees who provide this service on a day to day basis. As a government entity

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

you are tasked with the same responsibility, namely to provide service to the people. I believe the decision to allow a helopad at Children's Orthopedic Hospital serves the community and its children very well. I would be willing, if necessary, to provide first hand comments on particular children whom I have treated over the years. If I can provide any additional information or assistance to enable you to decide in favor of a helopad at Children's Orthopedic Hospital, please let me know.

Sincerely yours in service,

Captain Michael Koontz, Medical Services Officer

RE: Childrens Hospital/Medical Center
Permit for helicopter landing pad.

Dear Sir,

Being a referring physician to Childrens Orthopedic Hospital from far away, Port Townsend, we often need to helicopter emergency patients from our facility at Jefferson General Hospital to Childrens. This is especially true with sick newborns, certainly a rapid transport and the ability to land Childrens is extremely important. I certainly would favor the permit.

Sincerely,

John C Rowe M.D.

Frankly, I'm surprised to see that this issue is still kicking around unresolved. When the various attempts at government regulation of the health industry during the 70s and 80s were in vogue, this issue had come to the floor. It was opposed initially because the issues of the utility of helicopters for rapid patient transfer in the civilian environment had not been well established, and the issue was viewed by some as an element of medical grand standing. Obviously there are questions of environmental noise with respect to the surrounding community.

These issues need to be laid to rest. Over the years, helicopter transfer in civilian emergencies has been proved to be an essential part of medical care. Obviously, when the flight is of one of transfer over long distances and not of great urgency, then an alternative site such as the Edmonds pavilion field is desireable because of the lessened impact on the surrounding community. However, when the flights are utilized to save lives in terms of respiratory management or severe hemorrhage, or the necessity of offsetting the rapid effects of certain poisons, then time is of the essence, and the communities' noise considerations must be set aside. These are not very frequent, yet when they occur their urgency is overwhelming in terms of the need to deliver rapid care to a sick or injured child. To force a remote set down and then a land transfer under those circumstances makes no logical sense for saving lives. It is important that a tertiary treatment center of the stature of Children's Hospital and Medical Center have the ability for the true rapid emergency to have the patient delivered straight to the door of the hospital for the institution of the most rapid life saving therapies.

In contrast to testimony I gave on a similar discussion of this issue some 15 or more years ago, it is my current firm belief that the benefits to sick and injured children outweigh the invasion of helicopter noise upon the community in those few instances in which rapid transport is of the utmost necessity. I ask that you review this favorably and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

recommend that the helistop at Children's Hospital and Medical Center be permitted for use under true emergencies. This could be accomplished if necessary with a proviso that such thoughts be reviewed by a multi-disciplinary committee, such as the Seattle/King County Emergency Medical Services and Trauma Care Council.

While I am writing this letter as a private citizen, you need to know that my credentials in the emergency field span the entire development of emergency and pre-hospital emergency medicine since 1962. I have held official capacities both in the King County Medical Society, the Washington State Medical Association, and now the Governor's Committee on Trauma. I have participated in the writing of every piece of important emergency medical care legislation and the rule making that attends it since 1969. I do not make this recommendation lightly. I urge that you adopt a favorable stance with respect to Children's Hospital and Medical Center.

Respectfully submitted,

L. H. Pinkers, M.D., F.A.C.S.

Gentlemen:

A permit to build an helicopter landing pad outside the Emergency Room of Children's Hospital, should definitely be issued. The landing pad will make more expedient with greater safety those flights where critically ill children require a flight directly to the hospital.

Anybody near the path of a helicopter has a greater chance of being injured or killed by taking a bath or walking across the street, than by any kind of an helicopter accident.

Lawn mowers, blowers, edgers, tree sprayers, chain saws, traffic etcl, create higher noise levels, are of longer duration, and occur more often than the noise from a properly flown helicopter.

Neither of these concerns will have any effect whatsoever on property values.

Very truly yours,

R. L. Loesch

RE: Children's Hospital & Medical Center/Helicopter Landing Pads

RECEIVED BY
92 JUN -8 P 1:
OFFICE OF
HEARING EXAMINER

Dear Sirs:

On behalf of the King County Fire Commissioners Association, we would like to express our support for the building of a helicopter landing pad outside the emergency room at Children's Hospital Laurelhurst Campus and the improvements to the helistop located at the University of Washington Intramural Field.

After reviewing this issue, there is simply no compromise when this type of transport is necessary to save the critical time that is needed in life and death incidents or critically ill or injured children. And this time is saved only if the landing sites are strategically located next to an emergency room.

The compromise proposal that has been ironed out between the citizens of Laurelhurst and Children's Hospital to minimize the adverse effects of emergency helicopter transport addresses the community's concerns about noise, safety and frequency of flights yet still provides for the rapid transportation of critically ill or injured children. We feel strongly that this proposal will improve the level of critical care available to the children living or visiting in the Puget Sound area and Olympic Peninsula and increase their chances of survival. We highly support this proposal.

Members of the King County Fire Commissioners Association strongly urge you to approve the permit requests for these helistop sites.

We appreciate your careful consideration of this matter.

An Association of taxing districts dedicated to progress in fire prevention and life saving emergency medical service

Dear Hearing Examiner:

I am responding to the proposed helistop outside of the Emergency Room on the Laurelhurst campus of Children's Orthopedic Hospital.

As Chairman of the Board of Commissioners for King County Fire District Eleven, I would like to go on record stating our District is in full support of this project. As a department we handle over 3000 medical aid calls a year and are very much aware of how important seconds can be in critical cases - it can mean the difference between life and death.

Over the past few years this department has worked with AirLift Northwest and have seen first hand what a medically-trained staff and helicopter lifts and landings at different hospital sites can mean to the critically ill and injured. We feel the minimal environmental impact to the area will be far outweighed by the lives that will be saved by this proposed project.

We again are in full support of this landing site proposal and hope that this permit will be granted in the interest of Seattle and all of our surrounding areas for the purpose of savings lives.

Yours truly,

Jesse M. Anderson
Chairman

OFFICE OF
HEARING EXAMINER

June 3, 1992

Office of Hearing Examiner
City of Seattle
1320 Alaska Building
618 Second Avenue
Seattle, WA 98104

Dear Sir/Madame:

This is a letter of support for Children's Hospital and Medical Center's request for permit from the City of Seattle to build a helicopter landing pad outside the emergency room on the Laurelhurst campus.

Columbia Basin Hospital is a small rural acute care/long term care facility located in Ephrata, Washington. The hospital has had a helipad for the last 10 years and it is used approximately 2-3 times a week to transport adults and pediatric patients from Columbia Basin Hospital to hospitals in Spokane or Wenatchee. It is not uncommon for trauma or extremely critical patients to arrive in our hospital emergency room. Those patients are stabilized at the hospital and are transported to facilities that can best handle their care. We have a very good working relationship with the air transport services and without this helipad, we would not be able to offer the best possible health care services to the residents of this community and anyone who presents themselves to our hospital.

I strongly encourage you to grant the permit for Children's Hospital and Medical Center. Their reputation is unsurpassed in the Northwest and any avenue that can be used to save a child's life is invaluable. The children really are our future!

If you have any further questions about our helipad service at Columbia Basin Hospital, please feel free to contact me.

Sincerely,

James A. Diegel
Administrator/Superintendent

To Whom it May Concern:

I am a Pediatrician in Bellingham Washington. I transfer critically ill children from Bellingham to Children's Hospital and Medical Center approximately 6 times per year. These children need to have their transport accomplished as smoothly and as rapidly as possible. I believe that any child sick enough to transfer to a tertiary care center should be delivered directly to that tertiary care center without having to land elsewhere and be transferred into another emergency vehicle before being finally delivered to the referral center. Time is critical for these children. Transferring from one emergency vehicle, that is a helicopter, to a land based ambulance adds further time and stress that they can ill afford. I strongly urge you to approve the construction of a heli-stop to ensure adequate and safe delivery of my patients to Children's Hospital and Medical Center.

I would be happy to answer any questions that you may have for me about the type of patient's that I transfer and their need for direct transfer without the delay involved in a landing at Washington's Intramural Field. My phone number is 734-4302. Thank you, and again, I urge you to approve the construction of this heli-stop.

Sincerely yours,

David L. Johnson, M.D., FAAP

RE: Children's Hospital & Medical Center/Helicopter Landing Pads

Dear Sirs:

I am writing to express King County Fire Protection District #25's position of support for the building of a helicopter landing pad outside the emergency room at Children's Hospital Laurelhurst Campus and the improvements to the helistop located at the University of Washington Intramural Field.

The intended use of helicopter transports is for life threatening situations where time is essential to the child's survival. This critical time is saved only if the landing sites are strategically located next to an emergency room.

The compromise proposal that has been ironed out between the citizens of Laurelhurst and Children's Hospital to minimize the adverse effects of emergency helicopter transport addresses the community's concerns about noise, safety and frequency of flights yet still provides for the rapid transportation of critically ill or injured children. We feel strongly that this proposal will improve the level of critical care available to the children living or visiting in the Puget Sound area and Olympic Peninsula and increase their chances of survival.

King County Fire District #25 strongly urges you to approve the permit requests for these helistop sites.

We appreciate your careful consideration of this matter.

Sincerely,

KING COUNTY FIRE PROTECTION DISTRICT #25

Office of the Hearing Examiner
City of Seattle
1320 Alaska Building
618 Second Avenue
Seattle, Washington 98104

The Honorable Hearing Examiner:

I am writing to you on behalf of the Auburn Fire Department to urge your favorable consideration of the request of Children's Hospital and Medical Center to obtain a permit to build a helicopter pad outside the emergency room. The need for a improved landing surface and associated safety devices at Children's Hospital, goes far beyond the concept of simply landing a helicopter in a convient location. Such a facility would prove to be essential to the citizens of Seattle in a variety of situations.

The Auburn Fire Department has an F.A.A. approved heliport at our headquarters station in northeast Auburn. Since 1986, we have landed over six hundred aeromedical and helitack (fire fighting helicopters) flights without incident. A heliport has proved to be a far safer method of landing helicopters than the use of unimproved locations. In addition, heliports are a tremendous asset to city disaster plans...especially at hospital locations. In the event of an earthquake or several other types of disasters, it is not unreasonable to expect that the ground transportation system may be disrupted for up to 72 hours.

A fixed heliport, with known latitude and longitude, is accessible in marginal weather conditions and during night operations. Helicopters can translate the latitude and longitude to Uniform Mapping System coordinates which allow them to fly directly to the heliport. In addition, fixed facilities have some degree of built-in fire fighting protection in the unlikely event of a low impact helicopter accident. Further, security fencing precludes citizens

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

from entering the landing area.

The Auburn Fire Department is an emergency medical service provider agency and some of our children in the community end up at Children's hospital. As an emergency medical service provider and a strong advocate of aeromedical service, we urge you to also consider the necessity for this facility in terms of day-to-day emergency medical services. Ground transport of a severely injured child from Auburn to Children's Hospital, during rush hour, is simply not feasible or in the best interest of a critically injured child. The ground transport dilemma is shared by virtually all suburban cities that ring King County.

In conclusion, I would again indicate our most sincere recommendation that you permit Children's Hospital to develop either a heliport or helistop facility. Such a facility would be in the best interests of the citizens from Seattle, King County and many other portions of the state.

Respectfully,

Robert K. Johnson

92 JUN -8 PM 12:15
OFFICE OF
HEARING EXAMINER

June 4, 1992

Office of Hearing Examiner
City of Seattle
1320 Alaska Building
618 Second Avenue
Seattle, Washington 98014

To whom it may concern,

I have been asked to address an issue on behalf of CHILDREN'S HOSPITAL AND MEDICAL CENTER requesting my support in their quest for a helicopter landing pad on the medical campus of Children's Hospital.

To cut to the bottom line, I whole heartedly endorse the concept of a permanent helicopter site on the medical campus of Children's Hospital.

My professional background is in the emergency medical and fire services for 20 years. I am currently an emergency room Physicians Assistant for Group Health Cooperative, a certified Washington State Paramedic, Assistant Fire Chief for King County Fire District 10, and member of the Governors Steering Committee for EMS and Trauma representing the Washington State Association of Fire Chiefs.

In my working experience as an emergency health care manager and provider for those 20 years, I have come to the conclusion that there is a direct correlation with rapid transport of the critically sick and injured to the most appropriate facility and patient outcomes. In the case of children who are critically ill or injured it is my belief as a medical practitioner, and I believe I can speak for my colleagues in the field emergency and clinical setting, that the most appropriate place for these patients is Children's Hospital.

Helicopter technology is come a long way since Vietnam. As a Navy corpsman medevac crew member stationed with the US Marines in Vietnam, I realized the value of rapid airborne transportation to medical facilities for the people that came into my care as a result of hostile operations. We saved a lot of Marines and sailors who were critically wounded due to the rapid transport times afforded by helicopters.

175 N.W. NEWPORT WAY • ISSAQUAH, WA. 98027 • (206) 392-3433 • FAX (206) 391-8764

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Modern helicopter technology has developed a safer, faster and more capable piece of equipment that has the medical equipment, staff and flexibility to transport the critically sick and injured. Within the Puget Sound region including the City of Seattle environs, ground transportation is slow and with the increasing traffic congestion, unnecessary delay in arriving at the most appropriate hospital can affect patient outcomes. That is to say, the faster a patient can reach definitive care, the better off they will be.

The issue of care of sick and injured children is not limited to the King County/Seattle area. There is a bigger picture to consider. In the extended Greater Puget Sound area which includes Pierce, King, Thurston, Mason, Grays Harbor, Snohomish, Clallam, and Jefferson County's, ground (ambulance) transportation is measured in hours not minutes. With the use of the helicopters those hours are shortened to minutes.

I don't think that people in the Seattle area and surrounding Greater Puget Sound communities should settle for anything less than the opportunity for helicopter evacuation in those critical situations. Granted, helicopter technology has not developed a quieter piece of equipment but the occasional noise levels generated in the surrounding community is a small price to pay for an improved medical service.

Thank you for the opportunity to address this critical lifesaving issue and I anticipate a favorable ruling for Children's Hospital and Medical Center.

Our children's lives depend on it.

Warm regards,

John K. Murphy PA-C, EMT-P
Assistant Fire Chief

Dear Sir or Madam:

I am a Family Practice physician in Port Townsend, Washington. Our emergency room services a very large rural area. We have no pediatricians available in the vicinity, our closest pediatrician is over an hour away from us. We have found it mandatory to transport high risk new born infants by helicopter to Childrens Orthopedic Hospital numerous time over the past six years that I have been in this community.

I work as an emergency room physician as well, and often have called upon Airlift Northwest to transport critically ill children to Childrens Orthopedic Hospital. I feel this is a service which is absolutely mandatory for us to be able to care for our children.

Critically ill people, whether they are young or old, need to be transported as quickly and efficiently as possible when the need arises. I feel if the helicopter were unable to land at Childrens Orthopedic Hospital, and patients had to be transported by ambulance from a removed site, the patients would be placed at grave risk. Time is of the essence in most of our pediatric emergency cases, by multiple transfers the patient's ability to survive the transition is decreased.

I urge the community surrounding Childrens Orthopedic Hospital to reconsider its stand on the helicopter pad. Childrens Orthopedic Hospital has been a landmark in Seattle for many, many years, probably before most of the community surrounding it existed. I believe that the hospital and its inherent needs takes precedent over the community needs at this point, as Childrens services the whole of Western Washington and Alaska.

Thank you for your consideration.

Dear Hearing Office:

Cascade Valley Hospital of Arlington, Washington would like to go on record in favor of the Children's Hospital Medical Center's request for an on campus heliport.

We have high-risk infants and children which require tertiary level specialized care. Often this case is urgent and delay could result in disability or death.

The 5 to 10 minutes to offload from the chopper and load to an ambulance transport, off load the ambulance into the Emergency Room are minutes wasted if a heliport were unavailable on campus.

I know good city and facility planning can deal with appropriate safety and noise issues, but the most important goal of this issue is to expedite urgent care in the Hospital as soon as possible in a safe manner. With that goal, it is clear an on-campus heliport is vital.

Thank you for your consideration and support.

To Whom It May Concern,

The purpose of this letter is to strongly endorse the request of Children's Hospital and Medical Center to build a permanent helistop.

Children's serves a unique role within this greater community and region. They provide care for critically ill children that other hospitals, including Overlake Hospital Medical Center, cannot provide.

Having personally and professionally served in Emergency Medicine for over twenty years, I can attest that seconds count when treating a critically ill child.

I can understand the concerns of the local community relative to sound and safety, but I would hope they and the City can understand how important both Children's Hospital and air transportation are relative to improving the quality of life for all of us.

Your consideration is appreciated.

Sincerely,

Sanderson J. Jeghers

Dear Sir:

My letter is written to support the request of Children's Hospital and Medical Center for a permit to build a helistop outside the Emergency Room on their Laurelhurst campus. Our Pediatrics Department transfers patients to Children's Hospital at the rate of 4-6 children per year; some of these transfers are of critically ill or injured children and require helicopter transport and on-site landing at Children's in order to best assure the preservation of life.

Children's Hospital's proposed compromise plan to land only the most critically ill or injured children at the helistop should enable the continuation of the improving survival rates Children's has accomplished while not unduly impacting the surrounding Seattle community.

On behalf of Kennewick General Hospital and its Pediatric patients, I urge the City of Seattle to approve the construction of the helistop at Children's Hospital and Medical Center. The helistop is invaluable to the assurance of adequate and safe delivery of emergency medical services to children in our Pacific Northwest region.

Thank you,

Linda Garner

TO whom it may concern:

After endless protests I was most disheartened to find that Children's Hospital insists on having their own heliport on the hospital grounds. This helipad will cause Airlift Northwest to fly directly over the schoolyard at Jamestown Elementary School. Granting permission to do as will jeopardize the lives of 400 children every day to possibly save the life of one. Does this make any sense to you? The hospital already has a suitable landing pad on the IMA field 5 minutes away. Please send me a copy of the Hearing Examiner's Report.

RE: Children's Hospital and Medical Center Helistop Proposal

TO WHOM IT MAY CONCERN:

I would like to go on record as being strongly in favor of allowing Children's Hospital and Medical Center to establish a helistop on their campus immediately adjacent to their emergency room.

As a physician at an outlying community hospital, I have had numerous opportunities to refer critically ill and injured children and neonates to Children's Hospital for care. On many occasions, these infants or children are too ill to withstand any additional handling that might be required when landing at a facility distant from the Children's Hospital and requiring transferring to an ambulance.

As a referring physician and as a parent, it seems to be potentially tragic if a child should die simply because some neighbors do not want to be awoken by a helicopter in the night.

Sincerely,

Paul V. Williams, M. D.

Hello —

I am writing in support of maintaining the Heliport at Children's Orthopedic Hospital in Seattle. While I can sympathize with the neighborhood disruptions that must be occurring as a result of frequent flights, I feel the availability of direct flights to COH are vitally important. As an RN and Certified Nurse Midwife working in a Rural Hospital (Jefferson General, Port Townsend) I can attest to the fact that with an emergency transport of a newborn, minutes can be critical. I have personally done helicopter transports to UW with women in premature labor — on one occasion we made it to the athletic field where UW's helicopter landing site is located, only to have the woman deliver in the ambulance between landing & arrival at U.W. For newborns, such a delay could mean the difference between

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

survival & death, particularly if there are traffic delays. Please keep the heliport at COH!

thank you

Marty Garrish RN, CNM.

Norman G. Angelo, Fire Chief

June 2, 1992

Office of Hearing Examiner
City of Seattle
1320 Alaska Building
618 Second Avenue
Seattle WA 98104

Dear Hearing Examiner,

I am writing as the Fire Chief for City of Kent and King County Fire Protection District #37. It is my understanding that you are considering a request for a helicopter landing area for Children's Hospital. Our jurisdiction is projected to respond to over 10,000 alarms this year. Unfortunately a significant amount of these calls involve critical injuries and unique circumstances. In our business seconds not minutes are critical to life. Even if life and death are not the issue, it often can be the matter of being able to offer treatment by a medical person with specialized skills. That treatment often makes a critical difference in a persons wholeness and basic quality of life.

It seems that in South King County we experience more than our share of unusual traumas and accidents. Therefore our experience rate base is a little more frequent than others. We use many forms of transport, but only the most critical or unique situations are taken out by helicopter. It is not uncommon for our department to experience one to three (1 - 3) airlifts per week. I frequently listen to other fire departments that border us and they also use this same service frequently.

While there are many fine medical facilities, Children's Hospital is among the best in the ability to deal with critical and unusual injuries/situations that relate to young patients. Their focus on skills in treating patients in this area make them an invaluable asset to field emergency medical personnel.

I am not writing this letter to load your desk with paper to politically sway your decision. Rather, it is based on a strong personal and professional observation of: field emergency situations; the skills, quality and focus of Children's Hospital; and understanding the difference that their request could make in helping a young person live a life of reasonable quality. I would strongly urge you to consider support of their request.

To Whom it May Concern:

The purpose of this letter is to express our organization's support for the helistop proposal on the campus of Children's Hospital and Medical Center.

As an administrator with over twenty years experience in maternal and child care programs I have personal experience with the lifesaving benefits of direct hospital to hospital helicopter transport. Evergreen Hospital has a helistop on its campus approved within the Master Site Plan adopted by the City of Kirkland in 1990. As we all know in the Seattle area from our experience with the Medic I program, a few minutes of care can make a difference not only in saving a life but in the quality of that life which is saved. There simply is no substitute for a helistop at Children's Hospital.

Children's Hospital deserves recognition throughout the Northwest for the creation of a Medical Review Panel to monitor landings at the on-campus helistop. This panel will review the utilization of the on-campus helistop so that the appropriate criteria can be established and monitored to mitigate the disruption caused by the helicopter usage.

Airlift Northwest represents the finest example of cooperative health care planning to avoid the abuses of medical helicopter transport found in several other parts of the nation. Airlift Northwest can operate when medically needed without the inappropriate incentive of competing with other single hospital owned services. The cooperative development of Airlift Northwest assists the community in knowing that the service is used only when medically necessary.

Within a sense of community is the willingness to understand the needs of our neighbors. Residential communities and hospitals (even nationally recognized medical centers) live side by side. They grow from each others' strengths and have learned how to accept each others' strong characteristics. I believe the combination of safety and medical care criteria established for the use of the Children's Hospital helistop combined the best possible

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

criteria for success for both the hospital and the community in which it lives.

Your consideration of these observations is appreciated.

With best wishes,

Helistop

Project Number 8405870,

CF Number 297288,

Children's Hospital Emergency

Dear Hearing Examiner:

This letter is in response to your request for comments for the emergency helistop on the Children's Hospital and Medical Center (CHMC) campus.

First, here is my background concerning helicopter operations. As part of my work, I have spent about 300 hours as a passenger in helicopters. Most of this flying has been in Alaska and out over the adjacent pack ice. About half of this experience has flying from Coast Guard and NOAA ships, and half flying from land. My flying experience has been primarily in the Bell UH-1, JetRanger and Long Ranger, with some flight time in the French Alouette, and German Messerschmitt. My experience has given me the greatest respect for the capability and dangers of these machines.

I am also concerned about this request because I have two children, one of whom goes to Laurelhurst School and enjoys playing on the playground and at Laurelhurst park. My response is also colored by the recent death of Senator John Heinz whose helicopter crashed into a light plane over a crowded school yard, resulting in the death of all the passengers and several of the school children. The descriptions of the crash into the school yard were notable because the way in which some of the children panicked and were unable to get out of the way of falling wreckage.

For comparison with the proposed hospital landing site, let me describe some of the details involved in the landing and take-off of a helicopter from a ship. For example, when we would steam out of Kodiak or Seattle on a NOAA or Coast Guard vessel, we would also have the helicopter land on the ship after we had steamed several miles away from the port, to minimize damage to the port in case of a crash or fire. The procedure for landing is as follows: First, the decks would be cleared of all non-essential personnel, and smoking would be prohibited on the flight deck. Second, a fire fighting and personnel rescue team would be deployed adjacent to the flight deck in case of a crash or fire. Third, the ship would steam into the wind, so that the helicopter approach would be from the stern. Then a single officer serving as flight director would tell the helicopter when it was safe to land. A similar deployment scheme occurred during helicopter lift-offs. This whole sequence of safety regulations is designed to minimize damage to personnel, the ship, or helicopter. I would like to see evidence that CHMC will follow similar or equivalent safety precautions.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I am also very concerned that CHMC is in process of preparing its Fifteen Year Master Plan, which suggests that CHMC will grow in both height and density. The plan implies a new height of 105 feet, which suggests that the helicopters may be forced to land in the middle of a construction site, or a set of high-rises. For example, my office is adjacent to the University Hospital construction site. For the past six months, the site has been characterized by the presence of a tall crane with its attendant cables moving material about the site, and power shovels and bulldozers stirring up dust. The changing skyline represented by new construction will make it very difficult and unsafe for a helicopter to land.

Given these concerns, and the additional concern that CHMC is a crowded urban campus with the only two immediate alternate landing sites of the Laurelhurst School playground and the Laurelhurst Park being frequently heavily populated by children, I feel that Children's request deserves considerable scrutiny and oversight.

First, I support the establishment of an independent oversight and review committee.

Second, I recommend that a landing path be assigned that will avoid the Laurelhurst Elementary School and the Laurelhurst Park.

Third, I ask that the permit only apply for the present location of the helistop, and that if a new location is desired, the permit process be re-opened.

Fourth, I recommend in the event of new construction being approved for CHMC, that the permit process be reopened, at least to the oversight and review committee, so that changes in the flight plan can be evaluated.

Sincerely yours,

Seelye Martin

Dear Sirs:

I am writing this letter in support of the Children's Hospital and Medical Center request for permit to build a helistop outside their Emergency Room on the Laurelhurst Campus.

It seems to me that the number of children at risk (no matter how few) without such an emergency interventive measure is reason enough. Additionally, it appears that the hospital officials have done what could be done to be sensitive to neighboring community concerns. It seems the value of saved lives and reduced trauma to children and their families is far greater than possible noise or aesthetic effects. AS a concerned citizen and a professional in the child welfare arena I urge your reconsideration of the Children's permit to build this helistop.

Thank you for your attention to this matter. I trust you will make the right decision for the best possible service to our city's children.

Dear Sir,

I am a pediatrician in Bellingham, Washington, and deal with very critically ill children from time to time. Over the years the assistance that I have received from the physicians at Children's Hospital has been greatly enhanced by having helicopter service between Bellingham and the Children's Hospital available. I would strongly encourage you to greatly facilitate the care of these critically ill children by granting the request to have a helistop immediately at the emergency room of the Children's Hospital in Laurelhurst. The availability of such a facility may make a significant difference in the recovery and useful life of critically ill patients that we deem necessary for tertiary care at a hospital such as Children's is.

Thank you very much for considering this in your decision regarding thehelistop for Children's Hospital.

Sincerely,

RE: Meadowbrook Expansion Application

Dear Hearing Examiner:

I am in support of the planned 34 bed addition to the Meadowbrook Nursing and Convalescent Center. As a practicing physician in Seattle, and caring for residents at Meadowbrook Center, I can attest to the fact that these beds are sorely needed.

I remember the first time I went to Meadowbrook and was impressed with the way it blended in to the surrounding community. It was difficult for me to find it the first time because it looks more like a large home from the front than a nursing center.

With the sensitivity that the Sternberg's have demonstrated to the surrounding neighbors by modifying their plan to preserve the beauty and the privacy of the grounds, I feel that there should be a zoning variance given to allow the addition of these beds. The Sternberg's have maintained a consistently high quality of care for my patient's at Meadowbrook, and I feel that they should be allowed to expand their services to a level where they can maintain quality while providing maximal efficiency of this community resource.

Sincerely yours,

Kenneth B. Lauren, M.D.

Re: Helistop Proposal/Childrens Hospital

Ladies/Gentlemen:

As you near key decisions about Childrens Hospital's request for an onsite helipad, I am writing this letter to support the need for Children's to construct a helistop to ensure the adequate and safe delivery of emergency medical services to children in the region. I am appalled at the squeaky wheels of bureaucracy which has taken eight years and has yet to decide on this issue.

Lake Chelan is an isolated rural family resort area, over three hours drive from Seattle. Over the years, we have had critically ill and injured children requiring emergency air transport to specialized medical centers, such as Childrens Hospital. Air transport, to a rural community which Lake Chelan Community Hospital serves, is one very important and significant component of the regional medical care response system.

Immediate air transport, during the golden hour immediately following an accident or trauma, can be life saving in the most critical cases. Why? Because complex and emergency surgeries, overwhelming infections, and near drownings represent typical conditions in rural Lake Chelan area where every moment lost increases the risk of death to a child.

For these and other commonsensical reasons, we urge you to act promptly and favorably on Childrens' request for a permit to build a helicopter pad, outside its' emergency room. I do hope, for our sake for the sake of our children, that the wheels of bureaucracy will churn a lot faster than they have been.

Sincerely,

Moe Chaudry
Hospital Administrator

Gentlemen,

I have recently become aware that Children's Hospital and Medical Center has before you an application to permit a helistop near the emergency room on their Laurelhurst Campus.

Many times helicopter transport is absolutely critical in the health care of children suffering from trauma or serious illness. Upon occassion, helicopter transport is necessitated because of traffic or weather conditions even from as close in as our area here in Kenmore. It would be unfortunate if this necessary and important method of transport in King County were not allowed to happen due to some interference for the neighborhood. We need to remember that similar to emergency apparatus with their noisy siren that sometimes bothers us, each of these bothersome incidents is an occasion where someone is in a serious life threatening situation.

The purpose of this letter is to support Children's Hospitals attempt to obtain approval for their helicopter landing pad. Thank you for your consideration.

Sincerely,

Fred Baker

Re: HELISTOP - CHILDREN'S HOSPITAL

Dear Ms. Getches:

It has come to my attention that your office is about to review the request for location of a helistop at Children's Hospital and Medical Center. I understand that Children's has a history of receiving children to the hospital by means of helicopter.

I am writing to urge you to cast an affirmative decision, enabling Children's to develop a helicopter landing site which will be used to bring in only the most critically ill or injured children. While it is true that communities such as Mercer Island may have little direct use of such a capability; I think there are strong grounds for supporting this effort for use, not only by more remote Puget Sound and Olympia Peninsula residents, but also for the potential use of any child who is away from this urban core at camp or other recreational activities.

Printed on Recycled Paper

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's has a history of being a good neighbor. Skilled medical professionals who make these helicopter runs will make the essential decision about landing site choice. The Children's site will be maintained only for critical patients, reducing the time until they receive treatment. I support a position which increases the chances for these children.

Thank you for considering this information.

To whom it May Concern;

While the Childrens Hospital serves an important purpose, its location surrounded by single family residences poses some problems. I am very concerned about the granting of a conditional use permit to Childrens to use their grounds as an emergency Heliport. This entails —

① Added very loud noise which is aggravating
② Flights (low) over my home, which is dangerous

Please do not grant this permit. Have them set up pediatric emergency at UW or Harborview, instead.

Dear Hearing Examiner:

I am writing in support of the request of Children's Hospital and Medical Center to obtain a permit from the City of Seattle to build a helicopter landing pad outside the Emergency Room on the Laurelhurst campus.

Children's Hospital has done more than its share of compromising to meet any adverse environmental concerns of the surrounding neighborhood. The primary concern of the City should be the safety and lives of our children. Helicopter transport directly to Children's Hospital can mean the difference between life and death because it reduces transport time to the Hospital and the number of times a patient must be moved.

As Director of Fair Budget Action Campaign, I am deeply concerned about issues affecting children in Washington state. I strongly support the request of Children's Hospital and Medical Center. As a resident in the surrounding neighborhood, I feel that the benefits to the potential children and families involved far outweigh any perceived inconvenience to the neighborhood.

Sincerely,

Kathy Morefield

Re: Children's Hospital & Medical Center

Dear Hearing Examiner:

I understand you are currently taking comments on a permit application by Children's Hospital and Medical Center ("Children's") for construction of a helicopter landing pad or helistop outside the emergency room at Children's Laurelhurst campus. I am submitting this letter in support of Children's permit application.

My wife and I are residents of the Hawthorne Hills neighborhood and live in close proximity to Children's. We have always viewed Children's as an extremely valuable asset of the greater Seattle area and have considered ourselves fortunate to live near Children's.

We understand the helistop would be limited to use for transportation of only the most critically ill or injured children. We also understand that Children's has agreed to other mitigation measures to minimize the impact on the surrounding neighborhoods. Thus limited we view a helistop as a logical, important and necessary facility to enable Children's to continue to provide care for children of our area. We frankly are dismayed that residents of Laurelhurst or other surrounding neighborhoods would oppose the heliport. We view such opposition to be simply selfish and short-sighted.

I believe the majority of Hawthorne Hills' residents also support the helistop application. I am the Past President and a present trustee of the Hawthorne Hills Community Club. When this matter came up at our last meeting, the Board of Trustees was unanimous in its support of Children's helipad application.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Therefore, on behalf of my family and the Hawthorne Hills Community Club, I urge you to approve Children's helistop application.

Very truly yours,

Douglas E. Wheeler

I am writing in support of a helicopter landing pad located on the Laurelhurst Campus of Children's Hospital and Medical Center.

Direct air ambulance service to tertiary care facilities such as Children's Hospital and Medical Center is a critical component of the emergency medical response system in Western Washington.

Under the best conditions, round trip air transport time for critically ill or injured children from Forks Community Hospital is already several hours. A helicopter landing pad will reduce the time between stabilization of the patient in Forks and initiation of treatment at Children's Hospital.

I urge the City of Seattle to consider the regional impact of this issue and grant a permit to Children's Hospital for this important service.

Thank you.

RE: Children's Hospital & Medical Center
Helicopter Landing Pad

To Whom It May Concern:

I am writing in support of the application by Children's Hospital & Medical Center to build a helicopter landing pad, a helistop, near the emergency room of the Children's Hospital campus. As a regional referral center for North Central Washington, Central Washington Hospital is a periodic user of emergency helicopter transport to Children's Hospital. It is unconscionable to allow children to be landed elsewhere and then additionally be transported to the Children's facility for lack of a helipad. I can understand the concern of neighbors near the Children's Hospital, however, the additional trauma and precious time lost to the children is a catastrophic event, not a momentary unpleasantry caused by an increase in decibel level.

It is my understanding three to five of these children will require landing at the helistop at Children's each month. This is such a small inconvenience for such an enormous benefit and advantage to children, I would urge your approval of the Children's permit request. Children's has provided me with a considerable list of facts in brief that describe their efforts to mitigate the effects of their proposal. As I read them I am struck by how hard Children's is working to recognize the inconvenience to the neighborhood while advocating for our children whom they serve. I trust what is a sensible proposal at face not become an interminable debate that reflects badly on the community of Seattle who I know cares far more about our children than the few in the neighborhood opposing this plan.

Dear Hearing Examiners:

I write as a resident of Laurelhurst in strong support of the proposal that Children's Hospital Medical Center obtain a permit to build a helicopter landing pad outside the emergency room on the Laurelhurst campus. Although our home is only about four blocks from the hospital (4416 54th Avenue N.E.), the impact of helicopter activity at Children's Hospital on the neighborhood is trivial to non-existent. The possibility that this degree of disruption would cause any significant delay in constructing this important and necessary medical facility is not understandable to me. The quality of the services provided as a consequence of this should far outweigh any considerations related to impact on the community in a situation where such impact is so negligible.

Again, I join what I hope are the majority of my neighbors in providing strong support for the proposal of Children's Hospital to build a helicopter landing pad outside of the emergency room.

I appreciate you attention to this matter.

To Whom It May Concern,

I am writing to express my support for the approval of a permit for Children's Hospital and Medical Center to build a helicopter landing pad outside the Emergency Room on Laurelhurst Campus.

Periodically we are faced with the need to transport children to larger facilities when their well-being demands care beyond our scope. These situations are often life threatening and every second saved improves the child's chances. Considering the twenty-minute flight from our rural community to Seattle, the ability to land directly outside the emergency room could be crucial to their survival.

I urge you to support this request for a helistop. If I can be of further assistance, please contact me.

Regards,

Dear Sirs:

Dayton General Hospital is a small general hospital located in Rural S.E. Washington. Our medical staff consist primarily of Family Practice Physicians. Because of our rural location we find ourselves frequently needing the services of helicopter transport to larger medical facilities. The addition of a heliport has greatly improved our ability to provide a greater level of safety services for our area.

We sincerely support the need to construct a helistop for Children's Hospital & Medical Center.

TO WHOM IT MAY CONCERN:

This letter is written in support of the application of Children's Hospital to construct an on-site helistop to facilitate the safe delivery of critically ill and injured children to their facility. Children's Hospital is the facility of choice to receive such patients since they are dedicated solely to the care of children. They are an invaluable resource to the City of Seattle and the entire State. Children's Hospital, and certainly their small patients, deserve favorable consideration of their proposal.

As a rural hospital administrator, and a member of the steering committee which is attempting to improve trauma care for the State of Washington, I can attest to the often life saving potential of rapid and efficient helicopter transportation of the injured. It is frankly inconceivable to me that the minor noise created by an occasional helicopter landing could be regarded as more significant than the potential for saving even one child's life.

It appears to me that Children's has made every reasonable effort to address the concerns of the opponents of the project. I might add that our heliport, adjacent to the hospital, is located in a residential area, but is regarded by our neighbors and the entire community as a valuable and necessary community asset, well worth the inconvenience of a little noise from time to time.

Please give Children's proposal your favorable consideration!

Sincerely,

MERLIN L. TRAYLOR, ADMINISTRATOR

Dear Sir/Madam,

We are writing to you in regard to Children's Hospital and Medical Center proposed plan to build an on-site helistop on their campus at 4800 Sandpoint Way N.E.

We feel it is extremely unsafe to have aircraft activity over thickly populated residential areas such as those surrounding CHMC. This particular area has many condos, apartment complexes, private homes, two schools, a community center, playground and a hospital full of sick children.

We believe the CHMC facilities at Harborview Medical Center should be expanded to include a CHMC trauma unit in conjunction with the present Harborview trauma center for adults and children. A regional trauma center would be ideal. This should eliminate the necessity of impacting many neighborhoods in the city with requests for individual on site hospital helistops.

We further believe the University and CHMC could successfully develop a helistop at the U of W Intermural Field where helicopters have been landing for years. This area can be reached over open space and is only minutes away from CHMC and the U of W Hospital.

Thank you for your consideration in this matter,

Yours truly

Fred M. Wright Patricia O. Wright

We would like to receive a notice of the Hearing Examiner's recommencation.

May 22, 1992

Dear Sir:

I hear airplanes fly over my house all day and nite. I dont complain. These planes are not for emergencies. I for one would be happy to know I played a part in letting a helicopter land outside the Emergency Roomdoor if only one life was saved out of a hundred landings.

I think it is a crime that the U. of W. Intramural Field has to be used.

The people living so close dont want the noise. If their kids had to be pickedup by a helicopter to rush to a hospital in Tacoma, they wouldn't care if it landed in their front yard— or how much noise it made.

Please issue the needed permit. Some day it could be used for a child of some one you know and love.

Yours
Costa A. Lazzaretti.

My husband has expressed both our feelings so beautifully, I can only add my signature.

Sincerely,
Carol Ann Lazzaretti

Children's Orthopedic Hospital (COH) Shakes, Rattles and Rolls its Neighbors in Laurelhurst.

Gentlemen: May 26, 1992.

I live directly across the street for the COH parking garage.

We have been increasingly harassed by the sound of low-flying helicopters, the senseless abuse of ambulance sirens, false alarms from parked cars with faulty security systems, and frequent accidents as automobiles attempt to access Sand Point Way from N.E. 50th Street due to increased traffic congestion.

Thousands of neighborhood parents and children would be safer and better served if the hospital closed down its helipad and relied on the helipad located near by at the U/W playfield, or the pad at Harborview Hospital.

No persuaive evidence has been offered us to demonstrate the need for a helipad in our immediate neighborhood, and expert opinion opposing COH's helipad, recorded at earlier hearings, does not appear in the Environmental Impact Study!

There was a time when we supported COH by volunteering time and purchasing greeting cards. However, in recent years, the administration of COH has become too powerful, too greedy, and too insensitive to warrant the support of its neighbors.

Instead of voting to <u>expand</u> COH's existing helipad and garage facilities, my recommendation is that COH abandon it and make better use of the nearby pad on the U/W playfield and the pad at Harborview. Furthermore, that COH levy stiff penalties on owners of faulty security systems, that the City of Seattle enforce noise polution ordinances against ambulance companies and that a stoplight be installed at the corner of Sand Point Way and N.E. 50th Street before someone is killed.

Sincerely yours,

Re: Support for Children's Hospital Rezone & Heliport at Children's Hospital

Over fifty years ago our youngest son, John, then 2½ years old became ill and our Dr. Ruby asked us to call Dr. LeCocq. He came and called Children's Hospital at once asking specifically for certain nurses and anesthetic for an operation. It was streptococcal mastoiditis often Meningitis and for which most children did not recover. After an operation and then a second operation John recovered. We knew the agony of parents with a sick child in danger and the gratitude we have for his delivery. Penicillin had not yet appeared. Even though the diagnosis came a little late there was still a long period of recovery.

We learned that astoyglitis often was diagnosed as otitis because it was, during World War I, 95% fatal.

When I think that any child should be delayed

Dear Sir:

Whidbey General Hospital has followed, with great interest, the permit process that Children's Hospital and Medical Center has gone through to build a helicopter landing pad on their campus. We have supported their efforts over the past eight years.

On many occasions each year we count on the assistance of the regional air ambulance service to transport critically ill or injured children from Whidbey General Hospital to Children's Hospital. These are life saving decisions. To not have the ability to land the helicopter on the Children's Campus makes no sense.

We wholeheartedly support the need for Children's Hospital to construct a helistop on their campus to ensure the adequate and safe delivery of emergency medical services to the children of our region.

Sincerely,

Subject: Helicopter Landing Pad at
Children Orthopedic Hospital
at 4800 Sandpoint Way

It makes me very disillusioned that there would be any question about building a helicopter Landing Pad at Childrens Hospital for critically ill patients.

There is no excuse for not allowing the pad. It's life or death for kids!

The only possible objection is that some Laurelhurst (I am one but do not agree with my neighbors who oppose the pad)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that they don't want the noise and they cry 'unsafe for helicopter'. Basically they simply don't want the pad in their neighborhood.

Kid's life is more important than the little bit of noise the helicopter makes. If I hear a helicopter taking a Kid to COH, I just think "I hope they make it".

Anyone opposing the pad has no comprehension of what it's like to have a Kid in a critical medical condition. Every opponent of the pad would be outraged if they had a sick Kid and didn't get the quickest most expert care for their Kid.

Build the pad. I welcome it. Laurelhurst resident, mother and teacher. Augusta N. Howe.

Dear Sir:

I, an individual, totally object to a helistop on the campus of Children's Hospital & Medical Center (CHMC). I live nearby. Each flight in and out makes a low-flying turn right over my roof. The whole house vibrates. The dishes clink. My nerves are shattered. I never know whether the plane will make the turn or crash (this any time during day or night).

Our lives are endangered, our health is endangered, our property is at risk.

I find it completely unnecessary to have two helistops within a mile location. The University of Washington intramural field is adequate and accessible in open space whereas the CHMC campus is surrounded by residential areas.

We the taxpayers have not been given fair consideration. Our rights to a safe neighborhood have been totally disregarded.

Please stop this helistop plan and construction on the campus of CHMC. Thank you.

Sincerely,

Helen Newman

RE: Proposed Helipad at Children's Hospital

Dear Hearings Examiner,

I am writing to offer my unqualified support for the helipad at Children's Hospital, and to express my dismay at the length of time this has taken. Is there a reasonable explanation for this lengthy process?

I have been a resident of the Laurelhurst community for nearly six years, part of that time living in an apartment adjacent to Children's Hospital. I am not connected with the hospital in any way other than being a neighbor. I do not have children.

The noise is barely more that that of the crowds at the stadium when the Husky's score a touchdown. The danger is far less that attempting to enter traffic on Sandpoint from 50th Street at rush hour.

It is inconceivable that anyone could object to the noise of the chopper and not also object to the noise of fire engines responding to an emergency, yet I do not see any organized resistance to the sirens.

Let's get on with this process. The longer we wait the more expensive the construction will be and the more my insurance rates will increase to cover hospital costs.

Cordially,

Richard L. Mehrer

Sirs:

We are in support of Children's Hospital and Medical Center's attempt to build a helicopter landing pad outside the emergency room on its Laurelhurst campus.

We live at the Laurelon Terrace Comdiminium, a complex of townhouses, whose eastern boundry abuts the hospital grounds. The helicopters fly right over us, and the noise is very little bother in comparison to the great importance of saving young lives.

We encourage you to issue the necessary permits to build the landing pad to Chldren's Hospital.

Sincerely,

Mr. & Mrs. O.L. Almquist, Jr.

Dear Sir:

I am writing in support of granting a permit from the City of Seattle to Children's Hospital and Memorial Center to build a helicopter landing pad outside the emergency room on their Laurelhurst campus.

I am a family physician in Silverdale, WA, and use Children's Hospital as a referral and consultation source. In my nine years of practice in this community, I have seen a number of children from our area require emergency therapy at Children's Hospital. On occasion, these children are so critically ill or injured that they require immediate evaluation at Children's Hospital, and helicopter transportation may be lifesaving.

It is my understanding that helicopters are already landing at Children's Hospital outside the emergency room, and the request is to build a helicopter landing pad or helistop to improve safety.

Please closely evaluate this situation, and if you agree, then grant permission for building such a helistop.

Sincerely,

Carol A. Pierce, M.D.

Dear Sir:

I am writing in support of the helicopter landing pad at Children's Hospital and Medical Center. This ongoing controversy has intrigued me as it reflects on human behavior. Specifically, how could anyone not get a warm feeling knowing that some ill child is being rushed to medical care when they hear the helicopter. Unnecessary noise can and should be irritating to a neighborhood. But this is hardly unnecessary. During my training in Pediatrics at that hospital I lived in the Laurelhurst neighborhood for a year and enjoyed the neighbors and the neighborhood in general. I think the neighbors basically don't understand the importance of this service. Having that hospital, the premier children's referral hospital for the Northwest United States, even with its noise, should fill the Laurelhurst neighbors with pride. And I'm sure it does for most of the neighbors.

Practicing Pediatrics in a rural area (Port Angeles), I depend upon Children's Hospital to receive our critically ill children for tertiary care, which is not available on the Olympic Peninsula. The transfers are generally made by Airlift Northwest helicopters. Sometimes the patients are so ill that even a few minutes can make a difference. Sometimes the children die en route. Even though this is the exception, I appreciate the more critical cases being able to land directly at Children's Hospital. I further suspect that even the complaining neighbors would want their children/grandchildren to be given this courtesy, too.

Sincerely,

James E. Mantooth MD

RE: Children's Hospital and Medical Center Helistop Proposal

TO WHOM IT MAY CONCERN:

I would like to go on record as being strongly in favor of allowing Children's Hospital and Medical Center to establish a helistop on their campus immediately adjacent to their emergency room.

As a physician at an outlying community hospital, I have had numerous opportunities to refer critically ill and injured children and neonates to Children's Hospital for care. On many occasions, these infants or children are too ill to withstand any additional handling that might be required when landing at a facility distant from the Children's Hospital and requiring transferring to an ambulance.

As a referring physician and as a parent, it seems to be potentially tragic if a child should die simply because some neighbors do not want to be awoken by a helicopter in the night.

Sincerely,

Paul Williams MD

RE: Helicopter landing pad located at Children's Hospital and Medical Center

To Whom It May Concern:

This is to confirm my immediate and absolute support of a helipad located close to Children's Hospital and Medical Center emergency room. As an outlying community pediatrician I have periodically required the emergency evacuation of a critically ill child, one for example, that was in septic shock on intensive life support machines.

I have been extremely grateful for the helicopter to transport patients to Seattle for further care. The families have been grateful too.

But it is more than being grateful.

We as physicians, as well as families with a severely injured or sick child, expect a rapid and efficient transport method. It is the standard of care. This means that there should be no cumbersome intermediate transfers of body and equipment to and from vehicles in variable weather conditions. IT DOES MEAN that helipads are located next to the hospital so more direct transfer between hospital and helicopter takes place. It will take only one lawsuit involving a cumbersome transfer to or from a vehicle (where equipment fails or life supporting tubes or catheters are pulled out), or a vehicle stuck in traffic with a critically ill patient, to demonstrate the wisdom of this adjacent helipad.

PLEASE SEE THE WISDOM. Please allow for the establishment of a helipad at Children's Hospital and Medical Center for critically sick or injured children where seconds count and where the ease of moving delicate instruments, catheters and intensive care equipment is so important.

For the sake of children,

Steven P. Wisner, M.D.

To Whom It May Concern:

I write as a Pediatrician from an outlying community on Whidbey Island to support the helicopter pad at Children's Hospital and Medical Center. I have personally been, in years past, the accompanying physician who had to land with a critical child at an outlying soccer field and then make a critical transfer of care to ground ambulance, that may or may not be down below when we arrive at the scene.

There is no question that the most efficacious transport would be to land right at a landing pad outside the Emergency Room.

Thank you very much.

Sincerely,

Jane A. Mays, M.D.

In re: Project # 8405870 & 9106441/ CF # 297288 & 298740

We are opposed to a heliport on the CHMC campus because it presents and unacceptable safety hazard. As you know, the vicinity around CHMC includes the Laurelhurst Elementary School as well as residential buildings. The consequences of a crash could well be catastrophic, and the City of Seattle would certainly share in the liability for it.

I wish to be notified of your recommendation.

Sincerely yours,

Charles R. Nelson

Dear Sirs:

Northwest Pediatrics is one of two busy Pediatric group practices in Bellingham, WA. We serve the residents of Whatcom, Skagit, Island, and San Juan counties. We fully support the application of Children's Hospital and Medical Center for a permit to build a helicopter landing pad outside the Emergency Room on the Laurelhurst campus of the hospital.

St. Joseph Hospital is the only hospital serving Whatcom County. A helicopter landing pad is located on the hospital campus within 100 yards of the hospital. All helicopters transporting patients to or from this hospital use this landing pad. More than 50% of the infants and children transported from our institution to Children's Hospital and Medical Center are in critical or unstable condition. There have been documented cases over the past 2 years in which patients transported by helicopter from St. Joseph Hospital have deteriorated while being transferred from the helicopter to an ambulance at a site distant from Children's Hospital and Medical Center.

We feel that it is critical that a helicopter landing pad be sited near Children's Hospital and Medical Center on the Laurelhurst campus. Please feel free to contact any one of us with regards to our support for the permit.

Sincerely and professionally,

Kenneth B. Gass, M.D.

Dear Sirs:

I recently had occasion to refer a child to Children's Orthopedic Hospital and Medical Center on an emergent basis. The child had a bowel condition which normally would have resulted in his losing most of his bowel and perhaps his life in the process.

It was only because of the availability of helicopter transport that this child survived intact. Indeed, it is only because of the availability of helicopter transport that he survived at all.

I could continue to give you other examples of how important this service is to the surrounding communities, but this one vignette really says it all.

I hope that you will take this into account in your deliberations on the permit that Children's Hospital is seeking from the City of Seattle to build a helicopter landing pad.

Thank you for your attention to this matter.

Sincerely yours,

Henry L. deGive, M.D.

To Whom It May Concern:

This letter is in regard to Children's Hospital and Medical Center's request for a permit to build a helicopter landing pad outside the Emergency Room on the Laurelhurst Campus of the hospital.

As a pediatrician practicing in Bremerton, Washington, I know how important it is to be able to quickly transport a critically ill patient to Children's Hospital in Seattle. To drive around through Tacoma, over the Tacoma Narrows Bridge or to wait for the next ferry is not an appropriate means of transportation of a critically ill child.

I fully support the necessity of constructing a helistop to insure the adequate, safe delivery of emergency medical services to children in our region.

Thank you.

Respectfully yours,

Ward L. Hinrichs, M.D.
Pediatrician

RE: Children's Hospital and Medical Center Permit
For Helicopter Landing Pad

Dear Hearing Examiners:

I write this letter requesting support for the requested permit for Children's Hospital and Medical Center to build a helicopter landing pad at their Laurelhurst campus. I write this as one who sends referrals to CHMC, utilizing the Airlift Northwest helicopter. As such, most of the patient's that I refer are critically ill and flown in from Forks, Washington. Most often, Children's Orthopedic is the hospital best equipped to handle the emergencies that we send. As noted, most of the patients are critically ill and require immediate attention. I am concerned regarding possible delays in treatment to my patients whom I send over via the helicopter if they were to have to land elsewhere and then be transported by ground ambulance to Children's Orthopedic. I think that this could seriously compromise their care, and may result in harm to such patients. I would therefore urge you to approve the permit.

If you have any questions, please do not hesitate to contact me.

Sincerely,

John M. Shima, M.D.

Dear Office of Hearing Examiner:

I am a private Pediatrician in private practice on Whidbey Island. My practice encompasses a large rural area. As a result, we practice in a very small community hospital that has limited ability to care for critically ill children. Critically ill children are flown by helicopter to Children's Hospital in Seattle. Most critically ill children travel this way because it is a two hour ride by ambulance from our island and that is too long for transport of critically ill children because their status can change within minutes.

I am writing you to wholeheartedly support the need for Children's to construct a helistop. Children's have a remarkable capacity to decompensate very quickly and this can occur within a matter of minutes. It is absolutely essential that they reach their destination and receive care as quickly as possible. We have found with some of our very critically ill children that the transport to Children's Hospital is hampered because the helicopter has to make another stop at the University of Washington intramural field and then the child transported by ambulance. Every shuttling of the child from one vehicle to another risks the loss of life supporting I.V.s and tubes and also causes the child oxygen level, in many cases, to drop unnecessarily. It is very important that these transfers occur so that there is a minimum amount of transferring from one vehicle to the other.

Certainly there are children in our practice who are critically ill and not capable of being cared for by us, but yet still stable. These patients can be transferred from another facility to an ambulance without compromising their care. We are happy to so designate which children are that way while we are taking care of them. However, we transfer a significant number of unstable children who desperately need to be able to be transported directly to the facility.

I wholeheartedly support the helistop at Children's. I feel that this is a great step in providing equal access to critical care medicine for the children in rural areas just as they would receive in the City of Seattle.

Sincerely,
Sandra W. Horning, MD

Dear Sirs:

I am writing this letter to enthusiastically support Children's Hospital request to build a helicopter landing pad outside the Emergency Room of the Hospital in Laurelhurst. I have been in private pediatric practice in Port Angeles for the last eighteen years, and I have had many occasions to refer critically ill infants and children to Children's Hospital for specialized medical care. Earlier in my practice, before the Airlift Northwest services were available, I used to transport patients myself via U. S. Coast Guard helicopters from Port Angeles to Seattle. In those days, we had to land at the University of Washington athletic fields, and ground transport by ambulance to Children's Hospital. There were occasions when the extra time and moving of the patient during ground transport from the helicopter to the Hospital added considerable stress to all those involved in the transport, although I recall no incidents where it actually resulted in the death of the patient. At any rate, those of us in outlying communities such as Port Angeles, greatly appreciate having helicopter access to Children's Hospital and stronly believe in the necessity of having immediate access to the Hospital by the helicopter transport crew for critically ill children. Those minutes can indeed make a life or death difference in some occasions. I have reviewed the Children's Hospital Helistop Proposal, and I feel that their request to allow landings at the Hospital for truly critically ill children is reasonable, and I stronly urge you to support this application. Incidentally, the Airlift Northwest helicopters that provide transport from the Hospital in Port Angeles land at a helipad in the Hospital parking lot. This helicopter landing site is located within 50 to 100 yards of residential homes in the neighborhood adjacent to the Hospital. Airlift Northwest helicopters fly to and from this spot several times a week, and on occasions, several times a day. To my knowledge, there have been no complaints in this community about this helipad being located this close to the Hospital. Granted, it provides some inconvenience for people on a temporary basis, but this must be weighed against the potential of the Children's Hospital Helipad pro-

Dear Sir:

This is a letter to outline my strong conviction that a helicopter landing pad should be approved for use of critically ill children at the Children's Hospital Medical Center campus. As a practicing pediatrician in Kitsap County I have had numerous experiences with children who had an immediate need for Level III capabilities, as opposed to the primary services that we offer in community hospitals. Some children who are in the critically ill situation cannot be expected to have to be moved from one form to another of transport vehicle. Each time a patient transfer is made, such as from helicopter to ambulance, there is always a risk of injury in the confusion. The child may be placed in a more compromised situation.

I understand that more routine transports from Kitsap County to Children's certainly could be handled via ground transportation or helicopter run to a different site in King County that would then allow for easy ground transport to Children's. It is very important to realize though that there is a small number of children in which every moment counts and as I stated above, every transfer between vehicle puts the child at greater risk.

I understand there may be the occasional inconvenience of noise momentarily to the population about Children's Hospital, but in the larger picture of medical needs of the entire Western Washington area, there will be the occasionally critically ill child that requires the ability to get to the hospital as soon as possible.

Please feel free to contact me if you have further questions in regards to this matter.

Respectfully submitted,

John Corrales-Diaz, M.D., F.A.A.P.

Dear Examiners:

As a land owner in the Kinderemere Circle near the Childrens Hospital - I feel a strong responsibility to my tenants to ask that the Environmental Determination be appealed.

The noise factor and vibrations of surrounding buildings must be considered. It is frightening to be awakened in the night by the shaking of buildings - a health hazard.

Taxpayers should be considered as well as business concerns.

We would appreciate your consideration of the above conditions.

Yours Sincerely,
Kathleen N. McHugh-Johnston

Re: Helistop at Children's Hospital & Medical Center, #'s 8405870 and 9106441. (CHMC)

I have received the Notification of the Conditional Use Recommendation of the above proeject. I object and appeal the recommendation.

A helistop at CHMC is unsafe, unwise, unnecessary as follows:

1. CHMC is co-financing and using helistop with University of Washington at the Intramural Field. (UW)
2. UW helistop at the Intramural Field is less than a mile from CHMC. This site has been used prior to helicopters at CHMC for many, many years with no loss of patient lives as acknowledged by CHMC.
3. Clear approach to UW helistop at the field site.
4. Approach over dense residential neighborhood at CHMC campus.
5. Low-flying and turning on both in and out flights at CHMC over homes and condos pose extreme danger to residents. CHMC personnel and patients also at risk.
6. Endangerment of innocent, individual citizens' lives is being disregarded.
7. Documented history of helicopter malfunction and crashes, including medical helicopters. Most crashes occur at time of take off or landing. As recently as March, 1992, 3 medical helicopters crashed--March 5, 6, 7. These crashes occurred in Arizona, Michigan, Alaska. SEE news articles in the Seattle Times.
8. Planned expansion (45% of present buildings) at CHMC--both vertical and horizontal--lessens maneuverability space for helicopter landings, turning, take off at CHMC.
9. The expanded building at CHMC is basically for research labs and doctor offices. Patient beds are becoming secondary as CHMC becomes an adjunct of UW Hospital & Medical Center & School.
10. Harborview Hospital already has a helistop in place and a well-developed trauma center and pediatric department.
11. Noise pollution and vibration is high and at any time of day or night.
12. Institutional encroachment in a residential neighborhood destroys the quality of life for the neighborhood.
13. In the FEIS it is stated CHMC cannot refuse any helicopter landings, even the Army MAST planes, which are clearly oversize for residential neighborhood landings and for size of proposed helistop site at CHMC.
14. The estimated average of 15 to 21 patients per month landing at CHMC, meaning 30 to 42 overflights (in & out), could be exceeded as competing helicopter service occurs, according to the FEIS.
15. Omitted in the FEIS are clear, exact criteria/guidelines for helicopter usage, decision-making process as to who determines when and where and which hospital the helicopter uses.
16. Airlift Northwest and CHMC will keep a log of flights but should not be allowed to monitor their own work/decisions. Who will monitor the flights and landings?
17. We who live near and/or contiguous to CHMC property are alarmed over the expansion, including the helistop, at CHMC. In 1952 the hospital outgrew its site on Queen Anne. It has now outgrown its site at Sand Point and Laurelhurst residential area. It is time this property revert to its original residential status.

PLEASE STOP A TRAGEDY FROM HAPPENING (CRASH AND/OR CONFLAGRATION) IN A RESIDENTIAL NEIGHBORHOOD BEFORE IT OCCURS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Dear Hearing Examiner,

Resident: I reside at 4712 - 33rd Avenue NE. This locates me just north of the intramural field helistop on the UW campus & just west of the helistop at Children's.

I have several concerns regarding the helistops:

Issues:
1) landing & take-offs
2) length of time helicopter is left running while on the ground
3) definition of <u>emergency</u>

Explanation: 1) Many times the helicopter pilots either do not know where to land, or just they are sightseeing, and/or they approach & take off in large, low circles for their convenience. These machines should be able to drop from high altitude directly to the helistop without <u>Buzzing</u> the neighborhood several times.

2) Often a helicopter lands & sits idling even after the patient is long gone on a ride to the hospital. Specific limits

in minutes, such as 5 minutes, seem reasonable to keep the engine active. If we are talking about emergency conditions 5 minutes is an adequate space of time to complete patient transfer & vacate the area. I have often wondered what the pilots do for 40 or 45 minutes (almost 2hrs. is the record!) idling their engines in the middle of the night after delivering a patient. Time is not of importance to them it appears - or is it?

3) What is an emergency? Does it have to be a life & death situation to be an emergency? If it's not life & death then where is the cut-off on determining whether these flights are really needed or are used as a matter of convenance. Emergency, to me, means time is important. Judging from several observations of helicopters landing and having to wait for ground transport to pick up the patient time does not appear to be critical.

Recommendations: Very reluctantly approve heliport <u>only</u> with <u>STRICT</u> & <u>ENFORCEABLE</u> rules. This can be as important for the health of a neighborhood as for patients!

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Suggestion: This can work for everyone although there are significant costs to many people. Since were in this for a long time anyway of encouraging development of quieter helicopters?. If not then the rules are black & white & if violated there is a penalty.

Closure: As you can tell this is a big issue for me & my family & my neighborhood. I encourage you to take it very seriously and judge accordingly.

Sincerely,

Greg Schell

P.S. I would like to receive a notice of the Hearing Examiner's recommendation.

Children's Hospital & Medical Center

My name is Sylvia Porter. I am supporting the case of the Helicopter Landing Pad simply because in January of 1990 my daughter had a grand mal seizure for the first time in her life and mine. She was taken to Valley Medical hospital, under the assumption of her having spinal manigist. They transported her to Childrens by air lift. That saved her life considering time was at hand. I completely support the air lift helicopter land pad.

Thousands of kids uses the helicopter a year from other states. Without this my daughter may have lost her life.

Thank You
Sylvia Porter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NEFRN-PROPOSED CONDITIONS

1. Approval of the helistop at the Children's Hospital Medical Center (CHMC) Kitchen Garden site is temporarily granted for a period not to exceed two (2) years. During this time, the helistop proposal for the Kitchen Garden site shall be reviewed as part of the CHMC Master Planning process.

   If, through the Master Planning process, City Council approves a more permanent helistop at the Kitchen Garden site, conditions contained in this temporary approval of the helistop at the Kitchen Garden site shall be incorporated into the adopted CHMC Master Plan, together with any additional conditions that may be identified and required by City Council. The Kitchen Garden helistop shall cease operation at the end of this temporary approval period if the helistop is not approved in the CHMC Master Plan.

   [New NEFRN Condition]

2. Approval and operation of the Kitchen Garden helistop on the CHMC campus is dependent upon concurrent approval and operation of the Intramural Activities/Graves Field site. If, for any reason, the Graves Field helistop is not approved, or ceases operation after approval, the use of the Kitchen Garden site shall not be expanded in any way beyond this conditional approval.

   [New NEFRN Condition].

3. Approval for the helistop on the CHMC campus is limited solely to the proposed Kitchen Garden site as shown on Figure 5 of the April 1991 Final Environmental Impact Statement. Location of the helistop on any other portion of the CHMC campus will require additional environmental review and new land use approvals, including as part of the CHMC Master Plan review process.

   [New NEFRN Condition]

4. Only the most critical and life-threatening medical emergencies shall be allowed to land at CHMC. All other patients shall land at the Intramural Activities field site. The initial decision whether to land at the Kitchen Garden site or the Intramural Activities field is to made by the referring physician and/or attending medical team. For patients whose condition deteriorates in flight, the medical team on board the helicopter may decide to land at CHMC. The following conditions indicate a landing at CHMC is appropriate:

   a. unstable airway;
   b. inability to ventilate/oxygenate;
   c. inability to maintain adequate cardiac output;
   d. inability to maintain adequate cerebral bloodflow; or
   e. the persistence of unstable vital signs despite heroic attempts to control them.

   [DCLU Condition No. 1]

5. Landings at the CHMC Kitchen Garden site shall not exceed an average of 6 landings per month (calculated for each three-month quarter) and shall not exceed 15 landings in any given month. Additional landings that are clearly due to catastrophic events shall not be subject to the above limitations.

   [New NEFRN Condition]

6. Only Augusta 109 helicopters, with a four-bladed rotor, shall be permitted to land at the CHMC campus helistop, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area. Should Airlift Northwest or another aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Augusta 109 studied in the EIS, a supplemental EIS must first be prepared to evaluate the noise impacts of the new equipment, and new land use approvals must first be obtained. Two-bladed rotor helicopters, such as but not limited to the Huey helicopters typically used by the Military Assistance to Safety and Traffic (MAST), Coast Guard, and Navy, are prohibited from landing at the CHMC campus.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

To help ensure that the above restriction is observed, the size of the helicopter concrete landing pad at the Kitchen Garden site shall not exceed 20 feet by 20 feet.

[Revised DCLU Conditions No. 2 and No. 7]

7. A Medical Review Committee shall be established to review compliance with Conditions 4, 5 and 6, allowing only the most critically ill patients and only certain helicopters to land at CHMC. The Committee shall consist of the following 5 members:

a. One representative of CHMC selected by the Chief Executive Officer, who will co-chair the Committee with the representative from the Laurelhurst Community Club (LCC) described below;

b. One representative of the Laurelhurst residential neighborhood selected by the LCC, who will co-chair the Committee with the CHMC representative;

c. Two general non-CHMC-affiliated pediatric practitioners (primary care physicians), to be nominated and agreed upon by both the CHMC and LCC members in a) and b) above;

d. One representative with experience in emergency airlift services, to be nominated and agreed upon by both the CHMC and LCC members in a) and b) above.

Committee members will be appointed for up to a three year term, with replacements to be made by the original appointing authority. Committee members in b), c) and d) shall have no affiliation with CHMC, the University of Washington Hospital, Airlift Northwest or other organization that may present a potential conflict of interest, or the appearance of a conflict of interest. Nominees for positions c) and d) above shall submit to the CHMC and LCC Committee members a statement disclosing any potential conflict of interest, including but not limited to any past or present affiliation with CHMC, the University of Washington Hospital and Airlift Northwest, which can be evaluated by CHMC and LCC.

The Committee shall meet quarterly to review and evaluate helicopter transports to CHMC. To facilitate this review, CHMC will make available to the Committee all helicopter and medical data relating to each landing, including the number and type of helicopter landings, progress notes from the transport team and transfer notes from the referring institution and physician. It will be CHMC's responsibility to ensure patient-identifying information is removed prior to release of medical data to the Committee. The Committee shall evaluate the data to determine whether the use of air transport directly to the CHMC campus was justified in each case and whether the operation of the helistop complies with Conditions 4, 5 and 6. The Committee evaluations shall be included in a report submitted after each quarterly review meeting to the Department of Construction and Land Use (DCLU), the Chief Executive Officer of CHMC, LCC, the Airlift Northwest Executive Committee and Medical Director, and the Citizens' Advisory Committee for CHMC Master Plan. The report shall be made available to the public upon request and for a reasonable duplicating fee.

The Committee shall adopt rules and procedures as necessary to ensure compliance with laws and administrative rules governing confidentiality of patient medical records, while also providing for public input and review of the Committee's work. Each Committee member for positions b), c) and d) above will be compensated for his/her service on the Committee at the rate of $100.00 per landing, and all Committee members may be reimbursed for reasonable out-of-pocket expenses identified by the rules promulgated by the Committee. Compensation and expense reimbursement shall be paid by CHMC. CHMC shall provide administrative and staff support needed by the Committee, including assistance in preparing the quarterly report for Committee review and approval.

The Committee shall monitor CHMC helicopter landings for as long as there remains a helistop on the CHMC campus. Changes in Committee structure and operation shall be made only upon concurrence by CHMC, LCC and DCLU.

[Revised DCLU Condition No. 3]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

8. CHMC shall report on a quarterly basis to the Committee and to the community the number and nature of helicopter landings at the Intramural Activities/Graves Field site.

[Revised DCLU Condition No. 4]

9. Use of the CHMC campus helistop is limited solely to the transport of patients (and accompanying medical transport teams). Helicopters shall not be allowed to land at CHMC campus to transport medical staff prior to (or after) patient transport, or to transport organs, tissue, medical treatments, medical equipment or any other material not specifically required for and accompanying a patient.

[Revised DCLU Condition No. 5]

10. DCLU shall review the quarterly reports of the Medical Review Committee. More than one landing in violation of Condition No. 4, 5 or 6, above, in any given month shall be grounds for DCLU suspension of the helistop permit for the Kitchen Garden site. CHMC may request reinstatement of the suspended conditional use permit by appealing to the Hearing Examiner, who shall then hold a public hearing during which CHMC and the general public may offer testimony regarding the violations, suspension and requested reinstatement. The Hearing Examiner shall reinstate the helistop conditional use permit based only on effective, specific corrective measures that will be implemented to prevent repeated violations.

[Revised DCLU Condition No. 6.]

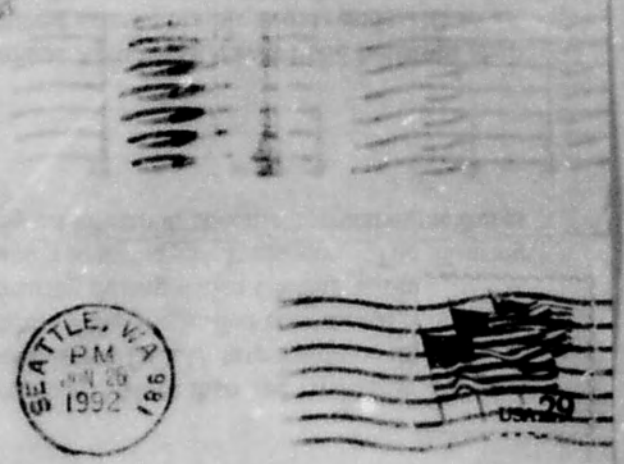
11. The flight paths for approach and departure to the CHMC and Intramural Activities/Graves Field helistops shall be strictly maintained as described in the Final EIS and shall to the greatest extent possible avoid residential areas. All helicopters shall follow the primary flight path along Northeast 45th Street and Sand Point Way, entering the CHMC campus from the north and northwest. The secondary flight path, which enters the CHMC campus from the northeast over the residential neighborhood, shall be followed only when winds out of the northwest quadrant are in excess of approximately 17 knots. Airlift Northwest and any other regular carrier shall establish a training program to introduce all pilots to the approved flight paths.

More than one deviation from or unjustified use of the approved flight paths per month shall be grounds for DCLU suspension of the helistop permit at the Kitchen Garden site. CHMC may request reinstatement of the suspended conditional use permit by appealing to the Hearing Examiner, who shall then hold a public hearing during which CHMC and the general public may offer testimony regarding the violations, suspension and requested reinstatement. The Hearing Examiner shall reinstate the helistop conditional use permit based only on effective, specific corrective measures that will be implemented to prevent repeated violations.

[Revised DCLU Condition No. 8.]

12. Prior to beginning regular use of the Kitchen Garden helistop, all Airlift Northwest (ALNW) pilots shall make at least one test landing and take-off at the site. CHMC and ALNW shall schedule the training/test flights for a weekday between the hours of noon and 3:00 p.m. Advance notice of at least ten (10) days shall be given to the surrounding communities of the test/training time, date and expected number of flights. The number of flights shall be held to the minimum necessary to provide adequate training.

[DCLU Condition No. 9.]



13. New pilots shall make at least one landing at CHMC under supervision of a pilot experienced in landing at CHMC prior to unsupervised patient transport landings. Non-patient transport training flights, if desired, may be scheduled no more than twice per year without approval from DCLU. Notice of training flights shall be provided to surrounding communities as stated in Condition 13.

[DCLU Condition No. 10.]

OFFICE OF
HEARING EXAMINER

6/30/92

Dear Ms. Alexis,

I am writing to urge you to support and adopt the conditions proposed by NEFRN regarding the establishment of a helipad at CHMC. Because of Children's well-documented history of non-compliance with city ordinances, their heroic efforts to circumvent any state or city established information-gathering process pertaining to land use development, and their total lack of regard for the neighborhood in which they are located, it is imperative that the conditions placed on this permit demonsirate an overwhelming concern for the safety of the neighborhood and be "weasel proof." Once adopted, these conditions must be strictly monitored and enforced by the City. Let's not leave the fox in charge of the hen house AGAIN.

Children's is not a civic minded institution. This is an institution that filed suit against DSHS rather than comply with their Certificate of Need process regarding the helipad. Health planning issues and certainly helicopter transport should have been considered from a broader state perspective and the discussion not limited to local areas.

This is an institution that ignores conditions the City places on its permits as demonstrated by the permit issued for their parking garage in 1981. It was only when CHMC applied for the helipad permit in 1984 that the City became aware that those conditions had not been honored. This is an institution that CONTINUED to ignore the City's conditions until the City threatened to hold other permits hostage.

This is an institution with an irresponsible and arrogant administration that has been unaccountable to the community, (no master plan) the city and the state. Their unwillingness to provide justification information for this helipad has slowed this review process every step of the way, dragging the process on unresolved for eight years. The travesty of this situation is that the record has become so voluminous that pertinent information has been lost or mysteriously disappeared. Suuch information was the testimony given by Paul Russell, a retired U.S.Coast Guard Captain and Flight Crew Instructor for the Boeing Commercial Airplane Co., given at a public hearing held at the Laurelhurst Elementary School in 1985 regarding the proposed helipad. Mr Russell testified a second time regarding the issue of safety as it pertained to the helipad in 1988 before Hearing Examiner, Margaret Klockars regarding MUP #887060. I am enclosing this testimony for you to read since the city lost record of his initial comments. Other pilots also testified at that first public hearing that the proposed helipad raised serious safety concerns but I do not have a copy of the testimony given by Mr. Richard Merrill or Mr. Bart Baxter to forward to you. Is the record really complete without their statements? Mr. Russell's comments have particular relevance to NEFRN's proposed conditions #3, 6, 11, 12, and 13.

I am alarmed that in the proposed conditions that Children's seems to have sole responsibility for turning over flight information to the review committee. We have found in the past that some of the periodic reports issued by CHMC describing landings at the hospital have been

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

incomplete and neighborhood complaints forced Childrens to issue addendums. The quarterly report was initiated only after repeated requests from the community. Airlift Northwest keeps a log of all of its flights and they should be required to submit those records to the review committee as well.

Condition #10 is extremely important as CHMC representatives have asserted on many occasions that once the helipad is constructed they will have no control over who lands there. I have already witnessed the illegal landings of the KIRO helicopter, other EMS helicopters and a military helicopter at the proposed site or CHMC's parking lot. The ability to hold a public hearing during which neighbors could testify about violations is very important. When Children's was found to be in violation of the land use code and Joe Garcia, a representative of the City convened a hearing, neighbors were not allowed to speak.

During the many years that I resided one block from Children's I witnessed repeated deviations from the flight path that were not provoked by weather conditions. Condition #11, which describes a mechanism for dealing with this situation is very important.

In closing, I would like to take the opportunity to remind you that there is no agency that has direct authority over the operation of EMS transport systems. The FAA has issued guidelines for the siting and operation of helipads but they are no more than that--just guidelines. They are not regulations. Once this helipad is in place, it will be the City's sole responsibility to monitor how it is used and to enforce the conditions placed on the permit. Because this service has been allowed to operate illegally for the past eight years, NEFRN is quite capable of identifying potential problem areas. The NEFRN proposals gives the city a mechanism for dealing with those problems as they arise, firm ground to stand on, and puts necessary safeguards in place for the community. I urge you to adopt these proposed conditons without delay.

Sincerely,

Liz Anderson (comm)

RE Hearing Examiner File- MUP-92-020
Project # 9005954, Meadowbrook Nursing Home, 3540 N. E. 110th st.
Seattle, Wa 98125
Louis and Virginia Sternberg,Owners

Dear Hearing Examiner:

I was unable to stay for the entire day of the hearing on June 10th but I have listened to the tapes of the hearing and have looked at copies of the new proposal. I am in agreement with the decision of the DCLU to deny the Administrative Conditional Use and Variances.

The Sternbergs have two lots that are now used for single family residences, one on N. E. 110th and the other on 38th Ave. N. E. They have gone to great lengths to describe the poor condition of the house on N. E. 110th, but are now collecting almost $600.00 a month in rent. The property on 38th N.E. is to be divided into two lots with the westerly portion to be added to the Nursing Home property. This is an encroachment of our residential neighborhood which our zoning laws are supposed to protect. It is obvious that that portion which is not proposed to be included in this project at this time will be used in some future expansion.

I think that too much emphasis is being given to the Certificate of Need issued by the DSHS. This certificate was issued only on the information submitted by the Sternbergs in the bidding process. It is my understanding that the DSHS wanted community input on the project so the Sternbergs went out of the residential neighborhood to the Lake City Chamber of Commerce to get a letter of recommendation. I spoke to Mr. Tony DeMeistro, an active member of the chamber and one of those who voted to send the letter of recommendation. I asked him if he had spoken to any of the residents who were personally affected by the proposed expansion of the Nursing Home, he said he had not and was taken back by the idea that that should have even been a consideration. But he also said he thought that the DCLU had already approved the project. I believe that it should have been pointed out to the DSHS that the community recommendation came from the business community and not the residential neighborhood directly affected by the proposed expansion.

Mr. Sternberg stated during the 6/10 hearing that there was no opposition to their proposed expansion in 1987. Well my husband and I were adamantley opposed as were our neighbors on all sides. We discussed it on a number of occasions after Mr. Sternberg had come around with his petition . We watched and waited for him to return again with the petition or for some further notice of the proposed expansion, after much time passed we concluded the project was scrapped because of lack of community support.

The next time around they shrewdly avoided the neighborhood and went to the business community where they could get what they needed.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7-7-92

2 of 2

I have enclosed a copy of the environmental checklist submitted by the Sternbergs 2/26/91. In view of the fact there were a number of erroneous or misleading answers to the questions on this check list I can't but wonder if answers to a similar type of questionaire were required by the DSHS and if so who was there to scrutinize the answers for accuracy like the DCLU did with the Environmental Check List.

Please see attached copy marked "A" which is page 5 paragraph one of a June 25 ,1991 letter to the DCLU from the Sternbergs,stating that the neighborhood was notified of a presentation by the architects of the proposed expansion on Aug 24th , 1990, Neither I nor any of the neighbors I have talked to, who are directly affected , had ever heard of this. That is why it came as such a shock when the Sternbergs came around with there 3/23/91letter saying the expansion had been approved. It is my understanding that these presentations were never prefaced with any mention of the necessity to get approval from the DCLU,but were presented as a DONE DEAL, just like their letter dated 3/23/91 to the neighbors, please see attached copy marked "B", some people took the letter to mean that they would have no voice in the matter.

When the Sternbergs bought the Nursing Home in 1986 they signed a Statutory Warranty Deed that contained a covenant restricting the number of patients , to be accommodated, to no more than forty seven (47) . They went about their plans for expansion anyway. With this cavalier attitude how can Mr. Sternberg expect that any written guarantee of his would be taken seriously, such as the one he stated during the 6/10 hearing, that he would put in writing that the property on 38th N,E would never be used for access to the Nursing Home.

I am sorry that this letter seems to ramble but I'm trying to express some of my concerns and frustrations. When the last expansion was given approval in 1971 it was given by the Hearing Examiner on the condition that maximum beds would be limited to no more than forty seven (47). Here they are again asking for more beds and more building space. How can there be any doubt what they will be asking for in the future.

Any delays in this process were not the fault of those opposed therefore the manner in which this latest proposal was thrown in at the last minute during the hearing is very disconcerting. It was the Sternbergs who requested and were granted the extensions that have caused this to drag on so long.

Please put me on record as being opposed to this new proposal and the manner in which it was presented.

Sincerely,

Kathryn L Buckley

"A"

Response: All residents of The Meadowbrook were informed, starting over two years ago. On Friday, August 24, 1990, after the award to The Meadowbrook of 34 additional beds, a major presentation by the architect was made to all guests, residents, their families, staff, plus friends of The Meadowbrook. You will find enclosed a picture of Ms. Betty Bartholomew, the Executive Director of the Lake City Chamber of Commerce, taken at the presentation of the plans to residents, friends, neighbors and families on Friday, August 24, 1990. This presentation was well attended. In addition to this special occasion, the Resident Council had a private presentation on Monday, December 17, 1990, and the Famil, Council on Friday, April 12, 1991.

Statement: . . . "The owners have told us that they had contacted everyone in the 98125 zip code area."

Response: No such statement was ever made by us. The only mention of the zip codes occurred when we were asked where most of our residents came from. Our response was the 98125 zip code, which is The Meadowbrook zip code.

Ruperta Alexis
Deputy Hearing Examiner
Room 1320 Alaska Building
618 Second Street
Seattle WA 98104

Dear Ms. Alexis:

I live near Children's Hospital (CHMC) and have been an active participant for years in the controversy over CHMC's helipad. I support the NEFRN-proposed conditions as being fair and reasonable in view of the history of this helipad. In fact, many of NEFERN-proposed conditions are similar to views expressed by Dr. Bud Nicola and other physicians over the last few years. When Dr. Nicola was Director of the Seattle-King County Department of Public Health, in a report he wrote to the Department of Construction and Land Use (December, 1985) he assessed the medical need for the CHMC helipad based on his medical background, discussions he held with physicians and nurses at CHMC and elsewhere, and review of the emergency medical research literature.

I would like to give evidence of concurrence of some NEFRN-proposed conditions with views expressed by knowledgeable physicians such as Dr. Nicola as shown in their (enclosed) letters, as well as my own thoughts based on years of experience in working on this issue and my background as a graduate nurse and medical sociologist.

NEFRN-Condition #1: proposes that approval of the helistop on CHMC campus be temporary, pending review of the CHMC Master Plan. This is of utmost importance as it directly affects the safety of the helicopter landings. Any further building on the north side of the hsopital, particularly near the helistop location, would further restrict an already-restricted landing site. Concerns about the safety of the site have been raised by pilots who are not involved with Airlift Northwest, such as Paul Russell.

NEFRN-Condition #2: proposes that approval of the CHMC helistop depend on concurrent approval of the Graves/intramural field site. It is important that this helistop approval at CHMC be seen as a "package deal" with the UW Graves field. If the Graves Field site is not available, the "whole deal is off," since the conditions would be dramatically changed, i.e., there would be pressure for more landings at CHMC. Dr. Nicola points out in his report on page 5, paragraph 3, "In most cases, one single site near Graves Field would be adequate for both the UW and COH; however, there will be a small number of cases...where the ability to land at the hospital may be life-saving." Without the Graves Field site, then, more landings would take place at CHMC campus than are STRICTLY MEDICALLY NECESSARY.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

This is undesirable since CHMC is in a single-family residential community and near an elementary school, so the risk to safety and the noise problems from the helicopter should be kept to a bare minimum.

NEFRN Condition #5 : Landings shall not exceed an average of 6 per month and shall not exceed 15 landings in any given month (except for catastrophes). Given the historical number of landings--i.e., 23 MAST trips during 1983-84 (12 per year)-- 6 per month as proposed by NEFRN seems generous. Also, 6 is exactly the number of landings CHMC Medical Director John Neff said is likely, at a public hearing in 1985 (Corr, P.I. article, enclosed). And, in his report, Dr. Nicola stated that "3 to 4 of these patients (per month) may have a need for helicopter transport to the doors of the hospital" (page 5, paragraph 4). Then, to account for seasonal variation in disease and to leave room for unintended error in determining who should be transported to the CHMC doors, Dr. Nicola estimates that 10 expected helicopter transports...per month was an "upward bound." (page 5, paragraph 6). So NEFRN's condition #5, placing 15 per month as an upward bound is generous and should be included as a condition of the permit.

NEFRN Condition #7: The makeup of the medical review committee should include one representative from CHMC, a Laurelhurst resident, 2 non-CHMC pediatricians and an emergency airlift person. Since CHMC apparently does not challenge DCLU's condition No. 3, which states that a Medical Review Committe shall be established with a number of non-CHMC affiliated members, I shall not trot out my quotes from experts who state how important it is to have "outside review." But I feel strongly that the lone Laurelhusrt resident on the review panel would have a difficult time getting her or his views across without additional allies. Health care providers such as physicians and nurses tend to have a narrow view of what should be considered in providing health care. They often are not aware of larger, community and even citywide factors that should be considered in their intensive attention to the individual patient's needs. For that reason I believe that a representative from the Seattle- King County Department of Public Health would be a useful addition to the team. I have met and talked with a number of Dept. of Public Health staff, including Dr. Nicola, and have always found them to be fair and knowledgeable, with a broader, more public health perspective than most direct care providers have.

NEFRN Condition # 8. CHMC shall report on a quarterly basis to the community the number and nature of helicopter landings at the Intramural Activities/Graves FIeld site. Please add: "and landings at the CHMC campus."

NEFRN Condition #9: Proposes that use of the CHMC campus helistop be limited solely to the transport of patients(and accompanying medical transport teams) and rules out other uses. This proposed condition is appropriate since the only landings that are necessary at CHMC campus are those where "medical interventions are delicate and cannot be disrupted by unnecessary additional transfers. These include endotracheal intubations and IV influsions," as Dr. Michael Copass,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Medical Director, Harborview Emergency Room and Airlift Northwest, described to Dr. Nicola in a letter of 24 October 1985. No one has made a case for other reasons for landing so near the hospital. In fact, for years Harborview had their helipad on the edge of their campus requiring transfer to an ambulance to transport the patient to the hospital. Only a parking lot (for doctors) stood between the helipad and the hospital. If closer access to the hospital had been needed, to avoid transfer to an ambulance, there was nothing to prevent the helipad from being moved closer. So, limiting the landings at the CHMC campus solely to the transport of patients is an important way to limit the number of these flights which are far riskier than those at wide-open Graves' Field.

NEFRN Condition #10 proposes that more than 1 landing in violation of listed conditions in any given month shall be grounds for DCLU suspension of the helistop permit for CHMC campus. Dr.Nicola, on page 6 of his report, recommended that the permit be conditional, pending, among other things, a review that the helistop be used for appropriate medical need in 6 months and the permit revoked if the helistop were being used for purposes outside that expressly permitted. I seen no reason to limit the review to 6 months as Dr. Nicola suggested; the review should be a continuing process, as NEFRN proposes.

Although I have not discussed the remaining NEFRN conditions, they are obviously relevant and I urge you to adopt them.

Thank you for your consideration.

Sincerely,

Anita Francis

Re: Council Conditional Use Permit
Project Nos. 8405870 & 9106441

Dear Ms. Alexis:

Our firm is counsel for Children's Hospital & Medical Center, the applicant for the above Council Conditional Use Permits

First, your office has confirmed that no appeal of the SEPA determination has been filed and that the hearing will be limited to consideration of the Council Conditional Use Permit applications for the helistops on the Children's campus and at the University of Washington intramural field.

Second, we understand that the morning of the hearing on June 23, 1992, has been scheduled for presentations by DCLU and Children's. This is fine, and we will be prepared to use our share of that three hours for presentations by Children's witnesses. Starting after the lunch break, the Examiner will take testimony from members of the public, probably for the remainder of the day.

In addition to the presentation which will be made the morning of June 23, Children's has approximately 12 additional witnesses to offer in support of the applications and to respond to questions raised by the public and the Examiner. The testimony of these witnesses will require approximately 4-5 hours. We will be prepared

Attention: Mr. Dennis McCarthy
Subject: SGA Helistop
Environmental Noise Assessment

Gentlemen:

This report is a summary of my findings regarding the SGA Helistop Environmental Noise Assessment prepared by the Parry Company. I have restricted my comments to issues relating to the adequacy of this document (which includes the September 1991 addendum) in terms of disclosing potential noise impacts to the surrounding community.

In general, I found the report to be technically accurate (for the most part), complete, and easy to read. However, there are some misleading statements and conclusions which I would like to point out. In addition, I have some general comments concerning the general approach to the noise assessment process.

In the first section I have addressed the issue of the general approach to the noise assessment process. Following this section I have presented specific comments which are in error or are misleading in the environmental noise assessment. The last section deals with my recommendations for additional testing which should help to fill in the gaps that currently exist in the environmental assessment.

Overall Approach

The overall approach that was used in the environmental noise assessment can be summarized as follows:

1. Helicopter noise measurements were conducted at seven different measurement locations in the community surrounding the helistop using the proposed helicopter and the proposed flight patterns.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Helicopter noise levels and contours were computed using the FAA's computer program HNM.

3. The calculated and measured A-weighted helicopter sound levels were compared with established community noise criteria.

4. Noise impacts were determined by comparing helicopter noise levels with these criteria as well as estimates of existing ambient noise levels.

5. Noise mitigation measures were identified.

This overall approach is appropriate, however there are several specific areas which are, in my opinion, lacking adequate foundation. The most significant of these is the assessment of the existing ambient noise in the residential community. The June 1991 report did not present any measure of the existing ambient noise over an extended period of time. The September 1991 addendum attempted to fill this void, but it failed to provide the necessary information because the noise monitoring location was improperly selected.

It is important to understand that the greatest potential noise related impact from this project will be in the residential community surrounding the proposed helistop. It is the people that live in these homes that are causing the greatest resistance to this development, and their concerns should be addressed.

In order to determine if there will be a noise impact as a result of this proposal, it is essential that the existing ambient noise characteristics of the community be known. It is not sufficient to simply "estimate" the ambient noise, nor is it sufficient to predict compliance with federal noise regulations. The measured noise levels associated with the proposed project should have been compared with the measured ambient noise levels in the community.

The ambient noise measurements presented in the September 1991 report should have been taken in the surrounding residential community, **not in the parking lot of the SGA office building while it was under construction.** The September 1991 ambient noise report indicated numerous noise events over 65 dBA including fork lifts as high as 87.7 dBA, trucks as high as 85.3 dBA, and cars as high as 73.7 dBA. These sound levels may be representative of the noise in the parking lot during construction, but they are not representative of what one would expect to measure outside of the typical residential bedroom window in this neighborhood.

Similarly, Table 3-4 in the June 1991 report shows ambient noise levels as high as 90 dBA from a passing school bus at Location #2. Although the report did not specify the exact location of the measurement microphone for these tests, levels this high would lead me to believe that the microphone was located too close to the street.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The September 1991 report shows that ambient noise measurements were also taken at five locations in the residential community (Sites 1, 2, 3, 6 and 7). However, the measurement period at each location was much too short to provide any realistic estimate of the ambient noise level. It appears from the report that the duration of these measurements was less than 5 minutes at each location. Ambient noise measurements in a residential community should extend for a minimum period of 24 hours, and preferably several days at each location. In addition, the precise location of the measurement microphone was not revealed in the report. If the microphone was located close to the street (as it appears from looking at the results), the noise from passing traffic will overestimate the true ambient noise in the community. The proper microphone location is a location which would yield results equivalent to the sound level existing outside a typical bedroom window.

The second area lacking foundation is the noise criterion for sleep interference. The basis for this criterion is Figure A1 in the June 1991 report. This figure plots the percentage of people awakened from sleep as a function of the interior maximum A-weighted sound level. This graph is derived from a report submitted to the FAA discussing the noise effects of aviation. There is no mention in the June 1991 report that this data is applicable to helicopter noise. I suspect that it is applicable to airplane noise, but helicopter noise is substantially different in character from airplane noise. Helicopter noise typically is much more impulsive in nature, and it usually contains low frequency tonal components. Both of these factors tend to make helicopter noise more annoying than fixed-wing aircraft, even at the same sound level. I can find nothing in the noise assessment to account for these factors.

The third area lacking foundation is the assumption that A-weighted exterior sound levels are the only noise metric that is relevant to this project. Although exterior sound levels are important to the community, it is the interior noise that is expected to cause the greatest annoyance and disruption as a result of this project. When people are inside their homes, they generally want to be isolated from the exterior environment, and they do not want to have the exterior environment interfering with their normal indoor activities. Interior sound levels were estimated in the report by subtracting 10 dBA (for open windows) or 20 dBA (for closed windows) from the measured exterior helicopter noise levels. There was no supporting evidence provided to indicate that this is a reasonable assumption for the spectrum of noise generated by the Bell Jetranger helicopter. This should have been provided. In addition, the level of interior low frequency helicopter noise should have been determined and reported.

As a result of these factors it appears that the percentage of the population who will be awakened from sleep was underestimated. The report suggests that with windows open, 15% of the sleeping residents would be awakened by the helicopter activity. This is based upon the graph presented in Figure A1 and an assumed helicopter maximum sound level of 65 dBA. However, a review of the measured helicopter maximum (Lmax) sound pressure levels presented in Table 3-2 of the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

September 1991 report shows that there are numerous locations and events where the exterior helicopter noise level exceeds 70 dBA. In fact, some events measured as high as 78 dBA. This is more than twice as loud as the 65 dBA Lmax level that was assumed in the September 1991 report on page 4-2. Using a helicopter Lmax sound level of 65 dBA for the entire community is incorrect and obviously leads to the wrong conclusion regarding sleep interference.

The appropriate method of presenting the sleep interference information would be to divide the community into areas of near equal helicopter noise levels similar to the contours provided in Figures 3-6 and 3-7 from the June 1991 report. For example, the sleep interference impact would be considerably less in the area between the 60 and 65 dBA Lmax contours than it would inside the 70 dBA contour. If one assumes that Figure A1 is applicable to helicopters, and one also assumes a 10 dBA exterior to interior noise reduction with open windows, then approximately 20% to 25% of the residents trying to sleep will be awakened by the helicopter if they live inside the 70 dBA contour. In addition, 40% to 45% will have the quality of their sleep compromised (sleep stage changed). The percentage figures should be translated to actual numbers based on the existing population within each contour and the expected number of people trying to sleep.

Specific Comments on the Environmental Noise Assessment

1. Executive Summary, page 3

   The range of maximum helicopter noise levels was stated to be 65 to 75 dBA. In fact, there were several readings of helicopter noise as high as 78 dBA in the residential community. The report also claims that other noise sources including buses, dogs, private aircraft, and automobile traffic produced maximum levels equal to those produced by the helicopter. This was not substantiated by ambient noise measurements taken with the measurement microphone in the proper location.

2. Executive Summary, page 4

   Under Forecasted Sound Levels the report states that "the maximum hourly Leq from helicopter activity is roughly equal to that of the existing background noise when flights are to the north." The average daytime or nighttime hourly Leq was not measured at any of the sites, so this statement cannot be justified. Even if this statement were true, this would result in a 3 dB increase in the hourly Leq. Similarly, the report claims that the DNL would increase from 0 to 1 dB by the proposed 2-3 flights per day. Again, this cannot be verified because the DNL was never measured in the community.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Executive Summary, page 5

The report correctly states that aircraft operations are exempt from the State and City noise ordinance requirements. However, it implies that the helicopter noise is quiet enough that it would be in compliance with these ordinances. This is definitely not the case. The allowable sound levels in these ordinances are based on a one hour measurement. The State and City ordinances allow noise levels up to 57 dBA during the day and 47 dBA during the night for steady noise sources. For noise sources that vary in sound level with time, somewhat higher levels are allowable for shorter periods of time. In no case is the noise level allowed to exceed 72 dBA during the day and 62 dBA during the night. It is obvious from the helicopter noise measurements presented in this study that the helicopter would not meet these ordinance restrictions.

4. Executive Summary, page 5

The report states that the FAA suggested single-event noise criteria for speech interference would be exceeded only when residents leave their windows open. This criteria level was not presented anywhere in the report. In addition, the sleep interference percentages are incorrect and misleading as described earlier in this report.

5. Executive Summary, page 5

The report suggests that sleep interference can be mitigated through limitation on the hours of operation. This is not realistic because many people must sleep during the day. These include infants, people who are sick, and people who have to work during the night (e.g. police officers, etc.). I suspect that sleep interference is an unavoidable adverse impact.

6. Executive Summary, page 5

The last sentence of this page states that the state and city noise ordinance criteria are not exceeded. This is inaccurate as previously noted.

7. Executive Summary, page 6

The report suggests that the proposed Bell 206B helicopter is the quietest in its class, according to the manufacturer. I suspect that most manufacturers would make this claim about their own machines. Perhaps it would be worthwhile to have an independent assessment made of this point.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

8. Executive Summary, page 6

Noise abatement flight procedures during approach and departure are listed as recommended noise mitigation measures. These include maintaining 1,000 ft. altitude, whenever possible. However, one of the conclusions of the noise testing was that altitude had no effect on the noise levels in the community (see page 2-2). This procedure cannot be listed as a noise mitigation measure since it provides no noise reduction. In addition, avoiding sharp maneuvers and using moderate approach and take-off angles is also suggested to eliminate blade slap noise. The report does not state what types of maneuvers the helicopter used during the tests (e.g. turns, approach and take-off angles, etc.), but I suspect that the maneuvers that are known to emphasize blade slap noise were not employed during the tests. Consequently, this should not be listed as a noise mitigation measure, but more accurately a measure which must be **required** to avoid <u>increased</u> impacts above and beyond those revealed in the environmental noise assessment.

9. Executive Summary, page 6

Nighttime flight operations are shown to be infrequent, 4% of all operations. If operations average 2.5 flights per day (based on 260 weekdays per year), then this would result in approximately 26 nighttime flights per year. This fact should be revealed.

10. Executive Summary, page 6

The conclusion of the executive summary is that noise mitigation measures are available. In fact, none of the proposed noise mitigation measures will have <u>any</u> effect in terms of reducing the expected helicopter noise level in the community compared to those measured during this study. If noise mitigation measures are shown in the environmental noise assessment, the net effect of each these measures should also be revealed.

11. Introduction, page 1-1

The report states that "the noise abatement flight procedures will virtually eliminate the noise impacts from the proposed operations." The report provides no substantial evidence to support this conclusion.

Proposed Additional Measurements

In my opinion it is imperative to conduct additional acoustical measurements if the noise impacts of this proposal are to be properly disclosed. These measurements should include the following:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. Ambient noise measurements in the community in at least four different locations. I would recommend two locations that fall inside the 70 dBA Lmax helicopter noise contour, and two other locations which fall between the 60 and 70 dBA Lmax contours. The measurement microphones should be located in the vicinity of an exterior second story window, and each measurement should extend for at least 48 hours. At a minimum, the measurement system should record the following hourly noise statistics: Leq, Lmax, Lmin, L(1), L(10), L(50), and L(90).

2. Helicopter noise measurements in the residential community surrounding the proposed helistop. Additional measurements are required in order to more accurately determine the interior maximum noise levels associated with the proposed project. Interior noise measurements with windows open and with windows closed are recommended. Preferably, these measurements would be taken in residences near the new ambient noise measurements. The helicopter noise measurements should include the following helicopter maneuvers:

   a) approach and departure at a steep and a moderate angle - no turns,

   b) approach and departure with a sharp turn,

   c) approach and departure with a high and low rate of ascent/descent.

   The acoustical data should be recorded on digital audio tape for post-measurement frequency analysis. In addition to measuring interior sound levels directly, this data will provide a means of determining whether or not excessive levels of low frequency noise will penetrate the exterior walls of the houses.

The helicopter noise tests could be conducted on a weekend, if desired. However, a weekend test is not essential. The ambient noise tests should be conducted primarily on weekdays, but over one weekend at one of the four locations.

I understand that some additional helicopter noise testing has been suggested for the Alki area to respond to the question regarding low visibility flying conditions. I do not believe that this testing would be very valuable considering the fact that the helicopter will always be 1/2 mile from the shoreline. The expected maximum sound level at this distance would be less than 60 dBA. Considering the expected frequency of low visibility flying conditions, it does not seem to me to be worthy of additional testing.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Summary

In summary, the Environmental Noise Assessment prepared for this project is inadequate because it has failed to accurately assess the probable impact of the proposed project. Errors were made in the determination of the existing ambient noise level in the community, and several unsubstantiated assumptions were made in the determination of the impact of interior helicopter noise in the surrounding residential community.

The SEPA process generally requires that the worse case environmental impacts be revealed. The June 1991 Environmental Noise Assessment (supplemented by the September 1991 follow-up report) fails to provide the necessary information to ensure this disclosure.

If you have any questions or comments concerning these findings and recommendations, please do not hesitate to give me a call.

Very truly yours,

Re: 4800 Sand Point Way Northeast
MUPs #8405870 and #9106441

Suzanne Peterson, Director
Governmental Relations
Children's Hospital and Medical Center
4800 Sand Point Way Northeast
P. O. Box C-5371
Seattle, Washington 98105

Dear Ms. Peterson:

The Department of Construction and Land Use (DCLU) is preparing to publish its recommendation on the proposed helistop at Children's Hospital and Medical Center (CHMC). Prior to publication of the recommendation, CHMC must pay the fee for the time spent reviewing the project. On February 22, 1989, DCLU notified CHMC that $71.00 per hour would be charged for environmental review costs incurred after January 1, 1989. CHMC must also pay, at an hourly rate of $71.00, for all time spent on the original Council Conditional Use component.

To date, over 600 hours of land use review time have been spent on this project. Since January, 1989, approximately 84 of these hours have been charged to billable environmental review. Since January, 1985, approximately 170 hours have been charged to the Council Conditional Use component. The remaining hours were assigned to environmental review and, according to our letter of February 22, 1989, are not billable.

The majority of the billable hours for this project have been, and will continue to be, charged to the original project, #8405870. CHMC also has a second project, at the Intramural Activities Field site, #9106441. This project is an integral piece of the preferred alternative to the originally proposed CHMC helistop. Because of its more recent application date, it is subject to the current fee ordinance with an hourly charge of $110. The hourly fee for project #9106441 will be $1,798.50 for 16.35 hours. You have paid a deposit of $1,100 toward this fee, so only an additional $698.50 is owing.

In addition to the hourly fees incurred to date, we estimate a substantial number of additional billable hours will be

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

spent in the upcoming public hearings. To cover these hours, as well as the time to finalize the recommendation, we are adding 50 hours to the current bill. Following a Council decision on the project, DCLU will total the billable hours. In the unlikely event that fewer than an additional 50 hours are accounted for, the overpayment will be credited to any other fees owing or will be refunded. If more than 50 hours are shown, a new bill will be generated.

The amount owing at this time accounts for hours spent through approximately April 20, 1992, plus an estimate of time needed to complete the project.

MUP #8405870

Council Conditional Use	170 hours	
Environmental Review	84 hours	
Additional Billable (estimate)	50 hours	
TOTAL	304 X $71.00 =	$21,584.00

MUP #9106441

Council Conditional Use (average hours)	16.35 X $110.00 =	1,798.50
	less deposit	<1,100.00>
TOTAL		$ 698.50
TOTAL AMOUNT DUE		$22,282.50

If you have questions concerning this bill, please call me at 233-3856. We hope to publish the recommendation in early May, but must receive payment prior to publication. We look forward to completing this project.

Sincerely,

Laura L. Gilbert

Dear Ms. Sumoden:

I write regarding CHMC's Final EIS on the helistop. I do not advocate a total ban on landings there, but do feel that there should not be an increase from current levels, maintaining use of the UW fields at 45th and Union Bay for most landings. The safety record of these flights makes it statistically a quite high risk activity. You know there are homes, schools, and play fields very much at risk. I don't think the risk to benefit Ratio supports expanding helicopter service at the hospital.

Dear Ms. Lumsden:

I am concerned about the proposed helistop at Children's Hospital Laurelhurst facility. I live five blocks away from the hospital and have a "center stage view" of helicopter landings and take-offs. I shudder inside each time I watch these maneuvers. It is unbelievable to me that my society can justify and condone putting so many people in peril for each landing and take-off. I would be happy to offer my home to you as a viewing site to watch and also hear the noise created by these landings.

Sincerely yours,
Lilla O'Grady

Dear Ms. Lumsden,

The continuing encroachment into the Laurelhurst community by the Children's Hospital and Medical Center has become a bone of contention for many in what was once a residential neighborhood. Many have remained silent as the aims of the original land owners are totally ignored; as the facility continues to pressure and overpower its neighbors.

The benefit of the hospital is without question as it is with low-income housing and other institutional facilities which surround us. It reaches a point, however, when one must try to call a halt to unnecessary (where alternatives are available) but especially to unsafe schemes as the helistop.

It is essential in my view that we do not permit this monolithic facility to "strong arm" us into submission on such a vital public safety issue. Please record my "No" vote on this matter.

Very truly yours,

Bruce Davis

Ms. Faith Lumsden
DCLU
710 2nd Ave. Suite 700
Seattle, Wa. 98104

Dear Ms. Lumsden,

I am writing today to ask that you deny the permit for COH to build a helistop in a residential neighborhood. The environmental impact statement that was issued by COH cover a variety of issues and highlights the reasons that major institutions would like the city to ignore the zoning in favor of disruptive and unnecessary expansion.

DISRUPTIVE quite simply due to the incredible noise that is created by the helicopter. The environmental impact statement would like one to simple rely on the measurable and statistically quantifiable impact of the noise. The EIS does not account for the prolonged impact of this noise. My entire family is disturbed every time the helicopter lands and continues while the unit is on the ground with the turbines running and is jolted again when the unit takes off from COH. We do not believe that the human impact that is felt by the families and the children in the area around COH is properly addressed in the ESI.

The ESI would like the DCLU to believe that this noise is not covered by the Seattle City Noise Ordinance because of it's emergency status. COH can only rely on this exception to the rule by breaking the established regulations and then asking that the DCLU legitimizes there abuse.

UNNECESSARY because COH has an alternative sight to use for landings and as the base for expansion. These sights are not in a residential area and are conducive to the landings and use that COH is trying to force Seattle neighborhoods to accept.

Please do not let the major institutions destroy the City's foundation, strong and positive neighborhoods.

The residential neighborhoods are the heart of every city.

Sincerely,

4715 47th Ave N.E.

Dear Faith:

It is my understanding from speaking with Suzanne Petersen that you have inherited the Children's Helistop project.

For a substantial part of my professional life I was the project manager for the EIS on the helistop. In this capacity I was responsible for the many drafts of both the Draft and Final EIS documents. While at times these documents appeared to have lives of their own, their evolution was in response to changes in alternatives, in CHMC and Airlift Northwest programs and procedures, in the improvements in aeromedical safety records, and a few dozen other factors. In speaking with John Doan I am aware that not all of these changes are fully documented in the DCLU files.

As a result of my 5+ years of involvement in the EIS I see myself as something of a project historian. Since the publication of the Final EIS I have left Shapiro and Associates and embarked on something of a 'walkabout.' However, I also have committed to Suzanne that I would help to see the project through the Hearing Examiner/City Council hurdles and hearings.

Having been the consultant on the EIS, I see that my first responsibility is to DCLU and to be available to assist the Department, as needed, during the preparation of the Department's decision and recommendation to the Hearing Examiner as well as to assist in the actual hearing.

I'm available to answer any questions that you may have on the project and that may not be readily available or apparent from the DCLU files. Please don't hesitate to contact me, if I can be of any assistance. Getting in touch with me is possible by calling (310) 858-4994 and leaving a message -- I pick up messages at least as often as every couple of days.

Best wishes,

Glenn Bachman

Final Environmental Impact Statement
Master Use Permit No. 8405870
4800 Sand Point Way N.E.
Children's Hospital and Medical Center Helistop

This document has been prepared in compliance with the State Environmental Policy Act (RCW 43.21C) and the Seattle SEPA Ordinance, Chapter 25.05, SMC. Copies of this document are available for public review at the Master Use Information and Notification Center, 408 Seattle Municipal Building and the following branches of the Seattle Public Library:

1. Downtown Branch - 1000 4th Avenue, Seattle 98104
~~Governmental Research Assistance Library - 3rd Floor, Seattle Municipal Building, Seattle 98104~~
2. North East Branch - 6801 35th Avenue N.E., Seattle 98115
3. University Branch - 5009 Roosevelt Wy N.E., Seattle 98105
~~University of Washington Library~~

AA

A limited number of copies for public distribution are available at the Land Use Information Center, 684-8467.

BB

The Department of Construction and Land Use will issue a recommendation on whether to grant, condition, or deny the project described above no sooner than seven days after the date of this document. A public hearing for citizens to comment on the proposal and recommendation will be scheduled at that time. The final decision will be made by the Seattle City Council. Notice of the decision will be published either on a Monday or a Thursday in the Daily Journal of Commerce. Notice of the decision will also appear in the Department's twice weekly Land Use Information Service bulletin and will be mailed to those who request a copy of the decision.

Sincerely,

REBECCA HERZFELD
Director
Land Use Division

We are opposed to the plan to build a helistop at Children's Hospital and Medical Center. We feel this is unsafe air traffic in our residential neighborhood.

I am a consultant in aviation. I prepared the 20-yr. helicopter study (PSCAG) for the Puget Sound. "Swoop + scoop" marketing expansion using power-lift medevac aircraft is an understandable marketing technique in an ever more competitive environment for hospitals. However, Childrens is a conditional use in a single family zone. They plan to build a new trauma facility in the Bellevue area, and a helistop / heliport can be more adequately designed for emergency cases at that location.

Until that facility becomes operational, the joint UW/Childrens helipad should be adequate.

As an alternative, Harborview is the area's trauma center — and should provide an environment where critical cases can be stabilized. We encourage further documentation and research into this matter.

The safety record for medevac operations has been dramatically improved in the last few years, but remains below that of fixed wing and rotorcraft operations nationally.

Please consider: ① Harborview for stabilization, ② providing the regions helistop for children in Bellevue at the planned facility, and ③ the repercussions of an "event" if an Airlift Northwest Augusta 109 should crash in a residential neighborhood during "emergency conditions.

Dear Ms Lumsden:

As a longtime resident of Lauelhurst I would like to voice my objection to a CH/H C building a helipat which would increase landings and take offs.

As a flight engineer flying in helicopters w the Coast Guard we always knew of the danger of unexplainable wind shifts, wind shear, mechanical failure due to undetected metal fatigue, and other failures that could cripple the aircraft even at take off and landing. Here we have a dense residential neighborhood to consider, unnecessary noise pollution, a diversion which could interrupt traffic, etc. The UW field is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

convenient and extremely close. The added less than 5 minutes of the emergency entrance by trained medical technicians give a extremely high level of medical services.

The risks of this heliport, I believe, outweigh the perceived benefits.

Dear Ms Lumsden:

The construction of a helistop at CHMC Should be approved.

A s far as neighborhood safety is concerned, we are all much more liable to be injured or die in our bathrooms or cars than by a helicopter accident; and, of course, any increase in noise is so slight and so short in duration as against cars, lawn mowers, leaf blowers, edge trimmers, garbage trucks, etc., that it is of absolutely no consequence.

The important fact to remember is that these flights are going to be made anyway since nobody would deny a child who requires immediate medical attention, the lifesaving potential of the helicopter. The helispot will help make these flights safer and speedier during takeoff and landing.

Very truly yours,

R. L. Loesch

RE: Helistop at Childrens Hospital & Medical Center

Dear Ms. Lumsden:

I am writing you to voice support for the endeavors of Children Hospital with regard to helicopter landings with sick children. If it were my child I would of course want to get the quickest and best medical care available, which I believe is at Children's Hospital.

My wife and I currently live at 3811 48th Avenue Northeast and I have been a Laurelhurst resident for over 35 years. When we had the Naval Air Base as a neighbor we enjoyed the disturbance because it was in the best interest of our country, as is the helicopter landings in the best interest of our children. I also believe that the helicopters should not be required to land at the University of Washington, as to delay emergency treatment of these children.

Please feel free to call me should you have any questions.

Very truly your

Dear Ms. Lumsden:

I am writing to express my concern about the proposed plan for a helistop at Children's Hospital and Medical Center as contained in the Final Environmental Impact Statement.

While the vital service provided by this institution is widely appreciated, it should not be forgotten that it is located in a primarily residential neighborhood which greatly predated its beginnings. Indeed, when the hospital first began about forty years ago, it assured the local community that it would respect the residential character of the neighborhood and maintain a relatively small scale. While these assurances seem to have been forgotten, the residential nature of the community remains and deserves consideration. Helicopter flights arriving and departing over our rooftops threaten both the quality and, in the very real possibility of a crash, the safety of our lives.

I am pleased to learn that serious consideration is being given to a permanent helistop near the University Intramural Athletic Field. In all but the most critical cases this site will provide adequate access to the Hospital. Children's Hospital and DCLU are to be commended for developing this possibility. As a resident of the neighborhood, I ask that use of the University site be maximized and that flights over our residences be prohibited for all but those critical cases where delays of minutes could be life-threatening.

Thank you very much for your consideration.

Sincerely,

Re: Children's Hospital helistop application, File No. 8405870

Dear Ms. Lumsden:

I appreciated the opportunity to speak with you on January 7 about the forthcoming DCLU recommendation on the Children's Hospital helistop proposal. As I mentioned, the frequency of helicopter transports has noticeably increased in recent weeks. Records maintained by Suzanne Petersen of the hospital indicate a total of 14 cases from December 1, 1991, through January 8, 1992. Following each flight into the neighborhood is, of course, a take-off sometimes as much as a hour later, thus in fact doubling the number of separate flight impacts to 28.

These figures are significantly higher than the "...1990...average of 4.3...per month..." (page 72, April 1991 final EIS). They also cast doubt on the projected 3-5 transports per month in 1995, under the EIS preferred alternative.

I can appreciate your frustration at designing enforceable, meaningful mitigating measures as you prepare the DCLU recommendation to the City Council. It will be virtually impossible to enforce a restriction on monthly landings to a specific number. Thus I suggested restricting flights of the truly critical cases to certain hours, such as 7AM to 9 PM. All other cases would land at the UW intramural field. The advantages of this time-constrained recommendation include: easier monitoring and enforcement, less risk of helicopter accidents or crashes if landings are allowed only during daylight hours; less sleep disturbance among neighborhood residents; and reliance on surface transport from the UW intramural field during times of least traffic congestion.

As you explained at a meeting of the hospital Master Plan Committee, the helicopter issue is technically "off limits" in the MP process. I appreciated your comment in our recent conversation, however, that helicopter landings cannot be divorced completely from the overall picture of activity on the hospital site, and thus will continue to arise in discussions and deliberations of both the MP Committee and the City Council. And in fact, the MP Committee suggests that the DEIS investigate the possibility of confining helicopter landings to Harborview, where the regional trauma center is. You might confer with Nathan Torgelson of your department, who is drafting the Committee's DEIS scoping letter, for the exact wording of this request.

Again, I appreciated the opportunity to visit with you on this issue.

Sincerely,

Jane L. Johnson

Re: Proposed helipad at Children's Hospital & Medical Center (CHMC)

Dear Ms. Lumsden:

In addition to the fact that Harborview Hospital is in process of building a new trauma center and pediatric emergency department and already has in place a helipad, I note the following concerns related to my opposition to the proposed helipad at CHMC:

1. Overflights of helicopters (in and out) impact a populous residential area where hundreds of people's lives are endangered and reasonable use and environment of their property has been disregarded.

2. In an article in the P-I, January 21, 1992, it was reported "CHMC will spend $24 million on charity care this year ... but legal residents of Washington get first priority. Our policy here is we don't turn anyone away, but we have to put a proviso on that or else we would be overwhelmed by people from other states or countries." In this article we were told about a little girl who was rejected by CHMC and who had to go to Spokane for needed treatment. She was turned away by CHMC because she was not a legal resident of Washington, but was a charity case. Exactly how does CHMC pick and choose? How do they decide which Airlift Northwest flights will go to CHMC? CHMC has acknowledged they have no control over the landings--whether Airlift Northwest, Army or Navy. There is no standard criterion so far established.

3. Nuclear research and disposal of nuclear waste from it in a residential neighborhood is unacceptable; it is especially questionable and dangerous one block from an elementary school.

Please consider these concerns. Please do not allow a helipad built at CHMC.

Thank you.

Sincerely,

Helen Newman

Re: Proposed helipad at Children's Hospital & Medical Center (CHMC)

Dear Ms. Lumsden:

Please, please recommend to deny the construction of the proposed helipad at CHMC. Safety is the prime issue.

This week three medical helicopters crashed. These were reported as follows in the Seattle Times:

Date	Place	Headline
3-5-92	Safford, Arizona	"Downed helicopter found: survivor rescued, 2 dead"
3-6-92	Detroit, Michigan	"Air ambulance crash kills all three aboard"
3-7-92	Juneau, Alaska	"Another helicopter crashes in Alaska"

No one wants this to happen here. The proposed site at CHMC is surrounded by a heavily populated residential neighborhood. A crash would be catastrophic.

As you know, a new neighborhood group has recently been formed--concerned and thoughtful citizens who clearly see the potential for such a catastrophe, who deserve to be heard and heeded in their sincere anti-helipad stand at CHMC.

I repeat what I have said in previous letters and conversations, we must stop a tragedy from occurring before it happens.

Thank you.

Sincerely,

Maryann E. Spangler

710 2nd Ave., Suite 700
Seattle, Wa. 98104

Dear Ms. Lumsden,

I have never written a letter like this before, but for many reasons I feel now is the time to start. I was told this is the time to express my opinion about the helistop at Children's Hospital.

Our family lives in a home on the corner of 44th NE and 47th Ave. NE. It is the closest house to the Emergency Room at Children's and as such we see and hear each landing and take-off of the medical helicopters. We purchased the house 18 years ago when our oldest son was 3 years old and needed nightly medical treatment at the Emergency Room of Children's. Yes, we understand the fear and helplessness that parents feel who come to the Hospital with desperately ill children.

I also worked at Children's Hospital for ten years. I was their Accounting Manager. When Mr. Katz and his new administration came to the Hospital in the early part of the 1980's many things changed. The most significant change came to the financial statements. His focus was to make Children's a financial success. I am a CPA, I realize that is the focus of most corporations, but Children's was created with a different purpose. The purpose had been to provide excellent medical care to children regardless of their family's ability to pay. And there had been great community support generated to ensure that this promise could always be kept.

Mr. Katz's administration has changed the criteria in the determination of which families receive the benefit of the Free Care Program. The emphasis has been to make the review of the financial strengths of the family more complete. If the family has an asset such as a home that can be mortgaged then they are expected to do that to cover the cost of medical care. In the past that sort of review was not done. It was thought that a family would not benefit from the added burden of that liability when their other financial resources were very limited and they were already burdened with a severely ill child. The families were required to proved that they had no medical insurance and had no immediate ability to pay for their care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

You must wonder what this has to do with helicopters. I use this as an illustration of the focus of the administration of Children's Hospital. With financial success their goal and growth their tool their is no hope that our neighborhood will survive the impacts that ever more service related visits to the Hospital by helicopter will produce.

In our home there are now three children who go to school, play baseball at the park, play basketball at the Laurelhurst School Gym, and ride their bike on the side walks next to the Hospital. How will we all be affected if the ever increasing landings are not monitored to determine <u>real</u> need versus the revenue that can be generated by the added billing to the insurance company? Who will be able to insure the safety of all the children who live, go to school and play in the three block radius of the Hospital? Who will be able to tell how the helicopters are being used and under what circumstances the decision is made to fly a child to Children's rather than another hospital which has a helistop? We are responsible parents and caring people who have seen too much to trust the judgment of the administration of Children's Hospital. The focus of the Hospital remains one of bottom line management. When a new administration returns the focus of Children's Hospital to families and children we will again become "neighbors" to Children's Hospital. But that is not the relationship we have at this time.

As you can tell we have a growing concern that when and if a legal permit is issued for the helicopter landings there will be an unbelievable growth in their use with no resource to stop a very well financed Hospital from expanding beyond the intent of the law. It will continue until there is an accident and then it will only be slowed temporarily.

My proposal is that very ill babies and children be air lifted to the trauma center at Harborview. When they are stabilized they can be transported to Children's Hospital by ambulance.

Thank you for your time and attention to this important matter.

If you have any further questions of me I can be reached at 524-8532 (home) or 546-4672 (work).

Sincerely,

Cheryl L. Kitchin

Dear Ms. Lavender:

re: Childrens' Hospital -

I see no reason for a helistop - they are landing there without one!? They get an idea for another kind of construction - away they go & keep bothering until they get their own way. They have decreased the value of my property substantially by taking away every bit of my view of our beautiful Olympic & that has made me very angry. We have been very patient while they continue to be completely unfair!

Most sincerely,

Elizabeth Shmidt

Dear Ms. Lumsden,

I wish to express my concern over the proposed building of a helistop at Children's Hospital and Medical Center.

Since there is a very good alternative by using the playing field landing site just minutes from the hospital by ambulance or aid car it seems irresponsible to endanger the citizens who live in the vicinity, including homes, condominiums and schools.

Not all of the children who are brought in by helicopter survive, and not all the children brought by ambulance from the playing field landing site will survive, but I think their chances are equal. Therefore it seems prudent to use the safer site.

Helicopters have a high accident rate, and the landing space at the Hospital is quite limited. Why endanger the lives of the many who live in the direct path of flight when there is a very good alternative?

Sincerely,

Lillian J. Mills

Dear Ms Lumsden,

We are writing to you in regard to the Children's Hospital and Medical Center proposed plan to build an on-site helipad on their Campus at 4800 Sandpoint Way N.E. For many years we have been strong and active supporters of Children's Hospital, however, we do not feel we can continue to support their constant requests for on-site expansion and an on-site helipad.

Since the CHMC became affiliated with the University of Washington, they have continually requested more expansion, have become a political entity and a big business. It is no longer the organization we so strongly supported in the past. It is now impacting street traffic as well as air traffic and has become an emotional issue.

We feel it is extremely unsafe to have aircraft activity over thickly populated residential areas such as those surrounding CHMC. This area has many condos, apartment complexes, private homes, 2 schools, a community center as well as a hospital full of sick children.

We believe the CHMC facilities at Harborview Medical Center should be expanded to include a CHMC trauma unit in conjunction with the current Harborview trauma center for adults and children. This should eliminate the necessity of impacting so many neighborhoods in the city with requests for individual on-site helipads.

We feel the University and CHMC could successfully develop a helipad at the U of W Intermural Field where helicipters have been landing for years, for other than trauma center patients. This area can be reached over open space and is only minutes from CHMC.

Thank you for your consideration of this matter.

Yours very truly

We are writing to you in regard to the Children's Hospital and Medical Center proposed plan to build an on-site helipad on their Campus at 4800 Sandpoint Way N.E. For many years we have been strong and active supporters of Children's Hospital, however, we do not feel we can continue to support their constant requests for on-site expansion and an on-site helipad.

Since the CHMC became affiliated with the University of Washington, they have continually requested more expansion, have become a political entity and a big business. It is no longer the organization we so strongly supported in the past. It is now impacting street traffic as well as air traffic and has become an emotional issue.

We feel it is extremely unsafe to have aircraft activity over thickly populated residential areas such as those surrounding CHMC. This area has many condos, apartment complexes, private homes, 2 schools, a community center as well as a hospital full of sick children.

We believe the CHMC facilities at Harborview Medical Center should be expanded to include a CHMC trauma unit in conjunction with the current Harborview trauma center for adults and children. This should eliminate the necessity of impacting so many neighborhoods in the city with requests for individual on-site helipads.

We feel the University and CHMC could successfully develop a helipad at the U of W Intermural Field where helicipters have been landing for years, for other than trauma center patients. This area can be reached over open space and is only minutes from CHMC.

Thank you for your consideration of this matter.

Yours very truly
Fred M Wright

Dear Ms. Saroseders

This is a request to please deny Childrens' Hospital & Medical Center their proposal to construct a Helistop pad on their site. This is a quiet, residential neighborhood of homes, condominiums, churches & schools. The noise, unsafe record and terrific expense of helicopters really concerns many of us and honestly feel it to be unnecessary with the exceptional treatment performed at Harborview. Thankyou

Sincerely

(Mrs Dec.) Barbara H. Smith

Re: Helicopters at CHMC

Dear Ms. Lumsden:

Attached you will find the helicopter flights at Children's Hospital & Medical Center for the months of October, November, December 1991. I received this list today.

You will note the following:

October -	9 landings	= 18	overflights
November-	6 "	= 12	"
December-	10 "	= 20	"
TOTALS	25	50	

You will also note one omission: 12-26-91 which was recorded by neighbors, one of whom called you about this particular flight.

Further, you will note that this is a large increase of total overflights for this/a three-month period (compare with other data I have given to you in the past).

Once again I voice objections to this continued and unsafe situation in a residential neighborhood. Once again I request that permission not be granted for a helipad on the present campus of CHMC.

Thank you.

Sincerely,
Maryann E. Spangler

Children's
Hospital & Medical Center

March 1992

To Our Neighbors,

In an ongoing effort to keep you informed about emergency medical helicopter activity at Children's Hospital, we are sending you quarterly reports about the number and types of cases of the children who required helicopter transport to Children's Emergency Room entrance.

In order to minimize the impacts on the community, only the most critically ill or injured patients are to land at the Children's Emergency Room entrance. Other patients determined able to withstand delay and movement are landed at the Intramural Field and are transported by ambulance to Children's. The decision about where to land is based on the condition of the patient. The majority of patients continue to arrive at the Emergency Room by ambulance.

Most requests for emergency helicopter transport of patients to Children's come from physicians in the Puget Sound area or Olympic Peninsula. Children's Hospital and Medical Center is a regional specialty hospital. Often, there are several pediatric specialists called to the case within minutes of arrival. Community hospitals do not have the resources to provide this highly specialized pediatric treatment and diagnosis.

This report is mailed to all households in the 98105 zip code and some in the 98112 zip code through a mailing service. We apologize for any address errors.

If you have questions about this report or about emergency medical helicopter landings at Children's, please contact Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write her at Children's Hospital and Medical Center, PO Box 5371, Seattle, WA 98105-0371.

Sincerely,

Treuman Katz

President and Chief Executive Officer

* Definition of Diagnosis / Treatment

Acute tracheitis: *Inflammation and swelling of the trachea (airway) that, if severe, will impair breathing.*

Hypoxia: *Lack of oxygen; in this case, because the hot dog was aspirated and was blocking the airway.*

Meconium aspiration syndrome: *Pneumonia-like illness of newborn due to inhalation at birth of fluids containing material from infant's bowel movement.*

Status asthmaticus: *Severe asthma attack during which the patient is not responsive to treatment.*

Streptococcal sepsis and streptococcal meningitis: *A bacterial bloodstream infection and a bacterial infection of the membranes covering the brain and spinal cord.*

Viral encephalitis: *A viral infection of the brain often associated with seizures, alterations of consciousness, fever, neurological dysfunction and mental changes. May be life-threatening, requiring intensive care and treatment.*

Ms. Faith Lumsden
Department of Construction
& Land Use
Dexter Horton Bldg.
710 Second Ave.
Seattle, WA. 98104

Dear Ms. Lumsden:

Thank you for taking the time and listening and talking with me on Friday, January 17. I appreciated this.

Here are the statistics which you requested related to helicopter landings at Children's Hospital & Medical Center for the one year, 1991:

Jan.	6
Feb.	7
Mar.	7
Apr.	8
May	3
June	6
July	4
Aug.	3
Sept.	10
Oct.	8
Nov.	5
Dec.	9
TOTAL	76 x 2 (in & out overflights) ='s
	152

Average per month: 6.33 x 2 ='s 12.66

As has been mentioned, at first CHMC did not count/include both the in and out flights: however, each flight is a part of the safety for residents. Invariably the departure, out-flight is lower and over Laurelon Terrace Condominiums.

Thank you again.

Sincerely,
Maryann E. Spangler

Seattle, WA 98105
February 23, 1992

Ms. Faith Lumsden
Department of Construction and Land Use
Dexter Horton Building
710 Second Ave.
Seattle, WA 98104

Dear Ms. Lumsden:

I am writing on behalf of a dozen or so families who live in owner-occupied dwellings in the vicinity of Children's Orthopedic Hospital in Northeast Seattle. This group, known as Northeast Families for Residential Neighborhoods, has been organized in response to recent actions of Children's Hospital that we see as harming the safety and integrity of our neighborhood, and leading ultimately to an institution far beyond the scale appropriate to the site that Children's Hospital presently occupies on Sandpoint Way. They authorized me at a meeting on February 12th to convey our concerns to you.

Our particular concern at this time is the desire of Children's Hospital to get a Conditional Use Permit to regularize the landing of helicopters in emergencies at the hospital's present campus. We are deeply concerned and opposed to such landings. While we recognize that saving lives may occasionally require helicopter transport of patients, we believe Children's Hospital's present campus is an inappropriate place for such landings, and that Children's Hospital could easily build emergency care facilities for children at other, more appropriate, sites such as Harborview Hospital--the only authorized helipad in the city, and already the site of a certain amount of emergency care for children--or the Issaquah campus that Children's Hospital is presently planning.

Let me explain why we feel that helicopter landings are inappropriate at the present campus of Children's Hospital.

(1) Helicopter landings in a residential neighborhood are dangerous.

As helicopters must land within 100 feet of family homes, we feel that accidents leading to injury of residents are a real danger. The COH campus is surrounded by residences--condominiums on the west and north that are largely occupied by senior citizens, and single family homes on the east and south mostly occupied by families with children. Laurelhurst School is one block from the campus and within 200 yards of the proposed landing site.

Crashes of medical, and other, helicopters are not unusual. In

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

typical cases such crashes happen when helicopters hit hazards such as telephone wires, trees, or other aircraft. These hazards can be minimized where visibility is good. Emergency helicopters have to fly when the patients are sick, however. This means they often must fly at night and in bad weather when visibility is poor and even seemingly minor hazards can be major problems. When the weather is good there is still the hazard of other small aircraft. Apparently because the Laurelhurst neighborhood and COH are on the direct flying route between Lake Union and the Lake Washington seaplane landing area, we get an amazing amount of small aircraft traffic in our area. I can stand in my yard across the street from COH for hours on many days and never once be unable to sight small aircraft in Laurelhurst airspace. This, of course, is in addition to the large aircraft heading at an altitude of a couple of thousand feet for Seatac Airport whose flight path goes directly over the University of Washington half a mile from COH.

We feel these hazards are real, and that residents near COH or the children at Laurelhurst School---who, as you known, come from all over the city, not just Laurelhurst--should not be exposed to such dangers. At present, the helicopters come into COH from all directions. This means that they sometimes directly fly over Laurelhurst School, but at other times fly over the residents nearest the heliport.

(2) Helicopters are noisy and disturb residents both day and night.

Residents close to COH are already being regularly woken up at night by shaking windows and vibration noise as helicopters come overhead. If helicopters come in very high and then descend vertically at the landing site, such noise can be reduced to a degree, but it has been our experience that pilots vary greatly in the direction from which they come, the altitude they overfly the neighborhood, and the closeness they come to trees, wires and other hazards. The size of the helicopter also makes a big difference in the amount of noise involved. Large military-type helicopters shake and rattle everybody's windows no matter how they come in. We do not believe that instruments set up to measure helicopter noise accurately measure real-life noise levels because whenever such instruments are set up, pilots are on their 'good behavior.' Our experience has been that when such devices are removed, some pilots remain on their good behavior, while others come in buzzing local houses in very frightening ways. This is not simply a distraction at night. Several residents do a significant amount of their work at home, and find frightening overflights during the day as distressing as those done at night.

Noise levels that might be tolerable in a commercial district with heavy noise already brought in by traffic, or that might be tolerable to the employees of COH, are intolerable in a residential neighborhood. After all, one can leave the commercial district or hospital after one's job or business are done. One's home is one's refuge from the noise and dirt of everyday life. If this refuge is disturbed, where can we go? Residential zoning ordinances are

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

designed to preserve the safety and peace of people living in their refuges, their homes, and we believe helicopter landings are incompatible with this residential use.

(3) It will be impossible, in the long run, to limit the number of neighborhood overflights

Unless COH is forced to develop another site dedicated primarily to emergency care where unlimited helicopter landings are appropriate, flights into the COH campus--with their attendant danger and noise--will inevitably increase, and effective control of them will be impossible. Even now, when overflights are supposedly limited to 7-8 a month, there have been months when this number has been exceeded. In December of 1991, for example, neighbors logged twenty-four flyovers of helicopters that landed at COH. If COH continues to use its Laurelhurst campus for this kind of emergency treatment, overflights will inevitably increase. Neither the neighbors of COH or the public at large would willingly sacrifice the life of a child, if the COH campus is the only place in town where that life can be saved. For this reason, the number of overflights will inevitably grow with growth of patient populations and more advanced life-saving technology. This illustrates the fact that the only real solution to helicopter overflights in a residential neighborhood is forcing COH to build a separate, more appropriately located facility with patient-care facilties to receive such flights.

(4) The danger and noise of helicopter overflights combined with other COH impacts have already affected the salability of houses bordering COH.

Even in today's real estate market, property has sold well in Laurelhurst, yet on the streets that border COH no houses that have come on the market in the past year have sold (one house has been on the market for almost two years). This is during a time when, one block away, three houses were all sold in fewer than three months.

(5) COH's recent proposed expansion raises serious issues about the helicopter landing pad.

The presently proposed helipad site is precisely in the middle of an area of COH's property for which a zoning change is being proposed. This site is on a part of COH's campus which, though still within 100 feet of a house, is as distant as possible from most other residences. The proposed zoning change, however, makes us wonder whether COH, once they get a conditional use permit, may change the location of the helipad to one that has a much more severe impact on neighbors than the presently proposed location.

Although we are opposed to helicopter landings at COH's Laurelhurst campus at all, there are certain measures that would mitigate the nuisance of a heliport.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(1) A paved helipad must not be built. For the number of flights COH has been talking about, a grassy helipad will be adequate, present fewer environmental problems, and be less unsightly. There is no need to build something creating drainage and run-off problems unless COH has bigger plans for the heliport than they have let on. Given the history of COH expansion in the past few years, we feel this latter point is a very real possibility regardless of what COH says publicly.

(2) The size of helicopters must be limited. No matter how they come in, large military-type helicopters are frightening and shake up houses and residences.

(3) The number of flights must be limited, and there must be a mechanism by which they are monitored by neighbors. Those of us who have lived near COH for a long time do not believe that COH will deal with neighborhood concerns in good faith. Though individual employees of COH are often helpful, we have found by experience that COH will only abide by agreements with the city if they are forced to. Already the Doctor's Pavilion, which COH promised would be used only for doctor's offices at the time of its zoning hearing, is being used for a variety of other purposes, and we see no reason COH will not behave similarly with the heliport. We are concerned that COH is in the process of creating a regional trauma center that will require many more flights per month than they are presently discussing.

(4) The routes and altitudes by which helicopters approach the hospital must be limited. Presently some pilots approach COH via Sandpoint Way and the hospital lower campus--a route that minimizes noise and danger to residents and avoids Laurelhurst School. Other pilots, however, come by any route they feel like--directly over houses, over Laurelhurst School, over Laurelhurst playfield, et cetera. We do not feel the extra danger presented by these flight routes is justified.

(5) The precise location of the heliport must be designated and new hearings be held if the location of the heliport is to be changed. In light of COH's expansion plans and their desire for a zoning change that bisects the proposed sight of the helipad we have serious concerns about its location. We especially are concerned that COH will eventually locate such a helipad on the edge of their campus where it will endanger and disturb residents even more than at present. COH's present zoning requires them to set even buildings well in from the street so as to minimize their impact on the neighborhood. These zoning requirements would be made a mockery if COH somehow managed to put a helipad on the edge of their campus, or atop a high building where noise will radiate throughout the community.

Although the above five points would help mitigate neighborhood

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

concerns, we feel that even if they were enacted, they would be incapable of effective enforcement. The city does not have the resources to enforce zoning requirements. This means that the burden will be on neighborhood residents. We are willing to bear that burden if nothing else can be done, but it is a real burden on local residents in this harried age of two working parents to ask them to do this. In any case, neighborhood citizens will never be in a position to question doctors' judgement. As mentioned above, then, we do not believe that the number of flights into COH could ever effectively be limited. If doctors were to say 50 emergencies a month required helicopter transport, no citizen would be in a position to say no. It may be, in addition, that the City of Seattle does not have the jurisdiction to require flight paths that minimize danger and impact on the neighborhood.

For all these reasons, we neighbors of Children's Orthopedic Hospital feel that it is effectively impossible for a Conditional Use Permit to be done that will ensure use of a helipad in such a way that it will not significantly, and seriously endanger local residents, harass them with inappropriate noise, and reduce the quality of life and value of homes around Children's Orthopedic Hospital. We thus oppose granting a conditional use permit at all.

We, like all residents of Seattle, want emergency care to be available for those children that need it. Our concern is solely with the inappropriate location of a helipad in a quiet, low-density, residential neighborhood. We believe the only solution to the problem of emergency care for children is that COH be required to build a separate facility in a more appropriate location where unlimited helicopter landings can be permitted. We do not believe that COH has made a good faith effort to examine alternatives to centralizing care at their Laurelhurst campus. Until such explorations are done in good faith, we feel a Conditional Use Permit should be denied.

Sincerely,

Clark W. Sorensen

Truman Katz
President and Chief Executive Officer
Children's Hospital and Medical Center
P.O. Box C5371
Seattle, Washington 98105

Dear Mr. Trask and Mr. Katz:

In an effort to resolve the outstanding issues regarding the possibility of permitting use of an existing helistop at Graves Field for both the University of Washington (UW) and Children's Hospital Medical Center (CHMC) helicopter landings, I have met with my staff several times and have consulted with the City's Law Department. We have developed a proposed solution which I hope will be satisfactory to all parties.

As you know, we are faced with a code issue which has hindered our ability to move forward on a permit decision for CHMC's proposed helistop. The preferred alternative now proposed by CHMC would have the majority of flights landing at Graves Field, which is within the UW's campus. The site has historically been used periodically by the University as a landing site for helicopters transporting injured persons. Although the new Major Institution Code does not require CHMC to include CHMC's use of Graves Field helistop in the CHMC master plan because the site is more than 1/2 mile from the hospital campus, the Major Institutions code does not explicitly provide that one institution may apply for such a new facility on another institution's campus. We understand that the UW does not want to apply for the CHMC facility because of the controversy which has been associated with the hospital's on-site proposal.

Regarding the UW's concerns that its helicopter flights not be subject to the permitting process, I believe that the UW use of the site should be considered grandfathered since this site has been used for many years as a helistop. No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

additional permitting of the UW's existing use at this location would be necessary. The Final GPDP and EIS includes discussion of the helistop, its continuous use by the UW and its intended future use by CHMC, referring to the pending parallel review process for CHMC's use of the site.

If the helistop at Graves Field is an existing use for the University of Washington, the Children's flights may be added in much the same way as other medical facilities at the University are available to Children's patients. Because the number of flights will increase substantially beyond the UW's historic use, we will require that the Children's use of the helistop be allowed only through the Conditional Use process. In the event the Council Conditional Use for Children's destined flights at Graves Field is not approved, no Children's landings would be allowed, but the grandfathered UW usage would not be affected. Prior to publishing a decision on the Children's flights, Children's must apply for a permit at Graves Field.

This solution relies on the cooperation of both institutions in arriving at a mutually beneficial result. CHMC would be able to apply for what it has identified as the preferred site for the majority of its proposed helicopter landings, and the UW use of the site would be recognized and grandfathered without formally going through the permit process. I trust that you will agree with this approach and work together with us to resolve this complex issue. I would like to move as quickly as possible for a decision on the Children's helicopter flights as the issue has lingered unresolved for an embarrassingly extended period.

I hope this proposed solution addresses the concerns of Children's Hospital and the University of Washington. If there are any questions, please contact me at 684-8899 or Senior Land Use Specialist John Doan at 684-8875.

Sincerely,

Dennis J. McLerran

CUCAC

City of Seattle/University of Washington/Community Advisory Committee

July 9, 1991

Tallman Trask, Executive Vice President
University of Washington
Mail St[illegible] AH - 30
Seattle, WA 98195

RE: REQUEST FOR ENVIRONMENTAL IMPACT STATEMENT
ON USE OF HELISTOP FOR CHILDREN'S HOSPITAL
ON U.W. INTRAMURAL RECREATION FIELD

Dear Mr. Trask:

The City - University - Community - Advisory Committee (CUCAC) is concerned that the University of Washington, as the responsible agency for SEPA compliance on its campus, has failed to provide an EIS for the potential permanent development of the Intramural Field Helistop and the U.W. agreement with Children's Hospital for expanded use as the primary landing site for helicopters delivering patients to Children's Hospital.

Children's Hospital and Medical Center is a private institution using state owned University of Washington property for helicopter landings. What are the total costs of the development of the helistop and the personnel to secure it for landings and takeoffs on a 24 hour basis? What is the source of funding?

CUCAC has long opposed non-University uses on the Unive[illegible]y campus because of the land-use pressures for state higher education [illegible]eds.

The students will lose a recreation site for which there is no replacement. Recreation equipment installed nearby may be classified as a hazard to helicopter activities.

The Children's Hospital EIS contained little concerning impacts on the U.W. campus or affected U.W. neighboring communities in the flight path. The EIS was not circulated to students (ASUW and GPSS). Student awareness of recreational losses and issues involved is likely negligible.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Some of the CUCAC concerns are:

(1) What will be the increase of helicopter landings and takeoffs?

(2) Will the helistop be developed with fencing, lighting, and paving?

(3) Although University Hospital is not considering a roof-top helistop at this time, is one to be planned in the future, making two helistops on the U.W. campus?

(4) Is it possible to implement a flight pattern that will diminish the adverse impacts of night and day helicopter flights over residential neighborhoods adjacent to the University?

Will the University provide an EIS process with scoping to determine the extent of concerns, to inform the University students and public about intended action and enviromental impacts related to helicopter landings on campus?

CUCAC would appreciate information on the status of the U.W. helistop, the agreement with Children's Hospital and the City process. Please cite any SEPA regulations which would exempt the U.W. from preparation of its own EIS as lead agency for actions on the U.W. campus.

Sincerely yours,

Ruth Moore

Re: Council Conditional Use Application (Helistop at Graves Field)

Dear Mr. McLerran:

In response to your January 30, 1991, letter to me and Tallman Trask III, Children's Hospital and Medical Center is submitting an application for a Council Conditional Use Permit for a helistop at Graves Field.

We are submitting this application as a way to implement the "preferred alternative" now proposed by CHMC. This alternative would provide for the majority of emergency helicopter flights to land at Graves Field and the remainder to land on Children's campus at the site proposed in our current Conditional Use application with the City. We believe that the preferred alternative will accomplish Children's objectives and mitigate adverse impacts on the community.

This application is submitted for a helistop at Graves Field to be operated in conjunction with the helistop on the main campus. The improved helistop at Graves Field is not intended to serve all emergency flights for patients destined to Children's.

I noted in your letter that you determined that the University of Washington's use of Graves Field as a helistop is considered grandfathered since this site has been used for many years by the UW. As you know, this site has also been used for many years for the landing of helicopters with patients destined for Children's Hospital. We also believe that use of the Graves Field site by helicopters with Children's patients is grandfathered. By submitting this application for Graves Field, Children's or patients bound for Children's do not intend to waive whatever rights we would have to continue landing at Graves Field (and the main campus) without any additional permits.

DEPARTMENT OF CONSTRUCTION AND LAND USE
DEC 13 1991

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We look forward to working with the City in the review of this application. We understand from your staff that the existing EIS for this project issued in April, 1991, will be used to support the review of this Council Conditional Use Permit application. We have, therefore, not submitted a new environmental checklist.

This proposal for a helistop at Graves Field has also been reviewed by the University of Washington and we have their permission to apply for a helistop at this location. We submit this application with the understanding that our application does not waive the University's right to use the existing helistop for its patients.

The helistop has been designed by the firm of Mills, John & Rigdon Architects; Mr. Sigmund A. Brudevold is the project manager. Suzanne Petersen, Director of Government Affairs, is the Children's Hospital contact person for this application (526-2530).

Thank you for your consideration of this request.

Sincerely yours,

Treuman Katz
President and CEO

Children's
Hospital & Medical Center

March 1992

To Our Neighbors,

In an ongoing effort to keep you informed about emergency medical helicopter activity at Children's Hospital, we are sending you quarterly reports about the number and types of cases of the children who required helicopter transport to Children's Emergency Room entrance.

In order to minimize the impacts on the community, only the most critically ill or injured patients are to land at the Children's Emergency Room entrance. Other patients determined able to withstand delay and movement are landed at the Intramural Field and are transported by ambulance to Children's. The decision about where to land is based on the condition of the patient. The majority of patients continue to arrive at the Emergency Room by ambulance.

Most requests for emergency helicopter transport of patients to Children's come from physicians in the Puget Sound area or Olympic Peninsula. Children's Hospital and Medical Center is a regional specialty hospital. Often, there are several pediatric specialists called to the case within minutes of arrival. Community hospitals do not have the resources to provide this highly specialized pediatric treatment and diagnosis.

This report is mailed to all households in the 98105 zip code and some in the 98112 zip code through a mailing service. We apologize for any address errors.

If you have questions about this report or about emergency medical helicopter landings at Children's, please contact Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write her at Children's Hospital and Medical Center, PO Box 5371, Seattle, WA 98105-0371.

Sincerely,

Treuman Katz

Treuman Katz
President and Chief Executive Officer

* Definition of Diagnosis / Treatment

Acute tracheitis: *Inflammation and swelling of the trachea (airway) that, if severe, will impair breathing.*

Hypoxia: *Lack of oxygen; in this case, because the hot dog was aspirated and was blocking the airway.*

Meconium aspiration syndrome: *Pneumonia-like illness of newborn due to inhalation at birth of fluids containing material from infant's bowel movement.*

Status asthmaticus: *Severe asthma attack during which the patient is not responsive to treatment.*

Streptococcal sepsis and streptococcal meningitis: *A bacterial bloodstream infection and a bacterial infection of the membranes covering the brain and spinal cord.*

Viral encephalitis: *A viral infection of the brain often associated with seizures, alterations of consciousness, fever, neurological dysfunction and mental changes. May be life-threatening, requiring intensive care and treatment.*

Hello:

As a resident of Laurelhurst, I am writing my support of the helistop for Children's Hospital which we are pleased to have within our neighborhood. I feel the adequate and safe delivery of emergency medical services to children in the region is vital and we are very luckly to have people at the hospital with the vision to look into the future. Personally, it would be a comfort to know if my children became ill or seriously injured while on an outing in the Northwest that they could be airlifted to Children's.

Please do not be swayed by the objectioners in the neighborhood. There is a powerful group of people that support no change, no progress, no future, and lobby against Children's, University of Washington, Batelle Northwest, Retirement Homes, new houses, and remodels. They do not believe in the future and are very narrow minded.

I look forward to the long range plans Children's Hospital has made to provide our community with top medical care for our children.

Thank you.

Sincerely
Phyllis K. Odell

Dear Ms. Ford:

Regarding your letter dated March 21, 1991 "Notice of Intent to Cancel", the plans which are currently in for review were corrected and returned to DCLU in March 1990. The project is currently awaiting final environmental review before further action can be taken by DCLU.

I understand that you have spoken with John Doan in the Land Use Division and he has clarified for you the status of the environmental review. John told me that you will take appropriate action to keep the permit application active.

This letter serves as our response to you.

If you have any concerns or wish to discuss this matter further, please contact me at 223-5167.

Thank you for your time.

Sincerely,

Mike Miller

Seattle, Washington 98195

Truman Katz
President and Chief Executive Officer
Children's Hospital and Medical Center
P.O. Box C5371
Seattle, Washington 98105

Dear Mr. Trask and Mr. Katz:

In an effort to resolve the outstanding issues regarding the possibility of permitting use of an existing helistop at Graves Field for both the University of Washington (UW) and Children's Hospital Medical Center (CHMC) helicopter landings, I have met with my staff several times and have consulted with the City's Law Department. We have developed a proposed solution which I hope will be satisfactory to all parties.

As you know, we are faced with a code issue which has hindered our ability to move forward on a permit decision for CHMC's proposed helistop. The preferred alternative now proposed by CHMC would have the majority of flights landing at Graves Field, which is within the UW's campus. The site has historically been used periodically by the University as a landing site for helicopters transporting injured persons. Although the new Major Institution Code does not require CHMC to include CHMC's use of Graves Field helistop in the CHMC master plan because the site is more than 1/2 mile from the hospital campus, the Major Institutions code does not explicitly provide that one institution may apply for such a new facility on another institution's campus. We understand that the UW does not want to apply for the CHMC facility because of the controversy which has been associated with the hospital's on-site proposal.

Regarding the UW's concerns that its helicopter flights not be subject to the permitting process, I believe that the UW use of the site should be considered grandfathered since this site has been used for many years as a helistop. No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

additional permitting of the UW's existing use at this location would be necessary. The Final GPDP and EIS includes discussion of the helistop, its continuous use by the UW and its intended future use by CHMC, referring to the pending parallel review process for CHMC's use of the site.

If the helistop at Graves Field is an existing use for the University of Washington, the Children's flights may be added in much the same way as other medical facilities at the University are available to Children's patients. Because the number of flights will increase substantially beyond the UW's historic use, we will require that the Children's use of the helistop be allowed only through the Conditional Use process. In the event the Council Conditional Use for Children's destined flights at Graves Field is not approved, no Children's landings would be allowed, but the grandfathered UW usage would not be affected. Prior to publishing a decision on the Children's flights, Children's must apply for a permit at Graves Field.

This solution relies on the cooperation of both institutions in arriving at a mutually beneficial result. CHMC would be able to apply for what it has identified as the preferred site for the majority of its proposed helicopter landings, and the UW use of the site would be recognized and grandfathered without formally going through the permit process. I trust that you will agree with this approach and work together with us to resolve this complex issue. I would like to move as quickly as possible for a decision on the Children's helicopter flights as the issue has lingered unresolved for an embarrassingly extended period.

I hope this proposed solution addresses the concerns of Children's Hospital and the University of Washington. If there are any questions, please contact me at 684-8899 or Senior Land Use Specialist John Doan at 684-8875.

Sincerely,

Dennis J. McLerran

Re: Children's Hospital and Medical Center Helistop

Ruth Moore, Member
CUCAC
4030 - 4th Avenue Northeast
Seattle, Washington 98105

Dear Ms. Moore:

I have received a copy of the letter you sent to Tallman Trask at the University of Washington regarding the Children's Hospital and Medical Center helistop. Because the Seattle Department of Construction and Land Use (DCLU) is the lead agency for the Environmental Impact Statement (EIS), I am responding to some of your comments.

Children's Hospital applied for approval in 1985 to allow all Children's destined patients to land on the Hospital campus. The Draft EIS for the helistop provided several alternatives to landing on campus, including landing all patients at the existing University of Washington Intramural Field helistop and on the University Hospital roof. That Draft EIS was widely circulated and commented upon.

Based on the comments, another alternative was developed for the Final EIS. It attempts to reduce impacts in the vicinity of Children's Hospital while allowing their medical service goals to be met. We feel consideration of Children's landings at the University of Washington is appropriate given the long-standing affiliation between the two institutions and the Major Institution policies discouraging duplication of activities. The EIS looks at flight paths which would reduce impacts to residential areas for the original and preferred alternatives.

Children's and the University have worked hard developing this alternative. With its completion, we have a continuum of options for consideration by ourselves, the Hearing Examiner, and ultimately the City Council; ranging from all landings at Children's to all landings at the University or Harborview. The ultimate decision must consider which option best satisfies the Conditional Use and SEPA criteria.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

With regard to the loss of recreation space, we do not believe this is a significant impact. Although any alternative with Children's landings at the University will increase use of the helistop, the University has been using that site for about 20 years, and we consider it to be an established use. Formalizing the landing area will not significantly change the University's recreation uses.

The EIS provides information for estimating the number of Airlift Northwest and other vendor flights to Children's and University facilities. These are estimates and it is impossible to provide a single definitive monthly estimate given uncertainties about population, medical technology, disease patterns, and other factors influencing medical referral rates.

Children's is currently working with the University to design the details of a permanent helistop location which will provide a safe and secure place for the helicopters to land. When complete, public notice will be provided so people may comment on the design.

Regarding the University rooftop helistop, the University has made it clear to us through the EIS consultant that they are not considering a rooftop helistop at this time. No rooftop helistop is included in the University's Physical Development Plan (GPDP). However, the rooftop location is included in the DEIS for the University's GPDP to discuss potential impacts in the event the University pursues a rooftop helistop in the future.

We believe the Children's EIS adequately addresses the project's impacts, including impacts on the University campus. Additional environmental review by the University is not necessary.

Thank you for commenting on behalf of CUCAC. If you have any questions, please do not hesitate to call Senior Land Use Specialist John Doan at 684-8875.

Sincerely,

DENNIS J. McLERRAN
Director

RE: REQUEST FOR ENVIRONMENTAL IMPACT STATEMENT
ON USE OF HELISTOP FOR CHILDREN'S HOSPITAL
ON U.W. INTRAMURAL RECREATION FIELD

Dear Mr. Trask:

The City - University - Community - Advisory Committee (CUCAC) is concerned that the University of Washington, as the responsible agency for SEPA compliance on its campus, has failed to provide an EIS for the potential permanent development of the Intramural Field Helistop and the U.W. agreement with Children's Hospital for expanded use as the primary landing site for helicopters delivering patients to Children's Hospital.

Children's Hospital and Medical Center is a private institution using state owned University of Washington property for helicopter landings. What are the total costs of the development of the helistop and the personnel to secure it for landings and takeoffs on a 24 hour basis? What is the source of funding?

CUCAC has long opposed non-University uses on the University campus because of the land-use pressures for state higher education needs.

The students will lose a recreation site for which there is no replacement. Recreation equipment installed nearby may be classified as a hazard to helicopter activities.

The Children's Hospital EIS contained little concerning impacts on the U.W. campus or affected U.W. neighboring communities in the flight path. The EIS was not circulated to students (ASUW and GPSS). Student awareness of recreational losses and issues involved is likely negligible.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Some of the CUCAC concerns are:

(1) What will be the increase of helicopter landings and takeoffs?

(2) Will the helistop be developed with fencing, lighting, and paving?

(3) Although University Hospital is not considering a roof-top helistop at this time, is one to be planned in the future, making two helistops on the U.W. campus?

(4) Is it possible to implement a flight pattern that will diminish the adverse impacts of night and day helicopter flights over residential neighborhoods adjacent to the University?

Will the University provide an EIS process with scoping to determine the extent of concerns, to inform the University students and public about intended action and enviromental impacts related to helicopter landings on campus?

CUCAC would appreciate information on the status of the U.W. helistop, the agreement with Children's Hospital and the City process. Please cite any SEPA regulations which would exempt the U.W. from preparation of its own EIS as lead agency for actions on the U.W. campus.

Sincerely yours,

Ruth Moore

Ruth Moore, Co-Chair
CUCAC
4030 4th Avenue N.E.
Seattle, Washington 98105

Dear Ms. Moore:

I respond to your letter of July 9, regarding the use of the University's existing helistop by Children's Hospital and Medical Center. The City of Seattle is the Lead Agency with respect to SEPA compliance per WAC 197-11-924-944. As the Lead Agency, the City has prepared a Draft and Final Environmental Impact Statement on Children's helistop proposal and alternatives. Use of the University's existing helistop was identified by the City as an alternative in the Final EIS. In addition, the project has gone through an extensive and lengthy public review process.

The University has reviewed both the Draft and Final Environmental Impact Statements for the helistop. The concerns and questions you raise in your letter are all addressed in the Final EIS, but may be further considered by the City during the review process.

As you know, the University and Children's have a very close continuing affiliation. Given this relationship, the University believes that it is appropriate for Children's to be allowed to use our existing helistop.

Regarding the suggested loss of recreational facilities, this area has been utilized as a helistop for more than 20 years. Continued use by the University and Children's will not adversely impact student recreational uses.

Children's will be applying for a City Council Conditional Use Permit. We have forwarded your letter to DCLU for their information and consideration.

Sincerely,

Tallman Trask III
Executive Vice President

Dear Ms. Mills:

Thank you for your letter to Tom Weeks regarding the proposed heliptop at Children's Hospital.

Because the City Council functions like a judge rather than a legislative body on many land use issues, Tom cannot read letters, respond to phone calls or be lobbied on individual land use projects. If he does, he risks prejudicing himself before all relevant facts of the case are determined and losing the right to vote on the project if it comes before the Council.

Since you cannot appeal directly to Tom on this issue, I have forwarded your letter to the staff members at the Department of Construction and Land Use who will be dealing with the project. You can reach DCLU at 684-8875. DCLU will add your name to the project mailing list, and you will be notified about all public hearings conducted on the project.

Your comments are extremely important as the Department of Construction and Land Use and the Hearing Examiner evaluate this project. I urge you to contact them directly, either in writing or by attending public hearings, and make your views known.

Tom cannot become involved in this process unless the Hearing Examiner's decision on this project is appealed to the City Council. If that happens, he will be permitted to review only the information contained in

Seattle City Council Members
Eleventh Floor
600 Fourth Ave.
Seattle WA 98104

JUN 21 1991

Dear Members,

From my windows on the 5th floor of my condominium building I hear and see the helicopters come slowly in and circle and circle Childrens Hospital trying to squeeze into the landing space.

I always think if they had just made a quick landing over in the playing field area, with an aid car or ambulance standing by that could speed to the hospital it would be better for all concerned.

Of course we want to save as many children as possible, but the helicopters endanger the lives of many residents when they circle over the area. Not all the children brought in by helicopter direct to the hospital survive, and not every child brought by helicopter and ambulance will survive, but most of them will. The potential for disaster is too great to risk a helistop at the hospital!

The hospital has far overbuilt their area which should never have been placed in a residential area in the first place, and it is becoming a real problem for the neighborhood. It is making it difficult to keep a good family residential area in the city and the tax-payers who live there have rights that should be considered.

Since there is a good alternative, please do not place a helistop at the hospital. Thank you -

Sincerely,

Lillian J. Mills

Seattle, WA., 98104

Dear Tom and all Council members:

The use of the Childrens Hospital and medical center as a heliport is a matter mrs Padelford and I are strongly opposed to, however much we do and always supported that fine Hospital. From an unimpeachable source information was given to me that very little use was justified, and in those cases where the Emergency Medical Facility was not used any child saved by such time difference in most cases should not have been saved. The above came to me, unfortunately, in confidence.. Two heliports would be clearly idiotic.

Very truly yours
Philip Padelford

LAND USE DIVISION

Dear Mr. McLerren,

From my windows on the 5th floor of my condominium building I hear and see the helicopters come slowly in and circle and circle Children Hospital trying to squeeze into the landing space.

I always think if they had just made a quick landing over in the playing field area, with an aid car or ambulance standing by that could speed to the hospital it would be better for all concerned.

Of course we want to save as many children as possible, but the helicopters endanger the lives of many residents when they circle over the area. Not all the children brought in by helicopter direct to the hospital survive, and not every child brought by helicopter and ambulance will survive, but most of them will. The potential for disaster is too great to risk a helistop at the hospital!

The hospital has far over-built their area which should never have been placed in a residential area in the first place, and it is becoming a real problem for the neighborhood. It is making it difficult to keep a good family residential area in the city and the tax-payers who live there have rights that should be considered.

Since there is a good alternative, please do not place a helistop at the hospital. Thank you -

Sincerely,

Lillian J. Mills

Seattle Wa 98104

Dear Ms. McTeman:

I am writing to voice my concerns about the helistop planned for the Childrens Hospital in the Laurelhurst neighborhood.

What concerns me is the myopic stance of the group (if there is one) who oppose the site on the basis of noise pollution, etc. As far as I am concerned, the noise couldn't be more than the jet skis or the float planes which fly the waterfront daily. As for as safety, it seems there are plenty of news & traffic-copters that fly into tight places & land hourly downtown with much less clearance and far more frequently than a life saving medical helicopter ever would.

I am a bit embarrassed by the priorities of some of my neighbors. There are hospitals (U. Wash and VA) which serve a Y state area. They [redacted] (my neighbors) need a 8 X 10 glossy of the big picture.

Sincerely Linda S. Carson

MAY 1991

HELICOPTER UPDATE

On April 25, the Final Environmental Impact Statement (FEIS) was issued on the proposed helistop at Children's Hospital & Medical Center (CHMC). A decision is usually rendered within seven days, followed by a 15-day period for response. An appeal and public hearing can follow.

On May 3, however, the Director of the Dept. of Construction & Land Use (DCLU) announced that an alternative plan needed to be studied further and that a decision would not be given for at least another 60 days.

The alternative plan being studied is: *two* helistops, to be used jointly by the UW Hospital and CHMC - one at the UW Intramural Field, the other at CHMC. This would mean two helistops within half a mile of each other.

The approach and site of the helistop at the Intramural Field is in an open area. Helicopters have landed here for years with ambulance transfer to CHMC with no loss of lives.

The approach and site at CHMC is in an extremely limited space with approach over dense residential neighborhood (single family homes, condominiums, an elementary school). Planned building expansion at CHMC would further limit helicopter maneuverability.

In Vol. I (of III) of the FEIS, it is estimated an average of 15 to 21 patients could be transported each month to CHMC. This would be 30 to 42 overflights (in and out flights per patient). Also, "...addition of competing helicopter service ... the number of patients ... could exceed the 15 to 21 per month average."

Further stated in the FEIS is that CHMC cannot refuse any helicopter landings, even the Army MAST planes, such as occurred March 24, 1991 – the "worst yet scenario." This landing was especially hazardous due to the extremely low flying altitude, size and age of the plane. It circled over residences and the hospital three times. The pilot had never flown to CHMC, did not know where to land, could not find a landing site, and was finally directed by hand signals from CHMC security personnel on the ground. There was no radio communication between plane and hospital.

Safety is the prime issue. Each landing and take-off poses endangerment to hundreds of lives of innocent citizens who live within the residential neighborhood surrounding CHMC. Since helicopter accidents occur most frequently during landing and take-off, the potential for a tragedy is real. Noise pollution and vibration affect the quality of life for these residents, too.

To voice your concerns about these safety factors and location of a helistop at CHMC, and to save our neighborhood from institutional encroachment, call or write:

MEETING DATES

Laurelhurst Community Club Board of Trustees
regular meeting. St. Stephens church, Monday,
June 10, 7:30 p.m.

VOLUNTEER EDITOR SEARCH

The board of trustees of the Laurelhurst Community Club is seeking an individual who will serve as the newsletter editor for a period of an agreed term, renewable.

The volunteer position is a vital part of the Community Club's effectiveness. The newsletter is the primary source of neighborhood information and announcements. Through the newsletter, we receive information about the community, the environment, and our own future.

The editor will attend the monthly Laurelhurst Community Club board meeting where newsletter subject matter is discussed. He/she may be a board member. The position requires: collecting the assigned articles, copy editing, coordinating with the newsletter's graphic artist, coordinating with the printer for delivery and distribution, and determining newsworthy subjects for following issues.

Requisite skills include writing, editing and organizing, and could include word processing, computer layout and previous newsletter involvement.

The Editor position is an excellent opportunity for someone to continue his/her interest and skill in writing and editing while serving as an important active member of this community.

Continued on page 2

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WELCOME VOLUNTEERS! - Other volunteers are also being sought for two vacancies now open on the board of trustees for the Community Club.

Interested persons may have a particular issue or project which they want to tackle. As an active board member, you will be able to get to the heart of the problem and affect the results. You will have the support of the board who can back you up and provide experience in managing successful community projects. Interested candidates, please call Rick Hess, 525-1361.

-Rick Hess

CRIME WATCH WORKS IF YOU DO!

Approximately 40 present and new Block Captains attended the Block Watch Captains meeting on April 18 at Laurelhurst school.

They were introduced to some successful new programs of the Seattle Police Dept. Officer Dennis Brown, School Emphasis Patrol, spoke about his experiences working with middle school and high school students in the North End. Officer David Severence, the Community Police Team, talked about the help his division gives in solving neighborhood problems.

Kathy Jean Kolarsick, the Northeast District representative from the Seattle Police Dept.'s Crime Prevention Division, gave an informative talk about personal safety.

NOTE: Kathy Kolarsick is available to meet with neighbors of blocks who would like to get together for an educational Crime Prevention session. Call 684-7555.

CRIME PREVENTION THOUGHTS: GOING ON VACATION

Everyone looks forward to taking a vacation. Unfortunately this can be an opportune time for a burglar to strike, especially if there are telltale signs of your home being unoccupied. Make your home appear to be occupied whether you are gone for a day or a couple of weeks.

• Check all doors and windows to make certain they are securely locked. If any locks need replacement or reinforcement, make these improvements before you leave.

• Use automatic electric sockets and timers to turn outside and inside lights on at dusk and off at dawn.

• If you plan to be gone for an extended period, arrange to have your lawn mowed, have a neighbor park a car in the driveway and use your garbage container.

• Make sure all items such as tools, ladders, furniture and children's toys are inside.

• Tell a trusted neighbor, relative or Block Captain about your vacation plans: when you are leaving, where you can be reached in an emergency, and your expected return date.

• Leave a key to your house with the trusted neighbor so that the position of drapes and curtains can be changed, newspapers, mail, etc. can be placed in the house.

• Inform your neighbors on all four sides of your plans, so that a complete lookout is maintained. Be selective, however, in announcing your plans to anyone else.

• Perform a thorough security inspection of your house, lock up, set your alarm system if you have one, and enjoy your vacation.

-Pat Wright

COMMUNITY PROJECTS SUPPORTED BY YOUR DUES

Your Community Club dues are vitally important to the Laurelhurst neighborhood. Through these voluntary funds, we are able - with matching neighborhood funding - to improve our playgrounds, boulevards and schools.

PLAYFIELD PLAYAREA - Special neighborhood projects, such as the children's play area will undergo more development this year. After the landscaping and picnic tables are installed, a specially-designed arbor area will be constructed to further enhance this already superb playfield.

BOULEVARD PROJECT - The boulevard project is an ongoing neighborhood labor of love that your dues helped fund in the beginning and continue to maintain now.

NEIGHBORHOOD CONCERNS - Many community issues are being tackled this year, such as land use, transportation, and environmental projects. These matters are pursued with diligent and knowledgeable effort by members of this community and especially by members of your board.

LAURELHURST LETTER - Your dues help publish this newsletter, which brings newsworthy information to each of us on a monthly basis and helps us be informed about the ongoing activities of the board.

All residents who have not paid their regular annual dues are requested to do so at this time. If you wish to see more community-based neighborhood projects such as the children's play area, the Laser portable facility or the boulevard project, your voluntary contribution is requested also at this time.

Annual dues are $20 per household. Checks can be made out to Laurelhurst Community Club and mailed in care of Luanne Johnson, treasurer; 4102 37th Avenue NE; Seattle, WA 98105. Annual dues statements and remittance envelopes were mailed out in January. If you need another one, call Luanne.

-Thank you, Rick Hess

Dear Mr. McLerran -

I very much oppose the use of helicopters at CHMC - Not only does this impact the safety and density question, but the quality of life in the Laurelhurst neighborhood.

While it may seem that there is little safety question, according to studies made available to you and your department, my experience at S.F. Int'l Airport Coast Guard rescue station was just the opposite - there were frequent accidents with the helicopters, and that was a specialty of the base.

In addition, we have seasonal weather fronts that come up quickly. Last Tuesday nite a capsized in LK Washington - a fluke wind came up. Had a helicopter been landing / taking off - it could have been very dangerous.

Please contain the copter, & the intermural field at UW - Mag room and safer.

Sincerely -
D.B. Nichols

Dear Mr. McLerran:

I would like to express the hope, in the strongest terms possible, that your department will not permit any extension of helicopter landing rights at Childrens Hospital. There is no earthly medical reason for helicopters landing in this residential district when they can land on open ground at the University of Washington, and the patients be quickly transported by ambulance to the hospital. Given this solution, it is impossible to understand why the hospital, in constant defiance of the good of the whole neighborhood, insists on trying to have a heliport here. I live right across the street from Childrens Hospital (and I have made many gifts to it), and I can testify to the perfectly horrible noise made by helicopters looking for the spot, hovering, landing, and taking off again. It can spoil a whole half day for us residents in the neighborhood. And this says nothing of the danger from a kind of craft which, according to regularly news stories, tends to be constantly in trouble. Please do not allow the hospital to extend their heliport landings. There should be none of these at all.

Sincerely yours,

Robert B. Heilman

EXECUTIVE SUMMARY

As part of the planning effort for the Environmental Impact Statement (EIS) required for construction of a helistop at Children's Hospital and Medical Center (CHMC), this study was commissioned by CHMC to: 1) review Airlift Northwest's current pediatric rotary-wing experience, and 2) project future pediatric rotary-wing volumes.

The Final Environmental Impact Statement (FEIS) contains a *Proposed Action* as well as a *Preferred Alternative*. The *Proposed Action* involves landing all CHMC destined patients at the CHMC campus. The *Preferred Alternative*, developed as a compromise proposal in the FEIS, allows only the most critical patients to land at a paved, secured helistop at the CHMC. All other critical pediatric patients would land either at Harborview, Intramural Field or Boeing Field and be transferred via ground ambulance to CHMC. The designation of patients who are most critically ill and require transport directly to CHMC's campus is currently, and will continue to be, determined on a case by case basis by the Airlift Northwest medical team on board the helicopter.

Specifically, this study defines and identifies three factors:

1) The geographic service area of Airlift Northwest's existing pediatric program;

2) The percentage of pediatric flights ultimately destined for CHMC (regardless of where they land) as well as the pediatric flights that actually land at CHMC; and

3) A projection of future Airlift Northwest pediatric flight volumes and a calculation of the number of flights likely to land at CHMC through the year 1995 under both the *Proposed Action* and the *Preferred Alternative*.

All data used in the review and analysis of current and projected CHMC landings were provided by Airlift Northwest.

A population/use-rate based projection method was applied to the two scenarios, the *Proposed Action* and the *Preferred Alternative*, to develop estimates of likely utilization. Only one element in the methodology differentiates the two scenarios. In the scenario assuming the *Preferred Alternative* one additional step was required to define the number of patients actually landing at CHMC. This step involved the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

determination of the average percentage of pediatric flights actually landing at CHMC during the 1987-1990 period. A review of the combined, four year data identified the following:

1987-1990 Airlift Northwest Rotary Wing Landings
Ultimately Destined for CHMC
by Landing Site[1]

CHMC landings	24.5%
Intramural landings	70.2%
Harborview landings	4.7%
Boeing Field landings	.5%
Other (Weather related)	.1%
Total	100.0%

1 Includes patient pick-ups at CHMC in 1989 and 1990

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The calculation of projected pediatric Airlift Northwest landings at CHMC in the years 1991 through 1995 is premised on several assumptions. These assumptions assume four constants: a constant use rate, a constant percentage of missed flights, a constant percentage of Airlift Northwest pediatric flights landing at CHMC, and a constant out-of-area utilization through 1995. The projected utilization under each scenario is as follows:

Year	***Proposed Action***	***Preferred Alternative***
1991	201 landings	49 landings
1992	204 landings	50 landings
1993	207 landings	51 landings
1994	210 landings	51 landings
1995	212 landings	52 landings

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Airlift Northwest is a non-profit emergency air ambulance service established in 1982 by an inter-hospital agreement among four member hospitals. The member hospitals are: Children's Hospital and Medical Center, Harborview Medical Center, Providence Medical Center and University Hospital. The service was established as a fixed wing service in response to a demonstrated need to serve rural hospitals in Eastern Washington, Southeast Alaska, Idaho and Montana and to provide advanced medical care to those communities in the greater Western Washington area that did not have tertiary level capabilities. In early 1985, in response to increasing requests for transport from Western Washington hospitals and emergency response programs, Airlift Northwest inaugurated a rotary wing service. The first helicopter landing by Airlift Northwest at CHMC occurred in August, 1985.

The first emergency landings by helicopter at CHMC occurred in the 1970's. By the early 1980's a need for a permanent helistop at the Hospital was becoming evident. In 1984, CHMC applied for a Master Use Permit to allow construction of a helistop at the hospital. As part of the application process the Department of Construction and Land Use determined that an Environmental Impact Statement would have to be prepared. The Draft EIS contains a *"Proposed Action"* to land all critically ill and injured pediatric patients directly at CHMC. A *"Preferred Alternative"*, to land at the CHMC helistop only with the most critically ill patients-- less critical patients would be unloaded at Harborview or Intramural Field and then transported by ground ambulance to CHMC, was developed as a compromise proposal and presented in the FEIS. As part of the EIS planning process, this study was commissioned by Children's Hospital and Medical Center to define and identify three (3) factors:

1) The geographic service area of Airlift Northwest's existing pediatric program;

2) The percentage of pediatric flights ultimately destined for CHMC (regardless of where they land) and the nature of pediatric flights that actually land at CHMC; and

3) A projection of future Airlift Northwest pediatric flight volumes and a calculation of the number of flights likely to land at CHMC through the year 1995 under both the *Recommended Action* and the *Preferred Alternative*.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

This study is divided into three main sections. The first section, ***Description of Methodology and Assumptions***, describes the sources and types of data used in this study. This section also details the specific methodology supporting the utilization estimates. The second section, ***Projections of Future Utilization***, calculates the likely pediatric utilization of Airlift Northwest's rotary-wing program in the years 1991 through 1995 under both the *Proposed Action* and the *Preferred Alternative.* ***Findings and Conclusions***, the final section provides an overview and analysis of the air-ambulance utilization projections.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

DESCRIPTION OF METHODOLOGY AND ASSUMPTIONS

All data used in the review and analysis of current and projected CHMC landings were provided by Airlift Northwest.

A review of Airlift Northwest's 1987 through 1990 patient flight origin[2] was undertaken to identify the primary geographic area from which all rotary wing flights, and specifically pediatric flights were generated. Patient origins were originally defined by local community but reconciled for this study into County boundaries.[3] Reconciliation into County boundaries was needed to allow for future projections of pediatric rotary-wing air ambulance use.

The data analysis identified the primary geographic area for Airlift Northwest's rotary program as: bounded on the west by the Pacific Ocean; bounded on the north by the Canadian border; bounded on the south by Lewis County, and bounded on the east by the Cascade Mountains.

Once the primary geographic area was identified, a further review of actual 1987 through 1990 utilization was undertaken by applying a widely accepted use-rate based projection method.[4] The specific steps in the methodology include the following:

---

2 After review of flight data for the years 1985-1990, and after discussions with Airlift Northwest administration it was concluded that the years 1985 and 1986 represented "start-up" years for the rotary wing program. In contrast the 1987 through 1990 experience was relatively constant between months and likely reflected the experience of a mature operation. Consequently, because the averaging of 1987 through 1990 data represents the most comprehensive and best available information on rotary wing use, it was used in this evaluation. This analysis assumes that the actual 1987-1990 transport experience remains relatively constant through the year 1995.

3 In review of the flight data, it became apparent that not all areas of King County equally request the services of Airlift Northwest. As such, King County was divided into four distinct planning areas. These planning areas are Central King, North King, East King and South King.

4 The 1987 Washington State Health Plan adopts use-rate based methods for projection of most hospital and acute medical services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1) Review and accounting of all 1987 through 1990 missed flights.[5]

2) The actual number of flights missed, due to inclement weather was subtracted from "total missed flights" to ascertain the actual number of flights missed due to factors other than weather.

3) A calculation of missed flights as a percentage of total flights. It was assumed that the percentage of flights missed was consistent between the adult and pediatric populations.

4) Adding the percentage of missed flights by primary geographic area to the average 1987 through 1990 pediatric flight volumes to arrive at a total potential pediatric flight number.

5) Dividing the average 1987 through 1990 potential pediatric population (by primary geographic area region) by the average 1987 through 1990 pediatric population in each region to calculate the 1987 through 1990 "use rate" of each region.[6]

Appendix 1 details the missed flight, total potential pediatric flights and county-specific use rate projections.

---

5 Missed flights are defined as those flights that are not responded due to either inclement weather or the non availability of transport equipment. The number of flights missed due to the non-availability of transport equipment decreased considerably after Airlift Northwest's initiation of a second rotary-wing helicopter in August 1988.

6 The use rate is defined as the average number of transport the pediatric population generates during a given calendar year. The statistic is presented as transports per 1,000 pediatric population (ages 0-14). While specific age data are not kept, according to Airlift Northwest staff, the majority of pediatric flights are for patients aged 0-14.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

PROJECTIONS OF FUTURE UTILIZATION

To project pediatric rotary-wing flight utilization in the years 1991 through 1995, the projected pediatric population for each planning area was identified. The source of the population data is the Office of Financial Management.[7] Applying the projected population to the previously developed use rate provides an estimate of the projected population in each County likely to require pediatric air ambulance transport in the years 1991 through 1995. These projections are depicted in Appendix 2.

The FEIS contains a *Proposed Action* as well as a *Preferred Alternative*. The *Proposed Action* calls for landing all CHMC destined patients at the CHMC Campus. The *Preferred Alternative* is characterized by the most critical patients landing at a paved, secured helistop on CHMC's campus. All other critical pediatric patients transported by helicopter to CHMC would land either at Harborview or Intramural Field. The *Preferred Alternative* represents a continuation of the actual 1987-1990 CHMC landing experience.

A population/use-rate based projection method was applied to the two scenarios, the *Proposed Action* scenario and the *Preferred Alternative* scenario, to develop estimates of likely utilization. Only one methodology element differentiates the two scenarios. In the scenario assuming the *Preferred Alternative* one additional step was required to define the number of patients actually landing at CHMC. This step

---

7 Since OFM data are county wide and do not sub-divide the information into sub-areas, the following method was utilized to develop the population projections for the sub-areas of King County. A Puget Sound Health Systems Agency report entitled "Projections of the Population by Age, Northwest Washington Health Service Area, By Planning Area: 1990" identified the percentage of individuals age 0-14 within each sub-area of King County. These percentages were assumed to remain constant and applied to the King County population estimates published by the Office of Financial Management. The percentage of population 0-14 within each King County planning area was held constant as follows:

Central	11.0%
East	33.9%
North	13.4%
South	41.7%

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

involved the calculation of the percentage of pediatric flights actually landing at CHMC. This was done by averaging the actual 1987-1990 experience. The specific formula for each scenario is described below.

Proposed Action

The formula for projecting the number of pediatric landings at CHMC, under the Proposed Action in the years 1991-1995 incorporates the number of projected landings and adds a factor for out-of-area use.

The out- of-area use factor was based on the actual average 1987-1990 pediatric Airlift Northwest experience. In the four year period under review, 2.49% of all pediatric flights destined for CHMC were generated from areas other than those defined in the primary geographic area analysis. This actual experience was assumed to remain constant. The formula for projecting landings at CHMC is as follows:

Total Airlift Northwest rotary wing patients destined for CHMC

+

out-of-area factor

=

Total rotary wing landings at CHMC

Using the above methodology, the projection of landings at CHMC under the Proposed Action is as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1991: 201

1992: 204

1993: 207

1994: 210

1995: 212

Preferred Alternative

One additional step is required to define the number of pediatric patients directly landing at CHMC under the Preferred Alternative. This step involves the calculation of the percentage of pediatric flights actually landing at CHMC during the 1987-1990 period. A review of the actual data identifies the following:

CHMC landings	24.5%
Intramural landings	70.2%
Harborview landings	4.7%
Boeing Field landings	.5%
Other (Weather related)	.1%
Total	100.0%

For projection purposes,the 1987-1990 pediatric landing experience, by site was assumed to remain constant.

The formula for projecting the number of pediatric landings at CHMC, assuming the preferred alternative in the years 1991 through 1995 is as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Total Airlift Northwest rotary wing patients destined for CHMC

x

CHMC Average 1987-1990 landing percentage

+

out-of-area factor

=

Total rotary wing landings at CHMC

Incorporating the above assumptions and formula, projections of pediatric rotary wing landings at CHMC are as follows:

1991	49 landings
1992	50 landings
1993	51 landings
1994	51 landings
1995	52 landings

Specific detail on the projected CHMC landings in the years 1991 through 1995, under both scenarios is included as Appendix 2.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FINDINGS AND CONCLUSIONS

The calculation of projected pediatric Airlift Northwest landings at CHMC in the years 1991 through 1995 is premised on several assumptions. The major assumptions assume four constants: a constant use rate, a constant percentage of missed flights, a constant percentage of Airlift Northwest pediatric flights landing at CHMC and a constant percentage of flights from out-of- area through the year 1995.

These projections make no assumptions regarding unknown variables which may increase or decrease demand for air ambulance services. For example, in March of 1990, CHMC initiated an Extracorporeal Membrane Oxygenation (ECMO) program. ECMO is a technology which serves as a lung-bypass for neonates; thereby allowing their lungs to recover from damage incurred from sepsis, meconium or other similar problems. It should be noted that ECMO is not a primary treatment, but rather a treatment of last recourse. In 1989 and early 1990, prior to the technology being available at CHMC, approximately 14 Airlift landings occurred at CHMC to pick-up CHMC patients in need of the technology and to transport them to Emanuel Hospital in Portland, the closest ECMO technology site. For the period of April 1990 - February 1991 no out-flights have been recorded. In addition, no in-flights specifically for ECMO have been recorded. This is due to the fact that ECMO is an end treatment, and that neonates in need of tertiary treatment have been transferred earlier in the course of their illness to CHMC. Most of this transport is via ground ambulance.

Accordingly, in this case it appears that ECMO is a technology which will ultimately result in decreased demand (in terms of out flights) for air ambulance services. However, and in an attempt to be conservative, no decrease in demand was actually forecasted. Other examples of variables which may increase or decrease demand include, the reconfiguration of health care services, changes in technology, or changes in the health status of the population could have the impact of either increasing or decreasing utilization over time.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

After conducting a literature search and reviewing all applicable studies, no generally accepted standards were identified that would allow for the incorporation, with confidence, of such variables into the calculation of use rates and subsequent landings. Therefore, it was concluded that the combined 1987-1990 actual experience is the best indicator of future utilization and that any attempt to quantify the above unknown variables would reduce the reliability and validity of the projections.

Re: Project No. ~~9100626~~
Address: 4800 Sand Point Way, NE

Attention: Mr. Nathan Torgelson

Dear Mr. Torgelson:

As an owner/resident of the Laurelon condominium, which is next door to Children's Hospital, I can say the helicopters that are already landing at the temporary heliport next door are noisy and a danger to the residents of Laurelon, over which they come in at a low altitude to land.

It has been estimated that only six or seven emergency cases would be brought in to Children's Hospital a month. If that is true, it seems an expensive investment to build a heliport for only a half-dozen patients a month, especially when they could be taken by helicopter to University Hospital, where the planes do not have to come in at such low altitudes over a densely populated area. However, I think we residents of Laurelon are being misinformed and that once the heliport is put in, there will be many more than seven emergency cases a month coming in over our heads.

I am against a heliport at the Children's Hospital. Thank you.

Yours truly,

Marjorie Kresge

Dear Mr. McLerran:

We are writing IN SUPPORT of the helistops for use by medical helicopters at Children's Hosptial & Medical Center and the University of Washington Intramural Field.

We live at the Laurelon Terrace Condominium, whose eastern boundry abuts on the hospital's grounds. The noise from the overflights, which are brief, are NOT bothersome. We believe the potential hazard from the medical helicopters is NO greater than that of all the other helicopters and airplanes that fly over our area.

The fast transportation for the critically ill patients should be the overriding factor.

Because we understand that considerable criticism of the medical flights has come from senior citizens, we wish to point out that all of us are over 65 years of age.

Sincerely,

Mr. & Mrs. O. L. Almquist, Jr.

Mr. Dennis Mc Lerran, Director

Dear Sir,

Having lived in Laurelhurst for the past 50 years, we are voicing our deep concern over Childrens' Hospital and Medical Centers' plan to build a helistop. We feel it is absolutely unnecessary for many reasons-- a few of which are, possible accident, noise pollution and vibration and the extreme cost to the patient or the hospital. The helicopter must land to pick up a medical crew, Take off to get patient, land again with patient and take off again. Helicopters have landed for years at the Intramural Field with ambulance transfer to the hospital with no loss of lives.

The extremely limited space over residential area, schools, churches and planned building expansion at Childrens Hospital would further limit helicopter maneuverability. CHMC has been extending construction of various buildings for years against their original promise of land use.

Please save our neighborhood from further institutional encroachment.

Sincerely,

Barbara H. Smith

Seattle, Washington 98105

Dear Ms. Moore:

I respond to your letter of July 9, regarding the use of the University's existing helistop by Children's Hospital and Medical Center. The City of Seattle is the Lead Agency with respect to SEPA compliance per WAC 197-11-924-944. As the Lead Agency, the City has prepared a Draft and Final Environmental Impact Statement on Children's helistop proposal and alternatives. Use of the University's existing helistop was identified by the City as an alternative in the Final EIS. In addition, the project has gone through an extensive and lengthy public review process.

The University has reviewed both the Draft and Final Environmental Impact Statements for the helistop. The concerns and questions you raise in your letter are all addressed in the Final EIS, but may be further considered by the City during the review process.

As you know, the University and Children's have a very close continuing affiliation. Given this relationship, the University believes that it is appropriate for Children's to be allowed to use our existing helistop.

Regarding the suggested loss of recreational facilities, this area has been utilized as a helistop for more than 20 years. Continued use by the University and Children's will not adversely impact student recreational uses.

Children's will be applying for a City Council Conditional Use Permit. We have forwarded your letter to DCLU for their information and consideration.

Sincerely,

Tallman Trask III

Dear Mr. Katz:

Enclosed please find an analysis of projected pediatric rotary wing landings for the years 1991-1995. This analysis was developed after a comprehensive review of Airlift Northwest's historical pediatric landing experience. The projections are based on County-specific population growth trends and historical County-specific use rates.

Please let me know if you require any additional information.

Sincerely,

Jody Carona

EXECUTIVE SUMMARY

As part of the planning effort for the Environmental Impact Statement (EIS) required for construction of a helistop at Children's Hospital and Medical Center (CHMC), this study was commissioned by CHMC to: 1) review Airlift Northwest's current pediatric rotary-wing experience, and 2) project future pediatric rotary-wing volumes.

The Final Environmental Impact Statement (FEIS) contains a *Proposed Action* as well as a *Preferred Alternative*. The *Proposed Action* involves landing all CHMC destined patients at the CHMC campus. The *Preferred Alternative*, developed as a compromise proposal in the FEIS, allows only the most critical patients to land at a paved, secured helistop at the CHMC. All other critical pediatric patients would land either at Harborview, Intramural Field or Boeing Field and be transferred via ground ambulance to CHMC. The designation of patients who are most critically ill and require transport directly to CHMC's campus is currently, and will continue to be, determined on a case by case basis by the Airlift Northwest medical team on board the helicopter.

Specifically, this study defines and identifies three factors:

1) The geographic service area of Airlift Northwest's existing pediatric program;

2) The percentage of pediatric flights ultimately destined for CHMC (regardless of where they land) as well as the pediatric flights that actually land at CHMC; and

3) A projection of future Airlift Northwest pediatric flight volumes and a calculation of the number of flights likely to land at CHMC through the year 1995 under both the *Proposed Action* and the *Preferred Alternative*.

All data used in the review and analysis of current and projected CHMC landings were prov ded by Airlift Northwest.

A population/use-rate based projection method was applied to the two scenarios, the *Proposed Action* and the *Preferred Alternative*, to develop estimates of likely utilization. Only one element in the methodology differentiates the two scenarios. In the scenario assuming the *Preferred Alternative* one additional step was required to define the number of patients actually landing at CHMC. This step involved the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

determination of the average percentage of pediatric flights actually landing at CHMC during the 1987-1990 period. A review of the combined, four year data identified the following:

1987-1990 Airlift Northwest Rotary Wing Landings
Ultimately Destined for CHMC
by Landing Site[1]

CHMC landings	24.5%
Intramural landings	70.2%
Harborview landings	4.7%
Boeing Field landings	.5%
Other (Weather related)	.1%
Total	100.0%

1 Includes patient pick-ups at CHMC in 1989 and 1990

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The calculation of projected pediatric Airlift Northwest landings at CHMC in the years 1991 through 1995 is premised on several assumptions. These assumptions assume four constants: a constant use rate, a constant percentage of missed flights, a constant percentage of Airlift Northwest pediatric flights landing at CHMC, and a constant out-of-area utilization through 1995. The projected utilization under each scenario is as follows:

Year	*Proposed Action*	*Preferred Alternative*
1991	201 landings	49 landings
1992	204 landings	50 landings
1993	207 landings	51 landings
1994	210 landings	51 landings
1995	212 landings	52 landings

Airlift Northwest is a non-profit emergency air ambulance service established in 1982 by an inter-hospital agreement among four member hospitals. The member hospitals are: Children's Hospital and Medical Center, Harborview Medical Center, Providence Medical Center and University Hospital. The service was established as a fixed wing service in response to a demonstrated need to serve rural hospitals in Eastern Washington, Southeast Alaska, Idaho and Montana and to provide advanced medical care to those communities in the greater Western Washington area that did not have tertiary level capabilities. In early 1985, in response to increasing requests for transport from Western Washington hospitals and emergency response programs, Airlift Northwest inaugurated a rotary wing service. The first helicopter landing by Airlift Northwest at CHMC occurred in August, 1985.

The first emergency landings by helicopter at CHMC occurred in the 1970's. By the early 1980's a need for a permanent helistop at the Hospital was becoming evident. In 1984, CHMC applied for a Master Use Permit to allow construction of a helistop at the hospital. As part of the application process the Department of Construction and Land Use determined that an Environmental Impact Statement would have to be prepared. The Draft EIS contains a *"Proposed Action"* to land all critically ill and injured pediatric patients directly at CHMC. A *"Preferred Alternative"*, to land at the CHMC helistop only with the most critically ill patients-- less critical patients would be unloaded at Harborview or Intramural Field and then transported by ground ambulance to CHMC, was developed as a compromise proposal and presented in the FEIS. As part of the EIS planning process, this study was commissioned by Children's Hospital and Medical Center to define and identify three (3) factors:

1) The geographic service area of Airlift Northwest's existing pediatric program;

2) The percentage of pediatric flights ultimately destined for CHMC (regardless of where they land) and the nature of pediatric flights that actually land at CHMC; and

3) A projection of future Airlift Northwest pediatric flight volumes and a calculation of the number of flights likely to land at CHMC through the year 1995 under both the *Recommended Action* and the *Preferred Alternative.*

This study is divided into three main sections. The first section, ***Description of Methodology and Assumptions***, describes the sources and types of data used in this study. This section also details the specific methodology supporting the utilization estimates. The second section, ***Projections of Future Utilization***, calculates the likely pediatric utilization of Airlift Northwest's rotary-wing program in the years 1991 through 1995 under both the *Proposed Action* and the *Preferred Alternative*. ***Findings and Conclusions***, the final section provides an overview and analysis of the air-ambulance utilization projections.

DESCRIPTION OF METHODOLOGY AND ASSUMPTIONS

All data used in the review and analysis of current and projected CHMC landings were provided by Airlift Northwest.

A review of Airlift Northwest's 1987 through 1990 patient flight origin[2] was undertaken to identify the primary geographic area from which all rotary wing flights, and specifically pediatric flights were generated. Patient origins were originally defined by local community but reconciled for this study into County boundaries.[3] Reconciliation into County boundaries was needed to allow for future projections of pediatric rotary-wing air ambulance use.

The data analysis identified the primary geographic area for Airlift Northwest's rotary program as: bounded on the west by the Pacific Ocean; bounded on the north by the Canadian border; bounded on the south by Lewis County, and bounded on the east by the Cascade Mountains.

Once the primary geographic area was identified, a further review of actual 1987 through 1990 utilization was undertaken by applying a widely accepted use-rate based projection method.[4] The specific steps in the methodology include the following:

---

2 After review of flight data for the years 1985-1990, and after discussions with Airlift Northwest administration it was concluded that the years 1985 and 1986 represented "start-up" years for the rotary wing program. In contrast, the 1987 through 1990 experience was relatively constant between months and likely reflected the experience of a mature operation. Consequently, because the averaging of 1987 through 1990 data represents the most comprehensive and best available information on rotary wing use, it was used in this evaluation. This analysis assumes that the actual 1987-1990 transport experience remains relatively constant through the year 1995.

3 In review of the flight data, it became apparent that not all areas of King County equally request the services of Airlift Northwest. As such, King County was divided into four distinct planning areas. These planning areas are Central King, North King, East King and South King.

4 The 1987 Washington State Health Plan adopts use-rate based methods for projection of most hospital and acute medical services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1) Review and accounting of all 1987 through 1990 missed flights.[5]

2) The actual number of flights missed. due to inclement weather was subtracted from "total missed flights" to ascertain the actual number of flights missed due to factors other than weather.

3) A calculation of missed flights as a percentage of total flights. It was assumed that the percentage of flights missed was consistent between the adult and pediatric populations.

4) Adding the percentage of missed flights by primary geographic area to the average 1987 through 1990 pediatric flight volumes to arrive at a total potential pediatric flight numbe..

5) Dividing the average 1987 through 1990 potential pediatric population (by primary geographic area region) by the average 1987 through 1990 pediatric population in each region to calculate the 1987 through 1990 "use rate" of each region.[6]

Appendix 1 details the missed flight, total potential pediatric flights and county-specific use rate projections.

---

5 Missed flights are defined as those flights that are not responded due to either inclement weather or the non availability of transport equipment. The number of flights missed due to the non-availability of transport equipment decreased considerably after Airlift Northwest's initiation of a second rotary-wing helicopter in August 1988.

6 The use rate is defined as the average number of transport the pediatric population generates during a given calendar year. The statistic is presented as transports per 1,000 pediatric population (ages 0-14). While specific age data are not kept, according to Airlift Northwest staff, the majority of pediatric flights are for patients aged 0-14.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

PROJECTIONS OF FUTURE UTILIZATION

involved the calculation of the percentage of pediatric flights actually landing at CHMC. This was done by averaging the actual 1987-1990 experience. The specific formula for each scenario is described below.

Proposed Action

The formula for projecting the number of pediatric landings at CHMC, under the Proposed Action in the years 1991-1995 incorporates the number of projected landings and adds a factor for out-of-area use.

The out- of-area use factor was based on the actual average 1987-1990 pediatric Airlift Northwest experience. In the four year period under review, 2.49% of all pediatric flights destined for CHMC were generated from areas other than those defined in the primary geographic area analysis. This actual experience was assumed to remain constant. The formula for projecting landings at CHMC is as follows:

Total Airlift Northwest rotary wing patients destined for CHMC

+

out-of-area factor

=

Total rotary wing landings at CHMC

Using the above methodology, the projection of landings at CHMC under the Proposed Action is as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

To project pediatric rotary-wing flight utilization in the years 1991 through 1995, the projected pediatric population for each planning area was identified. The source of the population data is the Office of Financial Management.[7] Applying the projected population to the previously developed use rate provides an estimate of the projected population in each County likely to require pediatric air ambulance transport in the years 1991 through 1995. These projections are depicted in Appendix 2.

The FEIS contains a *Proposed Action* as well as a *Preferred Alternative*. The *Proposed Action* calls for landing all CHMC destined patients at the CHMC Campus. The *Preferred Alternative* is characterized by the most critical patients landing at a paved, secured helistop on CHMC's campus. All other critical pediatric patients transported by helicopter to CHMC would land either at Harborview or Intramural Field. The *Preferred Alternative* represents a continuation of the actual 1987-1990 CHMC landing experience.

A population/use-rate based projection method was applied to the two scenarios, the *Proposed Action* scenario and the *Preferred Alternative* scenario, to develop estimates of likely utilization. Only one methodology element differentiates the two scenarios. In the scenario assuming the *Preferred Alternative* one additional step was required to define the number of patients actually landing at CHMC. This step

---

7 Since OFM data are county wide and do not sub-divide the information into sub-areas, the following method was utilized to develop the population projections for the sub-areas of King County. A Puget Sound Health Systems Agency report entitled "Projections of the Population by Age, Northwest Washington Health Service Area, By Planning Area: 1990" identified the percentage of individuals age 0-14 within each sub-area of King County. These percentages were assumed to remain constant and applied to the King County population estimates published by the Office of Financial Management. The percentage of population 0-14 within each King County planning area was held constant as follows:

Central	11.0%
East	33.9%
North	13.4%
South	41.7%

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1991: 201

1992: 204

1993: 207

1994: 210

1995: 212

Preferred Alternative

One additional step is required to define the number of pediatric patients directly landing at CHMC under the Preferred Alternative. This step involves the caiculation of the percentage of pediatric flights actually landing at CHMC during the 1987-1990 period. A review of the actual data identifies the following:

CHMC landings	24.5%
Intramural landings	70.2%
Harborview landings	4.7%
Boeing Field landings	.5%
Other (Weather related)	.1%
Total	100.0%

For projection purposes,the 1987-1990 pediatric landing experience, by site was assumed to remain constant.

The formula for projecting the number of pediatric landings at CHMC, assuming the preferred alternative in the years 1991 through 1995 is as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Total Airlift Northwest rotary wing patients destined for CHMC

x

CHMC Average 1987-1990 landing percentage

+

out-of-area factor

=

Total rotary wing landings at CHMC

Incorporating the above assumptions and formula, projections of pediatric rotary wing landings at CHMC are as follows:

1991	49 landings
1992	50 landings
1993	51 landings
1994	51 landings
1995	52 landings

Specific detail on the projected CHMC landings in the years 1991 through 1995, under both scenarios is included as Appendix 2.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FINDINGS AND CONCLUSIONS

The calculation of projected pediatric Airlift Northwest landings at CHMC in the years 1991 through 1995 is premised on several assumptions. The major assumptions assume four constants: a constant use rate, a constant percentage of missed flights. a constant percentage of Airlift Northwest pediatric flights landing at CHMC and a constant percentage of flights from out-of- area through the year 1995.

These projections make no assumptions regarding unknown variables which may increase or decrease demand for air ambulance services. For example, in March of 1990, CHMC initiated an Extracorporeal Membrane Oxygenation (ECMO) program. ECMO is a technology which serves as a lung-bypass for neonates; thereby allowing their lungs to recover from damage incurred from sepsis, meconium or other similar problems. It should be noted that ECMO is not a primary treatment, but rather a treatment of last recourse. In 1989 and early 1990, prior to the technology being available at CHMC, approximately 14 Airlift landings occurred at CHMC to pick-up CHMC patients in need of the technology and to transport them to Emanuel Hospital in Portland, the closest ECMO technology site. For the period of April 1990 - February 1991 no out-flights have been recorded. In addition, no in-flights specifically for ECMO have been recorded. This is due to the fact that ECMO is an end treatment, and that neonates in need of tertiary treatment have been transferred earlier in the course of their illness to CHMC. Most of this transport is via ground ambulance.

Accordingly, in this case it appears that ECMO is a technology which will ultimately result in decreased demand (in terms of out flights) for air ambulance services. However, and in an attempt to be conservative, no decrease in demand was actually forecasted. Other examples of variables which may increase or decrease demand include, the reconfiguration of health care services, changes in technology, or changes in the health status of the population could have the impact of either increasing or decreasing utilization over time.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

After conducting a literature search and reviewing all applicable studies, no generally accepted standards were identified that would allow for the incorporation, with confidence, of such variables into the calculation of use rates and subsequent landings. Therefore, it was concluded that the combined 1987-1990 actual experience is the best indicator of future utilization and that any attempt to quantify the above unknown variables would reduce the reliability and validity of the projections.

Dear Sir:

On a recent Saturday on television, Chanel 7, I listened to a report on the frequency of helicopter accidents compared with airplane accidents and was shocked at the frequency with which helicopter accidents occur.

I live near Childrens Hospital and shudder every time I see one of the helicopters circling over a congested populous area trying to squeeze into a too small landing area. How much safer for all if the helicopter would land in the large University playfield area available to them with an aid car standing by to rush the patient to the hospital.

I also understand a group of doctors have invested in the hospital landing site. Is this not a "conflict of interests"?

Please consider these factors and decide against a helipad at Childrens Hospital, since there is an available alternativewhich makes better sense.

Sincerely,

Lillian J. Mills

Re: Project No. 9100626 Children's Hospital and Medical Center

To the Director, DCLU:

Last week I received notice from your department of public meeting to be held in August re the above project and inviting my comments.

I am an owner/resident of the Laurelon condominium next door to Children's Hospital. Whenever the helicopters bringing in emergency cases come in for a landing at the hospital's temporary helipad, not only are they noisy but the vibration is definitely felt.

I sometimes hear news on television that a child who has been critically injured is brought in by helicopter to Harborview or University hospitals. Why, now, must Children's Hospital join these two hospitals in having helicopter ambulance service? I've heard estimates that only six or seven emergency cases in a month would be brought in by helicopter. Could not Harborview and University hospitals handle these cases as well? I'm not familiar with the helipad at Harborview but the helipad at University Hospital, once it is finished, will provide landing for helicopters that come in over the University playfields. In the case of Children's Hospital, the helicopters must come in over a thickly populated neighborhood.

Thank you for inviting my comment.

Sincerely,

Marjorie Kresge

LAURELHURST LETTER

Published by the Laurelhurst Comunity Club ... serving 2200 households

MAY 1991

HELICOPTER UPDATE

On April 25, the Final Environmental Impact Statement (FEIS) was issued on the proposed helistop at Children's Hospital & Medical Center (CHMC). A decision is usually rendered within seven days, followed by a 15-day period for response. An appeal and public hearing can follow.

On May 3, however, the Director of the Dept. of Construction & Land Use (DCLU) announced that an alternative plan needed to be studied further and that a decision would not be given for at least another 60 days.

The alternative plan being studied is: *two* helistops, to be used jointly by the UW Hospital and CHMC - one at the UW Intramural Field, the other at CHMC. This would mean two helistops within half a mile of each other.

The approach and site of the helistop at the Intramural Field is in an open area. Helicopters have landed here for years with ambulance transfer to CHMC with no loss of lives.

The approach and site at CHMC is in an extremely limited space with approach over dense residential neighborhood (single family homes, condominiums, an elementary school). Planned building expansion at CHMC would further limit helicopter maneuverability.

In Vol. I (of III) of the FEIS, it is estimated an average of 15 to 21 patients could be transported each month to CHMC. This would be 30 to 42 overflights (in and out flights per patient). Also, "...addition of competing helicopter service ... the number of patients ... could exceed the 15 to 21 per month average."

Further stated in the FEIS is that CHMC cannot refuse any helicopter landings, even the Army MAST planes, such as occurred March 24, 1991 -- the "worst yet scenario." This landing was especially hazardous due to the extremely low flying altitude, size and age of the plane. It circled over residences and the hospital three times. The pilot had never flown to CHMC, did not know where to land, could not find a landing site, and was finally directed by hand signals from CHMC security personnel on the ground. There was no radio communication between plane and hospital.

Safety is the prime issue. Each landing and take-off poses endangerment to hundreds of lives of innocent citizens who live within the residential neighborhood surrounding CHMC. Since helicopter accidents occur most frequently during landing and take-off, the potential for a tragedy is real. Noise pollution and vibration affect the quality of life for these residents, too.

To voice your concerns about these safety factors and location of a helistop at CHMC, and to save our neighborhood from institutional encroachment, call or write:

VOLUNTEER EDITOR SEARCH

The board of trustees of the Laurelhurst Community Club is seeking an individual who will serve as the newsletter editor for a period of an agreed term, renewable.

The volunteer position is a vital part of the Community Club's effectiveness. The newsletter is the primary source of neighborhood information and announcements. Through the newsletter, we receive information about the community, the environment, and our own future.

The editor will attend the monthly Laurelhurst Community Club board meeting where newsletter subject matter is discussed. He/she may be a board member. The position requires: collecting the assigned articles, copy editing, coordinating with the newsletter's graphic artist, coordinating with the printer for delivery and distribution, and determining newsworthy subjects for following issues.

Requisite skills include writing, editing and organizing, and could include word processing, computer layout and previous newsletter involvement.

The Editor position is an excellent opportunity for someone to continue his/her interest and skill in writing and editing while serving as an important active member of this community.

Stop Helistops in Residential Neighborhoods

Dear Editor & Readers:

A recent article appeared in the Seattle Times regarding proposed helistops. Additional, pertinent facts need to be published. I respond to the proposed helistop at Children's Hospital & Medical Center (CHMC).

CHMC is located in a residential neighborhood where I have lived since 1953. This is a family-oriented neighborhood. We love children. Recently we added new equipment and redesigned the play area for the children at the Laurelhurst Playfield. This playfield is located a block and a half from CHMC. The Laurelhurst Elementary School is one block from CHMC where classes and activities are held almost year round.

Single-family homes are adjacent to CHMC on the North, East, and South; a condominium complex of 135 units is contiguous to CHMC property on the West. Within two blocks are two other condominium complexes.

Over many, many years helicopters with CHMC patients landed at the UW Intramural Field with ambulance transport to CHMC. Records show no loss of life occurred with this method of transport. The Intramural Field is 2½ minutes from CHMC with open approach and landing area.

In 1985 helicopters began to land at CHMC in a small area called "The Kitchen Garden." The approach and landing space are extremely limited. The approach is over dense residential neighborhood. Planned building expansion at CHMC will further limit helicopter maneuverability.

After issuance of the final EIS on April 25, 1991, an alternative plan is being studied by the Dept. of Construction & Land USE (DCLU). This plan calls for two helistops to be used jointly by the UW Hospital and CHMC -- one at the Intramural Field with open approach and landing space, the other at CHMC with extremely limited approach and space. This would mean two helistops within half a mile of each other.

Harborview Hospital has a helistop. It also has an excellent department of pediatrics and trauma center. UW Hospital is well known as a leading preemie center in the area. According to a monthly newspaper from CHMC, entitled Focus, which is mailed to the entire neighborhood, increasingly specialization and research seem to be of prime focus at CHMC. In the quarterly brochure of helicopter transport mailed to the neighbors by CHMC, notable is the high number of inter-hospital transfers to CHMC versus accident origin emergencies.

The number of flights per month varies from 12 to 4. Each landing, of course, is 2 overflights (in and out). Each endangers the lives of hundreds of innocent citizens. Statistics tell that the majority of helicopter crashes occurs during take off and landing. Potential for crash and/or conflagration at CHMC is a hideous possibility to the neighbors, school, and CHMC. I implore the City of Seattle to stop such a tragedy from occurring before it happens.

In the final EIS, it is estimated an average of 15 to 21 patients could be transported each month to CHMC. This would be 30 to 42 overflights. Also, "...addition of competing helicopter service...the number of patients... could exceed the 15 to 21 per month average."

Further stated in the EIS is that CHMC cannot refuse any helicopter landings, even the Army MAST planes, such as occurred March 24, 1991--the "worst yet scenario." This landing was especially hazardous due to the extremely low

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

flying altitude, size and age of the plane. It circled over residences and CHMC three times. The pilot had never flown to CHMC, did not know where to land, could not find a marked landing site, was finally directed by hand signals from CHMC security personnel on the ground. There was no radio communication between plane and hospital.

A helistop at CHMC is totally inadvisable. Safety is the prime issue. Noise pollution and vibration affect the quality of life for the nearby residents, too -- all of which occur any time of the day or night. A helistop on the campus of CHMC is an ill-conceived idea and poses a distinct danger to the residential neighborhood in which CHMC is located.

CUCAC

City of Seattle/University of Washington/Community Advisory Committee

July 9, 1991

Tallman Trask, Executive Vice President
University of Washington
Mail Stop AH - 30
Seattle, WA 98195

RE: REQUEST FOR ENVIRONMENTAL IMPACT STATEMENT
ON USE OF HELISTOP FOR CHILDREN'S HOSPITAL
ON U.W. INTRAMURAL RECREATION FIELD

Dear Mr. Trask:

The City - University - Community - Advisory Committee (CUCAC) is concerned that the University of Washington, as the responsible agency for SEPA compliance on its campus, has failed to provide an EIS for the potential permanent development of the Intramural Field Helistop and the U.W. agreement with Children's Hospital for expanded use as the primary landing site for helicopters delivering patients to Children's Hospital.

Children's Hospital and Medical Center is a private institution using state owned University of Washington property for helicopter landings. What are the total costs of the development of the helistop and the personnel to secure it for landings and takeoffs on a 24 hour basis? What is the source of funding?

CUCAC has long opposed non-University uses on the University campus because of the land-use pressures for state higher education needs.

The students will lose a recreation site for which there is no replacement. Recreation equipment installed nearby may be classified as a hazard to helicopter activities.

The Children's Hospital EIS contained little concerning impacts on the U.W. campus or affected U.W. neighboring communities in the flight path. The EIS was not circulated to students (ASUW and GPSS). Student awareness of recreational losses and issues involved is likely negligible.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Some of the CUCAC concerns are:

(1) What will be the increase of helicopter landings and takeoffs?

(2) Will the helistop be developed with fencing, lighting, and paving?

(3) Although University Hospital is not considering a roof-top helistop at this time, is one to be planned in the future, making two helistops on the U.W. campus?

(4) Is it possible to implement a flight pattern that will diminish the adverse impacts of night and day helicopter flights over residential neighborhoods adjacent to the University?

Will the University provide an EIS process with scoping to determine the extent of concerns, to inform the University students and public about intended action and enviromental impacts related to helicopter landings on campus?

CUCAC would appreciate information on the status of the U.W. helistop, the agreement with Children's Hospital and the City process. Please cite any SEPA regulations which would exempt the U.W. from preparation of its own EIS as lead agency for actions on the U.W. campus.

Sincerely yours,

Ruth Moore

Re: Children's Hospital Helistop
(MUP #8405870)

Maryann E. Spangler
4013 Northeast 46th Street
Seattle, Washington 98105

Dear Mrs. Spangler:

In response to your March 25, 1991 letter regarding the landing of a large military helicopter on the Children's Hospital campus, members of my staff and I have talked to several residents of the Laurelhurst community about this landing. I assure you we share your concern about the landings of these large helicopters at the Children's site. It is our understanding that the hospital had arranged for an ambulance to meet the helicopter at the University of Washington Intramural Field. Unfortunately, because of difficulties communicating between the helicopter and the hospital, the hospital was not aware of changes in the medical condition of the patient which the flight crew felt dictated changes in the landing location. The Hospital has expressed to us several times their dislike for landings of the military helicopters on the Children's campus. If you have additional questions about this landing and the particular circumstances, I encourage you to call Suzanne Petersen, the Director of Government Relations at Children's Hospital, at 526-2530.

We are working with the Hospital to ensure future campus landings are limited to the smaller civilian aircraft until a final decision is made on the pending permit. Our recommendation on the permit will also address the landings by larger military helicopters. We plan to publish the Final Environmental Impact Statement (EIS) for this project this month. We will be publishing our recommendation shortly after that time.

Thank you for your interest and the chronology of events associated with this landing which you provided with your

Re: Helicopter overflights and landings at Children's Hospital and Medical Center (CHMC)

Dear Mr. McLerran:

On March 24, 1991 neighbors experienced the "worst yet" helicopter overflight at Children's Hospital and Medical Center. Overflights have been numerous, dangerous, continuous over the past four years.

This one was especially hazardous due to extremely low flying altitude, size and age of plane, repeated circling over residences. It was extremely upsetting and posed a potential endangerment to hundreds of lives in Laurelon Terrace Condominiums--contiguous to CHMC property on the west--other nearby homes, and even to the patients and staff at CHMC.

The attached sheet documents data related to this situation. All data can be substantiated.

These overflights must be stopped in this high-density, residential neighborhood. They must be stopped before a tragedy occurs (crash and/or conflagration). Statistics show that most medical helicopter accidents occur during landing or take off.

Please take appropriate action via power vested in you to ban all helicopter landings at CHMC. Thank you.

Sincerely,

Maryann E. Spangler

Helicopter Overflight and Landing at Children's Hospital & Medical Center
March 24, 1991

1. At 4:08 p.m. a helicopter was heard approaching the area.
2. The helicopter soon appeared over residential area surrounding CHMC.
3. It was a large Army MAST helicopter with a red cross on each side and underneath. It was approximately 20 years old. Aboard were 6 people, including the head maintenance man from Madigan General Hospital from which the four-year-old patient was being transferred.
4. The pilot had never been to CHMC. He looked for but could not find a marked landing site. There is none.
5. The helicopter circled over the hospital and nearby residences 3 times. It flew very, very low just a few feet above roof tops of Laurelon Terrace Condominiums--136 units located contiguous to CHMC property to its west side, home of approximately 200 people.
6. Noise was loud, and vibration strong.
7. Hazardous, unsafe conditions existed endangering hundreds of innocent lives. True of each overflight throughout the years, this was the worst due to: extremely low altitude of flight, size and age of carrier, and repeated circling over residential area and the hospital.
8. Finally security men from the hospital directed the pilot by hand signals to the minuscule landing space. There was no communication from plane to hospital. Who ordered the plane to land is unclear. On site no one took responsibility for the order.
9. The potential for crash and/or conflagration was very real.
10. Many neighbors went outside to view and commiserate. They were deeply alarmed and angry. Was it going to land in the parking area behind our condo units? Was it going to crash? Was it out of control?
11. Mr. Jerry Marcott, resident manager of Laurelon Terrace, went to the landing site. He talked with the pilot, others aboard, and security personnel from CHMC.
12. Mrs. Maryann E. Spangler and other concerned neighbors called the FAA hotline, left a message on the recording machine. Also called was CHMC. The CHMC person said: The landing was out of their hands; they had no communication and no control over its landing; the large army planes usually land at Graves Field, then bring patient by ambulance to hospital; conceded that several other army helicopters had landed at CHMC over years.
13. The helicopter left at 5:32 p.m. diagonally across Laurelon Terrace.
14. (One neighbor reported he saw the helicopter fly upwards from Graves Field then come on out to CHMC. I have only this one person's word on this. I asked (later, see item below) for verification from CHMC but have not received return call.
15. On March 25th, FAA returned my call. I talked with Candy Carrara. She promised to relay my detailed data to her supervisor, Jack Highfill and will call me back. She also said she would talk with Madigan Hospital and with the pilot.
16. Others from the immediate neighborhood promised to call the above at FAA. Several neighbors called to inquire whom to contact, how to register their objections.
17. On March 25th I called John Doan, leaving a message for him to call me.
18. I called Suzanne Petersen, CHMC who returned my call after a meeting. She said: CHMC apologized for the landing. The pilot had made the decision. CHMC was called by phone from Madigan. There was no radio aboard the plane. MAST planes were supposed to land at Graves Field though have landed at CHMC previously, too. She said she did not know all the details yet (her call was at 3:45 p.m.--almost twenty-four hours after the landing). She promised to check re the plane's reported landing at Graves Field first. To date she has not called back.
19. Records in the DCLU Office as well as City Council provide proof of neighborhood concerns over the past four years. No action has been taken on the final EIS for almost two years.

The Meadowbrook
Nursing and Convalescent Center
3540 N.E. 110th Street
Seattle, Washington 98125
(206) 363-7733

March 23, 1991

Dear Neighbor:

The Meadowbrook Nursing and Convalescent Center has been approved to add beds to its facility. The Meadowbrook is a skilled nursing care center with round-the-clock nursing care. It is located at 3540 N.E. 110th (site map attached.)

The present capacity of the Meadowbrook is 47 beds. It has been in continuous operation for over 25 years. In 1971 it was given approval to expand to its present 47 bed capacity. It has almost always been filled and has a waiting list of people to be served. Recently the state Department of Social and Health Services, the licensing agent for nursing care facilities, found that the need for skilled nursing care at the Meadowbrook was so great, they approved an expansion from 47 to 81 beds. Since the facility has the adjoining land to complete the project, there is expected to be little or no negative impact to the community (see attached). On the contrary, the additional beds will provide the elderly in our community with the long-term care that has become scarce.

The owners, Mr. and Mrs. Louis (Virginia) Sternberg, are both licensed nursing home administrators and will be happy to answer any questions you might have. They can be reached by calling 363-7733.

RECEIVED
JUL 21 1988
SHAPIRO AND ASSOCIATES, INC.

Dear Mr. Bachman:

In response to your inquiry, a brief statement describing distinctions between Mary Bridge and Children's Hospital is provided:

There are many similarities between Mary Bridge and Children's Hospital. Both are are specialty pediactric centers and both have excellent staff. Children's Hospital and Medical Center in Seattle, however, is a larger and more comprehensive facility. There are more full-time children's specialists at CHMC than at Mary Bridge. There also are some groups of critical surgical illnesses that are treated at Children's but not at Mary Bridge because Children's has teams of pediatric surgical specialists, anesthesiologists, intensivists and other pediatric specialists who cover the services 24 hours per day. These illnesses include most complicated congenital heart disease and children born with complicated newborn surgical problems. These include omphalocele and gastroschisis (children born with intestines extruding from the abdominal cavity), diaphragmatic hernia (children born with intestines in the chest) and tracheo-esophageal fistula (children born with a hole between esophagus and trachea and obstruction of esophagus). These are unusual situations that require specialty care of physicians who have treated enough of these problems to maintain their skills. Although infrequent, these children come from hospitals all over the state. These illnesses are emergency, life-threatening conditions. Children's Hospital is the only hospital in the Puget Sound area that provides surgery for these conditions on a regular basis.

Please let me know if I can be of further assistance. Thank you for your very capable and expert work on the helistop environmental impact statement.

Sincerely,

John M. Neff, M.D.
Medical Director

Dear Mr. ~~Bachman~~ Glenn:

Thank you for your letter requesting a schedule for review of the Children's Hospital Helistop EIS. Unfortunately, we are not able to commit to a schedule at this time. The complexity and uniqueness of the issues is requiring extensive review on our part. As soon as this review phase is complete, we can develop a schedule for the remainder of the project.

We are also interested in being able to complete the EIS and move on to the next step in this process. I appreciate your concern.

Sincerely,

HOLLY MILLER

Seattle, Washington; Monday, April 4, 1988

10:49 A.M.

PAUL RUSSELL, witness herein, having been duly sworn testiied as follows:

D I R E C T E X A M I N A T I O N

BY MR. EGLICK:

Q. Mr. Russell, could you state your full name and address for the record, please.

A. Paul F. Russell, R-u-s-s-e-l-l, 15400 - 203rd Avenue Southeast, Issaquah.

Q. And -- oh, I'm sorry. And what is your present occupation?

A. I'm a flight crew instructor for The Boeing Commercial Airplane Company.

Q. And what was your occupational experience prior to becoming a flight crew instructor for Boeing?

A. I'm a retired captain from the United States Coast Guard and I flew helicopters and fixed wing in various capacities for them for about 24 years.

Q. In the Coast Guard did you have any particular responsibilities or did you just fly helicopters, or did you do anything more with them?

A. I flew helicopters. I commanded two aviation units and was chief of pilot training for the Coast Guard

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

for three years.

Q. And chief of pilot training would include training for helicopter pilots?

A. That's correct.

Q. Now, are you familiar with the site of -- you've been sitting in the room for some time now, have you?

A. At least for about half an hour.

Q. So you know we're talking about the Children's Hospital and the proposed medical office pavilion. Are you familiar with the site of the proposed medical office pavilion?

A. Yes, sir, I am.

Q. And with the site which Childrens has asked for for siting of the proposed helistop?

A. I am, sir.

Q. And how are you familiar with that?

A. I reviewed the draft environmental impact statement for the helistop and I have walked over the ground in that area.

Q. In light of -- well, can you tell us what you understand to be the juxtaposition between the two proposals, the helistop and the medical office pavilion?

A. As you face the current hospital, the medical office building will be to the left. As you would

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

approach the proposed helistop, heading toward it, it would be slightly to the left hand.

Q. And what is your understanding, if you have any, of how far apart the two would be?

A. From the helistop to the nearest corner will be somewhere around 120 to 150 feet, of the proposed building.

Q. And are you familiar with the proposed height of the medical office pavilion or the general dimensions?

A. I understand it's a four-story building on a slope with the basement, so I'm generally familiar, yes.

Q. Do you have any opinion as to the safety from a traption point of view of the juxtaposition of the proposed medical office pavilion and the proposed helistop?

A. Yes, sir, I do. It's my opinion that construction of the building in that location and of that height degrades the safety of operations at the helistop, the proposed helistop.

Q. And can you explain why? What do you base your opinion on?

A. It is another visual distraction to the pilot on the proposed approach. There is the definite impact of changing wind problems in bad weather conditions, particularly with the wind from behind the hospital, and it reduces the clear areas that a pilot can wave off an unsuccessful approach safely.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Q. If you were flying helicopters into CHMC and this building were built and the helistop were located where it's also presently proposed, would you consider it a safe situation?

A. No, sir, I would not.

MR. EGLICK: No other questions at this time.

THE EXAMINER: Mr. Olejko.

C R O S S- E X A M I N A T I O N

BY MR. OLEJKO:

Q. When did you walk the site?

A. About a year ago, sir.

Q. About a year ago?

A. Yes, sir.

Q. So you haven't walked the site in the past twelve months?

A. No, sir. It's been about a year.

Q. Did you measure the slope of the hill? There is a hill there, isn't it?

A. Yes, sir, the whole area is sloped.

Q. Did you measure that slope?

A. No, sir, I did not.

Q. Now, how are you familiar -- how did you determine where the medical office building was going to go a year ago?

A. It was in general then, but since then I have

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

looked at the proposed -- the drawings of the site.

Q. But since you looked at the drawings, did you go back and look at the slope and where the building was?

A. No, sir, I did not.

Q. Do you know how tall the building is going to be, aside from the four stories?

A. A four-story building will generally be somewhere in the 60-foot category. It depends on how it's constructed and if they add any antennas and that sort of thing to the top.

Q. What about this building? How tall is this building?

A. I have not seen an elevation on this, sir, the exact elevation.

Q. You haven't, okay. How about antennas? Any antennas that you're aware of?

A. I have not seen anything that describes the antennas.

Q. Now, you said you had an understanding of the distance. How did you derive that understanding of the distance between the pavilion and the helistop?

A. From a drawing that was prepared by the group proposing the addition.

Q. Who specifically? Do you know?

A. It's this one over here. I don't know who

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

prepared that.

Q. You didn't measure it, then?

A. No, sir.

Q. Oh, so, you're making the assumption that it's 120 feet?

A. I'm making the assumption based on the blueprint, yes, sir, prepared by Medical Environments, Inc.

Q. Are you suggesting that Medical Environments measured the distance?

A. I'm suggesting they might have.

Q. They might have, but you don't know?

A. No, I don't know for sure.

Q. Now, as a Coast Guard helicopter pilot, how big are those helicopters that you fly and train in?

A. It depends on which type, sir.

Q. Okay. Well, why don't you tell me the type that you are most familiar with the safety issues regarding.

A. Okay. I'm most probably familiar with the H52, which is a helicopter about the same size as the Augusta that Life Flight is operating. It's 8,000 gross pounds. I've also operated S61's, which are considerably larger, Bell 222's, Jet Rangers, and H47's.

Q. Do you teach for all those?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A. No, sir. I only taught the H52 and the H3.

Q. And you'll have to excuse me. I know --

A. Commercial version was the S61 and the S62, which are -- one is a single turbine three-bladed helicopter. The other is a twin turbine, much larger. If you'll remember the Vietnam era, it's what the Air Force called a Jolly Green Giant.

Q. Oh, it's a rather large helicopter, then?

A. Yes, sir.

Q. You wouldn't want to put that down next to the hospital in any circumstances?

A. No, sir.

Q. And you operate, as far as I understand --

A. It's my understanding that the intent would be to operate what are normal medical evacuation helicopters, and you're talking Bell 222, Augusta versions, Air Force Special Dalphines, that size.

Q. You may have to spell some of those names for the court reporter before you leave.

What if just the building was there and there was no helistop? Would it be unsafe?

MR. EGLICK: Objection. The question is unclear. What would be unsafe?

Q. Would there be any impact on helicopter traffic if no helicopters were landing there?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A. No, sir.

Q. Is there any site on that campus where this new building will not have an impact?

MR. EGLICK: Objection. Not have an impact on what?

MR. OLEJKO: On safety. Excuse me.

MR. EGLICK: Of --

MR. OLEJKO: Well, I thought we were addressing safety of flight operations here.

MR. EGLICK: Okay. I didn't think the question said that. I withdraw my objection.

A. I'm not familiar with the extent of the campus, so I don't know -- you know, I don't know exactly where it could be put.

Q. So you don't know?

A. No, sir.

Q. But it's possible?

A. Generally, yeah.

Q. Now, you were talking about visual distraction.

A. Yes, sir.

Q. Is there any greater visual distraction from this building than the current hospital building?

A. Yes, sir. It adds another area off to the left which would probably be relatively dark at night, and now you may have a varying pattern of lights.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Q. In terms of -- are you familiar with medical evacuation operations?

A. Yes, sir.

Q. Do you know if the pilots change much? Do you know what the situation is here?

A. I don't know what you mean by change.

Q. Okay. Let me strike that and ask a slightly different question. Let's say you had a pilot who was quite familiar with both the approach and the landing field. Would you believe that familiarity increases safety?

A. Yes, sir.

Q. What if the weather conditions were perfect? I mean, there's no wind, beautiful, lovely day, and it's during the daytime. Do you see a safety issue at chat point?

A. Yes, sir, I still see a safety issue at that site.

Q. Could you explain that safety issue.

A. Any time you make a visual approach into -- or any approach into a generally restricted pad -- by that I mean you don't have a clear escape route at the same level all way around -- it's a relatively unsafe operation. Looking at the approach path in the EIS, most of the time they'll be coming almost directly toward the hospital

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

building, which eliminates a route of escape in the event they have a difficulty or he misjudges the approach, which can occur even on a clear day.

Q. Have you ever operated helicopters in situations you would consider unsafe as a Coast Guard pilot?

A. Yes, sir.

Q. Did it happen all the time?

A. Not all the time, no.

Q. Did it happen regularly?

A. Yes, sir.

Q. Did you refuse to operate that helicopter?

A. I have on occasion, yes, sir.

Q. But did you refuse to operate it in specific conditions or did you continue to operate it?

A. I'm not sure I follow your question.

Q. Well, you've testified that you're familiar with situations which are unsafe in the operations of helicopters; is that correct?

A. Yes, sir.

Q. Then I take it you have had personal experience operating helicopters in unsafe conditions.

A. Yes, sir.

Q. And how often have you done that?

A. I don't think I could put a number on it.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Q. It would be a substantial number of times?

A. I've done it a few times, yes, sir.

Q. Wouldn't, say, aerodynamically a helicopter no matter where operated has safety issues?

A. Yes, sir, but they can be mitigated. Any airplane in flight has safety issues.

MR. OLEJKO: Okay. I have no further questions.

THE EXAMINER: Mr. Monroe?

MR. MONROE: No questions.

THE EXAMINER: Mr. Eglick, redirect?

R E D I R E C T E X A M I N A T I O N

BY MR. EGLICK:

Q. Mr. Russell, is the height of the building, give or take, for example, ten feet, critical to your opinion?

A. No, sir.

Q. You said you were most familiar with the H52 helicopter.

A. That's correct.

Q. And in your view -- I want to make sure I understand what you said. In your view that's comparable to the helicopters used for medical evacuation?

A. In general size, yes, sir; slightly different body style, but general size.

Q. Okay. This question of operating under unsafe

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

conditions, is this something that you from your experience would recommend be done on a regular basis?

A. No, sir.

Q. If it could be avoided?

A. There's a difference between operating in what you consider to be unsafe and then doing it repeatedly.

Q. And in asking about whether familiarity with an unsafe situation would significantly increase the safety of that unsafe situation -- pilot familiarity, that is -- what's your view on that?

A. Training is a key to almost any safe operation. It's virtually impossible, however, to train under every situation.

Q. So would familiarity with an unsafe situation change your opinion if you could say that pilots were familiar with the unsafety that they were to face?

A. I think that the thing that the training will do is allow them to identify an unsafe situation and give them the knowledge to say no, on which to base a "no" decision; "I won't go in there."

Q. Is that an acceptable alternative to simply removing the unsafety, insafety -- I don't know what the right word is -- the unsafe situation?

A. No, not if you can eliminate it by other means.

Q. And you've come down here to testify today and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I assume that means you take this potential lack of safety seriously; is that correct?

A. Yes, sir.

Q. Do you think it's significant enough to warrant, for example, moving the building as one potential alternative?

A. That's a potential alternative, yes.

Q. And would the unsafe situation warrant considering that alternative?

A. It will reduce the risk factor. If you moved the building, it would reduce the risk factor at that site, but there's still a significant risk factor.

Q. Would change in the configuration of the building perhaps be another alternative that would reduce the risk factor? For instance, if you had a low-rise --

A. Yeah. If it was spread out over a long area and only one story high, yeah.

MR. EGLICK: Okay. No other questions. Thank you.

MR. OLEJKO: I have two very quick questions.

R E C R O S S E X A M I N A T I O N

BY MR. OLEJKO:

Q. First, the other alternative, of course, would be to relocate the helistop somewhere on the campus, isn't that true, rather than move the building?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A. Yes, sir.

Q. And are there any FAA rules regarding the location of the helistop relative to a building?

A. There are some FAA guidelines on the construction of helistops and helistop ports.

Q. And you weren't referring to them in your testimony, were you?

A. No, sir, I was not.

Q. At least you're not -- this location does not violate the FAA rules and guidelines, correct?

A. I'd have to review the rules and guidelines again to make sure, so I can't answer the question.

Q. So you don't know?

A. Yes.

MR. OLEJKO: I am sorry. I have no -- thank you.

THE EXAMINER: Mr. Eglick, anything further?

MR. EGLICK: No.

(Witness excused at 11:05 a.m.)

THE EXAMINER: Mr. Doan.

MR. EGLICK: Before I forget, I want to move the admission of 6, the TMP Memorandum of Agreement.

MR. OLEJKO: I have a question. Did Mr. Doan identify the page that's between 4 and 5 on the copies? There seems to be kind of a free-floating page in there. Is that part of the TMP that you're aware of? Otherwise,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I have no objection.

THE WITNESS: I'm not sure what that is. I'm assuming it is someone's calculations. I don't know.

MR. EGLICK: We can eliminate that. I don't know where that came from.

MR. OLEJKO: I just want to make sure the exhibit is correct.

MR. EGLICK: We got this from DCLU, and unless this is part of DCLU's --

THE WITNESS: I haven't the foggiest idea what this is.

MR. OLEJKO: Well, it's located between two numbered pages, if that's something else.

MR. EGLICK: It's fine, we can eliminate it.

THE EXAMINER: Any objection to 6?

MR. MONROE: No objection.

THE EXAMINER: 6 is admitted.

Sir:

I write in support of the application of Children's Orthopedic Hospital of Seattle, Wasnington for the construction of a Helistop on the campus of Children's Orthopedic Hospital.

Transportation of the critically ill or injured child is a challenge to all emergency personnel. In recent years advances in technology, treatment, and transport modalities have contributed to a decrease in pediatric mortality secondary to acute illness, poisonings and trauma. While over 100,000 children die each year in the United States, they are widely scattered throughout the country. Each community thus accumulates little experience in caring for the critically ill child. The necessity for adequate, efficient resuscitation and rapid transportation has been clearly demonstrated in patients with severe illnesses or injuries. A response to the need for prompt, efficient delivery of proper medical care has been the development of regional centers to care for specific problems including regionalization of pediatric critical care to children's hospitals. Early reports indicate that regionalization of some facets of critical care may result in lower rates of pediatric morbidity and mortality, particularly trauma. Many cities, Seattle included, have pediatric centers dedicated to the special needs of children. Development of these services is costly and clearly not available in every community, therefore it is imperative that these services are available to all children regardless of their location. The speed and efficiency with which the child is delivered to the regional center may make the difference in outcome.
