NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's Orthopedic Hospital is a regional center. It has a national reputation for excellence in pediatric critical care. It provides the physicians practicing in the region with quick access to its critical care units by means of a regional critical care air transport system called Airlift Northwest (ALNW). Airlift Northwest is a consortium activity of four Seattle area hospitals. Airlift Northwest provides medically configured, ventilator-equipped turboprop jet and rotary winged aircraft, with a medical team of ICU physician and ICU nurse to resuscitate and provide proper medical care en route to critically ill children.

The COH medical teams and ALNW transport very sick children. Children's Orthopedic Hospital accounts for one-third of the use of Airlift Northwest fixed wing activity. It accounts for 12% of the ALNW rotary winged acitivity. In the preceding fiscal year 83% (175 children) of those transported to COH were admitted to an ICU setting. 100% of the children transported by rotary winged aircraft were ICU admissions. 39% (88 children) transported by fixed wing were intubated. 71% of the rotary winged transports were intubated. 11% of the children had central venous lines. 4% had chest tubes; 8% had vasopressor and/or prostoglandin infusions. 3% (6 children) had on-going CPR!.

The children were very young as well as being very sick. 40% of the children were newborns. 50% of the children were less than 6 months of age; 75% were less than 5 years of age. One third (35%) of the children under 6 months of age brought by the helicopter required endotracheal intubation in addition to IV infusions and the administration of medications. These medical interventions are delicate and cannot be disrupted by unnecessary additional transfers. Thus the ALNW service provides an intensive care support to a large number of very small and very fragile patients.

To summarize, Children's Orthopedic Hospital is a regional pediatric center with nationally known critical care excellence. It receives critically ill patients referred by local physicians from the Pacific Northwest region, many of whom are transported by air. Speed of transfer for patients from around the Puget Sound region, a majority of whom need continuous advanced life support, has been accomplished by using a helicopter. The number transported from within the region by helicopter is estimated to be 42 per year or less than one per week.

The continuous delivery of critical care justifies the need to fly a relatively small number of critically ill children directly to the door of the regional pediatric critical care center. COH has, in the helicopter, extended its critical care capabilitites to the smaller communities of the region. It must be argued that any disruption of the components of the critical care transport system extend unwarranted risk to the child and detracts from the level of service provided by Airlift Northwest.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I ask that you permit the placement of the Helistop on the COH campus thus allowing Children's Orthopedic Hospital to have quick access to the critically ill children of the region transported by Airlift Northwest.

Respectfully your,

Michael K Copass

Dear Ms. Ryan:

This letter is in response to your request of August 30, 1985 for an opinion about the medical need for the Children's Orthopedic Hospital (COH) to establish a helipad on hospital grounds.

In order to review the complete facts of this issue, I have spoken with numerous physicians, administrators, community residents, and former patients. I have reviewed the medical literature on emergency medical services delivered by helicopter, viewed a simulated transport/helicopter landing at Graves Field and near the COH proposed helipad site, examined helicopter and transport equipment, held a public hearing October 24, 1985 in the City Council chambers from 6:00 to 9:00 p.m., (written testimony attached), toured the COH facility, reviewed Airlift Northwest logs and individual patient charts.

Existing Pediatric Emergency Medical Services System in Seattle

Pediatric and neonatal emergencies within Seattle which are hospitalized are generally admitted at one of the 19 neonatal intensive care (NICU) beds or 17 pediatric intensive care beds (PICU) at Children's Orthopedic Hospital or one of the 19 neonatal intensive care unit beds at the University of Washington Medical School Hospital. The only other NICU beds in the region are the 12 beds at Mary Bridge Children's Hospital in Tacoma; the only other pediatric or neonatal intensive care beds in the State are located in Spokane. All pediatric surgery in the region is currently done at Children's. Pediatricians and neonatologists from within the State and from surrounding states (Alaska, Montana, Idaho) generally use COH and the UW as referral centers for the most seriously ill children or neonates requiring tertiary specialty care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Personal health care can, in general, be subdivided into three functional levels: a primary level, where the health care system is entered and basic services received and where all health services are mobilized and coordinated; a secondary level, represented by ambulatory services of a specialist nature and inpatient services provided in a community hospital-type facility; and the tertiary level, which includes the highly complex and sophisticated services available only at a "medical center" (Alberta Parker, "The Dimensions of Primary Care" in Primary Care: Where Medicine Fails, 1974, New York, John Wiley and Sons).

The University of Washington has a program which admits high-risk mothers so that low birth weight babies do not have to be transported between hospitals. This method of delivering high-risk mothers has been found to substantially reduce the morbidity and mortality associated with the delivery of low birth weight babies (Hickok, D. et al., "Decreased Mortality of Very Low Birthweight Infants After Maternal Transport," Department of Obstetrics and Gynecology, University of Washington School of Medicine, unpublished paper.)

But even with an excellent maternal transport program, there will still be individual patients who deliver small birthweight babies at small community hospitals throughout the State, where the infant needs to be stabilized and transported to a tertiary care hospital. Even though the UW is the hospital generally designated for the care of premature low-birthweight infants, its beds are frequently full and patients are referred to COH. The same pediatric medical staff, including interns and residents, deliver services at both COH and UW. In addition to small birthweight babies who have undeveloped lungs and intestines and require intensive support for survival and growth, there are transfers from hospitals around the State to COH for pediatric surgery or acute infection. Trauma patients generally go first to the region's trauma center, Harborview Medical Center, but may be transferred to COH for follow-up after surgery and stabilization.

This referral pattern exists regardless of transportation mode.

Helicopter Transport

There are existing guidelines and standards for patient care while being transported (Guidelines for Perinatal Care, "Interhospital Care of the Perinatal Patient," American Academic of Pediatrics and American College of Obstetricians and Gynecologists, 1985) but there are no standard published guidelines for which mode of transportation to use on a given patient or, for example, which criteria a patient should have to be transported by helicopter versus ambulance. The State Medical Society's EMS Committee is working on the delineation of medical necessity or medical reasonableness for medical transport and under Dr. Lothar Pinker's direction are hoping to have guidelines published in six months (see attached letter). There are some generalities that all the experts agree on.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Over 150 miles it is most timely, stable and economic to use fixed-wing aircraft, so most interstate transports occur in fixed wing. Between 100 and 150 miles, rotary-wing aircraft or helicopters appear most appropriate, so regional out-of-County transfers appear to be the general rule. Less than 70 miles, depending on geography, ground transport is the generally agreed preference.

The key to any transportation of sick people is the stabilization of the patient, making sure that vital signs are stable and that the general physical condition is not deteriorating. One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse to the community hospital to stabilize a deteriorating baby. Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to a baby's heart and lungs, and check the stability of its condition. There appears to be a balance between amount of transport time required and possibility of deterioration.

There are several studies in the literature that assess the severity of illness and injury in pediatric air transport. In one study, Mayer and Wallie prospectively evaluated 636 patients transported over 79 months of service to a regional children's center. Of these patients, 57.5% were transported by helicopter. Eighty-one percent of patients were taken to surgery or admitted to the intensive care unit immediately on arrival at the regional children's hospital. Overall mortality was 9%; a trauma score was used to classify patients (Ann. Emerg. Med. 1984 Feb.; 13(2):108-11). At Johns Hopkins, Dr. Columbani et al reviewed 267 children over a one-year period; 46% of patients arriving directly from the injury scene were delivered by helicopter. Fourteen of seventeen deaths resulted from head injury; a more aggressive approach to the management of brain trauma was advocated (J. Pediatric Surg. 1985 Feb.; 20(1):8-13). Other areas reviewed include a Hawaiian MAST system (Hawaii Med. J. 1984 Jun.; 43(6):200,202,204); a Kansas perinatal system (Respir. Ther., Mar.-Apr. 1985, 15(2):47-50, ISSN 0048-7392.

Another study evaluating air transport in a rural EMS system looked at 569 patients with multisystemic injuries. The emergency helicopter service was rated, utilizing strict specific guidelines as either essential, helpful, or not a factor in the preservation of life. The helicopter was essential to 16.5% and helpful to 10.9% of patients. In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Baxt et al. looked at a group of 1,273 blunt trauma patients who were treated and transported from the site by seven different hospital-based rotorcraft aeromedical emergency care services and saw a 21% reduction in expected mortality ($p<.05$) in five of the seven services. There is some debate about methodologic errors in the study. An editorial in the same journal issue (Annals Em. Med. 1985 Sept.; 14:9; 859-61) states that

> The effectiveness of aeromedical evacuation of battlefield casualties is well established; the transfer of this technology to the civilian setting is a logical event. Its effectiveness for civilian trauma care should be based on the following three principles: 1) early field resuscitation; 2) rapid transport; and 3) delivery to the hospital best suited to admit and treat the patient definitely and without delay. As Baxt and colleagues point out, helicopter emergency medical service (HEMS) patients may benefit from a highly integrated team effort at the receiving trauma center that is the direct or indirect result of a program but for which the helicopter (unless distance is a factor) is the least important component. This is a strong argument for the concept of regional trauma care that concentrates multiply injured patients in trauma centers organized to best care for them. The potential role of HEMS in making regional trauma care a reality should be explored by EMS systems.

My conclusions from the literature review are that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on your question at issue, the current Graves field site versus the hospital site 3-5 minutes away.

Current Data

COH admits approximately 1,000 patients per month in 200 regular beds and 36 intensive care beds (previously described) In August of 1985 82 patient admissions were ambulance transports to the emergency room, 34 were prearranged newborn ground transports, 30 were prearranged fixed-wing transports, and 6 were prearranged rotary transports. On an annual basis, there are 400-450 ground neonatal transports through the neonatal team; 80-85% of these transports go to COH, the rest to UW. During fiscal 1985 (a one-year period ending June 31) 279 patients were transported by air: 148 into intensive care units (see Attachment 1). Thirty-nine percent of these patients were under one month of age; 16% were greater than five years of age (see Attachment 2). Seventy-one percent (197) had peripheral intravenous lines, 27% (76) were intubated, and 2% (6) were undergoing CPR (see Attachment 2).

wrong # = 136

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I also reviewed the detailed flight logs of Airlift Northwest for August, 1985. There were 52 fixed-wing flights with 859 average miles per flight; 18 (54%) flights were out of State; all flights were out of County; 30 flights were to (or from) COH. There were 34 rotary-wing flights from Airlift Northwest averaging 110 miles: no flights were out of state; all but one of the flights were out of County (a motor vehicle accident to Harborview from South King County); 6 flights to COH.

Recommendations

It is my professional opinion that there are hospital transfers to COH where 3 to 5 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small. The criteria for helicopter transport in these cases would include the previous comments on distance, stable clinical condition during transport, severe injury or illness requiring tertiary center treatment (rather than secondary or community hospital level), and a strong possibility of decompensation (severe clinical deterioration) during transport. The most important part of the transport, in most cases, will be in getting a specially trained team out to community hospitals around the State.

In most cases, one single site near Graves Field would be adequate for both the University of Washington and COH; however, there will be a small number of cases at each hospital where the ability to land at the hospital may be life-saving. From the transport physicians I have talked to, about 5-10% of all transported children might fall into that category.

The number of children transported by air into COH for any given month may be 30 to 40 and based on the above criteria and clinical estimates, 3 to 4 of these patients may have a medical need for helicopter transport to the doors of the hospital.

The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any number would have to include an additional number of patients whose condition at time of referral was appropriate for air transport but who over time were determined not to have need of helicopter transport as essential. There also needs to be some flexibility for seasonal variation in disease.

Taking into account these factors, I would estimate ten expected helicopter transports for critically ill pediatric patients per month as an upward bound for COH.

I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use, rather than a hospital-by-hospital provided service. A consortium of hospitals providing helicopter services such as the one in Airlift Northwest is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

certainly a most sensible approach and will make it easier to establish a systematic approach to provision of these services. We are, however, just beginning to integrate helicopter transport into our EMS system. Once a technology is made available to the medical community, it quickly becomes a standard of care for medico-legal reasons.

Until there is a defined systematic integration of these services on a County-wide (or regional or State-wide) basis, I would recommend that the permit granted be a conditional use permit pending a defined relationship to our existing State EMS system and final development of criteria by the Washington State Medical Association's EMS Committee, and that helistop use be reviewed for appropriate medical need in six months. Appropriate use could be monitored by review of individual patient records by an outside panel which includes recognized EMS/pediatric experts as well, perhaps, as out-of-County reviewers. The Health Department would offer our consultation services for that purpose, and I believe it might also be useful to ask the Department of Social and Health Services, Division of Health's Emergency Medical Services Program, and the Washington State Medical Society's EMS Committee for consultation assistance. If a helistop were being used for purposes outside those expressly permitted, I believe it would be appropriate to revoke the permit at the end of the six months.

I hope that these observations and recommendations will assist you in your permit procedure deliberations; please let me know if any comments need further clarification. My thanks to your staff, to a wide variety of health professionals involved in delivery care, to the staff and administration at COH, to the community residents of Laurelhurst, and to a number of other interested individuals who helped me to reach a better understanding of the emergency medical services delivered to infants and children in our community and the many factors which affect those services.

Sincerely,

Bud Nicola MD

Helicopter plan lands hospital in controversy

Mayor Charles Royer says Children's should go through the state Certificate of Need process and justify the helipad, even though the state has decided not to require it.

At a public hearing in Seattle last week, the state House Committee on Social and Health Services was asked by several speakers to begin reviewing the use of medical helicopters.

The review is needed, the committee was told, because medical helicopter service is spreading quickly around the state without the traditional state review process to determine the need for costly new medical equipment.

The state's Certificate of Need program only reviews hospital equipment costing more than $1 million to buy or $500,000 annually to maintain.

Hospitals seeking medical helicopter service can avoid the review process since there are many ways to buy that service without spending a million dollars.

The helipad proposed for Children's, for example, will cost just $60,000 to build.

"They're deceiving . . . They refuse to justify this helicopter pad in an open way," Sharon East says of hospital administrators. A Windemere resident, she is a member of the Elisabeth Ripley Guild, which last year raised $10,000. All but two of the guild's 25 members signed a protest, she says.

"There is all sorts of information that COH is deliberately not sharing with the guilds . . . because they are afraid of losing support," says Liz Anderson, a member of Citizens Concerned About Helicopter Transport, which is fighting the helipad.

"We have made a good, honest effort to let the community know not only what we're doing but what we're *thinking* of doing," Katz says, "yet I realize some people don't see it that way."

The application for the helipad is based on the simple argument that saving time saves lives.

Children's for years has benefited from the Army's free MAST (Military Assistance in Safety and Traffic) helicopter service that lands at a nearby University of Washington playing field, only minutes away by ambulance. Hospital officials say they want to eliminate those minutes and reduce the amount of jiggling when a patient is transferred between vehicles.

Children's has joined a consortium of five hospitals hiring Airlift Northwest for air transport.

Cummings, the associate administrator, cannot cite a life that was lost due to extra time needed to bring someone from the playing field. But saving time would be one more way to increase chances that a patient might recover, she says.

She points to a recent case when a helicopter landed at the hospital without a permit (the third such incident in August). On board was a 28-week-old premature baby whose lungs collapsed during transport from Forks. Other problems also developed.

Mel Morse, the on-board physician who decided to land at the hospital, says landing at the UW playing field would have added more bumping and jostling. Morse, who is undergoing training to specialize in airlift care, says that would have meant adding a "critical risk" to the patient.

Both times when the helicopter landed on site, "We had no choice," says Dr. John Neff, hospital medical director.

Medical opinion on the helipad is by no means unanimous, however. Some physicians say hospital arguments are greatly overstated.

'We do very well with ground transportation'

Dr. Jay Kranz, volunteer chairman of MAST's coordinating committee, says it is not necessary for Children's to have on-site landings.

Almost all of Children's helicopter arrivals have been transfers from other hospitals where time is not usually a critical factor. MAST will continue to do pick-ups from field locations, where time is almost always important. Kranz says the trip from the UW field takes six to seven minutes.

For now, Children's can only guess how often the helicopter will be used. At last week's Social and Health Services committee hearing, Neff said the hospital probably will use the landing pad about six times a month. The hospital is not projecting from the MAST trips, which numbered 23 during 1983-84.

Kranz says there never has been a problem involved in landing at the playing field, transferring to an ambulance and driving to Children's.

"The seriously ill people are all attended by doctors and nurses and special transport teams. So the question is whether the risk involved in establishing a helicopter pad in a neighborhood is justified by medical need. The answer is 'no.'"

Durlin Hickok, a neonatologist at Swedish Hospital, isn't taking sides on the helipad issue but doesn't express much concern about jostling. The helicopter ride itself is jostling, he says.

"We do very well with ground transportation in Western Washington," he says. "Stabilizing the baby at the (originating) hospital is the critical thing. Afterwards, ground transportation is fine."

He says there may be a few instances where saving a few minutes may make a difference, but "those circumstances are few and far between."

Paul Herndon, a pediatrician at Children's and a Laurelhurst resident, says in most cases an on-site helicopter landing is not necessary. He says marketing is a major aspect in Children's argument for the helipad. He'd like to see a study done to justify the need.

'We have to think of our overall mission'

As a possible compromise, Herndon suggests that Children's build a permanent helipad at the UW field so most landings would go there. When the unusual situation develops where on-site landing is vital, the helicopter can land where it has three times already, on a raised grassy island in front of the emergency room.

But the hospital is sticking to the proposal on the table. A few nearby guilds may be raising a fuss, but the hospital isn't distracted from its goals.

"We can't change everything for everyone because of one part of the constituency," says Neff, the hospital's medical director. "We have to think of our overall mission. Our constituency is broader than the Laurelhurst community."

Helicopter plan lands hospital in controversy

By O. Casey Corr
P-I Reporter

For 40 years, the women of the Minna Parks Guild have been tireless, unwavering supporters of Children's Orthopedic Hospital and Medical Center.

Members did volunteer work, joined penny drives, staged fund-raising carnivals and, in that era when women wore hats, mounted annual hat shows.

By raising $100,000, the guild has done its part to establish Children's as "Seattle's favorite charity," in the words of a hospital spokesman.

With annual fund raising at $3 million, a budget of $59.4 million, a powerful, well-heeled board of trustees, a pool of 15,000 volunteers and a 78-year history, no other single charity in the state surpasses Children's image and prestige.

The Minna Parks Guild, so named for a prominent supporter of the hospital, has never complained about the institution it so loyally served. Until one recent day, that is, when members heard about Children's plans to build a helicopter landing pad near its emergency entrance.

That raised the prospect of daily flights of noisy helicopters flying near homes and an elementary school. For years, Children's used a free military helicopter that landed a few blocks away. Patients were transferred from there by ambulance.

The Minna Parks Guild, largely comprised of Laurelhurst residents, agreed their big neighbor was becoming insensitive to the nearby, single-family community. They sent a letter of protest to the City Council, which will pass judgment on the helipad.

The Minna Parks Guild will continue to raise money for Children's, but trouble is brewing among at least some important, longtime hospital supporters.

Relations between hospital administrators and many Laurelhurst residents are souring.

At least four Laurelhurst area guilds have expressed unhappiness with the proposed helipad or Children's overall expansion efforts. At one guild of Laurelhurst-Windemere women, irritation with the hospital was so great that members briefly discussed disbanding, two members say.

That talk dismayed guild member Peggy Habegger, who is immediate past president of the hospital's board of trustees. Tensions between the Laurelhurst Community Club and the hospital "make my heart ache," she says.

Hospital officials say dissension by a handful of guilds is minor when compared with the more than 500 guilds supporting the hospital. They refuse to release names of guild presidents so an independent survey can be done.

Nothing so far indicates hospital fund raising is jeopardized, but open disagreement can have a corrosive effect on a charity's image. The hospital has assigned a top-level administrator to brief guilds on the issue.

Roberta Solhaug, chairwoman of the 42-member Marion Blethen Mesdag Guild, says members of her group talked briefly about disbanding. The Mesdag guild last year donated $1,000.

Solhaug is also a member of other guilds that each year donate several thousand dollars.

"When people have mixed emotions, that absolutely can have an effect on fund raising. When people are feeling offended or hurt, you don't want to be a part of it," Solhaug says. She adds that she personally feels Children's "does a wonderful job."

Solhaug is particularly upset by discontent toward Children's because the hospital has been an essential element of social life in that part of Seattle. For decades, the hospital has brought people together for fund-raisers of all kinds, making for long-term friendships. Children, even grandchildren, of guild members have formed new guilds. That spirit is threatened by tensions over the hospital.

"There's a sadness that the feeling is not the same anymore," Solhaug says.

Habegger says the few guild members in opposition will be more understanding once they hear all the facts. "I don't like the mudslinging," she says. "I wish we could make peace."

The trouble isn't entirely tied to the helipad proposal. The latest dispute has revived long-held grievances against the hospital that date back to when Children's moved to Laurelhurst in 1953 and promised to remain small and unobstrusive, several longtime Laurelhurst residents and a former president of the board say.

Aside from whether such a statement was binding, much less realistic, Children's has become a massive presence in a neighborhood that feels threatened by a host of proposed developments and zoning changes in Laurelhurst and along Sand Point Way.

Children's alone has grown from 220,000 square feet to 429,000, hospital figures show, not counting a new 215,000-square-foot garage. The hospital recently announced plans to remodel a surgical wing for more than $900,000.

It has yet to make public plans to build a 40,000- to 60,000-square-foot physicians' office building. Residents complain the hospital is vague about the future and won't share its long-term planning.

"I'm careful not to say 'never' anymore because people say, 'You promised,' and things do change," says Karen Cummings, associate hospital administrator.

What's more, the helipad controversy is a typical outgrowth in debate over modern, competitive health care. Helicopters, as even some of Children's own physicians will say, can be valuable not only as life-savers but as marketing tools.

Guild dissidents stress they remain committed to the hospital's care for children but say hospital administrators have become unresponsive, even rude, to neighbors.

Treuman Katz, the hospital's chief executive officer, says he's been "inappropriately treated" by some residents, adding, "Perhaps my responses have been unkind."

Katz has met with a four-member delegation from the Laurelhurst Community Club. By all accounts, the two meetings were strained and unproductive.

Katz told John Kehoe, president of the club and not a member of the delegation, that he'd prefer meeting with a different, "open-minded" group. The hospital has failed to respond to club questions sent last spring about the helipad.

Kehoe says Laurelhurst-Children's relations have deteriorated and are "as bad as I can remember." He's trying to ease tensions.

City Council President Norm Rice spoke to a club meeting in August and, hearing a stream of complaints, promised that every council member would inspect the proposed landing site before a conditional use permit is issued. Later, he said Children's "has a certain blindness" to the neighborhood.

Seattle, Washington 98104

Dear Dennis:

We appreciate the opportunity to review and comment on the preliminary draft of the Final Environmental Impact Statement (FEIS) for "Construction of a Helistop at Children's Hospital and Medical Center".

As we have stated several times over the past year, the University is ready and willing to assist the City and Children's in developing an acceptable solution to the helistop issue. We are prepared to allow CHMC flights to continue to land at the existing helistop as long as their use does not jeopardize our operations.

It is our understanding that a Conditional Uses permit is attached to land, rather than the applicant, and therefore conditions which the City may impose on CHMC's use of the helistop would be viewed as restrictions to the use of University property. This would not be acceptable to us.

There is no written agreement between the University and CHMC regarding use of the helistop. We have received a draft from CHMC and are reviewing it. Until such an agreement is signed, the "preferred alternative" listed is the FEIS is not possible.

We understand the City's desire to resolve this issue, and we will therefore expedite our efforts to finalize this agreement.

We really are trying to help.

Regards,

Tallman Trask III

Dennis McLerran
Director
Department of Construction and Land Use
400 Municipal Building
Seattle WA 98104

Dear Mr. McLerran:

Thank you for the opportunity to provide specific comments on the preliminary draft of the Final Environmental Impact Statement for construction of a helistop at Children's Hospital and Medical Center. This letter provides specific responses to statements made in the document. As you know, we are working with Nancy Fox and Children's Hospital and Medical Center on possible solutions to the larger issue of City approval of Children's use of University facilities. We are awaiting DCLU's recommendations before we take further action.

Comments - Volume I

Page 3, 3rd paragraph - The University does not intend to use the helistop on the roof of the University's Medical Center at this time. Since the Intramural Field helistop is an existing use, the University's position is that a Council Condition Use is not required. A use agreement between the University and Children's is being developed.

Page 6, 2nd to last line - University of Washington Hospital should be changed to University of Washington Medical Center.

Page 9, last paragraph - The reference to hospital should be changed to medical center, and cite 32 neonatal intensive care beds rather than 19.

Page 32, 2nd paragraph - Our understanding is that the Board of Health is now responsible for needs assessment and preparation of a biennial state health report. The Board of Health is separate from the Department of Health. The Department of Health does administer the Certificate of Need program. Since there is a paragraph covering the Certificate of Need program, perhaps this paragraph should be dropped.

Page 45, 5th paragraph - At this time, the University is not intending to use the rooftop helistop at the Medical Center.

Maryann E. Spangler

Re: Helicopter landings at Children's Hospital and Medical Center -- on-going

1. Enclosed is a copy of most recent report received unsolicited from CHMC by neighbors; date of receipt 9-13-90 for some, later for some.

2. Note number of in flights for May as told to you via phone and letter in June, 1990.

3. Most recently on September 22, 1990 the neighbors were endangered (and insulted) with two landings within a few hours on same day. These must be halted. When will appropriate action be taken?

4. Once again in this "flight activity" report, CHMC neglected to list the out-flight times. Once again the air activity over our homes is only half represented as for each landing there are two flights overhead-- in and out flights. This is not honest reporting on the part of CHMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Page 46, 1st paragraph - Reference is made to the Medical Center rooftop helistop. We recognize that this option was in the original DEIS; however, since it is no longer under discussion, it should be dropped from the FEIS.

Page 52 - Graphic refers to University Hospital. The name has been changed to University of Washington Medical Center.

Page 53 - The graphic does not show the current configuration of the University of Washington Medical Center. Also, the reference to the University Hospital should be changed, as previously noted.

Page 57, 1st paragraph - Reference is made to construction of a "second" helistop at the intersection of Clark and Walla Walla Roads. This statement is confusing. At this time, the University has no plans regarding the existing University of Washington helistop at this location. Minor safety improvements may be made to the University's existing helistop at that location sometime in the future.

Page 61, 3rd paragraph - The first sentence should read, "While not under consideration at this time,..."

Page 65, 4th paragraph - Reference to City Council approval of the University's Medical Center rooftop helistop should be omitted, since it is not under consideration by the University at this time.

Page 68, 1st sentence - Reference is made to "a" helistop at the Intramural Field rather than the existing helistop.

Page 69, 1st paragraph - References are made to construction of a new helistop at the Intramural fields and the rooftop helistop at the Medical Center. Both references should be revised, per our previous comments.

Page 115, 5th paragraph - Should be revised as follows:

> Construction noise impacts could occur if the University of Washington made improvements to the existing helistop. The Intramural Field alternative is not expected to result in noise impacts from helicopters, since it is an existing use and the primary approach and departure paths are used. There could, however...campus is used.

Page 118, 3rd paragraph - Should read:

> University - Neonatal, Obstetrical, and Adult Medical (including Cardiac) Emergencies

Page 120, 4th sentence - Should state that the University's Intramural field site is an existing helistop and, therefore, does not need any approvals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Page 121, Noise, 1st sentence - Should be revised:

> There would be noise generated during the two-month-long construction period if improvements were considered for the existing intramural field helistop.

Volume II

Response #3, Seattle-King County Department of Public Health - Transporting a patient via elevator from the roof of the Triangle garage to the underground tunnel is not a viable alternative because the elevator is too small to accommodate a gurney.

Response #149, Liz Anderson - This refers to a "proposed" helistop; the helistop is an existing use.

Response #201, Liz Anderson - Should be revised:

> Future improvements at the University of Washington's existing helistop at the Intramural Fields might include paving and fencing.

Response #206, Liz Anderson - Should be revised to note that the existing helistop is not currently paved.

Response #244, Liz Anderson - Should be revised to state that no accidents have occurred at the existing University of Washington helistop.

Response #14, Bruce Balick - Should note that the University does not plan to utilize the rooftop helistop location at this time.

Response #8, Dorothy McCormick - Should note University of Washington Medical Center.

Again, thank you for the opportunity to comment on these documents.

Sincerely,

Christine Knowles
Director

Seattle City Council

RECEIVED
APR 3 1990
DEPT OF CONSTRUCTION & LAND USE
SAND POINT BRANCH

April 2, 1990

Harold and Mildred Kurtz
5043 Sand Point Place NE
Seattle, WA 98105

Dear Mr. and Mrs. Kurtz:

Thank you for your letter to Tom Weeks regarding the heliport at Children's Hospital.

Because the City Council functions like a judge rather than a legislative body on many land use issues, Tom cannot read letters, respond to phone calls or be lobbied on individual land use projects, including the heliport. If he does, he risks prejudicing himself before all relevant facts of the case are determined and losing the right to vote on the project if it comes before the Council.

Since you cannot appeal directly to Tom on this issue, I have forwarded your letter to the staff members at the Department of Construction and Land Use who will be dealing with the project. You can reach them at 684-8875. DCLU will add your name to the project mailing list, and you will be notified about all public hearings conducted on the project.

Your comments are extremely important as the Department of Construction and Land Use evaluates this project. I urge you to contact them directly, either in writing or by attending public hearings, and make your views known.

Tom cannot become involved in this process until and unless this project is appealed to the City Council. If that happens, he will be permitted to review only the information contained in the public record. He will not be permitted to consider new information or to meet with any interested persons except at a public hearing. That is why it is so important for you to work with DCLU from the beginning.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I am sorry that Tom cannot be of more help to you on this issue. I appreciate your frustration and hope you understand the importance of his efforts to remain impartial. If you have any additional questions about the procedure by which this project will be reviewed, please feel free to call me at 684-8805. Again, thank you for taking the time to write.

Sincerely,

Mary Bourguignon

TOM WEEKS
SEATTLE CITY COUNCIL MEMBER

Q1

Honorable Councilman Tom Weeks
600 4th Avenue
11th Floor
Seattle, Washington 98104

Dear Councilman Weeks,

On the 20th of March, this year, another illegal Helicopter landing was made on the grounds of the Childrens Medical Hospital in the Laurelhurst residential district with considerable news media coverage.

We have long contended that a residential area is in no way an appropriate area for a helicopter landing pad--regardless of the reasons.

We have listed below some very basic points along with alternate suggestions that would alleviate a dangerous operation to everyones satisfaction.

1. When Sand Point Naval Airstation was closed, a public vote rejected any further air activity in this area due to dangerous overflying of a residential area.

2. There is strong action to limit the overflying of Seattle by commercial aircraft.

3. The Medivac Helicopter System has the poorest safety record of any type of flying activity, which gives us reason to question the wisdom of allowing this practice to continue.

4. One block from the Childrens Medical Hospital helicopter landing site is the Laurelhurst Elementary School, which is disturbed as well as endangered by each landing.

5. There is a very adequate landing area at the University of Washington Intramural Field that allows all air approaches over water and unpopulated areas. This eliminates any risk to life or property and is only 3 minutes away from the Childrens Hospital.

6. The University of Washington emergency hospital uses essentially the same area for emergency patient transport activity and we do not understand why the same conditions should not apply to all helicopter landings for this purpose.

We are asking that you take all of these thoughts into consideration and require that all emergency medical helicopter landings be confined to an area of minimal risk to life and property.

Thank you.

Very truly yours,

Harold L. Hurtz
Mildred L. Hurtz

Children's
Hospital & Medical Center

September 1990

To Our Neighbors,

We are sending you quarterly reports about patients transported by emergency medical helicopter to Children's Hospital and Medical Center in order to keep you informed about the number and types of the cases of children who require immediate transport directly to the emergency room entrance. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

Emergency helicopter transport of patients to Children's Hospital occurs when time is a critical element of saving a child's life. This service is used by emergency medical teams responding to crises in the field and by community hospital physicians who need to send patients to Children's for emergency tertiary (highly specialized) care services. For example, during the summer months, near drownings are too often examples of some of the conditions that require immediate, advanced medical intervention at Children's. The hospital's medical and surgical teams are notified of the helicopter transport and are ready to provide immediate treatment upon the child's arrival.

If you have questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Treuman Katz

Treuman Katz

*** Definition of Diagnosis/Treatment**

Bacterial meningitis: *Life-threatening infection of the membranes which surround the brain and spinal cord.*

ECMO: *Extracorporeal membrane oxygenation is a form of heart-lung bypass used as a treatment of last resort for newborn infants who are critically ill with reversible heart or lung disease. ECMO can take over most of an infant's heart and lung functions, giving the baby's injured organs time to rest and heal.*

In March, Children's Hospital began providing ECMO treatment for newborns in the Infant Intensive Care Unit.

Epiglottitis: *Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.*

Grand mal status epilepticus: *Rapid succession of major epileptic seizures attended by loss of consciousness.*

Pyelonephritis: *Infection of the kidneys which, if not treated promptly, can lead to growth arrest of the kidneys, deterioration of kidney function, and obstruction. In the most severe cases, acute pyelonephritis can spread, causing the child to develop a generalized, life-threatening infection of the blood.*

Sudden Infant Death Syndrome: *Also known by its acronym, SIDS is a collection of disorders whose common feature is the sudden death of an infant who appeared to be in good health and developing normally. SIDS deaths remain unexplained after a complete case study and postmortem examination is completed. The child is usually discovered during a sleeping period with no heart rate and no respirations. Emergency medical personnel will attempt to resuscitate a child who has a detectable heart rate or whose skin color is near normal.*

Re: Helicopter landings at
Children's Hospital &
Medical Center (CHMC)

Dear Mr. Doan:

Since our telephone conversation of May 29, 1990, the helicopter landings at CHMC have continued. Neighbors in Laurelon Terrace Condominiums (135 units contiguous to CHMC property) and Laurelhurst and Windermere Circle (adjacent to CHMC) agonize over these unsafe landings. SAFETY is the issue here. As you know, most helicopter crashes occur during landings or take-offs.

Enclosed are pamphlets mailed by CHMC to its neighbors. Notable omissions occurred: 5 landings were omitted in the June-December '89 report; all departure flight times were omitted in each June-December and January-March '90 reports. Departure flights are a definite part of the flight activity in our high-density, residential area.

Also enclosed is copy of the Laurelhurst Newsletter, May, 1990, with article about these reports.

Please take appropriate action to stop these landings. Thank you.

Sincerely,

Maryann E. Spangler

MAY 1990

NE 45th STREET REZONE PROJECT
by Bob Klug

Six year battle over the two vacant lots on NE 45 continues; NE 45th St. Neighbors request that it be a single family/SF5000 zone as it was in the past (1982); YOU CAN HELP: sign the petition and attend the public hearing of the City Council on June 6 at 7 pm, 11th floor, Municipal Building.

You may remember, the City Council, as a result of a map change request by the brother of the owner of those two lots, changed the zoning throughout the area in 1982. One day it was a single family SF5000 zone, the next day it was a high-density multi-family MF:L3 zone without any discussion or debate. Of course, the City Council had at the time suspended the regular notification process so no one had any idea that a zoning change had occurred in the area until 1985.

In 1985, the owners of the lots sold the land rights to a Bellevue developer and it was stated at that time that he would construct a four-story, fifteen unit apartment condo project. It was a project totally out of scale and character with the neighborhood, in particular the single family houses in this half block along NE 45th. The adjacent neighbors decided that they would fight the project as it would completely disrupt the single family character of this part of the area. With widespread support, they eventually defeated the project.

In 1988 the City Council put conditions or restrictions on the height, bulk, scale, and character of the project. To try to reverse that action of

Public Hearing, Case No. 29, NE 45th St. Rezone Project: Land Use Committee, City Council, Wednesday, June 6 at 7:00 pm (see lead story).

Regular Meeting, Board of Trustees LCC: Monday, June 11 at 7:30 pm, St. Stephens Epis. Church.

Work Party, NE 41st St. Boulevard Project: Saturday, June 16 at 9:00 am; 4102 37th Ave. NE.

GREEN LAKE PIPELINE UPDATE
by Susan Burchfield

SUBA (Save Union Bay Association) has been working vigorously to oppose the pipeline into Union Bay. They are concerned that pumping 11 mgd out of Union Bay and returning Green Lake and sewer water into Union Bay will cause negative environmental effects including increased entrification of Union Bay and leaching of toxins out of the Montlake fill. The executive committee (Susan Burchfield, Steve Sulzbacher, Frank Henry, Art Ward, Beth Morrison, Bill Holliday & Rick Hess) have attended numerous meetings, written letters, talked to DOE, City Council, and the Park Dept. SUBA filed a legal appeal of the FEIS and the hearing is set for August.

Thanks to everyone who phoned or wrote DOE, the DOE has given the Park Dept. a list of permits needed to implement the pipeline plan. Completion of all of the steps is expected to take 10 years -- and approval of permits is NOT anticipated. DOE recommends that the Park Dept. look at on-site treatment of Green Lake instead of pursuing the pipeline!

At this point in time we don't know the Park Dept. response. They have tried to pressure DOE to ease their regulations and they may continue to try to implement the pipeline. SUBA is following the issues closely and will continue to provide updates on new/continued developments.

ALERT ! ! ! HELICOPTER LANDING REPORT
by Maryann E. Spangler

A recent report received by neighbors in the Laurelhurst community listed flight activity by Airlift Northwest at Children's Hospital and Medical Center (CHMC) between June-December 1989. But this report was not complete!

Omitted were 5 landings: 2 in June, 1 in July, 1 in August and 1 in September. Also omitted were departure times for all flights. These are a part of the flight activity in our neighborhood. There are 2 overflights per landing. These endanger the lives of residents each time they occur.

Thus, between June-December 1989, there were 58 overflights from helicopter landings at CHMC!

(continued on page 2)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

REZONE PROJECT
(continued from page 1)

the council, the developer sought review of the issue in King County Superior Court through legal action against the Neighbors and the city.

Later that same year, the City Council identified (in Resolution No. 27850 dated Oct. 24, 1988) approximately 150 areas throughout the city where significant errors occurred in the zoning process in 1982. It was stated in the resolution that the city would within two years review each case. The half block area along NE 45th was one of these, as the City Council erred and had violated the land use code of the city when it put a high density multi-family MF:L3 zone and a single family zone together side by side on the map.

This so-called remapping process of the City Council could really help us and the neighbors in the area. Should the council decide in the review that it should be a single family zone rather than a multi-family zone, it would resolve the problem of out-of-scale development in this area.

The possible reversal of the 1982 zoning error will take much hard work however, as it is highly likely that the absentee owners of the two lots will oppose the changeback to single family zone. For that reason, it will be important that the Council see and clearly understand that the downzone project has widespread support.

Here's how you can help: (1) sign the position statement of the Neighbors and the Community Club that this area meets all the requirements of a single family zone in the land use code of the city of Seattle. To get a copy of that statement, call Bob Klug 527-4892 or Luanne Johnson 524-9736. (2) attend the public hearing of the City Council, 11th floor, Municipal Bldg. on Wed., June 6 at 7:00 pm. A big turnout can make a difference. For your help: thank you.

CRIME WATCH WORKS -- IF YOU DO

The Laurelhurst community in conjuction with the Seattle Police Department are the elements involved in the Crime Watch Program. It means a lot of eyes watching and people reporting suspicious activity promptly -- and it is quite effective in keeping crime and vandalism down in our area.

One of the key elements is to report anything that doesn't look quite right to you even if you are not sure whether you should or not. Capt. Farrar of the Seattle Police Department supports this idea completely. Call 527-6601 and let the Crime Watch staff follow up on your report. If you see something in progress -- even just groups of cars and kids gathering -- call 911 directly. And then call the Crime Watch number: 527-6601.

If you call the 911 number, please tell the Crime Watch people what was happening, what the police response was, etc. Sometimes a small bit of information can be helpful.

Crime Watch works -- if you do. Make the call.

IT'S ICE CREAM TIME AGAIN ! !

The fifth grade class at Laurelhurst Elementary will host its 16th Annual Ice Cream Social on Friday, June 8th, from 6:30 to 8:30 on the school's north playground.

Everybody is invited! Cone and sundaes will be the order of the day. And there will be the traditional sponge toss as well as the Bavarian Village Band, the moon walk, the cake walk, the SPD Mounted Patrol, and a fish pond.

This year Carolyn Meeks, M.D., Laurelhurst pediatrician, will be selling and signing copies of her new book, Prescriptions for Parenting, with a portion of the proceeds going to the Laurelhurst PTA.

In case of rain, the event will move inside the building. This Annual Ice Cream Social helps underwrite the class's outdoor education camp.

Have your dinner at home, but come to the school for dessert!

HELICOPTER LANDINGS
(continued from page 1)

Noting the omissions, a neighbor phoned Suzanne Petersen, the name given in the report as being the Director of Government Affairs at CHMC. She was shocked; she could not believe it possible that omissions had occurred. She requested a list of the omissions be mailed to her. Within the hour she called the neighbor back, said she had checked records, apologized, and acknowledged the omisions and said, "You are absolutely right. We did omit 5." She then gave the dates of omissions and stated that a corrected list would be issued.

Building expansion at CHMC has greatly reduced the space for helicopter landings. With condominiums of the Laurelon Terrace complex (136 units) contiguous to and single family houses adjacent to CHMC property, the landings/take-offs/overflights are extremely unsafe. They pose a life-threatening situation for residents. By contrast, landings at the nearby soccer field (NE 45th and Union Bay) in open space pose no threat. Furthermore, it is a fact that no child's life has been lost by landings at the soccer field.

The Northeast District Council will hold its regular meeting on Thursday June 7 at 7:30 pm in the St. Stephens Episcopal Church, 4805 NE 45th St.

NEXT DEADLINE: Fri., June 15, 1990

Children's
Hospital & Medical Center

May 1990

To Our Neighbors,

In an ongoing effort to keep you informed about patients transported by emergency medical helicopter to Children's Hospital and Medical Center, we are sending you periodic reports. These reports indicate the date, time and origination of the airlift; the age range and admitting diagnosis of each child; where the child went within Children's; and his or her outcome. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

Most requests for emergency helicopter transport of patients to Children's come from physicians in the Puget Sound area or Olympic Peninsula. These reports describe the cases of children most critically ill who require immediate transport to the emergency room entrance at Children's. Other critically ill or injured children, determined able to withstand delay and movement, are helicoptered to other landing sites in Seattle and then transported by ambulance to Children's Hospital.

If you have questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Treuman Katz

• Definition of Diagnosis/Treatment

Kidney and lung hypoplasia: *A condition in which the kidneys and lungs are underdeveloped, which can result in a lack of or diminished function of the organs.*

Oomphalocele: *A defect in the abdominal muscle structure causing some portion or all of the abdominal organs to herniate out of the cavity.*

Persistent fetal circulation: *A condition in which the blood circulation in newborns fails to switch over from in utero oxygenation or oxygenation by the mother, to oxygenation by the newborn's own lungs. As a result, the newborn's blood bypasses its lungs and fails to absorb enough oxygen. The infant's metabolism continues without sufficient oxygen, which produces acid in the bloodstream. This acid is toxic to body systems.*

Respiratory syncytial virus: *Also known by its acronym, RSV is a serious respiratory virus that affects the lining of the airways in the lungs, producing a large amount of mucous and swelling. Because young children cannot cough up the mucous, it remains in their airways and increases labored breathing. RSV is especially serious in premature infants, whose health is already compromised.*

ECMO: *Extracorporeal membrane oxygenation is a form of heart-lung bypass used as a treatment of last resort for newborn infants who are critically ill with reversible heart or lung disease. ECMO can take over most of an infant's heart and lung functions, giving the baby's injured organs time to rest and heal.*

In March, Children's Hospital began providing ECMO treatment for newborns in the Infant Intensive Care Unit.

Children's
Hospital & Medical Center

March 1990

To Our Neighbors,

As I'm sure you are all aware, the most critically ill patients admitted to Children's Hospital and Medical Center, particularly those from outside the city, are transported via the emergency medical helicopter operated by Airlift Northwest to the Emergency Room entrance at Children's.

In an effort to keep you informed about the number and types of cases landing at the hospital, we plan to send you periodic reports about medical airlift activity at the hospital. This report will indicate the date, time and origination of the airlift; the age range and admitting diagnosis of each child; where the child went within Children's; and his or her outcome. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

If you have any questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Treuman Katz

Treuman Katz
President and Chief Executive Officer

*** Definition of Diagnosis**

Congenital diaphragmatic hernia: *A condition at birth in which the abdominal contents are displaced into the chest cavity causing respiratory distress and usually requiring immediate surgery.*

Epiglottitis: *Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.*

A report to the community about emergency medical helicopter landings at Children's Hospital and Medical Center: A summary of Airlift Northwest flight activity is published quarterly by the Communications Department at Children's Hospital and Medical Center, Seattle, WA. If you have comments or questions, please call Suzanne Petersen, Director of Government Affairs, at (206) 526-2530.

*** Definition of Diagnosis/Treatment**

Congenital diaphragmatic hernia: *A condition at birth in which the abdominal contents are displaced into the chest cavity causing respiratory distress and usually requiring immediate surgery.*

Epiglottitis: *Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.*

Pulmonary hypertension: *A condition in which a newborn is unable to oxygenate his own blood because his lungs have malfunctioned due to high blood pressure in the lungs themselves. Blood vessels in the lungs constrict abnormally, increasing the amount of pressure required to deliver blood into the lungs to be oxygenated.*

ECMO: *Extracorporeal membrane oxygenation is a form of heart-lung bypass used as a treatment of last resort for newborn infants who are critically ill with reversible heart or lung disease. ECMO can take over most of an infant's heart and lung functions, giving the baby's injured organs time to rest and heal.*

In March, Children's Hospital began providing ECMO treatment for newborns in the Infant Intensive Care Unit.

A report to the community about emergency medical helicopter landings at Children's Hospital and Medical Center: A summary of Airlift Northwest flight activity is published quarterly by the Communications Department at Children's Hospital and Medical Center, Seattle, WA. If you have comments or questions, please call Suzanne Petersen, Director of Government Affairs, at (206) 526-2530.

June 26, 1990

Governor Booth Gardner
Capitol Building
Olympia, WA. 98504-0413

RE: Helicopter landings at Children's Hospital & Medical Center, Seattle (CHMC)

Dear Governor Gardner:

We have written to you previously on March 30, 1987 on the above subject and you were kind enough to answer. Thank you.

The helicopter overflights and landings at CHMC are still occurring -- and increasing. For example, during the month of May, 1990 there were 12 landings which means 24 overflights in a high-density, residential area (SEE: enclosed snapshot).

Enclosed is the most recent report from CHMC in which it is shown that 9 out of the 16 patients died. Each of these flights endangered hundreds of other lives--that is, the residents who live adjacent to CHMC. CHMC is responsible for these other lives, too. So are you as Governor for all of us. (Please note: Each landing means 2 overflights; thus, a total of 32 within this time frame. Children's does not show the time for departure flights; however, they are a part of the air activity in the area, too.)

CHMC has acknowledged that no children's lives have been lost over many years of landing at the nearby soccer field (corner of N.E. 45th St. and Union Bay). The University Hospital also uses this soccer field for its emergencies.

Please use the power vested in you and your office to stop these landings, to stop the danger of these low overflgihts (landings and take-offs) in a populated area. Safety is the issue. As you know, most helicopter crashes occur during landings and take-offs.

Thank you.

8405870

Sincerely,

Helen Newman

Dear Mr. McLerran;

I wanted to write in support of emergency helicopter service at Childrens Orthopedic Hospital and Medical Center. Our family is a resident, approximately three blocks from the hospital, and do hear the noise from the helicopter. Our feeling is that the benefits and life-saving possibilities far out weight the noise and possible "crash" risk factors.

We would be happy to testify or do anything we can to secure a permit for Children's to build a helicopter landing pad and keep the program going and ensure safety for all concerned.

Please support this needed and life-saving program.

Sincerely, Gayle M. Gray
Ladrelhurst Resident

Dear Mr. McLerran:

My address, as you see, makes me a "neighbor" of Children's Orthopedic Hospital. I also receive the Laurelhurst Newsletter, and I am aghast at the callousness of the people who are trying to stop the building of the heliopad at COH.

In your decision on this matter please consider my strong support for this project. I know I speak for many others in this area. Perhaps, most of them, like me, feel that, of course, such a life-saving project will be authorized.

Counting on a favorable decision from you, I am,

Sincerely,

Eileen M. Egan

TOM V[illegible]
SEATTLE CITY COU[illegible]

Seattle City Council
600 Fourth Avenue
Seattle, WA. 98104

Dear City Council Member Tom Weeks:

I wish someone on our City Council lived in the Laurelon Terrace Condominium complex (136 units) contiguous to Childrens Hospital and Medical Center, CHMC.

I wish someone on our City Council cared about the safety and quality of life of residential neighborhoods such as Laurelon Terrace.

I wish everyone on our City Council would read the letters and testimonies and petitions on record about the helicopter over-flights and landings at Childrens Hospital.

I wish everyone on our City Council would study the EIS on file on this project, which has lain in the DCLU office without action for over a year.

I am not a bald eagle, nor am I a spotted owl, but I, too, am an endangered species. I live in Laurelon Terrace (where I own my condominium). Each time a helicopter lands at CHMC, my life is endangered (along with hundreds of other innocent residents). Not only once for each flight but twice are we endangered with an in and an out flight.

To date in 1990, we have suffered 11* landings which equal 22* over-flights while I have been home (there may well have been others). I have six pages of single-spaced documentation of helicopter landings at CHMC. My records begin with 10-15-85 and go through 3-2-90.

Repeatedly I have written to City Council members, DCLU, and other offices to voice concerns about the unsafe situation of helicopter landings in minimal space (less and less as CHMC expands its build-ings), in high-density, residential neighborhoods, such as Laurelon.

Repeatedly I have asked that these landings be stopped before a tragedy (crash and/or conflagration) occurs.

I write again. I ask again. Please respond. Please stop these continuous helicopter landings at CHMC now.

Sincerely,
Maryann E. Spangler

Dear Mrs. Spangler:

Thank you for your letter to Tom Weeks regarding the heliport at Children's Hospital and Medical Center.

Because the City Council functions like a judge rather than a legislative body on many land use issues, Tom cannot read letters, respond to phone calls or be lobbied on individual land use projects. If he does, he risks prejudicing himself before all relevant facts of the case are determined and losing the right to vote on the project if it comes before the Council.

Since you cannot appeal directly to Tom on this issue, I have forwarded your letter to the staff members at the Department of Construction and Land Use who will be dealing with the project. You can them at 684-8875. DCLU will add your name to the project mailing list, and you will be notified about any public hearings conducted on the heliport.

Your comments are extremely important as the Department of Construction and Land Use and the Hearing Examiner evaluate this project. I urge you to contact them directly, either in writing or by attending public hearings, and make your views known.

Tom cannot become involved in this process unless the Hearing Examiner's decision on this project is appealed to the City Council. If that happens, he will be permitted to review only the information contained in the Hearing Examiner's record. He will not be permitted to consider new information or to meet with any interested persons except at a public hearing. That is why it is so important for you to work with DCLU from the beginning.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I am sorry that Tom cannot be of more help to you on this issue. I appreciate your frustration and hope you understand the importance of his efforts to remain impartial. If you have any additional questions about the procedure by which this project will be reviewed, please feel free to call me at 684-8805. Again, thank you for taking the time to write.

Sincerely,

Mary Bourguignon

TOM WEEKS
SEATTLE CITY COUNCIL MEMBER

Seattle City Council
600 Fourth Avenue
Seattle, WA. 98104

Dear City Council Member

There has been an increase in helicopter landings at Children's Hospital & Medical Center in recent weeks/months. In the original and final EIS, 3 a month were temporarily permitted. In 1990 thus far we have had 12 landings equalling 24 overflights (day and night hours).

There is no necessity for these landings. At both University Hospital and Harborview Hospital landings are not at the emergency entrance. This is an imposition which endangers our neighborhood.

It seems that CHMC is counting on "no response" from you and thus is doing exactly as they please with total disregard to any consideration for the neighborhood -- hundreds of innocent residents.

I hope you will change your "no response" to immediate reassessment of this matter and once and for all STOP helicopter landings at CHMC. This ought to have been done years ago.

After all you as elected officials represent the endangered citizens, do you not? Please now act on our behalf.

Thank you.

RE: **CHMC Helipad**
Job No. 23881.14
Report of Telephone Conversation – John Doan, DCLU, to Mike Miller on June 27, 1989 at 1:45 pm

I asked John if since the E.I.S. gives approximate dimensions for siting the helipad, we could alter the location yet stay on the same site .... the "kitchen garden".

John said that we could alter the location as long as we did not move to another site, i.e., south side of the hospital. He said that the drawings submitted for the Master Use Permit would give more accurate location information for the helipad and that the exact location could deviate from this drawing as long as it did not move from the kitchen garden site.

MAR 13 1989
DEPT. OF CONST. & LAND USE

March 10, 1989

Dennis McLerran
Director
Seattle Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Dear Mr. McLerran:

I have received your March 6, 1989, letter regarding the 4800 Sand Point Way N. E. MUP #8405870. We will be working diligently with our consultant in order to submit the final EIS for the proposed Helistop within the 45 day requested time frame (by April 20, 1989).

I do not agree that progress on the EIS has been unsatisfactory in light of the number, length, and complexity of the comments received. The extensive information we are gathering in order to respond to the comments and prepare the revised draft has required additional time and will fully address the issues raised.

Sincerely,

Treuman Katz
President and CEO

phs

Re: 4800 Sand Point Way N.E.
Children's Hospital and Medical Center

Allene C. Caddy
4658 41st Ave. N.E.
Seattle, Washington 98105

Dear Ms. Caddy:

Councilmember Street's staff has requested that I respond to your letter regarding development at Children's Hospital and Medical Center (CHMC).

The helicopter issue is one that we have been working on for several years. Because of the significant impacts, a consultant has been preparing an Environmental Impact Statement, which addresses the issues you have raised, including safety, noise, and the medical need for the facility. Unfortunately, because the project is unique and involves a great deal of information, the development of the EIS has been time consuming. I can appreciate your concerns and frustrations about the current landings at the hospital.

Although a notice of violation has been issued against the hospital, they have been given the opportunity to complete the permit review process, before ceasing operation. Following completion of the EIS, our Department and the City Hearing Examiner will make recommendations to the City Council on whether to grant the hospital a permit to land helicopters at the site. The City Council will ultimately have to make the decision. Council members cannot become directly involved in a project like this until it is formally referred to them.

Regarding general development on the CHMC campus, we carefully reviewed the medical office building, now under construction, prior to giving it any permits. The hospital was required to provide significant incentives to employees to ride the bus and carpool to reduce the traffic impacts experienced by the community. The Mayor and Councilmember Street have also recently proposed no changes to the zoning at CHMC Hospital. Although too complex to fully explain in this letter, the new regulations would greatly limit the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

outright development potential of the property. Deviations from the standards would only be allowed through the implementation of a master plan developed in conjunction with the community.

Thank you for sharing your concerns, and I encourage your continuing participation. I will make sure you are made aware of further activity regarding the helicopter permit. If you have any questions, please call John Doan, the Land Use Specialist assigned to this project, at 684-8875.

Sincerely,

DENNIS McLERRAN

STANDING ORDERS FOR CHILDREN'S LANDINGS

If during the transport of a critically ill child any of the following clinical conditions occur, a Children's Landing is authorized by the Medical Director of Airlift Northwest

I. UNSTABLE AIRWAY

- A. Diagnosis or clinical presentation of epiglottitis
- B. Inability to protect the airway
- C. Inability to provide an artificial airway

II. INABILITY TO VENTILATE/OXYGENATE

- A. Inadequate PaO2 confirmed by oxygen saturation monitoring
- B. Significant hypoxia in the face of 100% oxygen administration
- C. Inability to generate adequate gas exchange, as in status asthmatics or acute pulmonary edema.

III. INABILITY TO MAINTAIN ADEQUATE CARDIAC OUTPUT

- A. Low or absent blood pressure
- B. Lethal cardiac rhythm
- C. Inability to provide IV access in hypotensive patients

IV. INABILITY TO MAINTAIN ADEQUATE CEREBRAL BLOOD FLOW

- A. Uncontrolled seizures
- B. Signs and symptoms of massive cerebral edema as in Drowning, Carbon Monoxide Poisoning, Strangulation

V. THE PERSISTENCE OF UNSTABLE VITAL SIGNS DESPITE HEROIC ATTEMPTS TO CONTROL THEM

Re: Helicopter landings at Children's Hospital & Medical Center

Dear Mr. McLerran:

We have been and continue to be against helicopters landing at Children's Hospital which are endangering lives of those who live adjacent to the hospital, especially since a landing site is available nearby at the University of Washington soccer field without endangerment of lives. It is a crime to continue to expose the neighbors to the danger of helicopters landing at the hospital.

A case in point, within the past ten days, two air ambulance medical helicopters have crashed with loss of lives (one in southern Oregon, the other near Spokane, WA). More lives would have been lost had these crashes been in high density residential neighborhoods such as surround Children's Hospital.

Please do not sanction a helipad at Children's Hospital. Think about the hundreds of innocent neighbors whose lives are endangered by each flight in and out. Crashes most frequently occur during ascent and descent of the helicopters.

Please review all previous letters emphasizing the safety factors of helicopter landings at Children's Hospital. Thank you.

RE: Unauthorized Helicopter Flights at Children's Hospital and Medical Center

Dear Mr. McLerran:

We appreciate and share your concern about preserving the livability of Seattle's neighborhoods.

However, we are not certain that you are aware of the continuous and frequent unauthorized helicopter landings at Children's Hospital. We feel that the adverse public impact and comments concerning these landings have been ignored. Letters of concern are on file as well as testimony at public hearings. Due process regarding the helipad permit is not taking place. After four and one-half years this issue remains unresolved.

Each landing, in increasingly limited space now that enlargement of the Medical Office Building at Children's is in progress, poses endangerment of lives of hundreds of innocent patients, staff and nearby residents. This is particularly true for the residents of the Laurelon Terrace Condominium complex (136 units) contiguous to Children's property and for the single-family residents nearby. Each landing means two flights--one in, another out--placing hundreds of lives in needless jeopardy.

Why does DCLU and City Council give special consideration to Children's Hospital over widespread public objections and the history of medical helicopter crashes? Why does DCLU and City Council allow a continued extension of a temporary permit to land at Children's Hospital? What is the rule for granting continuations of temporary permits--where in the code is this stated? Why have public objections been ignored?

Please do not wait until a tragedy (crash and/or conflagration) occurs before action is taken to halt once and for all these helicopter landings at Children's Hospital in a high-density, residential neighborhood.

Please revoke the temporary permit for landings. Please stop the landings on Children's campus. Please place this on-going, long-suffering issue at the top of your list for the earliest possible resolution in 1989.

Thank you.

Sincerely,

BOARD OF TRUSTEES of the
Laurelhurst Community Club

Re: 4800 Sand Point Way N.E.
(MUP #8405870)

Mr. Stanley T. Sinex
Portage Bay/Roanoke Park Community Council
2611 Broadway East
Seattle, Washington 98102

Dear Mr. Sinex:

I want to thank you for keeping me informed about your correspondence with Children's Hospital and Airlift Northwest.

On December 10, 1985 the Department of Construction and Land Use issued a notice of violation against those two organizations for landing helicopters on the Children's Hospital campus without a permit. The Department of Construction and Land Use Director, at that time, made the decision to continue the enforcement action to a time adequate for the hospital to complete the permit review process. Unfortunately, because of the complexity of the issues and uniqueness of the permit, it has taken a great deal of time to prepare the necessary environmental impact statement (EIS). We are in the final stages of the EIS process, and are refining information on medical need and safety impacts. After the EIS is completed, both the Department of Construction and Land Use and the Hearing Examiner, following a public hearing, will make recommendations to the City Council. The City Council will make the final decision on the permit application.

The authority to extend the compliance date for a notice of violation comes from the enforcement provisions of the Land Use Code (Chapter 23.90). Section 23.90.008 provides that among the considerations for the Director to use when determining a compliance date are "the procedural requirements for obtaining a permit to carry out corrective action" and "the complexity of the corrective action...."

With regard to the use of the University of Washington intermural field for landings, neither the University nor Airlift Northwest has a permit for those landings. We have

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

informed the University of the requirement for a permit and have indicated that we will be issuing a notice of violation if a permit application is not submitted.

I hope this addresses your concerns about our violation process. I will make sure you are kept aware of future actions relative to the helistop permit at Children's Hospital.

If you have any questions about that permit, please call Senior Land Use Specialist John Doan at 684-8875. If you have questions about the notice of violation, please call Housing and Zoning Enforcement Division Director, Joe Garcia at 684-7899.

Sincerely,

Dennis J. McLerran

Re: Continued Jet Aircraft Overflights in Residential Neighborhoods for Childrens Hospital & University of Washington.

Dear Dr. Copass,

Thank you for your letter of February 14, 1989. Your response to my letter was what I had feared, and justifies my concern and desire to have your operations stopped as soon as possible.

Your justification for doing business is both irrelevant and fails to address the problem I initially wrote you about. This region has many hospitals that could provide the services you mentioned and nothing is stopping the U.of W. or Childrens Hospital from developing satellite services at Harborview or other locations where TWIN JET Helicopters do not regularly impact residential neighborhoods.

You service is intrusive and as I stated asks us to subsidize it with the lessening of our quality of life and health.

You also wrongly state that you have worked with community groups to develop flight paths that have minimal impacts. You have never worked with our community nor the Montlake Community and the Laurelhurst opposition is totally unsatisfied with your operation and wants it eliminated since there is no mitigation of Jet Helicopters.

We oppose your continued operation and with this latter ask that the City Attorney review the Director of D.C.L.U.'s decision to ignore the land use code section 23.90.016 which clearly states that no extension of a land use violation may be granted if there are adverse impacts. Your letter indicates that there are negative overflight impacts and seems to indicate the incredibly selfish position that since there are other impacts, you should be allowed to add to them?!!!

As a health professional you must realize that overflights do have negative health & quality of life impacts and that our existing impacts already are significant - are you saying that you want to increase the negative health impacts that already exist???

We are disappointed that Hospitals with the reputation of Childrens and U. of W. seem to want to use their "good name" to bully the city and the neighborhoods into accepting this unnecessary service in a residential area. The TWIN JET rotor aircraft you fly are the greatest noise impacts in this area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I have researched the F.A.A. regulations and understand that what they allow, and what is reasonable in a residential area are two very different things - as is evidenced by our support to regulate Seaplanes on Lake Union and our support for the changing of Sea-Tac overflights. Why would you think we would support your MORE intrusive JET AIRCRAFT overflights?

Again, your argument that you are flying within F.A.A. standards is not relevant, and the statement that you regularly fly at one thousand feet merely substantiates my complaint that you do fly far below this level at least irregularly as you did again today at 4:30 P.M. (literally shaking my home)

Lastly, we would be happy to meet with you as I stated to Ms. Lippman however, our time is valuable and if you are only going to continue to justify your current unacceptable (as this letter indicates) position there is not much point.

You seem to have made an poorly researched business decision that requires us to subsidize it - I hope this letter makes our position clear.

Sincerely,

Stanley T. Sinex

FEB 15 1989
DEPT. OF CONST. & LAND USE

February 14, 1989

Mr. Stanley T. Sinex
Portage Bay/Roanoke Park Community Council
2611 Broadway
Seattle, WA 98102

Dear Mr. Sinex:

Thank you for your letter of January 22, 1989 which was referred to me by Mr. Treuman Katz, Chief Executive Officer of Children's Hospital & Medical Center, and Mr. Robert Muilenburg, Executive Director of University Hospital. In response to your letter, Ms. Wendy Lippmann, Public Relations Director for Airlift Northwest, was instructed to schedule a meeting with representatives of your community. I understand, however, that you do not wish to meet with Airlift Northwest representatives without receiving a promise that Airlift Northwest will either change its flight patterns or cease operation. I hope you will reconsider your position.

I should like to respond specifically to the points raised in your letter:

*Since Airlift Northwest helicopter service began in 1985, we have worked with neighborhood community groups to develop flight paths that have minimal impact on residential areas. The current flight patterns to and from Children's Hospital & Medical Center, University Hospital and the Graves Field landing site were developed through long-term, ongoing discussions with the people who live near these regional, tertiary care hospitals.

*Airlift Northwest adheres to Federal Aviation Administration Regulations (F.A.R.) with respect to minimum altitudes. F.A.R. 135.203 establishes a minimum flight altitude of 300 feet for helicopters except for take-off and landing. Airlift Northwest helicopter pilots routinely fly at a minimum altitude of 1,000 feet during the approach to the Graves Field landing site.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

*The internal modifications to Airlift Northwest aircraft, enabling them to serve critically ill or injured patients, do not affect aircraft speed or engine noise.

*The normal approach and departure patterns for Airlift Northwest flights transporting patients to Children's Hospital and Medical Center and University Hospital are as follows:

The helicopter follows Interstate-5 and turns east at Interstate-520, following the highway. From a minimum altitude of 1,000 feet, the pilot begins his descent at or near Husky Stadium while following Montlake Boulevard toward Graves Field, or NE 45th Street/Sandpoint Way to Children's Hospital. On departure, the pattern is reversed.

-or-

The helicopter follows Interstate-5 and turns east at NE 45th Street. The aircraft follows the major arterial, begins its descent at or near 15th Avenue NE, continues to follow NE 45th Street to Graves Field, or Sandpoint Way to Children's.

*In selecting flight paths, Airlift Northwest is sensitive to considerations of safety, reduction in patient transport time, and noise. In general, when and where possible, the pilots avoid flying over hills, over or near densely populated areas, or at altitudes less than 1,000 feet. Flight patterns are never "short cut" to save fuel or maintenance.

We make every effort to keep aircraft noise at the lowest possible level in your community. As you can see, our flight pattern follows major arterial and interstate routes, in compliance with existing safety and noise reduction guidelines. Unfortunately, residents living along or near these thoroughfares experience some inconvenience due to helicopter noise, as well as from the noise of other emergency medical vehicles, such as ambulances and fire engines.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Finally, I'd like to share some thoughts about the mission of Airlift Northwest. Airlift Northwest transports only extremely ill patients to hospitals with specialties unavailable in their home communities. We represent regional, tertiary care hospitals that are dedicated to caring for seriously ill or injured patients. Children's Hospital & Medical Center and University Hospital, for example, are the only two hospitals in King County that offer neonatal services, while Children's is one of two in all of Washington, Alaska, Montana and Idaho that can perform pediatric cardiac bypass surgery. Airlift Northwest is part of an emergency services system in the Northwest that was developed as a regional system, and helicopter transport is integral to the provision of these services. The service was founded to serve the critical care health needs of all the people of the region, including you, your family and neighbors.

Thank you for this opportunity to respond to your concerns. I hope you will contact me at your earliest convenience. I look forward to meeting with you and your neighbors.

Respectfully,

Michael K. Copass, M.D.

(206) 325-8400

Dear Sirs,

We are writing to express our concern on the subject of Airlift Northwest's unreasonable flight pattern, noise pollution, and lack of cooperation.

We have received complaints from our residents as well as Montlake residents over your medivac service's extremely loud engine noise and vibration in our residential homes during normal business hours as well as many 3:00 a.m. arrival and departure flights. We have verified complaint times with Airlift N.W. flights.

We believe that this is caused by the following conditions:

1. They fly below F.A.A. minimum ceiling of 1,000. Eye witnesses available.

2. They have modified their aircraft with the result being a dramatic increase in noise and vibration. (Note: Only military aircraft approach these levels of noise and vibration. Independent tests will prove this.)

3. In their desire to save fuel and maintenance they are short cutting their flight pattern, both by route and flight ceiling level

4. They refuse to work with the community in altering their flight plan to a reasonable height and over the Freeway bridge and through the University of Washington Campus rather than over our residential neighborhoods.

With this letter we will be making a formal complaint to the F.A.A. asking them to revoke their license because of unsafe flying practices and our belief that they have altered their aircraft.

We will also be asking D.C.L.U. to eliminate or severely restrict the Helipad operation until you responsibly establish a medivac Trauma Center at an airport or use Harborviews' facilities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We would like to work with you to find a solution to medivac types of services that include establishing a Trauma Center at Boeing Field or Sea-Tac since your current service requires that we subsidize it with negative impacts to our health and the peaceful enjoyment of our Homes.

The success of YOUR service is too much for us to pay.

Sincerely,

Stanley T.Sinex

Mr. Dennis McLerran
400 Municipal Building
Seattle WA 98104

Dear Mr. McLerran:

I am not sure what is the present status of the application by Childrens Orthopedic Hospital for a helipad and for further landings by helicopters in this residential area. Like many people in this area, I fear that the hospital will in some way manage to sneak through a permit and ignore the unanimous wishes of residents in this ~~area~~ neighborhood.

Every helicopter flight is an auditory abomination. While some residents are bothered by the flights of passenger jets over this area, I find that they are relatively easy to tune out. But no one who lives ~~in this area~~ here can tune out a helicopter flight (it's always two flights--first the circling in for a landing, and then later on, a take-off and departure). The noise is so awful that there should be no such flights at all in a residential ~~area~~ section.

Besides, as is evident from almost daily news stories in the press, helicopters have a degree of unreliability that makes every landing and take-off at the hospital a risk to life and property in the area.

Hence I urge--and I am sure that this feeling is unanimous in this area--that no permit be granted for any helicopter landings and take-offs at the hospital. The hospital, however worthy its work, has already inflicted enough damage on a residential neighborhood; it should in no way be permitted to do any more. What is at stake is the quality of life of a whole residential area.

Sincerely yours,

Robert B. Heilman

(MUP No. 8405870)

Helen Newman
4525 Northeast 50th Street
Seattle, Washington 98105

Dear Ms. Newman:

I understand your concerns and those of your neighbors regarding the noise and safety of helicopter flights at Children's Hospital and Medical Center.

Our department is working with the Environmental Impact Statement (EIS) consultant, experts, and interested parties to gather information for the City Council, which must make a decision on the application. By early this summer we hope to be able to release the Final EIS and our recommendation to the Hearing Examiner.

If you have any questions about the EIS or how you can participate, please call Senior Land Use Specialist, John Doan at 684-8875

Sincerely,

DENNIS J. McLERRAN

Re: Unauthorized Helicopter Flights - Children's Hospital

Dear Mr. McLerran:

Once again I am writing to express my concern and objection to the unauthorized helicopter landings at Children's Hospital. We in the surrounding neighborhood have been under this pressure for four and a half years.

We have endured the danger of possibility of a helicopter falling on our roofs. Often the helicopter flies so low it barely misses the tree tops. (The FAA measures height by tree tops, incidentally.)

We have endured disruption of sleep as the flights are noisy, jarring, and frightening. This affects little children, senior citizens, and the ill (the latter including my late husband).

It is time to heed the rights of these citizens and to protect their lives. Please stop these dangerous flights.

Please refer to the numerous letters on file in the DCLU office, City Council, and FAA, some of which in answer questioned the height of these flights.

Thank you.

Sincerely,

Helen Newman

(MUP No. 8405870)

Robert H. Klug, President
Board of Trustees
Laurelhurst Community Club
4013 Northeast 46th Street
Seattle, Washington 98105

Dear Mr. Klug:

Thank you and the other members of the Community Club Board of Trustees for the letter regarding the Children's Hospital helistop permit.

As you know, this project raises a number of complex and unique environmental issues. This has complicated the Environmental Impact Statement (EIS) preparation and made it very time consuming. We are completing our review of the Final EIS and plan to release it and our recommendations this summer.

The notice of violation action against the hospital and the helicopter operator, Airlift Northwest, has been continued to allow completion of the permit process. With our recommendation pending, we will not change that decision at this time. We anticipate instead being able to complete the permit process and reach a final decision on this project soon.

I appreciate the neighbors patience in dealing with this complex issue. If you have any questions or inquiries about the project status, please do not hesitate to call Senior Land Use Specialist John Doan at 684-8875.

Sincerely,

DENNIS J. McLERRAN

RE: Unauthorized Helicopter Flights at Children's Hospital and Medical Center

Dear Mr. McLerran:

We appreciate and share your concern about preserving the livability of Seattle's neighborhoods.

However, we are not certain that you are aware of the continuous and frequent unauthorized helicopter landings at Children's Hospital. We feel that the adverse public impact and comments concerning these landings have been ignored. Letters of concern are on file as well as testimony at public hearings. Due process regarding the helipad permit is not taking place. After four and one-half years this issue remains unresolved.

Each landing, in increasingly limited space now that enlargement of the Medical Office Building at Children's is in progress, poses endangerment of lives of hundreds of innocent patients, staff and nearby residents. This is particularly true for the residents of the Laurelon Terrace Condominium complex (136 units) contiguous to Children's property and for the single-family residents nearby. Each landing means two flights--one in, another out--placing hundreds of lives in needless jeopardy.

Why does DCLU and City Council give special consideration to Children's Hospital over widespread public objections and the history of medical helicopter crashes? Why does DCLU and City Council allow a continued extension of a temporary permit to land at Children's Hospital? What is the rule for granting continuations of temporary permits--where in the code is this stated? Why have public objections been ignored?

Please do not wait until a tragedy (crash and/or conflagration) occurs before action is taken to halt once and for all these helicopter landings at Children's Hospital in a high-density, residential neighborhood.

Please revoke the temporary permit for landings. Please stop the landings on Children's campus. Please place this on-going, long-suffering issue at the top of your list for the earliest possible resolution in 1989.

Thank you.

Sincerely,

Dear Jim Street,

I have lived in the Laurelhurst area for over 35 years. When I moved into my present home, I gave no thought to the hospital.

The first time the hospital decided to do was build a parking lot that would not be seen from Sand Point. You can see it from Sand Point.

Then a little over five years ago I was awakened between 1 or 2 AM by a loud noise. I thought it was a helicopter but why so low. It was landing at the hospital. We have had several meetings only to be told the helipad would be used only in emergency and that a doctor from the hospital would determine if it was an emergency. I question what happened to the other emergencys before this time.

There weren't many! I remember that a helicopter would land at the bottom of the hill on what is now known as a baseball field. The helicopter would be met by an ambulance and a police escort that would take them up the hill to the hospital. I've learned that once a place offers a service or special service, people say 'Let's go there they offer this or that'.

So have this service offered for over 5 years with no consideration to the residents and the school is unbelievable. In one of the meetings, one of our

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

residents asked How often do you have accidents involving helicopters?' The reply was One every 20 years.' When questioned when in the 20 years were we now - the resident got no reply.

I feel the need for a helipad is not important, especially when the reason is to be able to come to well other hospitals - like the University Hospital, which is less than 5 miles away, both owned by the University of Washington.

The hospital is now building a new building that is going to take over 2 years to build. The original concept of the hospital was to be a college hospital. Some college! When will it stop!

This helipad is an accident just waiting to happen. I hope that both the city and the helicopter service - not to forget to mention the Children's Hospital have enough money saved to pay the suits that will be filed.

Re: 4800 Sand Point Way N.E.
(MUP #8405870)

Suzanne Peterson, Director
Governmental Relations
Children's Hospital and Medical Center
4800 Sand Point Way N.E.
P.O. Box C5371
Seattle, Washington 98105

Dear Ms. Peterson:

This is in regard to the permit application for a helistop on the Children's Hospital Campus.

At application for your permit, $272.50 was paid to cover the environmental review. The Permit Fee Ordinance establishes that the fee for an Environmental Impact Statement is a function of the project's construction value. The helistop proposal is unusual because it has no valuation for fee calculation purposes. The fee ordinance provides that special fees shall be assessed to recover city costs where the valuation or other methodology normally used (to determine costs) does not reflect actual costs. In conformance with this, we will be charging you the hourly fee of $71.00 per hour for the time spent on the EIS.

Because we are informing you of this at this late date, you will only be responsible for the environmental review costs incurred after January 1, 1989. Payment of these fees and those owing as a result of the Council Conditional Use will be due prior to our publication of a decision. The Conditional Use charges through 1988 are approximately $7,500.00.

This information is being provided to help you plan for the resolution of this issue. If you have any questions, please do not hesitate to call me at 684-8875.

Sincerely,

DENNIS McLERRAN
Director

RECEIVED
MAR 3 1988
DEPT. OF CONSTRUCTION & LAND USE

Mr. John Doan
Department of Construction and Land Use
City of Seattle
402 Municipal Building
Seattle, WA 98109

Dear John:

Per your request, I am identifying the items related to the proposed Children's Helistop that have changed from the time that the Draft EIS was issued to date. I also am providing some brief statements on how the changes may relate to the consideration of whether a Supplemental or an Addendum is appropriate, or whether the Final EIS would be sufficient.

A. REGULATORY BACKGROUND

The following provisions of the Seattle SEPA Ordinance were considered:

Supplemental EIS

SMC 25.05.405 (4) states that:

"A supplemental EIS (SEIS) shall be prepared as an addition to either a draft of final statement if:

(a) There are substantial changes to a proposal so that the proposal is likely to have significant adverse environmental impacts; or

(b) There is significant new information indicating, or on, a proposal's probable significant adverse environmental impacts."

EIS Addendum

SMC 25.05.600 (4) states that:

"Existing documents may be used for a proposal by employing one or more of the following methods:...

(c) An addendum, that adds analyses or information about a proposal but does not substantially change the analysis of significant impacts and alternatives in the existing environmental documentation."

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Final EIS

SMC 25.05.560 (1) states that:

an FEIS response to comments shall be prepared by one or more of the following means:

"(a) Modify alternatives including the proposed action.

(b) Develop and evaluate alternatives not previously given detailed consideration by the agency.

(c) Supplement, improve or modify the analysis.

(d) Make factual corrections..."

B. CHANGES

The following items are the key changes that I've identified:

The Preferred Alternative: The Preferred Alternative, which was presented in the preliminary Final EIS but not the Draft EIS, is a combination of features from the Proposed Action, the Intramural Field Alternative and the No Action Alternative. This alternative would appear to be consistent with SMC 25.05.560 (1), (a) and (b).

Loss of University Helistop Alternative: The 'Rooftop' Alternative was an alternative that was mandated by the City through its scoping process. The "Rooftop" was intended to serve as a 'reasonable alternative of lesser environmental impact' with respect to the concern regarding establishment of precedents. It never was a medically acceptable alternative in the minds of CHMC. Consequently, CHMC indicated that it would not pursue the alternative if it were the Build Alternative that was approved by the City.

The withdrawal of the University's support and pursuit of this alternative does not alter the 'availability' of other helistops (i.e. The Intramural Field) to serve as a reasonable alternative of lesser environmental impact with respect to the concern regarding establishment of precedents.

Helicopter Basing: The Airlift helicopter is now based at Harborview instead of at Boeing Field. Medical transport teams are at Harborview rather than at CHMC as envisioned when the Draft EIS was issued. Consequently, instead of the helicopter landing at CHMC to pick up the medical transport team, the helicopter is flying directly to pick up the patient. Thus, for every patient being transported there is only one round-trip into CHMC: while the number of patients being transported is effectively the same, the total number of flights in and out of CHMC is less than what was assumed in the Draft EIS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Flight Numbers: The Proposed Action and Alternatives are structured around building a helistop that would allow critically ill and injured children to be transported by helicopter to CHMC. It was assumed that for every patient transported to CHMC there would be two round trip flights landing at the Proposed Helistop: one to land and leave with the medical transport team to pick up the patient; the other to deliver the patient and leave to return to base. The patient transport numbers initially estimated by CHMC and Airlift Northwest were provided as a means to quantify noise and risk of accident impacts.

Actual patient transport numbers reveal that the estimates for 1990 in the Draft EIS (15-20/month) were achieved in 1987, when there was an average of 15 patient transports per month. It is uncertain as to whether the number of patients being transported would exceed the upper bound (20/month) by 1990.

Safety Data: The data that have been assembled on EMS aircraft safety have been growing by leaps and bounds. Data are now available and presented in the Final EIS that simply had not been collected or interpreted by any group or agency at the time that the Draft EIS was issued.

We now have better data on accident rates by patient transport rather than by engine time (Incidentally, the accident rate dropped dramatically from approximately 20.7 accidents per 100,000 patient transports in 1985, which was presented in the Draft EIS, to approximately 4.5 accidents per 100,000 patient transports in 1987).

There also are better data on accident causes for EMS operations. These in part serve as a basis for the development of recommendations from NTSB and 11 other agencies, as discussed below.

The NTSB Report: In response to the EMS accident rate that occurred during the mid-1980s, the NTSB was commissioned to investigate causes of EMS accidents and means by which EMS helicopter operations could be improved. The results of the investigation were presented at the Helicopter Association International (HAI) EMS Safety Seminar last month and the report will be on the streets in March. It does not appear as though there will be recommendations that are substantially different than Airlift Northwest's existing operations.

Professional Organization Safety Guidelines: Again, in response to the EMS accident rate that occurred during the mid-1980s, the American Society of Hospital Based Emergency Aeromedical Services (ASHBEAMS) and the National Emergency Medical Services Pilots Association (NEMSPA) established guidelines for the pilots of their member organizations. At the time of the issuance of the Draft EIS these standards had not been

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

finalized; the guidelines, however, have been finalized since. Airlift Northwest's consistency with these guidelines are examined in the Final EIS. According to Airlift, there are no important departures from the provisions of the NEMSPA and ASHBEAMS guidelines.

It should be noted that the National Flight Nurses Association is intending to develop safety guidelines this summer.

Federal Aviation Administration: The FAA has updated (January 1988) their Advisory Circular on Helistop Design Guidelines. The preliminary Final EIS evaluated, in response to a comment, the consistency of the Children's Helistop with the provisions of the earlier version of the FAA Circular (The helistop was consistent.).

Based on conversations with FAA representatives regarding the contents of the new Circular, I believe that the proposed helistop design will remain consistent with FAA guidelines.

DSHS: At the time that the Draft EIS was issued, the Air Ambulance Subcommittee of the Washington State Medical Association's EMS Standards Committee was investigating the development of guidelines for the use of helicopters. DSHS since has taken the committee recommendations and proposed amendments to the WAC to address licensing, personnel, equipment, and selection and use of air ambulances.

Dr. Nicola did review (in his second report to DCLU) patient transports to CHMC with respect to the proposed guidelines and determined that the helicopter transports were appropriate.

Airlift Northwest Expansion: The Airlift consortium recently added St. Joseph's of Tacoma as an Associate Member of the consortium. This brings Mary Bridge Children's Hospital into the consortium as an Associate Member. Although there is some services that both CHMC and Mary Bridge offer, Airlift believes that because their EMS helicopter service is a service to the referring physician (rather than to a hospital) that the patient transport pattern will not change significantly, if at all. The number of patients transported to CHMC is not expected to change as a result of this addition.

General Changes to the EIS: As a result of comments on the Draft EIS, as well as other research, there have been a number of subtle changes and modifications to the text provided in the Final EIS. These changes include more detail on dispatching, ground transport times, updating the Nicola report and a variety of other improvements, as well as the fact that the City has granted permits for helistops elsewhere in the City.

In examining these changes, it does not appear as though there is new information that has a bearing on the significance of the adverse environmental impacts. Based upon the cited sections of the Seattle SEPA

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Ordinance, there are neither substantial changes to the proposal or significant information which would require a supplemental EIS or recirculation of the EIS in draft form. The new information that has been obtained since the Draft EIS has been incorporated into the preliminary Final EIS in order to supplement and improve the analysis.

In any case I hope that this information has been helpful to you. If you should have any questions, I'd be pleased to discuss them with you.

Sincerely,

SHAPIRO AND ASSOCIATES, INC.

Dennis McLerran, Director
Dept. of Construction and Land Use
600 Fourth Avenue
Seattle, WA 98104

Dear Mr. McLerran:

The intent of this letter is to follow up on and confirm Liz Anderson's phone conversation with you on November 22. The memorandum we recently received from Peter Eglick, attorney, stated that you received a call from Treuman Katz, Chief Executive Officer of Childrens Hospital. Apparently, Mr. Katz had suggested to you that he wants to make another effort at negotiating with the community on issues "relating to the helipad and other concerns."

We appreciate your efforts to help us reach a settlement on these matters. As a general policy, we are always willing to work on good faith efforts at negotiating. We would be pleased to receive in writing from Childrens Hospital any proposals that they are interested in making. Only by seeing such proposals is it possible for us to be definite about whether negotiations would be fruitful.

As you know, we have met Hospital representatives many times over the past four years. We have asked for additional information and they have denied the requests, we have asked for reviews of land use policies and they have said their lawyers argue against even discussing such things; so we are not optimistic about the value of yet more discussion. However, if they wish to make specific proposals we will certainly review them and respond. We are interested in a resolution of the many issues between the community and the Hospital.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The helicopter landing site at the Hospital emergency door is inherently dangerous and, as you know, we are unhappy about the continuing illegal landings at the Hospital, in violation of the city code. These landings at the Hospital are especially aggravating since there is a safe, open, level landing site nearby.

Thanks again for your efforts on this issue.

Sincerely,

Anita

Dear Mr. McLerran:

Thanks very much for returning my recent calls. I know your schedule must be incredibly busy these days. Laurelhurst Community appraciates your interest in our problems and the time you spend on them.

As I understand from our conversation, you share our concern that we must have adequate time to review the FEIS and, understandably, this precludes our reviewing it during the holidays. You also understand that we are concerned that we have enough time to review the document and get our comments to you so that you may review them prior to making your recommendation. Thanks for your reassurance on these matter and for your continued help.

Sincerely,

Liz

Dear Katy:

On Monday, July 27, I gave Liz Anderson eight copies of Children's proposed medical review committee plan. As has been our practice, we wanted to allow sufficient time for the neighbors to review documents prior to our meeting with them to discuss their opinions. Liz told me today that their group has not yet had an opportunity to meet among themselves, and that she would call me with their proposal as soon as possible.

Although Jan Kumasaka from the Department of Community Development has a copy of the proposed plan, I thought you might appreciate a copy. Please call me if you have any questions or concerns.

Sincerely,

Nancy Greenawalt, Director
Government Affairs

DATE: Proposed Medical Review Committee

RE: July 23, 1987

The Seattle City Council can permit construction and operation of a helistop on the CHMC campus as a Council Conditional Use if they conclude that:

(1) The helistop is needed to save lives;

(2) The helistop is located so as to minimize impacts upon surrounding residential property; and

(3) Use of the helistop will be restricted to occurrences involving life threatening emergencies.

The following is a draft proposal for a Medical Review Committee offered by Children's Hospital and Medical Center (CHMC) as a mitigating measure to review compliance with condition (3) and to recommend corrective action where appropriate. The proposal addresses:

* purpose of the Committee
* composition and appointment
* responsibilities
* staff support and funding
* operations
* reports and recommendations
* evaluation/duration

We look forward to meeting with you to discuss the proposed Medical Review Committee at your earliest convenience.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

DRAFT

MEDICAL REVIEW COMMITTEE

(July 23, 1987 Draft Proposal)

Purpose of the Committee

The purpose of the Medical Review Committee is to review compliance with condition (3) of the Council Conditional Use Permit and recommend corrective action where appropriate.

Composition and Appointment

The Committee will consist of the following five members:

(1) The Director of the Seattle-King County Department of Public Health, who will serve as Committee chair.

(2) A representative of CHMC selected by the Chief Executive Officer.

(3) A physician representative of the Washington State Medical Association (WSMA), selected by the President of the Association. The representative must be a qualified neonatologist, pediatric intensivist, or pediatric emergency physician.

(4) A physician representative of the Washington State Society of Pediatrics (WSSP), selected by the President of the Society. The representative must be a board certified pediatrician.

(5) A distinguished citizen, appointed by the Mayor of Seattle and confirmed by a majority of the Seattle City Council.

(6) A rep of Laurelhurst

The representative of CHMC will be appointed for a term set by the Chief Executive Officer of CHMC. The representatives of the WSMA, the WSSP, and the Mayor/City Council will be appointed for three

DRAFT

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

years. In the event a Committee member can no longer serve, a replacement will be appointed by the original appointing authority.

Responsibilities

The role of the Committee is advisory. The Medical Director of Airlift Northwest (ALNW) will retain ultimate authority and responsibility for all ALNW helicopter transports to the CHMC campus.

The Committee members will work cooperatively with the Chief Executive Officer of CHMC, the Chairman of the ALNW Executive Committee, and the ALNW Medical Director to assure use of the helistop will be restricted to life-threatening emergencies.

The five-member Committee will have the following responsibilities:

(1) In consultation and cooperation with the ALNW Medical Director, develop written guidelines for determining whether a helicopter transport to the CHMC campus involves a "life-threatening emergency." The ALNW Medical Director will be responsible for establishing the final guidelines.

(2) In consultation with the ALNW Medical Director and based on the final guidelines and information available at the time of transport, conduct a semi-annual (twice a year) review and evaluation of all helicopter transports to the CHMC campus to determine whether each transport involved a life-threatening emergency.

(3) Prepare and submit a semi-annual report to the Mayor of Seattle, the Director of the Seattle Department of Construction and Land Use, the Chief Executive Officer of CHMC, the Chairman of the ALNW Executive Committee, and the ALNW Medical Director discussing the Committee's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

evaluation of all helicopter transports to the CHMC campus.

(4) Prepare and implement written policies and procedures designed to assure the Committee's proceedings and the results of the Committee's work are open to the public to the extent allowed by the laws and administrative rules governing the confidentiality of patient medical records.

(5) Adopt additional rules and procedures needed to govern the conduct of the Committee's responsibilities.

Staff Support and Funding

The City of Seattle will provide the Committee's staff support and funding as follows:

(1) The Emergency Medical Services (EMS) Division of the Seattle-King County Department of Public Health will provide the staff support needed by the Committee to carry out its responsibilities.

(2) The City of Seattle (through the EMS Division) will provide the funds needed for equipment, supplies, and other Committee expenses.

(3) The City of Seattle will reimburse Committee members for their reasonable expenses required to carry out their responsibilities. Committee members will not receive any compensation or other benefits for their service on the Committee.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Operations

CHMC will request the written consent of the parent or guardian of each patient transported by helicopter to the CHMC campus for Committee members to review the patient's medical records.

Each Committee member will agree in writing to abide by all laws and administrative rules governing the confidentiality of patient medical records.

Semi-annually, the EMS Division staff will conduct a preliminary review and evaluation of all helicopter transports to the CHMC campus.

The Committee will meet semi-annually to consider the EMS Division staff evaluation of all helicopter transports to the CHMC campus for the previous six months.

With the help of EMS Division staff and the ALNW Medical Director, the Committee will prepare and publish semi-annual written reports of the Committee's evaluation of all helicopter transports to the CHMC campus.

Reports and Recommendations

Based on information available at the time of transport, the Committee's semi-annual reports will identify and report all helicopter transports to the CHMC campus that did and did not involve a life-threatening emergency.

The semi-annul reports will recommend actions to be taken by the Chief Executive Officer of CHMC, the Chairman of the ALNW Executive Committee, the ALNW Medical Director, and the Committee to decrease the incidence of medically unnecessary helicopter landings on the CHMC campus, if any.

DRAFT

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Committee will submit the semi-annual reports to those officials listed above in subparagraph (3) of Responsibilities. The Committee's reports will be made available to interested community groups, appropriate media, and any community resident or interested citizen who requests a copy.

Evaluation/Duration of the Committee

Within three years of the date of the Conditional Use Permit, the Seattle Mayor and City Council will evaluate the Committee's operations and results to determine whether to continue the Committee. The Committee will be discontinued after three years unless the Mayor and City Council decide to continue it.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Marvin O. Christman
4350 53rd Avenue Northeast
Seattle, Washington 98105

Dear Mr. Christman:

In response to your letter, the Seattle Land Use Code gives the Department of Construction and Land Use (DCLU) authority to regulate where helicopters may land.

DCLU cited the hospital for permitting landings without an authorized use permit and originally set a compliance date for April 3, 1987. To give the hospital the opportunity to complete the environmental review process, we have extended the compliance date to October 1, 1987.

Ms. Nancy Greenawalt is Children's Medical Center Director for Government Relations. I encourage you to call her to discuss your concerns.

If you need further information about our enforcement procedures, please call Joe Garcia, Director of our Housing and Zoning Enforcement Division at 624-5031.

Sincerely,

HOLLY MILLER
Director

DEPT. OF CONST. & LAND USE

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

Here is a copy of information provided by Mr. Paul Russell, an experienced helicopter pilot and flight instructor. He has personally examined the Childrens Hospital proposed helipad site and the UW playing field site in coming to his conclusions about the relative safety of each site. We hope that you will take his opinion, based as it is on a great deal of operational experience, into account when you formulate your recommendations on the hospital's request for a helipad. Mr. Russell stressed repeatedly to us that his opinion would be completely objective, so we think his judgements about the relative safety of the two proposed sites should receive your careful attention.

We intended to send this to you in April, when we received it, but just recently discovered that it was not sent at that time. Thank you for your attention to this matter.

Sincerely,

Anita Francis

20 April 1987
CHHP 02-87

Ms Anita Francis
5003 45th NE
Seattle, WA

Dear Ms Francis;

In my report to you of 4 March 1987 (CHHP 01-87) I did not address the safety aspects of operating from the University of Washington soccer field. I did not address the subject because it seemed obvious that the soccer field is a far safer area for helicopter operations than the proposed helistop at Children's Hospital.

Medical evacuation helicopter operations have been conducted at the soccer field for at least the last thirty years without mishap. The approach paths to the field are much easier to fly, transit more open areas and are thus safer than the proposed path to the helistop. A malfunction, such as loss of tail rotor control, on takeoff is not nearly as hazardous when operating from the field as it would be at the helistop.

Disregarding any medical considerations, the soccer field is far and away the best landing site of those outlined in the Draft Environmental Impact Statement.

If I can provide any additional information please contact me.

Sincerely;

Paul D. Russell
Captain, U.S. Coast Guard (Ret)

4 March 1987
CHHP 01-87

Ms. Anita Francis
5003 45th NE
Seattle, WA

Dear Ms. Francis;

As you requested, I have reviewed the Draft Environmental Impact Statement for the Children's Hospital and Medical Center Helistop. I believe the proposal, as it now stands, will lead to an unsafe operation. I base this conclusion on three major considerations:

1. The proposed flight path to the helicopter pad is not the safest approach.

2. There is a total lack of adequate regulations concerning the qualifications and training levels of the helicopter crews operating from the pad.

3. There is a total lack of adequate regulations concerning the minimum performance capabilities of the helicopters which will be operating from the pad.

Additionally, the proposed helistop is to be constructed without consideration as to its impact on any regional plans for medical evacuations. The Environmental Impact Statement's analyses are lacking in depth and scope on the regional implications of this proposal. For this reason, it is difficult to determine the true need for the helistop versus the commercial interest of bringing additional patients to this particular hospital instead of to a different adequate facility which might be closer. To truly serve the needs of the public, a regional emergency medical transportation plan should be developed. Allowing construction of medical evacuation helicopter pads based solely on commercial considerations will result in a proliferation of such pads and will not guarantee that patients receive the needed care in a timely manner.

The enclosures to this letter briefly discuss each of these points. If I can be of any further assistance please feel free to contact me.

Sincerely,

Paul D. Russell
Captain, U.S. Coast Guard (Ret)

Enclosure 1) to CHHP 01-87 of 4 Mar 87

CHILDREN'S HOSPITAL AND MEDICAL CENTER HELISTOP

FLIGHT PATH

In an effort to provide noise abatement the proposed approach and landing flight path requires, under most weather conditions, a descending right turn of approximately 120 to 150 degrees into the helistop. The final phase of this approach involves a flight path directly toward rising terrain, the hospital itself and the proposed medical office building. This requires the pilot to not only maneuver the helicopter but to adapt his visual sense to a changing landing site picture. These adjustments can be particularly difficult with strong winds or under conditions of reduced visibility.

As the flight path nears the landing site the area around the site becomes more restricted and is subject to gusting, and variable, winds caused by the structures. Throughout the approach the number of safe missed approach paths steadily decreases until,on final approach,the pilot is reduced to a near vertical climb over the buildings and terrain,or a small radius right turn over a group of apartment buildings,if he decides that he cannot finish the landing.

Under visual meteorological conditions pilots who have landed at the site, during training, should have little difficulty in making the approach and landing. Under conditions of darkness, reduced visibility or high winds, with the added tensions inherent in EMS operations, the proposed flight path is unsafe. It is particularly hazardous if the pilot has not previously landed at the facility during training, or if the helicopter has minimum performance characteristics.

Relocation of the helistop to the top level of the parking garage and adopting straight in approach paths would be safer. This might, however, negate some of the medical benefits of helicopter transport by increasing the distance traveled by the patient while exposed to the elements. It will also impact noise abatement considerations. The Environmental Impact Statement does not adequately investigate mitigation of the impacts of a site on the garage, nor does it adequately address the safety of the proposed flight path.

The EMS transportation operation has the worst safety record of any group within the non-military aviation community. EMS operations are particularly telling on the psychology of the flight crews leading them to press on in situations when they would normally back away. It is imperative, therefore, that the flight paths we expect them to fly be as safe as possible.

Enclosure 2) to CHHP 01-87 of 4 Mar 87

CHILDREN'S HOSPITAL AND MEDICAL CENTER HELISTOP

REGULATORY ASPECTS

The regulations which currently exist are inadequate to ensure safe operations from the proposed helistop. The Federal Aviation Administration has yet to establish the unique standards required for safe EMS operations. The guidelines proposed by several helicopter groups for EMS operations are just that - guidelines. They can be disregarded at the whim of the operator.

The pilot qualifications currently used by Airlift Northwest are the minimum acceptable for safe operation into the helistop. However, there are no regulations that restrict the use of the helistop to Airlift Northwest. Under the proposal, any helicopter transporting a patient could land at the helistop regardless of helicopter type or the skill (ratings) of the pilot. There are no regulations which require a training landing, even for Airlift Northwest pilots, before operations are permitted under actual conditions. As currently proposed a pilot who meets the minimum Federal Aviation Administration licensing requirements for carrying passengers, flying a single engine helicopter, can operate into the pad under conditions of reduced visibility without ever having seen the pad before. This is not safe.

While there is no single system to gather detailed statistics on EMS aviation accidents/incidents, most data sources agree that 85-90% of all EMS accidents since 1980 can be attributed to "human error". This is generally accepted as meaning error on the part of the pilot as opposed to an accident caused by failure of an aircraft component. There are a number of ways to reduce "human error". Many are within the sole purview of the operator and depend on the operators approach to safety, training program and hiring practices. However, one way is directly controllable by state/local agencies - The establishment of standards for qualification and training of the personnel involved in operations permitted to use the helistop. Operations requiring the use of helicopters into restricted sites, within residential neighborhoods, must be controlled for the safety of the helicopter passengers as well as the areas residents. Allowing unrestricted use of the helistop, by any helicopter flying a patient, is asking for an accident. Not every pilot, nor every helicopter, can safely operate from the proposed helistop.

For safe operations it is mandatory that operations into the helistop be restricted to operators whose equipment and crews meet minimum standards. These minimum standards must include the requirements for pilots to possess an instrument rating and receive a minimum number of landings at the site under training. Additionally, because of the nature of the landing site, only multi-engine helicopters with single engine climb capability should be allowed to operate into the helistop.

Many EMS accidents occur when the flight crew attempts to continue a flight when conditions are unsafe. This is a natural tendency when attempting to save a life or reduce suffering. It is particularly true when children are involved. The Impact Statement does not address the need for operational procedures, established by the hospital, to respond to the situation when a helicopter arrives and cannot safely land at the helistop. Unless standard

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

operating procedures have been established the pressure will be on the pilots to attempt the landing when it is unsafe. No operations from the helistop should be permitted until the hospital has developed and tested such a plan.

It is very easy to say that the pilot has the final decision on whether to continue the flight, however, reports are still received that pilots involved in EMS operations have been released for failure to complete a flight. This cannot be prevented by regulation, however, any contract pertaining to EMS helicopter operations must not contain financial, or any other considerations, for completing flights.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CHILDREN'S HOSPITAL AND MEDICAL CENTER HELISTOP

REGIONAL EMERGENCY MEDICAL SERVICES CONSIDERATIONS

The proposed helistop can only be adequately viewed as a part of a regional emergency medical transportation system. Before permitting routine helicopter operations into a residential area, their absolute necessity must be established. This has not been done in the case of the proposed helistop. The Impact Statement does not adequately address the medical implications of the lack of a helistop at the hospital.

Construction of the helistop will encourage transport of patients by helicopter when surface transport to a closer facility would be adequate. The tendency will be to use the helicopter in any questionable case to prevent suit at a later time for failure to utilize the fastest possible mode. Additionally, in the absence of a regional plan, EMS helicopters will be encouraged to use the helistop at Children's Hospital when a safer landing at an alternate facility should have been available.

Worrying about one destabilizing move of a patient at one end of the transport seems ludicrous if you don't worry about the number of moves made to get him in the helicopter at the point of initial loading. The only way that this point can be addressed is via a regional analysis of EMS transport requirements and development of a regional plan.

The proposal to construct a helistop at Children's Hospital should be held in abeyance until a regional analysis can be completed and a plan developed.

The EMS Safety Dilemma: A Matter Of Maturity

The expanding helicopter aeromedical industry finds ill side effects to dramatic growth and a critical safety problem is prompting an eager search for a cure.

By David Harvey and David Jensen

PERHAPS IT IS characteristic of all ripening aviation industries. Like awkward adolescence, well into a rapid-growth stage, there is a tendency to be accident prone.

Regardless, many believe the safety record of today's emergency-medical-service (EMS) market has become critical, as mishaps over the previous few years have broken out like a bad case of acne. As a result, groups like the American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS) and National EMS Pilots Association (NEMSPA), along with hospital administrators and government agencies, are seriously examining ways to help the industry grow out of this stage. Their efforts in cleaning up the EMS industry's record and reputation will not be small.

How bad is it?

"In terms of pure numbers, the situation is alarming," says Tom Guterl, senior vice president of the United States Aviation Underwriters, a group understandably concerned about safety problems. "The average accident rate for EMS helicopters is now running at a rate of 20.7 accidents per 100,000 flight hours—about five times the accident rate for commercial helicopters." The fatality rate is also higher, running 6.5 lives per 100,000 hours, according to the Aviation Safety Institute, in Columbus, Ohio.

(Guterl's figures compare but don't exactly match those from other sources keeping tabs on EMS safety. This punctuates the fact that there is no official central source for such information.)

Gabriel Martyak, assistant director of Geisinger Medical Center's Life Flight program, in Danville, Pa., says there have been 16 major EMS accidents since 1980, resulting in 47 fatalities and six injuries. An additional 17 accidents were classified as "substantial" and accounted for 51 injuries.

Ten people lost their lives last year due to EMS-helicopter accidents. By October 16 incidents involving EMS helicopters were recorded for 1986 and, with winter coming on, industry officials were anticipating still more bad news before year's end.

Referring to an unofficial survey he conducted, Martyak reports that EMS programs in the U.S. today fly some seven million miles annually. "We estimate [these programs] are now carrying between 6,500 and 7,000 patients a year," he adds. "That's an achievement that shows how significant EMS is becoming. But since 1980, 50% of the EMS programs in this country have experienced some kind of accident or serious incident."

What factors feed such a record?

Human error

There are indications, Martyak replies, that 89% of the EMS accidents since 1980 were due to human error. The remainder could largely be attributed to engine failure. The term "human error" invariably translates into "pilot error" and that points to factors ranging from crew-rest time to assessment of what makes a good EMS pilot.

Don Wright and Tom Einhorn, founders of the two-year-old NEMSPA, say fatigue and stress caused partly by understaffing have contributed significantly to the safety problem. They believe a four-pilot team should accompany each EMS helicopter pulling 24-hour duty. Too often, they claim, such programs employ three or even only two pilots.

Human error in EMS operations frequently begins with decisions to fly at night or during adverse weather conditions. Martyak's survey reveals that 78% of the EMS mishaps occurred during such conditions. This no doubt accounts for the fact that about 75% of the accidents took place while the helicopters were en route.

"The issues boil down to: pilot, night flying, and weather," says Martyak. "In some places, for instance, we have VFR-trained pilots flying in IFR conditions. We have got to approach zero on this kind of problem."

"That's all good," counters NEMSPA's Tom Einhorn, "but we're continuing to hear from members who are getting fired for refusing to fly missions under certain conditions."

Also, even without pressures from program management and/or medical staff, EMS pilots have been known to be their own worst taskmasters. Humanitarian instincts too often take over from good judgment and thus they fly when they shouldn't. They simply don't know how to say, no.

"We pay people to say, no, when it has to be said," says John Heiskell, director of operations-medical group for Rocky Mountain

For night flights like this one being completed by a Bell LongRanger, the insurance industry proposes minimums of 1,000 feet and three miles visibility.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopters Inc. (RMH), "but it is often hard to say."

But not all responsibility lies in the pilot's lap. Tom Guterl claims the insurance industry "feels strongly that safety is a management problem, not a pilot one.

"We need to have things like weekly, formal safety meetings," he adds, "and this is an area where management should be increasing its visibility.

"Also, management can play a big part in reducing stress. One immediate solution would be to mandate two-crewmember operations for all night flying."

Einhorn believes good EMS-program management means involving the pilots as well. They can frequently identify safety problems, he points out, "but often have no authority to make changes. If we don't get the pilots more directly involved in part of the

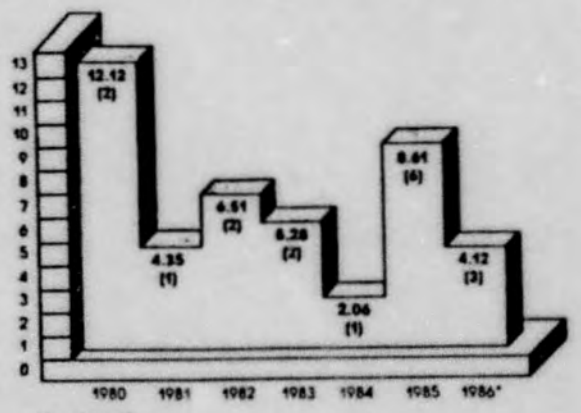
(Continued on Next Page)

The insurance factor

An industry's troublesome safety record is invariably followed by the shadow of insurance woes and the EMS field is no exception. For the about 150 programs in the United States, there is the growing threat of escalating insurance premiums or, worse, insurance cancellation.

Tom Guterl, senior vice president with United States Aviation Underwriters, describes the EMS industry's current situation as "disastrous" and elaborates by saying, "Liability payments are outrunning at three times the premiums taken in.

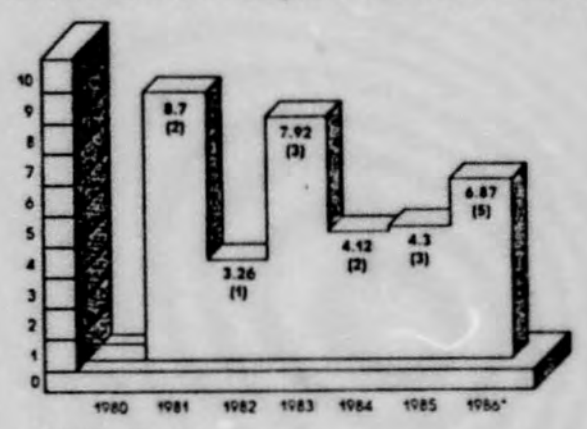
"If you combine hull and liability over the past five years, losses have been outrunning premiums by a factor of 2.5 to one." The situation is aggravated, he adds, by the fact that accidents have occurred at the same time the insurance industry has been hit by payouts arising from claims made in 1985, the worst year yet for the aviation-insurance industry.



"At the start of EMS programs a few years ago, we actually reduced insurance premiums for operators," Guterl recalls. "Then 1983 hit. That forced a lot of insurers out of the market. The London [insurance] market began pricing itself out of carrying insurance for U.S. programs. There was some recovery in 1984, then came 1985, which eclipsed 1983."

So now the insurance dollars for coverage have dwindled. "EMS has to compete for those dollars like everyone else," says Guterl. "But the supply is down and in some cases, not there at all."

He explains that coverage for programs will be considered "on a case-by-case basis. We'll try and work with existing clients, albeit at a higher price. A lot will depend on the individual record."



Guterl doesn't believe all news is gloomy, however. The insurance industry sees an optimistic trend toward twin-engine helicopters and, he perceives, "there is a shared realization that something has to be done."

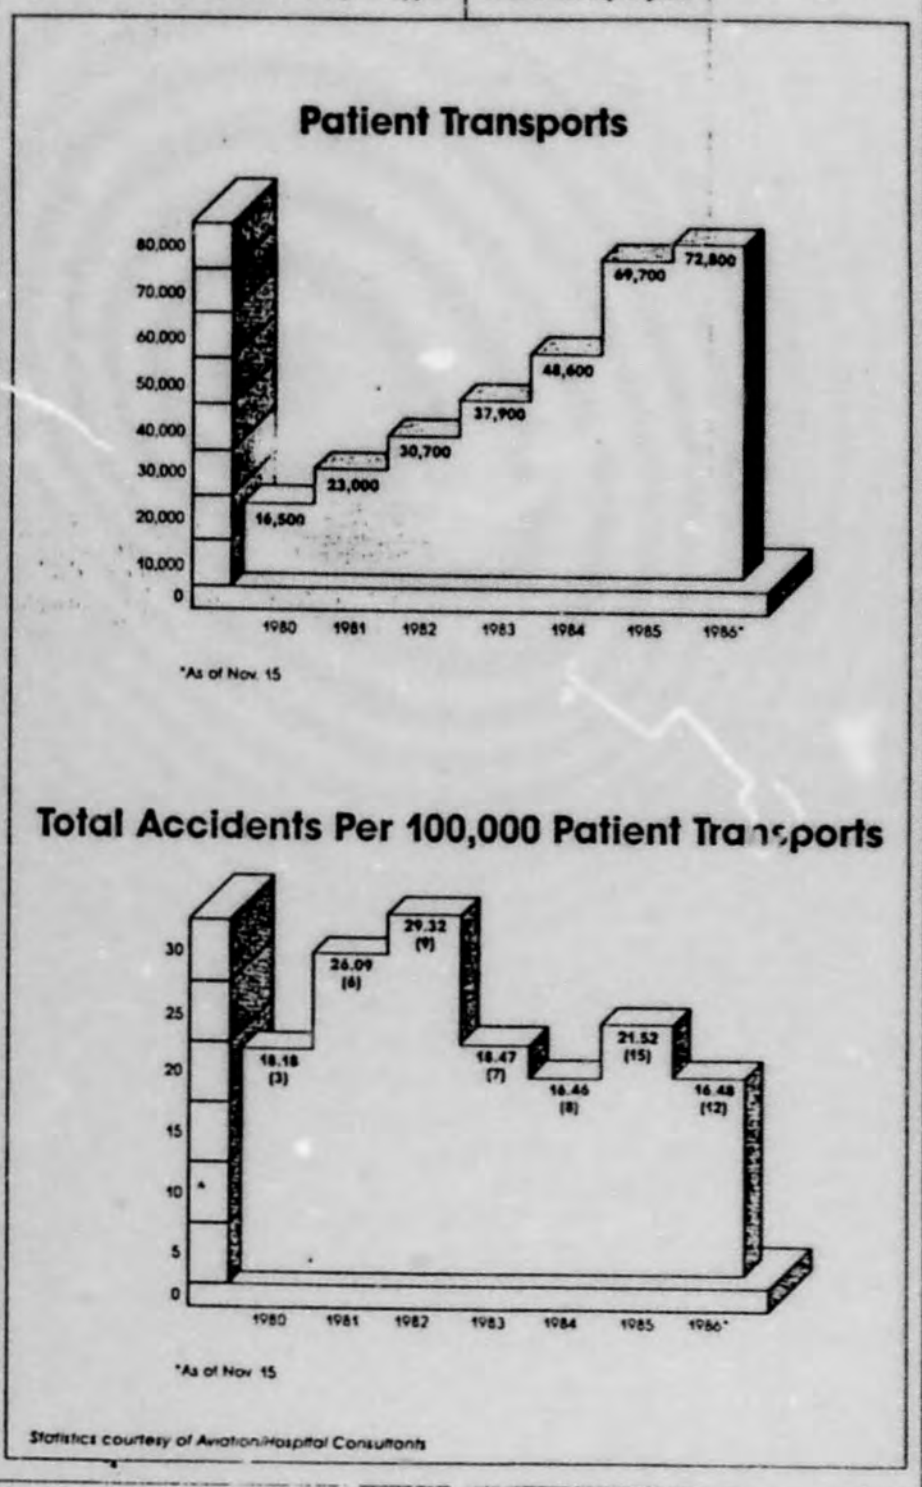
management loop, the accident rate is going to increase."

Recruiting the right stuff

Despite management's role, the focus of EMS safety remains clearly on the pilot, which presses the question: are there unique characteristics that should be looked for when recruiting EMS pilots?



Some say, yes; others disagree.

An industry spokesman who says, yes, comments that, "Pilot error begins in the interview process."

Some people in the industry propose going beyond extensive interviews with pilot applicants and administering psychological testing. "In the near future, I see us going into some sort of personality testing," says RMH's Heiskell.

An aeromedical pilot should "have a personality that fits into the hospital environment," he explains. "Adaptation is important because you go from a controlled area, in the hospital, to a situation with little control.

"Many pilots [applying for EMS jobs] have a lot of flying time but not in a variety of work," adds Heiskell, who claims RMH hired 60 to 70 pilots over a recent six month period. "It's better to hire a lower-time pilot who has done a variety of jobs."

Talk of pilot adaptability brings to issue the hiring of civil-trained or former-military pilots. Some EMS-industry officials argue that military training can make a pilot too rigid and unable to adjust to the extremely varied situations EMS missions present. They also claim military aviators are used to flying dual pilot and most EMS programs haven't the luxury of a left-seat crewman.

But others in the industry fervently argue that EMS pilots should not be deemed different from other helicopter pilots, be they civil- or military-trained. "I keep hearing about how different the EMS pilot is," says an official of an operator with EMS contracts. "The only difference is the emotion of the job. Outside of that, it's the same."

Another industry spokesman agrees. "Whether he flies an EMS helicopter or whatever, the pilot doesn't have that many decisions to make," the spokesman comments. "He has to takeoff and land, and do so within certain confines."

Critics also disagree that dual-pilot experience is a handicap in the single-pilot EMS world. "It's not bad that your experience is mainly dual-pilot," says a spokesman. "In fact, that pilot has been observed. He's been flying with another person looking over his shoulder."

Industry standards

Whether right-seat occupants of EMS helicopters represent a unique breed of pilot or not will no doubt remain in debate. But the fact that they often fly at night or in adverse weather and sometimes land in streets and other unprepared landing areas makes their mission undeniably unique. Recognizing this uniqueness, some in the industry have decided some nationwide standards must be drawn up.

While stressing that the insurance industry "does not intend to become a policeman," Tom Guterl says it has established standards because "the operational situation [during an EMS mission] is one that adds stress to an already stressful situation.

"The [insurance] industry believes that standard minimums should be a 500-foot ceiling with two miles visibility during day VFR and 1,000 feet and three miles at night," he recites. "Three hundred feet and one mile is, in our view, totally unrealistic."

The Federal Aviation Administration (FAA) has yet to establish standards unique to EMS operations but the agency's Southwest Region has begun to take action. In mid-November, all helicopter inspectors in that five-state region gathered to discuss the EMS safety problem and possible solutions.

"We're not going out on a witch hunt," an FAA official quickly notes. "We want to get as much continuity between us and the operators as we can."

He adds that standards resulting from the November meeting won't evolve into a separate FAA regulation but, through cooperation with, say the Helicopter Association International (HAI), "they will hopefully reach the national level."

On top of operating standards, an aggregate of safety suggestions for the EMS industry includes crewmen wearing helmets, initiating safety programs, using shoulder

Lessons from an oil company

Can lessons from an oil company's successful helicopter operation be transferred to the still-emerging EMS industry? Jack Piehl, president of Sentinel Aviation Systems, recounts his experiences with Shell Oil's aviation department.

He recalls serious safety problems in the oil industry at one time and, as a result, hammering out a long-term plan to tackle those problems at the source. That plan turned "an-accident-a-week" situation into one in which Shell could fly nearly a half million hours without "injuring an employee."

When Piehl looked at the company's safety problem, he was aided by a contractor who "went through the business from top to bottom." Also, company advisors conducted a survey of Shell Aviation helicopter pilots. They found that maintenance ranked No. 1 as an issue of concern and unreasonable bad-weather standards ranked No. 2.

Landing platform/heliports posed another problem. Many of Shell's facilities were in remote areas, as far as 150 nm off the Gulf coast, and some platforms were unmanned.

"It was a situation where the pilot felt he was completely on his own," says Piehl, summing up the complaints. "He also felt pressure to perform and some pilots were told, 'hey, if you don't want to do the job, we can easily find someone who will.'"

Armed with this information, Piehl and his colleagues set out to establish a five-year program, concentrating on the operation's weak areas. "We found that 50 heliports were in need of serious attention. We started looking at the weather standards and set new and more reasonable ones. We also set up programs to evaluate the contractors who were vending the helicopter services to us, to see what they were doing in terms of their pilot relations."

Another scheme involved establishing roving maintenance teams, which would periodically visit each heliport. Shell also set up operating standards, so pilots could rightfully decline flights they deemed unsafe. In addition, Shell officials combed through years of malfunction reports, to determine which items are most likely to fail. Operators were also asked to supply comprehensive hazard reports.

Shell's safety policy took shape but, Piehl stressed, it all took time. "This took about five years by the time we published an operations manual that was helping standardize operations. We met a lot of resistance from within the oil industry, which was afraid this would cut into profits and result in 'North Sea rules' that would regulate aviation from a central point. Finally, it was a full 11 years before we managed to get our own heliport design guide approved."

Was it successful? Piehl believes it was, not just because the safety rate eventually reached over 400,000 accident-free miles but it helped "take the surprises" out of helicopter operations.

Piehl believes more and more events will be judged on what are known as "prudent man" rules. He explains that these aren't just legal standards but standards adopted by an industry as a whole.

"The standard must be the way the industry does it, not what the FAA says it is," he concludes. "It's up to industry to fix its own problems and to set the higher levels of standards." ■

Aeromedical helicopters like this Alouette III must often operate in confined areas.

harnesses, establishing protocol for "combative patients," addressing the two-pilot issue, and debriefing after flights.

Industry officials also believe there is a need for anonymous incident reporting. Gabriel Martyak goes further by advocating a nationwide information center, which can absorb and dispense EMS-incident data.

Resemblance to offshore

"In the U.S., there is no central point from which information flows," he exclaims. "The problem is, and remains, gathering the necessary data."

One operator in the Gulf of Mexico likened the EMS safety problem today with a similar situation in the late 1970s, when the offshore-support market was entering its adolescent stage. It was a time when oil activity was at its highest and the market was being swamped by new entrants.

"We all got together at that point and decided enough was enough," he recalls. "We needed safety standards."

The Gulf-coast spokesman believes EMS operators have reached that point, when safety standards must be established. "But they've got to want it to happen first." ■

Mr. Jerry B. Schneider
Ms. Liz Anderson
5003 45th N.E.
Seattle, Washington 98105

Dear Mr. Schneider and Ms. Anderson:

Thank you for your letter of August 28, 1986, concerning helicopter air ambulance services. As you requested, I have enclosed the editorial published EMERGENCY MEDICINE. I have also enclosed a copy of an article published in the AMA News, September 5, 1986.

While I feel that air ambulance operations are being massively overused and that by my own count perhaps 80% of the patients presently transported by air ambulance could have been conveyed just as expeditiously by ground ambulance, I do not wish these contentions to be interpreted that I am totally opposed to this form of transportation. My thesis is that is should be used only for those appropriate medical cases and should not be used merely as an expensive marketing ploy for a hospital.

In these days of cost containment when we are being asked to provide equal or better medical services at decreased costs, (i.e., an equally effective but less expensive antibiotic,) hospital administrators and regional planners should apply this same logic to prehospital transport.

As the American Medical News article points out, hospital based aeromedical helicopters have the worst accident rate in modern aviation history. The reasons for this are numerous. The double tragedy occurs when an unnecessary death secondary to the crash occurs and close analysis reveals that the mission was not required or the patient's conditions was such that air ambulance transport was either unnecessary or contraindicated.

Sincerely,

Kenneth L. Mattox, M.D.

Viewpoint

Kenneth L. Mattox, M.D.

Standards for EMS Helicopter Transport

Currently, over 100 hospital-based air ambulance services are in use in the United States and they represent a multimillion dollar industry. The cost of purchasing a helicopter ranges from $700,000 to $1.5 million and the annual operating budget is in excess of $1 million per helicopter. The cost of an air ambulance ride ranges from $200 to $1800, with the national average close to $1000; an ambulance ride on the ground averages $100 to $120.

Responsible spending of the health care dollar is now mandated by DRG regulations. The same logic that decrees the in-hospital use of less expensive but equally effective antibiotics should be applied to prehospital transport. One must question the percentage of helicopter-transported patients who have medical conditions that, on close scrutiny, do not even require the use of a basic life support ground ambulance. Urban time-distance studies have shown that a ground ambulance 35 miles from a hospital can deliver a patient just as fast as an air ambulance with comparable advanced life support personnel on board—and perhaps achieve greater patient stability. Therefore, from 50 to 80% of patients transported by air ambulance could be transported just as efficiently and at considerably less expense by ground ambulance.

Air ambulance flights may actually be detrimental to some patients. The tight cabin space prevents effective interventions during flight. According to some neonatologists, a helicopter flight for a premature infant almost guarantees an intracerebral hemorrhage.

In some cities, air wars just short of blazing guns are waged between helicopters from competing hospitals and the helicopter crew that wins will transport the patient to their hospital even if a quality medical center lies closer to the emergency center or site of accident. Investigation of some recent helicopter accidents revealed that in more than one incident, the patients being transported did not have conditions that warranted air ambulance transport, nor was the distance great enough to require such an expensive and risky vehicle.

The helicopter can be a valuable transport modality when used appropriately. To reduce the possibility of misuse, national standards for air ambulance transport are long overdue. I would like to propose four basic standards:

1. Air ambulances should be limited to patient care activities; they should not be regional multipurpose helicopters used for weather, traffic control, police, and other activities as well.
2. Air ambulances should be used only for patients who require advanced life support.
3. The use and dispatch of an air ambulance service, whether public or private, should be under the direction of the regional EMS director who supervises regional ground ambular tivities.
4. An advisory panel composed of indi who have no financial interest in the hos hospitals that own a helicopter should re review the necessity, effectiveness, and r economic impact of air ambulance oper

Through implementation of such star the true value of air ambulance operatic be preserved and misuse for marke strictly competitive purposes will be elim

January 6, 1986

Ms. Liz Anderson
Citizens Concerned About
Helicopter Transport
4746 45th N.E.
Seattle, Washington 98105

Dear Ms. Anderson:

I read your letter of December 10, the report of Doctor Nicola of December 4 to Beatrice Ryan, as well as the supportive letters and documents in Doctor Nicola's report. The issues are actually limited to just three: 1) What is the appropriate use of helicopter ambulance service? 2) What is the number of patients requiring this appropriate use, as defined by the University Hospital and the Children's Hospital? 3) Where should the helipad or helipads be built?

There is no clear indication about the appropriate use of air ambulance operations, especially for distances less than 35 miles, or in the case of your report, 70 miles. Without question, many helicopter ambulance services transport numerous patients who could have been transported just as efficiently by ground ambulance, taxi or even automobile. The numbers in Doctor Nicola's report likewise suggest numbers of critically ill or injured children and adults which would be shared by the Air Life Northwest consortium which would not justify the expense of the air ambulance operation. According to my local helicopter sources, at least one hospital admission per day is needed to recoup the expenses of running an air ambulance operation. If the patients do not exist to justify the air ambulance operation, then there is either a concomitant increase in individual patient charge or an overuse of the service. There is ample material in Doctor Nicola's report to justify both fixed wing and helicopter flights for distances greater than 75 miles from Seattle. Of course, many of the patients on long distance flights would be stable prior to transport.

The second issue of numbers is extremely difficult to analyze. Your letter, indicating that there is one flight per day landing at the grassy knoll at the Children's Hospitals, would indicate that Doctor Nicola's numbers of ten/month needing such services are already an overusage.

In page three of your letter you indicate that even if the helipad is built at the Children's Hospital it would require a 75 yard secondary transport to the emergency room. That is 3/4 length of the football field; by my calculations it require almost the same three minute time frame to push the patient as it would be required if the helicopter landed at the neutral territory on the soccer field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The suggestion of Doctor Nicola to Mrs. Ryan to analyze the current usage or the anticipated usage during a short time period seems germane. In that the helicopter is presently landing at the grassy knoll at Children's Hospital at the rate of one per day (your numbers), it does not seem necessary or prudent at this point to build a helipad until this controversy has been solved. By March or April, 1986, there would be enough data for a group of disinterested evaluators to assess the real need for a permanent helipad. The building of a permanent helipad is, therefore, not necessary to solve the local political issue.

At the current time frame, the use of air ambulances is somewhat of a fad and public relation instrument. It is my firm conviction that within a year or so the massive expenditures of dollars for patients whose conditions do not warrant such flights will come under the same tight scrutiny as currently is applied to hospital admissions and the overuse of expensive antibiotics when a less expensive, but equally effective, one would have been just as good. DRG's hopefully will be applied across the board to ambulance services, helicopter services, hospital admissions, operations, and home health care services.

Mattox's relevant point

Locally, my neonatology consultants indicate their extremely strong feelings that high risk infants and neonates, especially low birth weight neonates, should not be transported by helicopter. Such a procedure almost guarantees that an intracerebal hemorrhage will occur. From the material you sent, it apparent that the trauma cases which are unstable are being transported to Harbor View Hospital, and do not require a helipad at Children's Hospital. When one subtracts the infants and the neonates who might suffer damage from intracerebral bleeding because of the vibration of the helicopter, the Doctor Nicola's suggested numbers which could benefit from air ambulance transport to Children's Hospital become less than ten.

I wish you well in trying to bring order to an extremely volatile, emotional and obviously big business situation. I, too, have read all of the references which were listed in Doctor Nicola's letter. I agree with you and him that they contain virtually no scientific information which supports the theses of those who strongly endorse air ambulance operations (especially for distances less than 35 miles).

Sincerely,

Kenneth L. Mattox, M.D.
Professor of Surgery

Pilot group calls for safety standards

Hospital chopper crash rate aviation's worst

Continued from: page 1

lost per 100,000 flying hours. That is nearly triple that of commercial helicopters in general, which suffered 2.2 lost lives per 100,000 flying hours.

There have been 21 hospital helicopter accidents so far this year, including one in June near Birmingham, Ala., that killed a pilot and two flight nurses (*AMN*, June 13, 1986). "It's a miracle that more of the accidents this year didn't result in fatalities," said John B. Galipault, president of the aviation institute. Last year, 10 people were killed in hospital helicopter accidents.

Einhorn said that "the one threat to the survivability of aeromedical EMS in this country is the issue of safety." He cited several factors that have contributed to the string of accidents. They are:

Photos: Ryan Ver Berkmoes/AMN

Pilots Don Wright (pictured at right in photo at left) and Tom Einhorn head National EMS Pilots Assn., which wants standards that would improve hospital helicopter safety statistics.

- Stress and fatigue. Don Wright, president of the helicopter pilots' association, said that too many hospitals are trying to run their aeromedical program with only two pilots. This means that each pilot must work at least 12 hours a day, seven days a week, to provide around-the-clock coverage. Wright said that pilots had confessed to him that they had fallen asleep at the controls due to fatigue.

Einhorn noted that flying a helicopter requires far more pilot concentration than does flying a regular airplane. Hospital helicopter pilots also must be on the lookout for wires and obstructions, navigate with street maps, and at the same time, communicate with air traffic controllers and emergency service dispatchers, he said.

- Training. Most EMS pilots have military and commercial backgrounds that do not prepare them for the challenges of aeromedical flying, where they must frequently land by expressways, in the middle of subdivisions, or in populated areas that aren't prepared for helicopter landings. Problems are compounded when the pilot flies at night or in bad weather. A large number of crashes resulted after the helicopter struck an unseen electric or telephone wire. Presently, there are no national training standards for aeromedical pilots, and as a result, the quality of training given to pilots varies widely from program to program.

- Equipment. In order to economize, many aeromedical EMS programs operate with helicopters that have only one engine, as opposed to the preferable two, and that don't have all the instruments and equipment needed for some flights.

- Operating standards. There are no nationally accepted operating standards for aeromedical programs that would govern when conditions are suitable and unsuitable for flight. Presently, Einhorn says that all too often, a heroic "save the patient" attitude exists, causing flights to be made in conditions that are unsafe.

In addition to questions of safety, questions regarding the very need for hospital helicopters were raised. Wright said that too often a hospital starts a program for financial, and not medical reasons. "The administrators may have seen the studies that show that patients brought in by helicopter are overall better insured and tend to stay in the hospital three times longer than average patients."

In addition, Wright said that administrators may be swayed by the 150-mile radius of coverage a helicopter will give a hospital, and the vast amount of free publicity it provides. "TV news shows love shots of helicopters whisking injured patients away from accident scenes," he said, adding, "Too often a hospital in a city will start an aeromedical program, and that in turn will spark other hospitals in the area to start their own. This happens in cities that can't even support the first one."

Dr. Stewart said that data is "sparse" to support air over ground transport of patients to hospitals. "We are not certain that air transport improves patients' outcomes; preliminary data suggests that it may be detrimental."

Dr. Stewart cited a study that showed that cardiovascular patients, who make up a high percentage of those transported by helicopters, had a greater incidence of problems when transported by air instead of by ambulance. Kenneth W. Kizer, MD, the director of the California Dept. of Health Services concurred with the studies saying, "It's not surprising that a heart patient who finds himself loaded aboard a cramped machine with whirling rotors would have problems."

Those who spoke at the conference stressed the need for studies of the need for aeromedical programs, and the results of those operating so far. They also stressed the need for coordination in communities that already have competing programs. Dr. Kizer explained the situation he had found in the Los Angeles area. "Any or all of 31 helicopters could respond to a patient. Before they started trying to cooperate, they stopped just short of air-to-air missiles in competing for patients."

Wright and Einhorn said the pilot's association was calling immediately for a minimum standard of four pilots per aeromedical helicopter to alleviate the problems of fatigue. They also are working to develop operating procedures and standards, and minimum weather requirements for flight. —**Ryan Ver Berkmoes**

Group aims to put 'medical' back in EMS

Seeking to increase physician involvement in emergency medical services (EMS), a new cross-specialty organization, the National Assn. of EMS Physicians, defined its goals and approved its constitution at its second annual meeting in San Diego in August.

"We want to put the 'medical' back in EMS," said Ronald D. Stewart, MD, the founder and first president of the association.

"Our major job," Dr. Stewart said, "is to educate the public and officials that emergency medical care must be as good as in-hospital care, with the same standards, procedure guidelines, and review." The organization seeks to cross specialty lines and involve not only emergency physicians, but others in emergency medical care, such as anesthesiologists, surgeons, internists, nurses, aeromedical pilots, and others.

In the preamble to its constitution, the association states, "With the documented efficiency of physician-extender personnel in the prehospital setting, EMS systems have developed rapidly over the past 10 years. While the original systems were closely controlled by the physician organizers and subject to medical scrutiny and continuing evaluation, the widespread growth of the various forms and systems of EMS has made medical supervision and accountability more difficult. As a result, costly EMS systems have evolved which have not necessarily improved prehospital survival. A broad spectrum of prehospital care has developed; from the expensive ride to the hospital to elaborate, well-meaning but medically unwarranted attempts at field stabilization which could lead to deleterious delays in definitive care.

"The situation in poorly controlled medical systems has led to criticism of the EMT [emergency medical technician] and paramedic, rather than the examination of the root cause of the present problems — lack of responsible, competent physician involvement and inadequate accountability in EMS systems. The recognition that both on-line EMS physicians and medical directors need to maintain — or even regain — medical authority over patient-care systems prompts the need for an association to give voice to this principle, as well as support those physicians who are responsible for medical standards and other aspects of medical care."

THE FORMATION of the association stems from a conversation Dr. Stewart had with several other physicians at an EMS meeting in South Carolina almost two years ago. They saw the need for a cross-specialty organization devoted to EMS, and to this end they contacted physicians in the field across the country, which resulted in an initial meeting, held last year, to form the association.

"Our goal for the first year was to build liaisons with other specialty organizations. We knew we had to do that to ensure our survival," Dr. Stewart said. "Some of the other specialties were at first skittish of us. However, after talking with them, they realized that we would complement them rather than compete with them."

In fact, support and acceptance of the organization has become widespread. *Annals of Emergency Medicine*, the publication of the American College of Emergency Physicians and the University Assn. for Emergency Medicine, published an editorial earlier this year that said in part: "Rarely do we take the opportunity to write an editorial about an organization. But the recently organized National Assn. of EMS Physicians (NAEMSP) already has generated so much spontaneous enthusiasm and a promise of academic potential that it deserves our acknowledgement. Not only does the NAEMSP offer an open forum for the many talented specialists wishing to improve the practice of medicine in the prehospital setting, but it also meshes perfectly with the stated goals and objectives of both our sponsoring organizations."

About 150 people attended the conference out of a total membership of 200. Eventually, Dr. Stewart expects membership to reach 300. "These are the same people we kept seeing at EMS meetings for the past few years," he said.

With the adoption of a constitution, the association plans to devote the next year to organizing its committees, including executive, research, education, legal affairs, membership, conference, fiscal affairs, and standards and clinical practice.

Initially, the association is headquartered at the Lowcountry Regional EMS Council in Charleston, S.C., which has agreed to provide logistical and office support services. A national resource center of EMS data and scientific information will be located at the U. of Pittsburgh, where Dr. Stewart is a professor. —**Ryan Ver Berkmoes**

American Medical
NEWS
SEPTEMBER 5, 1986

John Irwin/Chicago Tribune

Hospital helicopter accidents such as this one in Chicago in April have led experts to voice serious safety concerns.

Air rescue threatened by chopper crash rate

Hospital-based helicopters crash far more frequently than other helicopters or civil fixed wing aircraft, according to aeromedical experts at a meeting of emergency medical personnel in San Diego.

The efficacy of hospital-based helicopters also was questioned at the conference, with some expressing doubt that the popular aeromedical rescue teams are any more effective at saving lives than ground ambulance crews.

New group for EMS MDs.—page 33

"We have a long way to go in justifying the need for these programs in terms of patient outcome cost, and, most importantly, safety," said Ronald D. Stewart, MD, the president of the conference's sponsor, the National Assn. of EMS Physicians. Dr. Stewart is also a professor at the U. of Pittsburgh, and president and director of the Center for Emergency Medicine of Western Pennsylvania.

The use of hospital helicopters has grown quickly in the past 10 years. There are now 150 hospital aeromedical programs, and some predict that there will be 500 by 1996.

A stinging indictment of hospital helicopter safety came from Tom Einhorn, vice president of a recently formed association of hospital helicopter pilots, the National EMS Pilots Assn. "Hospital-based aeromedical helicopters have the worst accident rate in modern aviation history," Einhorn said.

According to the private, Columbus, Ohio-based Aviation Safety Institute, through 1985, the fatal accident rate for aeromedical flights was 6.5 lives

Easing the bite

MDs must re-examine investments to avoid higher taxes under reforms

Physicians who have used tax shelters in the past to protect their earnings will have to retool their investments if they want to outwit the taxman under reforms now pending before Congress.

That is the message from attorneys and investment counselors who say physicians, as well as other high wage earners who have relied on various tax preferences to reduce the bounty they pay to the federal government, must begin now to restructure their financial strategies.

3 of 4 MDs would owe more taxes. —scenarios, page 9.

"People who have tried to take advantage of tax deductions in the past will have to do some scrambling," said Carl G. Gargula, JD, tax principal of Arthur Young and Co. in Chicago.

The provisions that are forcing physicians to take a long, hard look at their personal finances are contained in a package that economists and lawmakers alike are heralding as the most sweeping revision of the tax code since the inception of the federal income tax in 1913.

THE LANGUAGE, still in tentative form, is expected to be passed by both houses of Congress this month. In general, the bill would:

- Shift $20 billion of the federal tax burden from individuals to corporations and expand the tax base by more than $800 billion, primarily through a curb on tax deductions.
- Scrap the nation's 14 tax brackets (including an existing 50% maximum rate) in favor of a structure that includes two lower basic rates, 15% and 28% scheduled to be totally phased in by

Continued on page 10

Ophthalmologists targeted for first Medicare cuts

As expected, ophthalmologists will be the first victims of new Medicare rules aimed at reducing payment for procedures that program officials regard as "overpriced."

Under rules proposed in the Aug 15 *Federal Register*, Medicare would limit payments for cataract extractions with an intraocular lens implant to only 10% more than payment for cataract removal alone. The plan would be phased in with the limit set at 20% in 1987 and at 15% in 1988, before falling to 10% in 1989 and thereafter. Public comments will be accepted on the plan until Sept. 15 and unless convinced otherwise or forced to abandon the proposal by Congress, officials in the Health Care Financing Administration (HCFA) expect the plan to take effect Jan. 1, 1987.

The proposal would make cataract extraction the first procedure singled out for national price controls under new regulations extending the use of Medicare's requirement that charges be "inherently reasonable" (*AMN*, Aug. 22/29, 1986). Its impact will vary drastically from state to state but some physicians would lose more than $1,000 a case or $200,000 a

MDs at risk also, court rules

Payers can be held liable for care limits

Third-party payers can be held liable for cost containment decisions that deprive patients of needed care, a California appellate court has ruled.

The opinion, written by Judge Barnet Cooperman of the Second Appellate District Court in Los Angeles, also warns physicians that they will be held liable if, against their medical judgment, they comply without protest with limits imposed by third-party payers.

The decision is believed to be the first court ruling to put third-party payers on notice that they may be held legally accountable for decisions that are detrimental to patients and to warn physicians that they may be liable if they do not protest.

Legal observers consider the opinion important nationally because courts in other states often find opinions written by the California courts to be persuasive.

The case involves Lois J. Wickline, a Medi-Cal beneficiary who alleged that Medi-Cal's failure to approve a requested extension of her hospital stay led to complications that resulted in amputation of her leg. Medi-Cal is the name of California's Medicaid program.

A superior court jury awarded Wickline $500,000, but Cooperman overturned the award on the grounds that, in this instance, the denial of an extension was within the "standard of care." Wickline's attorney plans to appeal the decision to the California Supreme Court.

In deciding *Lois J. Wickline v. State of California*, Cooperman said that the court recognized that this case "appears to be the first attempt to tie a health care payer into the medical malpractice causation chain" and therefore deals with "issues of profound importance" to the health care community.

Kirk Johnson, general counsel of the American Medical Association, said the decision offers a "very valuable lesson" for physicians. When a third-party payer has a cost containment program that requires preauthorization for a non-elective hospital admission, a continuing hospital stay, or other procedures, and the physician's medical judgment runs counter to the reviewer's recommendation, "you have to protest strongly or you can be held liable," Johnson said.

The other important point "is the court's recognition that prior authorization programs will be held liable if they

Holly Miller
Director, Dept. of Construction and Land Use
Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

I am writing about the proposed helipad at Children's Hospital. I am a pediatrician and on the staff of Children's Hospital, so I am not unsympathetic to the need for efficient and effective transportation of sick children. However, I believe that the current plan proposed by the hospital is insufficient and does not contain adequate safeguards for either the patients or the community.

Regarding the patients, while it may seem intuitively obvious that faster transport will enhance survival, this is not necessarily the case and should be documented with good scientific studies. Judging by Dr. Nicola's recent excellent review of the literature on this issue, there are none. A possibly analagous example of the misuse of technology is the situation with monitoring of near-term fetuses, where the use of electronic monitors increases the rate of Cesarean sections but does not necessarily enhance rates of survival of infants. Ground transportation has advantages over air transportation. The only way to resolve situations in which such uncertainty [illegible] perform proper comparisons of the available methods on appropriate [illegible] aw some during last nts in I think that ify the use and society strictly tal? What rt for all irlift ty suffer ? What it is er litany of ge that this spitals

John— in this letter of DR Bell's there are 2 points relevant to helicopter use:

1. He agrees with us, + DR Nicola that there are no ~~scientific~~ scientific studies showing that helicopter transport is better

2. "Intuitively obvious" notions are not necessarily correct— his example of fetal monitoring, which he has researched very carefully, is but one example that could be given of medical procedures that seemed to be a good idea + later turned out to be useless or even harmful.

Unneeded medical care bloating bills, says report

Chicago Tribune

CHICAGO — In an unusually sharp criticism of doctors, a report in the Journal of the American Medical Association says unnecessary tests and procedures by physicians are a major factor adding to the nation's skyrocketing health-care bill.

Far from being beneficial, much of the medical care in this country is unnecessary — by which I mean that (it) is of no demonstrated value to those getting it — and some of it is harmful," said Dr. Marcia Angell, deputy editor of the New England Journal of Medicine, in the JAMA report released yesterday.

Among the unnecessary procedures, she said, are one-fourth of all the 200,000 coronary-artery bypass operations performed each year, at a cost of $4 billion.

Although waste in medicine has been criticized for years and has provoked the recent federal cost-cutting in Medicare and Medicaid, Angell's article is perhaps the most critical report on medical practice to appear in JAMA, said Dr. George Lundberg, JAMA editor.

JAMA is the world's most widely distributed medical journal, with a circulation of more than [illegible] copies weekly.

The nation's soaring bill for health care has generated increasing pressures to ration health care as a means of curbing costs.

NB

An example of the fallibility of medical opinion when it is not backed up by research.

Also — this is another type of harm that can come about through unwarranted use of helicopters — ie, the harm of unneeded medical care raising cost

sorry I don't have a date on this — it is fairly recent, tho. 1987 or 1988 JAMA

Report Finds High Risks With Medical Helicopters

By a WALL STREET JOURNAL Staff Reporter

The risk of being killed or injured in an emergency medical helicopter is at least 30 times greater than in emergency ground transportation, according to a study done at Johns Hopkins School of Public Health.

The study's author, Erich Daub of the school's Center for Injury Prevention, said the emergency air-evacuation system already is "demonstrably dangerous" and called on the federal government to promptly tighten safety rules.

The Federal Aviation Administration has been studying the industry. Currently, medical helicopters operate under the general rules for helicopters. There are 199 air-emergency programs in the country, many of them run by private companies.

Mr. Daub presented his findings yesterday to the annual meeting of the American Public Health Association in New Orleans. He said that the crash and injury rate for medical helicopters for the past six years is 100 times that of private planes and five times that of helicopters in general.

An official for Helicopters Association International, a trade group that opposes more government controls, said Mr. Daub's figures overstate the accident rate for emergency helicopters.

30X Higher Risk of accident with EMS helicopter than with ground ambulance.

BEHAVIORAL CORRELATES OF INJURY IN CHILDREN

Accidents are the number one killer of children under age 18. Identifying children most at risk for accidental injuries is essential to the development of prevention strategies. Studies have implicated hyperactivity as a child characteristic correlated with accidental injuries and "accident prone children". This study was an attempt to identify behavioral correlates of injury in children. A Conners Abbreviated Symptom Questionnaire (CASQ) (screening tool for hyperactivity) was administered to 376 parents or caretakers of children brought to a children's hospital emergency room during a 3-week period. Children were categorized as trauma or nontrauma by chart review. The 90 trauma patients were matched by age and sex to 90 nontrauma patients and mean scores on CASQ were compared. Children with repeat visits to the emergency room were identified by using the University of Missouri-Kansas City Argus CHARTS Injury Surveillance System. Repeaters' mean CASQ scores were compared to mean scores for trauma and nontrauma patients. Preliminary results indicate that trauma patients and repeat patients score higher on the CASQ than nontrauma patients. Thus an important behavioral correlate of accidents (injury may be hyperactivity.

Audrey Galizia, M.A., M.S. ; Biostatistician, NYC Poison Control Center, NYC Department of Health

Leslie Fisher, M.P.H., Director, Injury Prevention Unit, Injury Control Program, NYS Health Department

ANALYSIS OF COST BENEFIT OF THE NEW YORK STATE REGIONAL POISON CONTROL CENTERS

An analysis of the cost savings resulting from the operation of regional Poison Control Centers in New York State demonstrates a substantial savings in the cost of health care for poisoning. In 1985, a total of 151,756 calls were reported to Poison Control Centers in New York State. If all these calls were to be treated in an Emergency Service with an average annual total cost of care (both direct and indirect costs) of $150 per visit (patient not admitted) then the estimated projected cost of care would have been $22,763,400 (151,756 x $150). Since not all callers to a Poison Center require a hospital visit we can look at the total number of callers where an emergency services visit was not necessary and estimate the cost savings. These total 128,149 calls and result in a annual savings of $19,222,350 (128,149 x $150) in preventing unnecessary cases from going to the Emergency Services. It is necessary to take into account that the estimated operating costs of the regional Poison Centers was about $2.7 million in the year 1985. Therefore the New York State Poison Centers reduced the cost of care for poisoning by 72% ($16,522,350/$22,763,400) which resulted in an estimated savings of $16.6 million ($19,222,350 - $2,600,000) in the year 1985. This means that for every dollar spent in 1985 approximately $6.24 was saved. These regional centers reach only 50% of the state population thereby rendering the potential for expansion and for substantially higher savings due to the operations of such centers despite ever increasing operational expenditures.

THE ECONOMIC IMPACT OF INJURY

Estimates of the economic impact of injury (totaling $83 billion) have largely been based on broad assumptions and data derived from multiple sources. Further, it is not known who ultimately pays for costs incurred. This study was designed to provide better estimates of the costs associated with non-fatal injuries on a per episode basis and to examine more closely the relationship between costs and type, severity and cause of injury. 498 study patients were interviewed at discharge from acute care and at 6 and 12 months post-discharge. Information was obtained about the use of health services, the associated costs and expected source of payment. Providers and third party payers were contacted to supplement respondent information. Estimates of direct 1 year expenditures are presented by type of service and by type, severity and cause of injury. Percent expenditures paid by patient, Medicaid and other insurers is also examined. Estimates of foregone earnings are also provided. Implications for deriving population based estimates of the economic impact of non-fatal injury are discussed in light of the results.

A. Woolf, K. Helsing, C. Azzara, S. Gallagher, S. Fish, & F. Lovejoy. Massachusetts Poison Control System & Dept. of Public Health, Boston, MA

POISONING HOSPITALIZATIONS IN MASSACHUSETTS: A POPULATION BASED STUDY OF PRODUCT TYPE AND INJURY SEVERITY

We analyzed 11,571 primary discharge diagnoses related to poisonings and toxic effects for all ages recorded in the Massachusetts Uniform Hospital Discharge Data Set (UHDDS) for the fiscal years 1982 and 1983. Results showed the overall hospitalization rate to be 100.8/ 100,000 population. Although prescription medications were the most frequent cause of hospitalization accounting for more than 50% of the total cases non-prescription (over-the-counter) medications also resulted for over 1500 hospitalizations during the period studied (13% of the total). Lead was the most frequent reason for hospitalization among younger children; aspirin, alcohols, anti-depressants, and benzodiazepines predominated among adolescents and adults. Poisoning with over-the-counter medication was twice as common among females as males and, for both sexes, resulted in an average hospital length of stay of 3.94 days. Our results suggest hospitalization data can identify unexpected causes of serious poisonin to high risk groups. Such data should be used by Poison Centers to supplement telephone call data in planning educational and other interventional objectives.

Trudy Karlson, Ph.D. and Jerry Rose, MBA, Center for Health Systems Research and Analysis, University of Wisconsin-Madison

SURVIVAL OF TRAUMA PATIENTS TRANSPORTED BY HELICOPTER AND LAND AMBULANCE

In an evaluation of a helicopter transport service, the authors compared survival of trauma patients transported by helicopter and by land ambulance from April, 1985 to April, 1986. Each group was restricted to patients transferred between hospitals, within the same mileage range, and with a select group of life-threatening trauma diagnoses. We used three measures for severity of injury--Trauma Score (TS), Wisconsin Multiple Trauma Severity Index (MTSI) and the Injury Severity Score (ISS). Comparisons of survival rates differed by the method used to classify severity. Survival rates of helicopter patients in the high severity groups were: ISS - 70% (31/44); MTSI 60% (24/40); and TS - 52% (17/33). For land ambulance patients, survival rates were ISS - 70% (7/10); MTSI - 38% (3/8) and TS - 20% (1/5). Improvements in survival rates were not statistically significant (p≥.20). Our findings are suggestive of possible improvement in survival associated with helicopter transport but further research with a larger land ambulance population is necessary.

POLICY IMPLICATIONS OF 37 FATAL EMERGENCY MEDICAL SERVICES HELICOPTER CRASHES.

The epidemiology of fatal and non-fatal EMS helicopter crashes in the U.S. will be discussed. Recent research indicates a rise in the mortality rate (1985 = 2.4/10,000 flights vs. 1986 = 2.8/10,000), as well as an increasing case fatality rate, regardless of the measure of exposure chosen. The crash ratio for EMS helicopters vs. all other non-military helicopters is 2:1; vs. small airplanes it is 2.5:1. The increase in hospital-based EMS helicopter programs in the last 9 years was 37 fold. The operational elements unique to EMS helicopter services will be reviewed, as well as factors likely to contribute to death and injury. Evidence supporting the clinical contributions of such transport systems in reducing motality and severity of injury will be reviewed and the policy implications (economic, preventive, clinical) of this transport mechanism will be presented.

Medical Helicopters: Carbon Monoxide Risk?

THOMAS J. POULTON, M.D.

Creighton University School of Medicine, Omaha, Nebraska

POULTON TJ. *Medical helicopters: carbon monoxide risk?* Aviat. Space Environ. Med. 1987; 58:166-8.

Carbon monoxide exposure of medical personnel working beneath the turning rotor of a medical helicopter appeared to cause mild clinical illness. We measured the carbon monoxide levels found in various locations beneath the rotor of a jet helicopter under two different conditions. Carbon monoxide levels ranged from 8-76 ppm depending on location of sampling and speed of operation of the engine. This level of carbon monoxide is potentially a problem, as is the inhalation of jet fuel vapor, when working beneath the rotors of an operating helicopter.

THERE ARE CURRENTLY nearly 100 hospital-based helicopter medical transport programs in the continental United States (1). Although these programs may benefit selected patients (2,3), they do present certain risks to those who use them. These hazards are similar to those of ground transportation for critically ill and injured patients and include crashes, injuries from either main- or tail-rotor strikes, noise exposure, injury to bystanders or medical personnel from flying debris, and exposure to extreme wind chill factors in the rotor downdraft (4).

In some circumstances, patients may be moved into and out of helicopters while the engine is running and the rotors turning. When this is done, an additional hazard may exist. Especially when the helicopter has landed in a closed area, such as the bottom of a narrow valley or between tall buildings, carbon monoxide levels might accumulate significantly as the engine exhaust is blown beneath the rotors.

Our flight program's helicopter was summoned to the site of an industrial accident beside the loading dock of a warehouse in an urban area. The landing area, a parking lot approximately 200 ft long and 80 ft wide (60 × 25 m) was surrounded on three sides by 2- and 3-story buildings. The fourth side opened onto a heavily traveled five-lane street. The ambient temperature was 76° with a relative humidity of 85%. Winds were calm. The helicopter landed and sat with the engine running for approximately 6 min while both medical crew members worked to stabilize and load the patient.

Because of the patient's large size and the nature of his injuries, it took approximately 3 min to position and load him under the turning rotors. Both flight crew members and ground rescue personnel and the pilot experienced tearing and burning of the eyes. The medical crew members, who spent approximately 3 min longer under the rotor than ground personnel, also experienced mild nausea, headache, lightheadedness, and continued burning of the eyes. By the time the patient was unloaded and further treated at the receiving hospital, 20 min had elapsed, and both crew members were experiencing only mild nausea and burning of the eyes, both of which were gone 1 h later. Because symptoms were mild and improving, no medical evaluation or treatment took place.

Since most of the flight crew symptoms were consistent with carbon monoxide exposure, we designed a study to evaluate the potential for significant carbon monoxide exposure of personnel working in the downdraft of helicopters sitting on the ground with the engine running.

This manuscript was received for review in November 1985 and was accepted for publication in January 1986.

Thomas J. Poulton, M.D., is Medical Director of Life Flight and Associate Professor of Anesthesiology, Pediatrics, and Internal Medicine, at Creighton University School of Medicine.

Send reprint requests to Dr. Poulton at 601 N. 30th St., Omaha, NE 68131.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We sampled carbon monoxide levels in the environment around our Bell 206L LongRanger single-engine jet turbine helicopter. This is the helicopter used most widely in recent years for emergency medical services applications (5).

MATERIALS AND METHODS

We used a Wilkes Miran Specific Vapor Analyzer (Model 103—Foxboro Analytical Co., South Norwalk, CT) to continuously measure the carbon monoxide levels in parts per million (ppm) on the downwind side of our helicopter while it ran under two conditions: idling with flat pitch on the rotor blade and with just enough pitch applied to the rotor to take a small amount of weight off the skids. Measurements were made on the downwind side of the aircraft as it sat on a relatively open urban helipad with one tall building on the downwind side and the other three sides of the helipad widely exposed. The wind was blowing at 6-7 mph (9.6-11.2 kmh) at the time of testing. Sampling was done at several points beside the aircraft, including beside the skid (where a patient might be placed on the ground prior to lifting for loading), at the level of the cargo door (where supplies might be retrieved), and approximately 15 other random locations within 10 ft of the aircraft itself.

RESULTS

With the engine idling, carbon monoxide levels varied from as low as 8 ppm to as high as 43 ppm, depending on the location of sampling. With the engine at full speed and pitch applied to the rotor, peak levels of 76 ppm were recorded in several locations. We found the peak levels could be located consistently by placing the sensor at those locations where the heat from the engine exhaust could be felt maximally in the downdraft. These locations varied somewhat from moment to moment, but were always within 5–6 ft of the aircraft.

DISCUSSION

Our single-engine jet turbine helicopter consumes approximately 0.15 gal (0.56 L) of fuel per minute while sitting on the ground. Twin-engine helicopters, many of which are used in EMS applications, consume nearly twice this amount of fuel.

Jet turbine helicopters use JP4 jet fuel, a mixture of 65% kerosene and 35% aviation gasoline (5). The latter is a 115–145 octane petroleum distillate fuel used in pure form for reciprocating aircraft engines. Both kerosene and aviation gasoline, as well as the JP4 mixture of the two, are toxic. The vapors of JP4 are narcotic and can cause CNS impairment. Direct contact with JP4 can cause severe skin irritation. In addition, prolonged exposure, as from spillage on clothing, can lead to significant systemic uptake.

Aviation gasoline fumes are also a known upper respiratory irritant and produce tearing, rhinorrhea, and coughing. Prolonged exposure to high concentrations of the fumes has caused death. The exhaust from the helicopter smells strongly of JP4, which has an unmistakable hydrocarbon odor. It is possible that some of the symptoms of our medical personnel may have been from the inhalation of and exposure to JP4 fumes rather than to carbon monoxide alone, since combustion in the jet turbine engine is incomplete and significant amounts of JP4 fuel may appear in the exhaust as a vapor.

The level of carbon monoxide in jet engine exhaust itself is approximately 10,000 ppm (5). In reciprocating engines, the exhaust may contain almost 100,000 ppm (i.e. nearly 10% carbon monoxide) at take-off power settings. At idle settings, the carbon monoxide levels will be approximately one-third this level or up to 30,000 ppm in reciprocating engines and up to 3–4,000 ppm for jet engines. Further dilution of exhaust gases by ambient air ought to reduce carbon monoxide concentrations rapidly as a function of distance from the exhaust port.

Are the levels of carbon monoxide documented in this study dangerous? Three frequently quoted guidelines for acceptable levels of carbon monoxide in breathing air exist. The Occupational Safety and Health Administration (OSHA) forbids time-weighted average levels greater than 50 ppm during an 8-h period (6). The National Institute for Occupational Safety and Health (NIOSH) recommends that permissible exposure limits not exceed 35 ppm (6). At that level, carboxyhemoglobin levels of up to 10% may occur after an 8-h exposure. This guideline further directs workers to immediately leave any area in which carbon monoxide levels exceed 200 ppm.

The United States Environmental Protection Agency publishes "danger levels" for carbon monoxide. These prescribe a 1-h mean maximum of 35 ppm and an 8-h mean not to exceed 9 ppm. These exposures are calculated to keep CHB levels of the nonsmoking general public at less than 2% (7).

The levels of carbon monoxide documented in our investigation exceed the levels permissible for prolonged exposure in a workplace. Nonetheless, the duration of exposure in any reasonably imaginable operational situation with a civilian helicopter would be less than 6-8 min. It is easy to imagine that, with a more enclosed landing site and calm wind conditions, much higher levels of carbon monoxide might build up quickly. A mere three-fold increase over the level measured in our relatively open-field testing with a significant prevailing wind would result in levels exceeding permissible standards for even brief exposures (200 ppm). At the same time, JP4 vapor levels would also be expected to rise rapidly.

We encourage all personnel involved with EMS helicopter operations to be aware of this potential hazard. Although carbon monoxide is odorless and not detectable without specific measuring equipment, it is reasonable to assume that its levels near the aircraft will parallel those of the easily perceived JP4 vapor. Thus, when medical personnel or rescue personnel are working under or very near a helicopter whose engine is running, they must be aware of the additional potential hazard of exposure to these toxic substances. If such personnel find that they are significantly bothered by the effects of fumes in such a setting, and the exposure is likely to last more than a very few minutes, they should discuss with the pilot the advisability of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

shutting the engine down. The pilot might also be affected by the fumes and carbon monoxide with possible impairment of performance.

Shutting down the engine of a jet turbine helicopter requires a cool-down period of approximately 3 min and a subsequent warm-up period of 1-2 min. Thus, the departure of the aircraft would be delayed 4-5 min under the most adverse circumstances. Since the work of evaluating and stabilizing the patient can proceed while the cool-down takes place, the delay in departure from the scene would ordinarily be less than 3 min. It is probably quite rare that a departure delay of this duration would have a clinically significant impact on patient outcome.

Advanced Prehospital Care for Pediatric Emergencies

During an 18-month study period, the mobile intensive care unit (MICU) in Jerusalem responded to 307 pediatric emergencies, representing 5% of the total MICU case load. The most common medical problems were seizures, diagnosed in 100 cases (32%), and conditions related to trauma, diagnosed in 77 cases (23%). Forty-one cases (13%) were cardiac arrests. Nineteen patients were pronounced dead with a resuscitation attempt; resuscitation was attempted in 22 patients. Four patients were stabilized for admission to the hospital, but there were no long-term survivors. Eighteen cardiac arrest patients (82%) were found in asystole, and most had previous serious medical problems. Based on our experience children are less likely to require or benefit from advanced levels of prehospital care compared to the adult population. When resources for advanced care are limited, priority should be given to adult emergencies. [Applebaum D: Advanced prehospital care for pediatric emergencies. Ann Emerg Med July 1985;14:656-659.]

INTRODUCTION

Prehospital emergency medical services (EMS) systems are designed to deliver life-saving medical care directly at the scene of emergencies. Studies have demonstrated the benefit of EMS for cardiac arrests and traumatic emergencies in adults,[1-3] yet few studies have addressed the use and benefit of EMS for children. This report describes the experience of a mobile intensive care unit (MICU) in treating pediatric emergencies during an 18-month period.

MATERIALS AND METHODS

In Jerusalem a physician- and paramedic-staffed MICU provides services for a population of about 450,000 people. Thirty-six percent of the population (165,000) are under age 15. The MICU responds to an average of 350 calls per month; all calls are identified by a dispatcher as requiring advanced emergency care. The criteria for sending the MICU are such symptom-related key words as unconsciousness, chest pain, severe shortness of breath, seizures, and severe trauma. For less critical emergencies, ambulances staffed with an emergency medical technician (EMT) are dispatched.

The MICU physicians are licensed to practice medicine and surgery by the Israel Ministry of Health, and have met requirements similar to those for advanced cardiac life support certification.

All children under age 15 receiving treatment by the Jerusalem MICU from October 1982 through March 1984 were included in the study. Demographic and treatment data were taken from the paramedic's run sheet, and diagnostic data were taken from the physician's medical report. For patients delivered or referred to a hospital emergency department (ED), outcome of the ED visit was taken from the ED registration book. For patients not referred to an ED, telephone follow-up was carried out two days after the MICU visit.

Differences between subgroups of patients were examined with the help of an SPSS computer program and were tested for statistical significance by chi square or t tests.

RESULTS

During the study period, the MICU responded to 307 pediatric cases (5%

John - I'm not sure this is really relevant - they're not discussing helicopters here - but, it is an interesting question, especially in view of CHMC's extremely high mortality rate for helicopter-transported children - anita

of total MICU cases). One hundred eighty-three patients (59.6%) were boys. Age and sex distribution are shown (Table 1).

The most commonly encountered emergency was seizures, accounting for 32.6% of cases (Table 2). The second most common emergency was trauma (25%). In 52 patients (66%) trauma was related to motor vehicle accidents and was considered minor injuries.

Forty-one patients (13.4%) were pulseless when the MICU arrived. Of this group, 19 patients were pronounced dead without a resuscitation attempt; nine patients suffered sudden infant death syndrome (SIDS); six cases involved trauma (three motor vehicle accidents, two injuries suffered in a collapsed building, and one drowning). Four patients were chronically ill (two were severely mentally retarded, one had Tay-Sachs disease, and one had Down's syndrome).

Cardiac arrest victims for whom a resuscitation was attempted are listed according to etiology, age, and cardiac rhythm on arrival of the MICU at the scene of the arrest (Table 3). Of 22 resuscitation efforts, four patients regained pulse and blood pressure and were admitted to the hospital, but there were no long-term survivors. Thirteen patients (59.1%) were less than one year old. Almost all patients were found in asystole (one patient was in ventricular fibrillation, two were in severe bradycardia). Twelve of 18 patients (66%) not in the SIDS category had previous medical problems that may have been related to the cardiac arrest (Table 3).

We examined the time elapsed between receipt of the call and arrival of the MICU on the scene in the following three patient groups: 1) no cardiac arrest (n = 266); 2) cardiac arrest with no resuscitation attempt (n = 19); and 3) attempted resuscitation (n = 22). The times were 6.2, 7.3, and 6.5 minutes, respectively, and the differences were not statistically significant.

Medications were used in 11.1% of all cases (Table 4). The most commonly used drugs were diazepam (17 patients [5.5%]) and epinephrine (10 patients [3.2%]). Steroids and sodium bicarbonate were each used in seven cases (2.3%). Glucose, lidocaine, atropine, and calcium were each used once.

More than 75% of the pediatric emergencies were referred to a hospital ED: 111 (36.1%) by MICU transport, 85 (27.7%) by EMT transport, and 39 (12.7%) by private transportation. Forty-five patients (14.7% of total) were treated definitively in the prehospital phase and were not referred to an ED. Twenty-six patients were pronounced dead (19 without resuscitation, seven after resuscitation was terminated). One patient refused treatment.

Of 229 patients referred to an ED, follow-up information was available in the ED registration books in 200 cases. Of these cases 134 (67%) were admitted to the hospital, 11 (5.5%) were pronounced dead in the ED, and 55 (27.5%) were discharged home.

DISCUSSION

The use of MICU services is low in the pediatric age group. Children make up 36% of our community, yet constitute only 5% of MICU cases.

The most common pediatric situation confronting our MICU was seizures. Although exact etiologic data are not available, most of the seizures were first episodes of febrile convulsions, and the seizure ended before the MICU arrived. Medical intervention was initiated in only 16 of 100 seizure

patients, and always in the form of parenteral diazepam. (One patient also received 50% dextrose solution.) While treatment may have been indicated clinically in several cases, prehospital medication probably was not necessary to bring about a favorable outcome. None of these patients required intubation or ventilation.

Accidents contribute significantly to childhood morbidity and mortality.[4,5] In our experience accidents were responsible for 27% of MICU calls. Two-thirds of these cases were motor vehicle accidents. While some of these injuries were potentially life threatening, interventions needed in the prehospital phase generally were conservative; intravenous fluids were administered to ten, fractures were immobilized in 13, analgesics were offered to only one, and basic cardiopulmonary resuscitation (CPR) was performed on two accident victims. Six additional patients with cardiac arrest secondary to trauma were pronounced dead without a resuscitation attempt because of their extensive injuries.

We responded to 41 cases of pediatric cardiac arrest. In 19, CPR was not initiated. In 22 cases, resuscitation attempts were unsuccessful. Response times for the two groups were not different. The group for whom CPR was not initiated consisted of patients suffering from SIDS, severe trauma, or chronic illness, making cardiac arrest not unexpected. All were in asystole when the ambulance arrived. In contrast, the group for whom CPR was started also consisted of patients with unexpected cardiac arrest resulting from drug overdose, foreign body aspiration, and what appeared to be routine illness.

The decision to initiate CPR is a difficult one, with irreversible consequences. There is an overwhelming tendency to err in favor of preserving life, no matter how remote the chances. Frequently parents bring an unconscious child outside to wait for the ambulance. In such cases the decision to proceed with CPR is dictated by circumstances more than by patient salvageability.

By comparison our experience with adult cardiac arrest is very different. Of 683 adult cardiac arrests during the same period, CPR was attempted for 401 patients. Forty-six patients (11.5%) were long-term survivors. Response times did not differ from those in the pediatric cardiac arrest group.

Eisenberg and colleagues[6] concluded that the likelihood of successful pediatric resuscitation, although lower than that in adults, is high enough to warrant vigorous efforts. We had no long-term survivors from 22 attempted resuscitations. It is difficult to identify accurately the reasons for the poor results in pediatric cardiac arrests. Our physicians are not trained extensively in pediatrics, and they are less comfortable with han-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

dling pediatric arrests than adult arrests. This is shown by the fact that endotracheal intubation was carried out in only eight pediatric patients, while it was achieved in almost 100% of adult patients. Although personnel are trained in pediatric resuscitation techniques, there is no substitute for cumulative experience. Because pediatric cardiac arrest is a relatively rare occurrence, it is difficult to accumulate such experience.

The physicians' inexperience, however, does not seem to be responsible for these results. We found, as did Eisenberg,[6] that almost all patients were in asystole. In Eisenberg's group of eight successfully resuscitated children, four were near-drowning victims and two were in anaphylaxis. He reported no cases of discharged cardiac arrest in patients less than 15 months old. Furthermore Eisenberg's series failed to demonstrate a significant advantage for advanced-paramedic prehospital care over basic EMT care. One of 17 cardiac arrest patients (6%) treated by EMTs were discharged, compared to seven of 102 patients (7%) treated with advanced paramedic care. In our study group, there was one drowning, no cases of anaphylaxis, and 13 patients less than 15 months old.

We have found two extremes in our pediatric emergencies attended by the MICU. At one extreme we treated emergencies that did not require advanced prehospital care, as indicated by the few medical interventions needed before arrival at the hospital. At the other extreme the most severe cases were not likely to benefit from our care.

CONCLUSION

In a two-level EMS system such as ours, the physician- and paramedic-attended MICU is a scarce resource, and its efficiency must be maximized by reserving it for life-threatening situations for which advanced prehospital care might favorably influence outcome. While the MICU may play a role in pediatric emergencies and vigorous efforts at pediatric resuscitation should be made, it seems prudent to give first priority to adult emergencies, for which advanced care is more likely to contribute to a favorable outcome.

The author thanks Paul Slater, MD, for his valuable assistance in analyzing the patient data.

The EMS Safety Dilemma: A Matter Of Maturity

The expanding helicopter aeromedical industry finds ill side effects to dramatic growth and a critical safety problem is prompting an eager search for a cure.

By David Harvey and David Jensen

PERHAPS IT IS characteristic of all ripening aviation industries. Like awkward adolescence, well into a rapid-growth stage, there is a tendency to be accident prone.

Regardless, many believe the safety record of today's emergency-medical-service (EMS) market has become critical, as mishaps over the previous few years have broken out like a bad case of acne. As a result, groups like the American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS) and National EMS Pilots Association (NEMSPA), along with hospital administrators and government agencies, are seriously examining ways to help the industry grow out of this stage. Their efforts in cleaning up the EMS industry's record and reputation will not be small.

How bad is it?

"In terms of pure numbers, the situation is alarming," says Tom Guterl, senior vice president of the United States Aviation Underwriters, a group understandably concerned about safety problems. "The average accident rate for EMS helicopters is now running at a rate of 20.7 accidents per 100,000 flight hours—about five times the accident rate for commercial helicopters." The fatality rate is also higher, running 6.5 lives per 100,000 hours, according to the Aviation Safety Institute, in Columbus, Ohio.

(Guterl's figures compare but don't exactly match those from other sources keeping tabs on EMS safety. This punctuates the fact that there is no official central source for such information.)

Gabriel Martyak, assistant director of Geisinger Medical Center's Life Flight program, in Danville, Pa., says there have been 16 major EMS accidents since 1980, resulting in 47 fatalities and six injuries. An additional 17 accidents were classified as "substantial" and accounted for 51 injuries.

Ten people lost their lives last year due to EMS-helicopter accidents. By October, 16 incidents involving EMS helicopters were recorded for 1986 and, with winter coming on, industry officials were anticipating still more bad news before year's end.

Referring to an unofficial survey he conducted, Martyak reports that EMS programs in the U.S. today fly some seven million miles annually. "We estimate [these programs] are now carrying between 6,500 and 7,000 patients a year," he adds. "That's an achievement that shows how significant EMS is becoming. But since 1980, 50% of the EMS programs in this country have experienced some kind of accident or serious incident."

What factors feed such a record?

Human error

There are indications, Martyak replies, that 89% of the EMS accidents since 1980 were due to human error. The remainder could largely be attributed to engine failure. The term "human error" invariably translates into "pilot error" and that points to factors ranging from crew-rest time to assessment of what makes a good EMS pilot.

Don Wright and Tom Einhorn, founders of the two-year-old NEMSPA, say fatigue and stress caused partly by understaffing have contributed significantly to the safety problem. They believe a four-pilot team should accompany each EMS helicopter pulling 24-hour duty. Too often, they claim, such programs employ three or even only two pilots.

Human error in EMS operations frequently begins with decisions to fly at night or during adverse weather conditions. Martyak's survey reveals that 78% of the EMS mishaps occurred during such conditions. This no doubt accounts for the fact that about 75% of the accidents took place while the helicopters were en route.

"The issues boil down to: pilot, night flying, and weather," says Martyak. "In some places, for instance, we have VFR-trained pilots flying in IFR conditions. We have got to approach zero on this kind of problem."

"That's all good," counters NEMSPA's Tom Einhorn, "but we're continuing to hear from members who are getting fired for refusing to fly missions under certain conditions."

Also, even without pressures from program management and/or medical staff, EMS pilots have been known to be their own worst taskmasters. Humanitarian instincts too often take over from good judgment and thus they fly when they shouldn't. They simply don't know how to say, no.

"We pay people to say, no, when it has to be said," says John Heiskell, director of operations-medical group for Rocky Mountain

For night flights like this one being completed by a Bell LongRanger, the insurance industry proposes minimums of 1,000 feet and three miles visibility.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopters Inc. (RMH), "but it is often hard to say."

But not all responsibility lies in the pilot's lap. Tom Guterl claims the insurance industry "feels strongly that safety is a management problem, not a pilot one.

"We need to have things like weekly, formal safety meetings," he adds, "and this is an area where management should be increasing its visibility.

"Also, management can play a big part in reducing stress. One immediate solution would be to mandate two-crewmember operations for all night flying."

Einhorn believes good EMS-program management means involving the pilots as well. They can frequently identify safety problems, he points out, "but often have no authority to make changes. If we don't get the pilots more directly involved in part of the

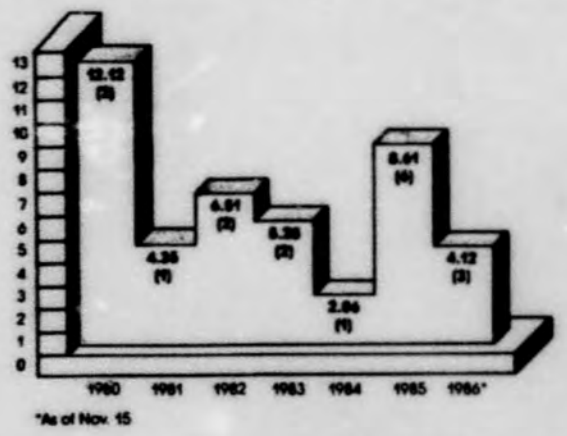
(Continued on Next Page)

The insurance factor

An industry's troublesome safety record is invariably followed by the shadow of insurance woes and the EMS field is no exception. For the about 150 programs in the United States, there is the growing threat of escalating insurance premiums or, worse, insurance cancellation.

Tom Guterl, senior vice president with United States Aviation Underwriters, describes the EMS industry's current situation as "disastrous" and elaborates by saying, "Liability payments are outrunning at three times the premiums taken in.

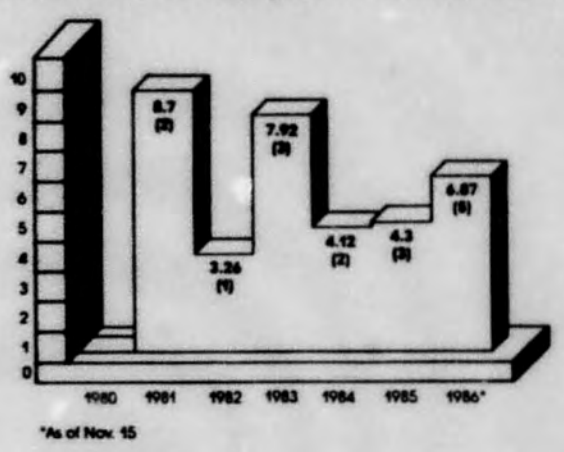
"If you combine hull and liability over the past five years, losses have been outrunning premiums by a factor of 2.5 to one." The situation is aggravated, he adds, by the fact that accidents have occurred at the same time the insurance industry has been hit by payouts arising from claims made in 1985, the worst year yet for the aviation-insurance industry.



"At the start of EMS programs a few years ago, we actually reduced insurance premiums for operators," Guterl recalls. "Then 1983 hit. That forced a lot of insurers out of the market. The London [insurance] market began pricing itself out of carrying insurance for U.S. programs. There was some recovery in 1984, then came 1985, which eclipsed 1983."

So now the insurance dollars for coverage have dwindled. "EMS has to compete for those dollars like everyone else," says Guterl. "But the supply is down and in some cases, not there at all."

He explains that coverage for programs will be considered "on a case-by-case basis. We'll try and work with existing clients, albeit at a higher price. A lot will depend on the individual record."



Guterl doesn't believe all news is gloomy, however. The insurance industry sees an optimistic trend toward twin-engine helicopters and, he perceives, "there is a shared realization that something has to be done."

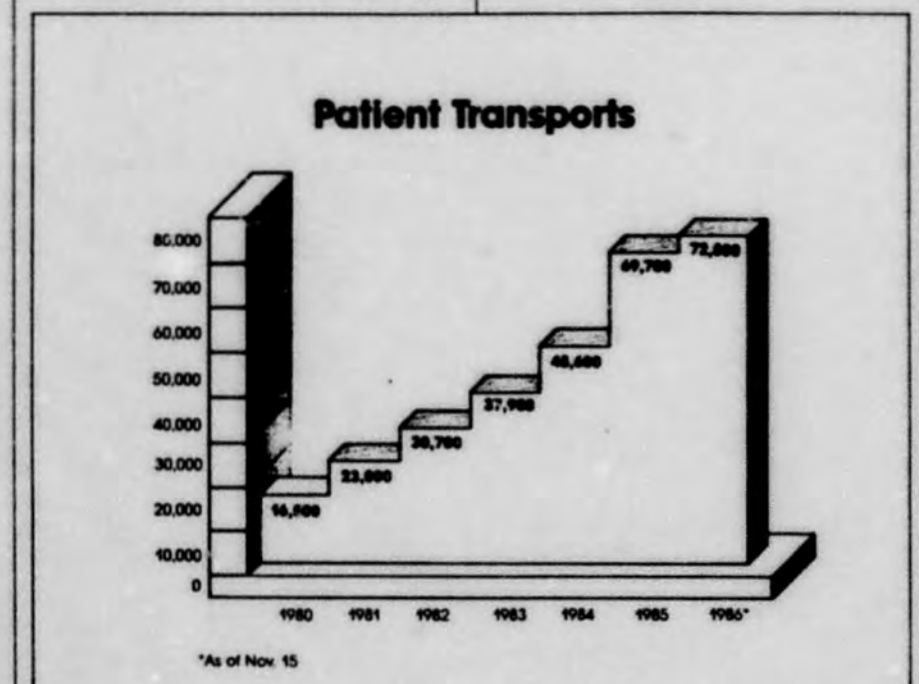
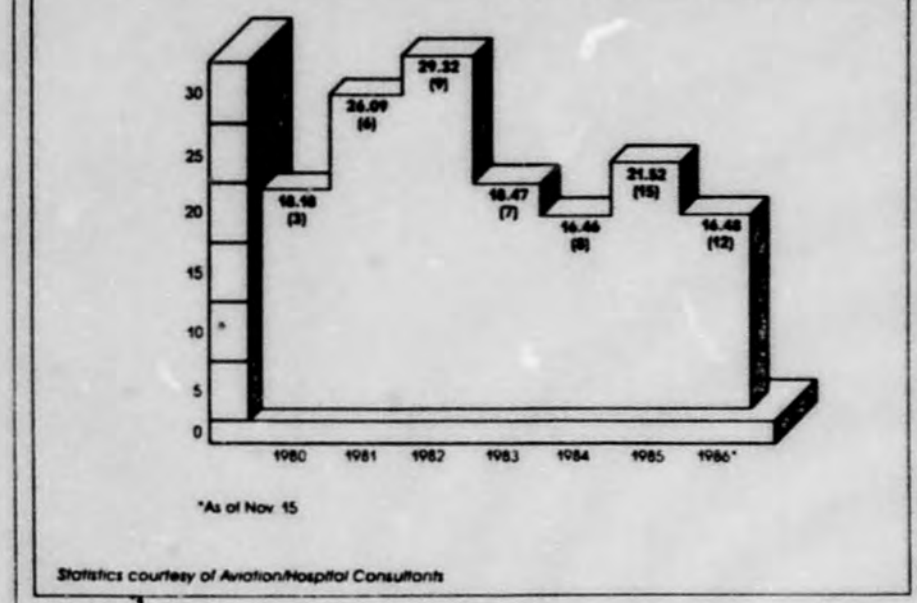
management loop, the accident rate is going to increase."

Recruiting the right stuff

Despite management's role, the focus of EMS safety remains clearly on the pilot, which presses the question: are there unique characteristics that should be looked for when recruiting EMS pilots?



Some say, yes; others disagree.



An industry spokesman who says, yes, comments that, "Pilot error begins in the interview process."

Some people in the industry propose going beyond extensive interviews with pilot applicants and administering psychological testing. "In the near future, I see us going into some sort of personality testing," says RMH's Heiskell.

An aeromedical pilot should "have a personality that fits into the hospital environment," he explains. "Adaptation is important because you go from a controlled area, in the hospital, to a situation with little control.

"Many pilots [applying for EMS jobs] have a lot of flying time but not in a variety of work," adds Heiskell, who claims RMH hired 60 to 70 pilots over a recent six-month period. "It's better to hire a lower-time pilot who has done a variety of jobs."

Statistics courtesy of Aviation/Hospital Consultants

Talk of pilot adaptability brings to issue the hiring of civil-trained or former-military pilots. Some EMS-industry officials argue that military training can make a pilot too rigid and unable to adjust to the extremely varied situations EMS missions present. They also claim military aviators are used to flying dual pilot and most EMS programs haven't the luxury of a left-seat crewman.

But others in the industry fervently argue that EMS pilots should not be deemed different from other helicopter pilots, be they civil- or military-trained. "I keep hearing about how different the EMS pilot is," says an official of an operator with EMS contracts. "The only difference is the emotion of the job. Outside of that, it's the same."

Another industry spokesman agrees. "Whether he flies an EMS helicopter or whatever, the pilot doesn't have that many decisions to make," the spokesman comments. "He has to takeoff and land, and do so within certain confines."

Critics also disagree that dual-pilot experience is a handicap in the single-pilot EMS world. "It's not bad that your experience is mainly dual-pilot," says a spokesman. "In fact, that pilot has been observed. He's been flying with another person looking over his shoulder."

Industry standards

Whether right-seat occupants of EMS helicopters represent a unique breed of pilot or not will no doubt remain in debate. But the fact that they often fly at night or in adverse weather and sometimes land in streets and other unprepared landing areas makes their mission undeniably unique. Recognizing this uniqueness, some in the industry have decided some nationwide standards must be drawn up.

While stressing that the insurance industry "does not intend to become a policeman," Tom Guterl says it has established standards because "the operational situation [during an EMS mission] is one that adds stress to an already stressful situation.

"The [insurance] industry believes that standard minimums should be a 500-foot ceiling with two miles visibility during day VFR and 1,000 feet and three miles at night," he recites. "Three hundred feet and one mile is, in our view, totally unrealistic."

The Federal Aviation Administration (FAA) has yet to establish standards unique to EMS operations but the agency's Southwest Region has begun to take action. In mid-November, all helicopter inspectors in that five-state region gathered to discuss the EMS safety problem and possible solutions.

"We're not going out on a witch hunt," an FAA official quickly notes. "We want to get as much continuity between us and the operators as we can."

He adds that standards resulting from the November meeting won't evolve into a separate FAA regulation but, through cooperation with, say, the Helicopter Association International (HAI), "they will hopefully reach the national level."

On top of operating standards, an aggregate of safety suggestions for the EMS industry includes crewmen wearing helmets, initiating safety programs, using shoulder

Lessons from an oil company

Can lessons from an oil company's successful helicopter operation be transferred to the still-emerging EMS industry? Jack Piehl, president of Sentinel Aviation Systems, recounts his experiences with Shell Oil's aviation department.

He recalls serious safety problems in the oil industry at one time and, as a result, hammering out a long-term plan to tackle those problems at the source. That plan turned "an-accident-a-week" situation into one in which Shell could fly nearly a half million hours without "injuring an employee."

When Piehl looked at the company's safety problem, he was aided by a contractor who "went through the business from top to bottom." Also, company advisors conducted a survey of Shell Aviation helicopter pilots. They found that maintenance ranked No. 1 as an issue of concern and unreasonable bad-weather standards ranked No. 2.

Landing platform/heliports posed another problem. Many of Shell's facilities were in remote areas, as far as 150 nm off the Gulf coast, and some platforms were unmanned.

"It was a situation where the pilot felt he was completely on his own," says Piehl, summing up the complaints. "He also felt pressure to perform and some pilots were told, 'hey, if you don't want to do the job, we can easily find someone who will.'"

Armed with this information, Piehl and his colleagues set out to establish a five-year program, concentrating on the operation's weak areas. "We found that 50 heliports were in need of serious attention. We started looking at the weather standards and set new and more reasonable ones. We also set up programs to evaluate the contractors who were vending the helicopter services to us, to see what they were doing in terms of their pilot relations."

Another scheme involved establishing roving maintenance teams, which would periodically visit each heliport. Shell also set up operating standards, so pilots could rightfully decline flights they deemed unsafe. In addition, Shell officials combed through years of malfunction reports, to determine which items are most likely to fail. Operators were also asked to supply comprehensive hazard reports.

Shell's safety policy took shape but, Piehl stressed, it all took time. "This took about five years by the time we published an operations manual that was helping standardize operations. We met a lot of resistance from within the oil industry, which was afraid this would cut into profits and result in 'North Sea rules' that would regulate aviation from a central point. Finally, it was a full 11 years before we managed to get our own heliport design guide approved."

Was it successful? Piehl believes it was, not just because the safety rate eventually reached over 400,000 accident-free miles but it helped "take the surprises" out of helicopter operations.

Piehl believes more and more events will be judged on what are known as "prudent man" rules. He explains that these aren't just legal standards but standards adopted by an industry as a whole.

"The standard must be the way the industry does it, not what the FAA says it is," he concludes. "It's up to industry to fix its own problems and to set the higher levels of standards."

Aeromedical helicopters like this Alouette III must often operate in confined areas.

harnesses, establishing protocol for "combative patients," addressing the two-pilot issue, and debriefing after flights.

Industry officials also believe there is a need for anonymous incident reporting. Gabriel Martyak goes further by advocating a nationwide information center, which can absorb and dispense EMS-incident data.

Resemblance to offshore

"In the U.S., there is no central point from which information flows," he exclaims. "The problem is, and remains, gathering the necessary data."

One operator in the Gulf of Mexico likened the EMS safety problem today with a similar situation in the late 1970s, when the offshore-support market was entering its adolescent stage. It was a time when oil activity was at its highest and the market was being swamped by new entrants.

"We all got together at that point and decided enough was enough," he recalls. "We needed safety standards."

The Gulf-coast spokesman believes EMS operators have reached that point, when safety standards must be established. "But they've got to want it to happen first." ■

Aeromedical Aircraft Accidents Register Sharp Increase in 1987

By Paul Proctor

Washington—Recent crashes near Great Falls, Mont., Saginaw, Mich., and at Bridgeport, Calif., have brought the number of fatalities resulting from commercial aeromedical aircraft accidents this year to 19, just two fewer than in all of 1986.

Ten commercial aeromedical aircraft have been involved in serious accidents in 1987, including four fixed wing aircraft and six helicopters. Last year there were 28 serious aeromedical accidents, all of them involving helicopters. Overall, the aeromedical accident rate for 1986 was almost three times that of other U.S. commercial helicopters.

Only one of this year's accidents, occurring near Greenville, N.C., involved the death of a patient. The majority of those killed in last year's accidents were also either pilots or on-board medical crew.

Increased Activity

The rising number of fatalities reflects increasing aeromedical aircraft activity in the U.S., with 100,000 patient transfers expected by year-end. In 1986, U.S. commercial aeromedical aircraft flew approximately 85,000 patients and had a fatal accident rate of 5.88 per 100,000 patient transports. In 1985 that rate was 8.35, with a total of 71,831 patients flown.

The use of fixed wing aeromedical aircraft, as well as the associated accidents, is also influencing statistics as doctors and hospitals are finding them a reliable and rapid means of transporting patients and critical organs to distant specialized care facilities. Fixed wing aircraft have been responsible for 40% of the accidents and over 30% of all aeromedical fatalities so far this year.

Suspected Causes

The Great Falls crash, which occurred on June 5, involved a Bell 206L LongRanger single turbine helicopter and killed four, including two doctors, the pilot and a flight nurse. Weather was possibly a factor in that accident. Mechanical failure is suspected in the crash of a twinengine Messerschmitt-Boelkow-Blohm BO. 105 helicopter north of Saginaw two days later. That accident killed the pilot and a flight nurse and injured a paramedic. The aircraft had just taken off for a training demonstration at a local fire department when control was lost.

The crash at Bridgeport occurred as a Rockwell Turbo Commander 690 fixed wing aircraft approached the airport at night to pick up a patient. The twin turboprop aircraft apparently experienced an engine failure during its approach to the field. Both the pilot and a flight nurse were killed.

As a result of the rising aeromedical accident rate, the Federal Aviation Adminstration in March began a special two-month safety surveillance of the approximately 166 U.S. commercial aeromedical operators. The agency plans to issue an advisory circular containing recommendations and guidance for operators on aeromedical crew rest and duty times and other safety criteria, possibly as soon as this month. If ineffective, it may be backed with new regulations (AW&ST June 8, p. 24).

The FAA surveillance program was partially spurred by complaints by the National Emergency Medical Services Pilots Assn. (NEMSPA). Formed in August, 1984, the group is concerned with flight safety problems including extended pilot duty shifts, inadequate program staffing and training, and minimal aircraft safety equipment. NEMSPA does not address wage and salary issues and cannot legally bargain in behalf of pilots.

Over the past decade bad weather, poor visibility and pilot fatigue have been cited as factors in as many as 90% of all commercial aeromedical helicopter crashes. This pattern appears to be continuing in the 10 fatal aeromedical aircraft accidents so far this year, according to Thomas Einhorn, NEMSPA vice president.

Of concern to the pilots association is the industry practice of 24- to 72-hr. pilot duty assignments, often combined with rotating shifts. Such work schedules result in chronic pilot fatigue, according to the group. "It's really a quality of life issue. Fatigue, stress and emotion are all interrelated . . . the first thing to go is your judgment-making ability," Einhorn said.

Draft versions of the proposed FAA advisory circular essentially limit pilot duty times to include 10 hr. of rest in any 24-hr. period, according to Part 135.267 of the Federal Aviation Regulations. Aeromedical pilots can only fly life or death emergency medical evacuation flights with less rest under FAR Part 135.271.

The draft circular also addresses weather and visibility hazards and recommends

Plastic Media Paint Stripping Hangar In Operation at Duncan Aviation

First dedicated plastic media paint stripping hangar for business jets has been opened at Duncan Aviation, Lincoln, Neb. The process removes aircraft paint by spraying a plastic media, similar in size and shape to sand granules and borne by 30-40 psi. compressed air at metal aircraft surfaces. The process helps solve hazardous waste disposal problems associated with conventional paint stripping operations. It is already in use by some airlines and at Hill AFB.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

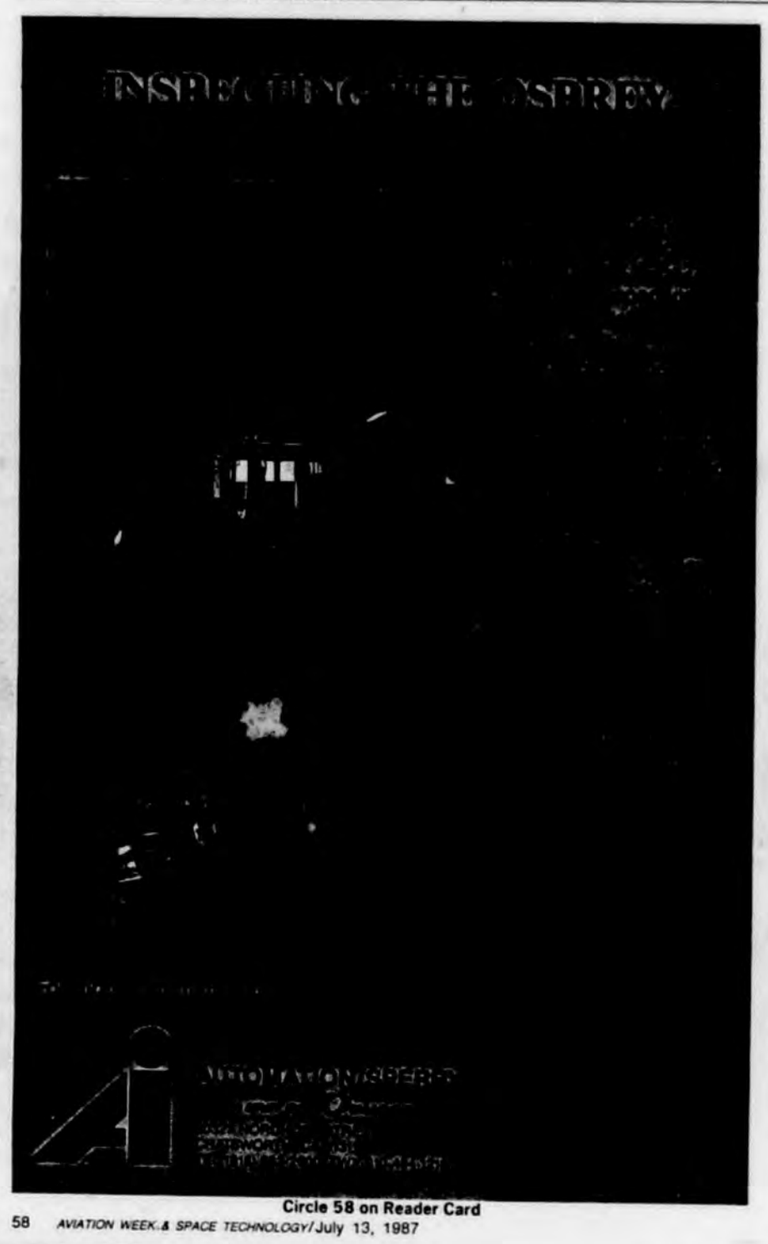
aeromedical helicopter operations allow local daytime sorties only if cloud ceilings are 500 ft. or higher and visibility is greater than 1 mi.

Minimums for daytime cross-country flights should be 800 ft. ceilings and 2 mi. visibility, the agency said, with nighttime local standards set at 800 ft. with 2 mi. visibility and 1,000 ft. and 3 mi. visibility for longer trips.

Although not directly or extensively addressed in the advisory circular, both NEMSPA and the American Society of Hosptial Based Emergency Aeromedical Systems, which represents aeromedical helicopter operators, have suggested minimum experience and initial and recurrent training requirements for aeromedical pilots and staff. NEMSPA would like to see four crews assigned to all single helicopter aeromedical programs to assure adequate pilot rest and time off.

Initial pilot experience standards are not considered a problem. Aeromedical pilots are generally high time pilots, many with military flying backgrounds.

Other methods to improve aeromedical flight safety include requiring pilot qualification and currency in instrument flight conditions. Many aeromedical helicopters are equipped to fly only in visual weather conditions owing to equipment cost and the use of uninstrumented landing sites. Another problem arises from typically low helicopter operating altitudes. Often take-off site and destination weather conditions are clear but pilots encounter unforecast weather or ground fog in between.



A recent nationwide survey indicated most aeromedical pilots have experienced inadvertent flight into potentially dangerous instrument weather conditions at least once annually.

Use of a two-pilot flight crew is another alternative to enhance safety. At least two U. S. aeromedical operations are now flying with two-pilot crews, and a third plans to require two pilots at night. Twin-engine aircraft are also an option.

Other significant commercial aeromedical aircraft accidents in 1987 include:

- The Jan. 8 crash of a Bell Long-Ranger near Greenville, N. C., which killed four. The aircraft was en route at night.
- The loss of a Cessna Conquest twin turboprop fixed wing aircraft near Phoenix, Ariz. The Feb. 20 accident was fatal to two and occurred at night in bad weather.
- The crash of an Ypsilanti, Mich.-based Learjet 23 business jet en route to a patient at night in marginal weather. The accident killed three.
- The crash of a Bell Model 222A helicopter near Tyler, Tex., which killed two on Apr. 15. The accident occurred in the en route phase of flight during daylight conditions. □

Aeritalia Seeks Investors For P86 Trainer Production

Naples—Italy's main aerospace company, Aeritalia, is seeking private investors to become involved in production of the single-engine P86 Mosquito civilian basic trainer developed by the Partenavia general aviation division.

Aeritalia officials said the P86 is too small an aircraft to be produced in a cost-effective manner by Partenavia. Therefore, the company is looking for other participants interested in P86 production. A decision on whether to go ahead with manufacture of the aircraft could be made later this year, officials said.

The P86 is a high-wing, twin-tail aircraft developed as a relatively inexpensive trainer.

The government-backed Italian Aero Club has expressed an interest in purchasing the aircraft if it is committed to production.

The Impact of a Rotorcraft Aeromedical Emergency Care Service on Trauma Mortality

William G. Baxt, MD; Peggy Moody, RN

The mortality of 150 consecutive trauma patients treated at the site of injury and transported to a trauma center by standard land prehospital care services was compared with that of 150 consecutive trauma patients treated at the site of injury and transported to the same trauma center by a rotorcraft aeromedical service staffed by a physician and nurse. A statistical analysis designed to predict mortality based on injury severity revealed that the mortality of the land group was statistically no different from that of a large index trauma patient population treated at a major trauma center. There was a 52% reduction in predicted mortality of the aeromedical group, which was highly significant. (*JAMA* 1983;249:3047-3051)

A REPORT in 1966 by the National Academy of Science termed accidental injury "the neglected disease of modern society."[1] This report led to a generalized realization that the medical care of trauma, both at the prehospital and hospital levels, was in need of change. The passage of the National Highway Safety Act and other federal legislation paved the way for the eventual upgrading of prehospital care by the funding of emergency medical technician (EMT) and paramedic training programs and the improvement of hospital trauma care by funding systematized and regionalized trauma care systems.

For editorial comment see p 3074.

In the ensuing years, most major population centers have obtained paramedic or EMT prehospital care services, and many areas have developed formalized regional trauma care systems. Today, however, trauma remains the third leading cause of death and the leading cause of death between the ages of 1 and 35 years. Because of these persisting, grim statistics, there have been recent attempts to upgrade the national approach to the treatment of trauma. To this end, there has been a reemphasis on improving prehospital care and extending organized regional hospital trauma care systems. One recent development has been the use of hospital-based rotorcraft staffed with advanced medical treatment crews that respond directly to the actual site of injured patients and provide major semidefinitive interventive care. This work is devoted to an analysis of the effect of such a system on patient mortality.

The first major use of rotorcraft as an adjunct to medical care took place during the Korean conflict. Although it has been said that the pronounced drop in mortality from 4.5 deaths per 100 casualties in World War II to 2.5 deaths per 100 casualties in the Korean conflict was partly due to the rapid treatment afforded casualties by use of rotorcraft,[2] this is difficult to confirm in view of the advancements in clinical expertise between these years and the important introduction of front-line surgical hospitals. The use of rotorcraft was further developed during the Vietnam War, when casualties were moved inside the craft and treated en route to definitive care. Mortality fell to less than one death per 100 casualties,[3] but again, with improved trauma care, it is impossible to totally attribute this to the utilization of rotorcraft. The use of rotorcraft for patient care in the civilian sector began in the late 1960s, when rotorcraft were utilized in dual-purpose law-enforcement systems that had a limited commitment to medical response.[4] Although helicopters were first dedicated totally to patient care in Europe in the mid-1960s,[5] it was not until 1972 that rotorcraft were put into such service in the United States.[6] These craft were based at hospitals and responded within minutes with physician and/or nurse medical crews who were trained in advanced life support. They responded both to the scene of ill or injured patients and to other hospitals to transport patients rapidly to more advanced treatment centers. These services brought about several radical changes in prehospital care: (1) A higher level of medical expertise was rapidly brought to the patient at the site of injury or illness over a broad geographic area; the acute care crews were trained to place endotracheal tubes, central access intravenous catheters, and thoracostomy tubes. They were also certified to

administer all medications used in the hospital. None of these interventions had traditionally been practiced by existing prehospital care systems. (2) Critically ill and injured patients were transported at speeds two to three times faster than land ambulances. (3) The services could gain access to patients who either could not be reached at all by ground transportation or who would be forced to wait an inordinate amount of time for land emergency medical services (EMS) response.

Since the inception of rotorcraft services, numerous similar systems have emerged throughout the world. To date, only five studies have attempted to evaluate the impact of such service on patient mortality.[1-5] Since none of these studies statistically analyzed their data or compared the outcome of their patient group with a control group of patients treated by standard land care and transport services, the potential advantage of aeromedical care service could not be appreciated. Since these programs are extremely costly, it seems appropriate to examine this question.

Until recently, it has been virtually impossible to compare the outcome of injured patients treated at different medical facilities. With the development of a severity scoring system for acute head trauma by Teasdale and Jennett,[6] the mortality and morbidity of patients who suffered major head trauma could be compared among different medical centers. Although similar types of indexing systems for generalized trauma were developed, a statistically sound system was not derived until the development of the Trauma Score (TS).[7,8] The TS has been applied to a large number of patients and has been shown to be a reliable predictor of patient outcome. In addition, the predictability of survival (P,), derived from the TS by regression analysis of a large index population of trauma patients, provided a specific way in which patient outcome at one treatment facility could be compared with that at another center. Recently, Champion et al further refined this approach by using the Injury Severity Score (ISS)[9] and age as additional variables to compute the probability of survival.[10]

We used this methodology[10] to compare the mortality of 150 consecutive blunt trauma patients treated by land EMS systems and taken to a trauma center with the mortality of 150 consecutive blunt-trauma patients treated by a rotorcraft aeromedical emergency care system staffed by a physician and nurse and transported by air to the same center.

METHODS

The land EMS system was comprised of ambulances staffed by two EMTs and mobile intensive care units staffed by two paramedics. The rotorcraft system utilized a small cadre of acute-care physicians and nurses trained to perform oral or nasotracheal intubation and to administer a broad spectrum of medications. The medical teams were airborne in an average of four minutes after being requested and traveled at 100 mph to the site of injury. The medical interventions provided at the scene of injury by each of the three potential medical response services are listed in Table 1.

Two groups of patients were compared in this study: 150 consecutive patients who had sustained blunt trauma, were treated at the site of injury, and transported to the study trauma center by land EMS units and 150 consecutive patients who sustained blunt trauma, were treated at the site of injury, and taken to the same trauma unit by the rotorcraft aeromedical service. Only patients who had no spontaneous respiration and pulse at the site of injury and [illegible] whom no resuscitative measures were [illegible] were excluded from the study. [illegible] re no patients in either group [illegible] cardiopulmonary resuscitation on them at any time in course. Mortality was defined as death caused by the original injury or complication of that injury. Patients were followed up to discharge from the hospital. The data of the two patient groups were collected during an identical 30-month period. The rotorcraft aeromedical service could only be utilized if the first public safety unit responding, the patient requested its use. In general, first medical responder units would request the use of the service when patients were injured in rural areas, while patients injured in urban areas were usually treated and transported by the land EMS system.

Trauma Scores were developed blindly on initial physician contact as described previously.[7,8] The TS was developed on land patients in the trauma resuscitation area immediately on arrival and on aeromedical patients on initial contact by the rotorcraft physician. Injury Severity Scores[9] were developed from patient charts and autopsy records at the completion of admission.

The P, was computed as outlined by Champion et al,[10] using the following computations:

$$P_s = 1/(1+e^{-b})$$

where

$$b = b_0 + b_1 (TS) + b_2 (ISS) + b_3 (Age)$$

where b_n are weights for each variable derived through use of the Walker-Duncan regression analysis[11] of a large index population of trauma patients treated at a trauma center[7,10] assumed to be operating at the accepted standard of care. Age was coded as 0 for age younger than 60 years and 1 for age 60 years or older.

The statistical significance of any observed variation in mortality of a [illegible] group from that predicted by the P, was accomplished by using the method of Flora[12] with the following approach:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

$$Z=\frac{D-\Sigma Q}{\sqrt{\Sigma P_i Q_i}} \quad (3)$$

Where Z is the statistic of comparison of predicted to actual survival, P_i is the probability of survival as derived fro... Champion et al,[1] and $Q_i=1-P_i$. D equals the actual number of patients that died in the test study. The significance of the observed variation in mortality between treatment groups was determined by using the Mantel-Haenszel test.[20]

RESULTS

Table 2 summarizes the data of the 150 blunt trauma patients treated and transported to the trauma center by land and the 150 blunt trauma patients treated and transported to the center by aeromedical service. The mean age, sex, association with motor vehicle accidents, and presence of close head trauma were statistically similar in the two groups. More land patients were injured in urban areas while more aeromedical patients were injured in rural areas. More land patients were initially treated by paramedic services, while more aeromedical patients were initially treated by EMT services.

The average medical response time to the two treatment groups is summarized in Table 3. The average response time to the land treated and transported patients was seven minutes. The average time spent at the scene was 18 minutes, and the average transport time to hospital was minutes.

The average response time of the rotorcraft to the aeromedically treated and transported patients was 24 minutes. The actual time from injury to activation of the service was longer than the response time since the rotorcraft service could not be activated only after a first response unit had examined the patient. The approximate response time of these units in this setting was ten minutes. The time interval between injury and initial contact with a physician when the TS was developed was, on the average, 35 minutes for the land patients and 34 minutes for the aeromedical patients.

Table 4 gives an arbitrary stratification of the continuous P_i distribution of the two groups, and Table 5 gives the P_i means of the two groups. The mean P_i for the land group was 0.902. Nineteen of the 150 patients died, whereas 15 patients were predicted to die. The mean P_i of the survivors was 0.965, and the mean P_i of the nonsurvivors was 0.508. The mean P_i for the aeromedical group was 0.865. Ten of the 150 patients died, whereas 21 patients were predicted to d... The mean P_i of the survivors was 0.898, and the mean P_i of the nonsurvivors was 0.360.

Table 5 summarizes the statistics. A 2×6 contingency table χ^2 analysis of the P_i strata of Table 4 revealed $P>.05$ when the land and aeromedical sets were either compared with the standard index trauma patient population or when the two sets were compared with each other. Therefore, there was no significant difference in the distribution of severity among the three data sets. The Z statistic (equation 3) for the land transport group had a $P>.05$. The Z statistic for the aeromedical group had a $P<.001$. The stratification of the P_i as given in Table 4 can also be viewed as multiple data levels as defined by Mantel and Haenszel[20] and subjected to the Mantel-Haenszel test. The statistic obtained by comparing the observed difference in mortality between the land and aeromedical groups by this methodology had a $P<.001$.

Time from injury to arrival at trauma center	35 min	58 min

COMMENT

Patients treated and transported to the study trauma center showed statistically similar injury severity distributions and mortality rates to patients treated at the index trauma center. Since the study trauma center was operating at the expected standard of trauma care, it is appropriate to compare the mortality of those patients brought to the center by the traditional land EMS system with those brought to the center by the aeromedical service.

Although it would be of interest to derive a direct numerical comparison between the mortality rates of the two treatment groups based on injury severity, such a contrast is fraught with problems because of the nature of this methodology. The most appropriate comparison is gained from reflection on the difference in the number of projected (ΣQ_i) and actual (D_i) deaths within each group. In the land set (Table 4), 15 patients were projected to die, while 19 patients died. In the aeromedical set (Table 4), 21 patients were expected to die, while ten patients died, which represents a 52% reduction in the predicted mortality. A more direct com-

parison would be statistically invalid, in that the distribution of the severity of injury among the two treatment groups was not identical.

The statistical significance of the differences observed in the mortality of the land and aeromedical treatment groups was established by two independent means. The Flora methodology (equation 3) tests the statistical significance of the difference in the observed mortality from the predicted mortality based on the P_s. The Mantel-Haenszel approach tests the statistical significance of the overall observed differences in mortality within the severity stratifications between the treatment groups. The difference between the observed and predicted mortality of the land treatment group was not significant (equation 3, $P>.05$), while the difference between the observed and predicted mortality of the aeromedical treatment group was highly significant (equation 3, $P<.001$). The observed difference in mortality within the [illegible] was [illegible]

[illegible], Jr.

major improvement in the mortality of patients treated and transported by the rotorcraft aeromedical service was in those patients with a $P_s<0.95$ (ten of 42 patients dying when 18 patients were expected to die). Patients who have scores between 0.99 and 0.95 are probably not critical enough to require rotorcraft intervention, and such intervention had less impact on their survival (no deaths when three patients were expected to die).

In addition, Table 5 reveals that the actual nonsurvivors in the land group had a mean P_s of 0.508, whereas the actual nonsurvivors in the aeromedical group had a mean P_s of 0.360. This suggests that not only was survival more likely in aeromedical patients in the more severe injury classifications, but that the aeromedical patients in those classifications who died were dying of more severe injuries than the nonsurvivors in the land group.

The major improvement in survivability occurred in the more severe classification groups, which represent only a fraction of all trauma patients. If the standard population is utilized, these groups represent less than 10% of injured patients brought to that medical center. This suggests that the efficacy of this type of rotorcraft care is appropriate only to a small subset of all trauma patients.

Before any conclusions about the value of the use of rotorcraft in this setting can be made, there are a number of weaknesses in this study that must be taken into consideration. Although the age, sex, nature of trauma, and distribution of the severity of injury of the two patient groups were statistically similar, there were a number of major differences between the two groups: (1) the location of injury (urban v rural), (2) the initial care rendered victims (paramedic v EMT), (3) the care after initial medical intervention, and (4) the route to the trauma center (paramedic v physician), and (4) the possible difference of patient handling after reaching the trauma center.

The difference in the location of injury may have had two effects. Patients injured in rural areas had to wait slightly longer for the arrival of a medical first-response unit. The rural medical first-response units had an average of three minutes longer to reach aeromedical patients than they took the urban medical first-response units to reach the land patients. Patients injured in rural settings also had a longer transit time. On the average, it took 23 minutes longer for the aeromedical patients to reach the trauma center and definitive intervention. Both of these factors could have had a negative impact on the aeromedical patient's outcome.

The difference in the initial level of care rendered to each group may also have been a major factor. As noted previously, land patients were usually injured in urban settings where initial treatment was administered by paramedics, while aeromedical patients were injured in rural settings where initial treatment was usually administered by an EMT service. Due to the higher level of care administered by paramedics, it is conceivable that by the time the land patient reached the trauma center, their condition had been improved by therapy. On the other hand, because of the lack of definitive care given to the aeromedical group, the TS of these patients may have worsened before contact by the aeromedical crew.

the time of injury, the land patients may have been more severely injured and the aeromedical patients less severely injured than the actual TS indicated. This possible anomaly is partially mitigated by the inclusion of the ISS in the methdology and by the fact that the subset of the aeromedical patients who were treated initially by paramedic level service before contact by the aeromedical team were statistically indistinguishable from the patients treated initially by an EMT service (data not given).

The difference in the care after initial medical contact may also have affected these data. The land group was treated by a variable spectrum of different first responders, while the aeromedical group, after initial intervention, was treated by the same small group of flight nurses and physicians. It is conceivable that the improved mortality of the aeromedical group is not only a reflection of the more advanced modalities of treatment afforded by the aeromedical teams, but also a reflection of the continuity and standardization of care afforded by the highly trained physician-nurse teams. This may have also had a further effect on

...ent after reaching the trauma center. Unlike the treatment teams on the rotorcraft service, the treatment teams in the trauma resuscitation area consisted of rotating physicians and nurses with a moderate turnover. Since the time it took patients in each group to be contacted by these two treatment teams was almost identical, a difference in the medical efficacy with which each respective team operated may also have accounted for the observed results. The aeromedical patients may have been better evaluated and more substantially stabilized, allowing for definitive treatment to have been provided more rapidly than to the land patients.

Due to the aforementioned factors, these data must be viewed with a great deal of caution. The conclusion cannot be made that the reduction in mortality observed in the aeromedical group was due strictly to the use of rotorcraft. It may be conceivable that placing the same physician-nurse teams on urban ambulances may afford similar or greater improvements in patient mortality. What rotorcraft do afford is the ability to move a highly skilled physician-nurse team rapidly over a far wider geographic area than possible by transport, who can quickly sta... and transport patients to defi... care that can be prearranged by ra... before arrival. These results demonstrate that the use of rotorcraf... staffed by a physician and nurse facilitate the provision of semidefinitive trauma care and improve patient mortality when compared with a patient population with similar injuries, at less distance and a longer time from definitive care, treated at the prehospital level by EMTs or paramedics.

In view of these data, it appears that physician-nurse staffed rotorcraft emergency care services may be a valuable adjunct to the prehospital care of patients who have sustained major blunt trauma. It seems warranted to study further the impact of such services.

The rotorcraft crews who made this work possible included James Dunford, MD, Lee Griffith, MD, Steven Guber, MD, David Guss, MD, Tom Neuman, MD; flight nurses Martha Bennett, RN, Mary Anne Bockman, RN, Janet Gill, RN, Catherine Kennedy, RN, Laurinda Martin, RN, Phillip Moomjean, RN; pilots Randall Mains, Joseph Hatley, and Howard Albecker. Charles Berry, PhD, and William Sacco, PhD, helped with the manuscript.

Hospital-Based Rotorcraft Aeromedical Emergency Care Services and Trauma Mortality: A Multicenter Study

A group of 1,273 blunt trauma patients who were treated and transported from the site of injury by seven different hospital-based rotorcraft aeromedical emergency care services were studied using a methodology based on injury severity designed to predict the mortality of such patients. The methodology predicted that 241 patients should have died; 191 patients did die. This 21% reduction in expected mortality was highly significant ($P < .001$). Each of the seven rotorcraft services had a reduction in predicted mortality. The reduction was statistically significant ($P < .05$) in five of the seven aeromedical services, or 86% of the total patient cohort. Hospital-based rotorcraft aeromedical emergency care services may reduce the expected mortality of blunt trauma patients treated at the site of injury. INTRODUCTION

Rotorcraft have played an increasing role in emergency medical services (EMS) missions since the Korean War.[1-4] They were used initially in dual-purpose public safety systems. Because the rotorcraft crews had limited medical training, these services did not bring a higher level of medical expertise to the field, but rather provided more rapid transport of, and better accessibility to, ill and injured patients. By 1972 rotorcraft were being stationed at hospitals and were dedicated fully to EMS missions. Because these craft were placed directly at hospital sites, their medical flight crews could be culled from the more sophisticated medical personnel available. For the first time, these services made possible the use of such advanced medical techniques as endotracheal and thoracostomy tube placement at the site of patient injury and illness.[5-8]

Although such services have been in operation for more than ten years, until recently it had not been demonstrated that they had a positive impact on patient outcome. It was not until the development of injury indexing systems such as the Glasgow Coma Score (GCS),[9] the Injury Severity Score (ISS),[10] the Trauma Score (TS),[11,12] and the TRISS methodology[13] that it became possible to study this question.

In a recent study using the TRISS methodology in a prospective manner, the mortality rate of 150 blunt trauma patients who were treated and transported by a land EMS system and taken to a trauma center was compared to that of 150 blunt trauma patients treated and transported by a rotorcraft aeromedical emergency care service staffed by a physician and nurse and taken to the same trauma center.[14] Because all patients had been treated and transported directly from the scene of injury to the same trauma center, the only difference was in treatment rendered at the prehospital level. The TRISS methodology allowed for the statistical prediction of mortality. The mortality of patients treated and transported by the land EMS system was not statistically different from that predicted, while there was a statistically significant ($P < .001$) reduction of 52% in the predicted mortality of patients treated and transported by the aeromedical services. These data suggested that the aeromedical service may have helped reduce mortality in patients who had sustained major blunt trauma.

Although there was no clear cause for the reduction in patient mortality, the authors suggested that the improved patient outcome may have been due to the use of advanced medical interventions at the site of patient injury, followed by rapid transportation of the patient to definitive care that could be arranged prior to arrival. There was no evidence that the aeromedical patients received either prehospital or definitive care more quickly than did the patients treated by the land EMS service.

The first phase of the national multicenter major trauma outcome study (MTOS), which used the TRISS methodology to study 3,133 blunt trauma patients from 45 participating Level I and Level II trauma centers, recently has been reported.[15] This study created a large patient population that represents the treatment experience of a large segment of the country. The outcome of this group of patients now stands as the national norm against which the effect of new and existing modalities of trauma care can be measured. The logistic regression constants derived from this index population can be used with the TRISS methodology to study other populations of trauma patients whose outcome can be compared directly to that of the MTOS cohort.

The most important question raised by the original rotorcraft impact study[14] was whether trauma patients treated and transported by similar rotorcraft aeromedical emergency care services also realize a reduction in predicted mortality. To determine this, a multicenter study of seven hospital-based rotorcraft aeromedical emergency care services was undertaken using the TRISS methodology to study prospectively the mortality of blunt trauma patients treated at the site of injury and transported by these services.

METHODS

The participating hospitals were Allegheny General Hospital, Pittsburgh; Geisinger Medical Center, Danville, Pennsylvania; Hermann Hospital, Houston; Methodist Hospital of Indiana, Indianapolis; St Anthony's Hospital Systems, Denver; University of California, San Diego Medical Center, San Diego; and Valley Hospital Medical Center, Las Vegas.

Patients who had suffered blunt trauma and were contacted directly at the site of injury and transported to the base hospital of each service were included in the study. Patients with no spontaneous respiration and pulse at the site of injury were excluded. The patient inclusion criteria for this and the MTOS[15] were identical. All patients were followed to discharge. Mortality was defined as death caused by the original injury or complication of that injury. The data were collected from March 1981 to March 1983. If information was missing from a patient study record, the patient was not included. A minimum of 50 patients from each participating center was required.

The TS variables were developed by each service on initial medical crew contact after initial medical first-responder treatment was initiated.[13,14] The ISS[10] was developed from patient charts and autopsy records at the completion of admission.

A collator at each rotorcraft aeromedical emergency care service reported on patient age, sex, mode of injury, nature of injury, morbidity, and mortality, and calculated the TS and ISS on each patient. All services used a standard reporting form for all data.

The probability of survival (P_s) was computed as outlined by Champion and coworkers,[11,12] using the following computations:

$$P_s = 1/(1 + e^{-b}) \quad \text{(Equation 1)}$$

where

$$b = b_0 + b_1(TS) + b_2(ISS) + b_3(age) \quad \text{(Equation 2)}$$

where b_{0-3} are weights for each variable derived through use of the logistic regression analysis[16] of the 3,133 patients collected in the MTOS;[15] where $b_0 = -3.710$, $b_1 = 0.7080$, $b_2 = -0.0925$, and $b_3 = -2.587$. Age was coded as 0 for age younger than 55 years and as 1 for age 55 years or older. By using the MTOS logistic regression constants, the outcome of the concurrent historical MTOS cohort is built into the methodology as the norm against which patient survival is measured.

The statistical significance of an observed variation in mortality of each test group from that predicted by the P_s was accomplished by using the method of Flora[17] with the following approach:

$$Z = \frac{D_i - \Sigma Q_i}{\sqrt{\Sigma P_i Q_i}} \quad \text{(Equation 3)}$$

where Z is the statistic of comparison of predicted to actual survival, P_i is the probability of survival as derived from Equation 1, and $Q_i = 1 - P_i$ (patients predicted to die). D_i equals the actual number of patients who died in the study group. In addition the significance of the observed variation in mortality between each service and between the patients reported in the MTOS[15] was determined further by using the Mantel-Haenszel test.[18]

TABLE 4. *Summary of statistical analysis of 1,273 patients treated and transported by seven rotorcraft aeromedical emergency care services*

*Calculated by using Equation 3.

RESULTS

Four services used physician/nurse crews, two services used a nurse crew, and one service used a nurse/paramedic crew. The medical interventions used by each of the services were similar (Table 1). Records of which medical procedures were performed on each patient were not kept; however, all the services operated under identical protocols. All patients had multiple large-bore intravenous lines placed. All patients in shock had military antishock trousers placed and inflated, accompanied by crystalloid fluid replacement. All unconscious patients had endotracheal tubes placed. Cricothyroidotomy, open venous catheterization, central venous catheterization, and thoracostomy tube placement were performed infrequently.

The smallest number of patients submitted by a service was 58; the largest was 370. The means of the study are summarized (Table 2). The mean P_s of all patients studied was 0.81. The mean P_s was 0.90 for survivors and 0.26 for nonsurvivors. These were lower than those values of the MTOS, in which the mean P_s of all patients was 0.94, 0.97, and 0.36, respectively.[15] Additionally the mean P_s of each of the seven aeromedical services' total patients was lower than the respective values of the MTOS.[15]

Patients were divided arbitrarily into six probability-of-survival strata (Table 3). Of the total patients studied, 241 were predicted to die; 191 patients actually died.

The statistical analysis of the reduction in mortality of the seven services is shown (Table 4). Two different approaches were used — the Flora approach (Equation 3) and the Mantel-Haenszel test. The Flora Z statistic of each of five services was $P < .05$. These five services represented 1,094 of the 1,273 patients, or 86% of the total patient cohort. Two services had a Z statistic greater than four standard deviations more than the MTOS mean. The combined patient population had a Z statistic greater than six standard deviations more than the MTOS mean.

The Mantel-Haenszel test compared the differences in expected to realized deaths within each of the six severity strata. In this instance, each of four services had a statistic of $P < .05$. These four services represented 981 patients, 77% of the total patient cohort. Analysis of the total study group compared to the MTOS was $P < .001$.[15]

DISCUSSION

Unlike the original study that reported a reduction in the predicted mortality of blunt trauma patients who had been treated and transported by a rotorcraft aeromedical emergency care service,[14] our study did not use a concurrent internal control group of patients treated and transported by the land EMS services operating at each center. We believed that the MTOS offered a comparable group of patients with whom to compare the patients treated by the aeromedical services. The MTOS data[15] were collected from virtually the same time window as these data, and more than 83% of those patients received their prehospital care from traditional land EMS systems. In addition this large cohort represented the trauma treatment experience of the entire country and the patient outcome realized by that experience. Because the MTOS used the TRISS methodology, the use of the MTOS patient cohort as a control group could be built directly into the TRISS methodology by using the logistic regression[16] constants derived from that study.

There are several criticisms that can be made about our methodology. Poor interrater reliability could have a major effect on the data. The interrater reliability of the TS has been studied and shown to be highly correlated when Navy corpsmen were compared to trained nurse raters. Ninety-two percent of the time there was agreement to within one point, and 62% of the time there was complete agreement.[19] In addition the vital-sign data necessary to determine the TS and the anatomic data necessary to determine the ISS were available for 605 patients. The TS and ISS were recalculated for these patients and there was no statistically significant difference between the original scores and the recalculated scores.

Another criticism that could be made of our approach is that the variation in expected mortality experienced by each of the seven aero-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

medical services is not a reflection of the aeromedical service, but of an overall improvement in performance of the medical center at which the rotorcraft was based. This possibility is unlikely because of the 45 trauma centers in the MTOS, only three had a statistically significant reduction in mortality from the MTOS mean. Four of the centers studied were part of the MTOS, and each center has confirmed that it was not among the three centers whose overall patient mortality was reduced significantly below the MTOS norm.

Our study does have intrinsic problems, as did the original rotorcraft study and the MTOS. Although the age, mode, and nature of injuries were similar in all three studies, the match was only in similarity and not in exactness. Therefore any comparison of the treatment groups must be qualified. It would have been preferable to have designed a randomized, blinded study in which patients were treated either by land EMS systems or by aeromedical services, but this was impractical.

There is one factor that may have reduced the difference between the predicted and realized mortality of the aeromedical patients. A total of 571 patients reported were part of the MTOS cohort. If regression constants are derived from a patient cohort that contains a subpopulation of patients who have a statistically significantly better outcome than the remainder of the cohort, the net effect of the presence of the subpopulation is to bias the derived logistic regression constants as to underpredict mortality. That is, if the MTOS cohort were to be reanalyzed without these 571 patients (representing 17% of the cohort) and new logistic regression constants were derived, the use of these constants in our study would have led to the prediction of a greater number of deaths than reported.

As was observed in the initial rotorcraft mortality impact study,[14] the greatest reduction in predicted mortality occurred in those patients with a $P_s < 0.75$, even though 77% of the patients studied had a $P_s \geq 0.75$. Of the patients with a $P_s < 0.75$, 220 were expected to die and 159 did die. The importance of this repeated observation is that aeromedical services probably will have a positive effect only on patients who have suffered major injuries. To this end, in the field setting such services should be used for the more seriously injured patients. Because such patients represent only a small portion of all trauma patients, a limited number of such services should be necessary.

Of the patients with a $P_s \geq 0.95$, seven were expected to die while 20 patients actually died. It is not clear why more patients died than was predicted. These patients may represent a subpopulation of patients with preexisting severe disease that complicated their chances of survival. This observation deserves further study, however, because the difference observed was statistically significant ($P < .05$) when Equation 3 was used to analyze these data, and the phenomenon was observed in six of the seven services studied. Although it may not be apparent immediately why these patients fared worse, the initial conclusion is that rotorcraft aeromedical emergency care services may be detrimental to this subgroup of patients.

As in the original study,[14] the mean P_s of the aeromedical service nonsurvivors and survivors was lower than that of the MTOS. Thus the aeromedical nonsurvivors died of more serious injuries than did the MTOS nonsurvivors, and the aeromedical survivors survived with more serious injuries than the MTOS survivors.

The exact reason for the observed reduction in mortality in patients who have suffered major blunt trauma is not clear. Two factors must be given serious consideration. Traditionally the level of medical intervention practiced in the prehospital setting has been very limited. With the advent of advanced life support (ALS) systems in the late 1960s, advanced treatment skills were practiced in the prehospital setting. Jacobs and coworkers,[20] using the TS, have reported the improvement in outcome of major trauma patients who were treated by an ALS system, compared to those treated by a basic life support (BLS) system. Fortner and collcagues[21] have reported the improvement in survival of patients who suffered injuries from major falls when an ALS system replaced an existing BLS system. Klauber and coworkers[22] also have reported the sudden decline of the death rate in patients who had sustained serious head injuries in a community after an ALS system replaced an existing BLS system and a rotorcraft aeromedical emergency care service was started.

All of the aeromedical services in our study used more advanced medical skills than those traditionally used in the prehospital setting. One possible explanation for the improvement in patient outcome is that this was in part a result of the use of these advanced skills in the prehospital setting paralleling these findings. The exact number of times each specific advanced medical skill was practiced is not known. It is known, however, that because the rotorcraft medical crews are composed of a small number of individuals who use their skills frequently, they are extremely adept. There was virtually a 100% success rate in the performance of field medical procedures.

The advantage of rotorcraft lies in their ability to move a highly trained medical crew over a wide geographic area. It may be prudent to consider placing such crews on land EMS vehicles to respond to a selected group of seriously injured patients who are too close to definitive care centers to justify aeromedical rotorcraft response.

The second possible explanation is that hospital-based aeromedical services realize a reduction in mortality for the same reason trauma centers realize such a reduction — both are profiting from a timely, organized, and coordinated approach to patient treatment which, as embodied in the "systems" concept of trauma care delivery, has been held responsible for an improved patient outcome in the past.[23] The hospital-based aeromedical service is an active treatment arm of the hospital at which it is based; the regional land EMS service is usually a separate entity. As a result prehospital care administered by the hospital-based aeromedical service is fully integrated into inhospital definitive care. Vitally needed resources can be readied, treatment plans can be formulated, and patient priorities can be set prior to patient arrival, saving precious time before definitive treatment is rendered. In addition, this may not be able to occur as effectively when patients are transported by ground EMS services because there is rarely significant warning time prior to patient arrival. The longer rotorcraft transport times allow for periods during which this preparation can occur.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CONCLUSION

Our data appear to extend the original observation that a rotorcraft aeromedical emergency care service may reduce the predicted mortality of patients who have suffered major blunt trauma. Of the seven services studied, each experienced a reduction in predicted mortality. Although there are many inherent confounding factors in this study and these data must be viewed with reservation, it appears that hospital-based rotorcraft aeromedical emergency care services, staffed by advanced medical personnel who respond directly to the site of severely injured patients and use advanced medical skills to treat such patients, may have the ability to reduce mortality.

The authors thank Charles Berry, PhD, Kathleen James, and William Sacco, PhD, for their help in preparation of the manuscript.

trauma, regional trauma system, utilization

Utilization of Medical Care in Orange County: The Effect of Implementation of a Regional Trauma System

To determine the effect of implementation of a regional trauma system on utilization of medical care we studied ambulance transports, emergency department (ED) visits, and hospital days for trauma and nontrauma patients before and after system implementation. Serious injury affects approximately one of every 1,000 persons each year and accounts for approximately one of every 250 ED visits, one of every 100 hospital days, and one of every 20 ambulance transports. Following system implementation the trauma hospitals experienced insignificant changes in annual percentage of market share of ED visits and hospital days and in annual rate of growth of ED visits and hospital days. We conclude that implementation of a medically directed regional trauma system has resulted in a predictable redistribution of a small number of seriously injured patients, and has not been associated with significant changes in utilization of EDs or hospitals. INTRODUCTION

Implementation of regional trauma systems has raised questions regarding their effect on care of trauma and nontrauma patients.[1-5]

We previously have reported decreases in the proportion of potentially salvageable deaths and the mortality rate following implementation of such a system.[6,7] The effect of trauma regionalization on emergency department (ED) visits also has been reported.[8]

This report on the experience of Orange County, California, is the first published investigation of utilization of ambulances, EDs, and hospitals by trauma and nontrauma patients before and after implementation of a regional trauma system.

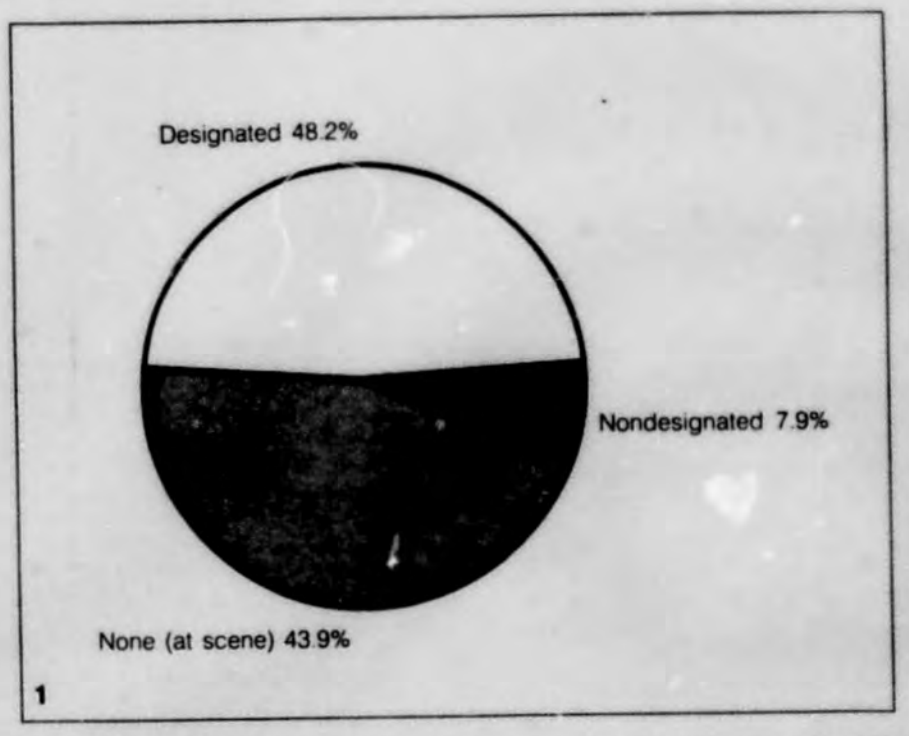
MATERIALS AND METHODS

System Background

Orange County is a 784-square-mile suburban community in southern California with a population of 2 million. Six base station hospitals provide medical direction for the prehospital advanced life support system.

In June 1980 the county implemented a trauma system that provided for transport to one of five designated hospitals. On-line medical direction of care for individual patients is accomplished by emergency physicians using standardized protocols for triage and treatment. Regardless of the final diagnosis, each potential trauma patient triaged to a trauma hospital becomes a designated trauma patient and is included in the trauma registry.[9,10]

Data Collection



Total annual trauma deaths, including nontransported deaths, nondesignated hospital deaths, and trauma hospital deaths, were obtained from the coroner for 1980 through 1983.

Total annual ED visits and total annual hospital days for all patients for each of 35 hospitals were obtained from the state health department for 1976 through 1983.

Total annual ED visits and total annual hospital days for designated trauma patients for each of the five trauma hospitals were obtained from the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Fig. 1. *1983 trauma deaths by type of hospital.*

trauma registry for 1980 through 1983. Total annual serious injury victims, defined as all deaths and designated patients, also were obtained for this period.

Total annual ambulance transports, defined as paramedic dispatches resulting in ambulance transport, were obtained from the county emergency medical services (EMS) agency for 1980 through 1983.

Data Evaluation

Data evaluation was divided into three parts: the effect of the trauma system on EMS, on ED visits, and on hospital days.

The effect of the trauma system on emergency medical services was determined by calculating the incidence of serious injury based on population, ED visits, hospital days, and ambulance transports. Proportions also were calculated for trauma deaths that occurred at the accident scene, in nondesignated hospitals, and in trauma hospitals.

The effect of the trauma system on ED visits was determined for all patients and nontrauma patients. To determine its effect for all patients, an annual total was obtained for each of the 35 hospitals for 1976 through 1982. To determine its effect for nontrauma patients, the annual totals for 1980 through 1982 for each of the five trauma hospitals were corrected by subtracting the number of designated trauma patients. The resulting values were used to evaluate the percentages of market share and the differences in growth rate following system implementation for nondesignated hospitals and trauma hospitals.

The annual percentage of market share of ED visits for the trauma hospitals was determined by dividing the total number of patients seen in the five trauma hospitals by the total number of patients seen in all 35 hospitals. The percentages for 1976 through 1979, which preceded implementation of the trauma system, were analyzed using linear regression; the percentages expected if no trauma system had existed were projected for 1980, 1981, and 1982 using the standard error of the forecast. Actual and projected percentages for 1980, 1981, and 1982 were compared, and probabilities were calculated.

TABLE 1. *Annual incidence of serious injury*

Compared to:		
Population	0.1%	(1/1,000)
Emergency department visits	0.4%	(1/250)
Hospital days	1%	(1/100)
Ambulance transports	5%	(1/20)

The difference in growth rate of ED visits between the five trauma hospitals and the 30 nondesignated hospitals was determined by calculating the growth rate for each of the 35 hospitals from 1979 through 1982. All 35 hospitals were ranked in descending order, and the probability of difference in rank was calculated using the Mann-Whitney U test.

The effect of trauma system implementation on hospital days was determined for all patients and nontrauma patients. To determine its effect for all patients, an annual total was obtained for each of the 35 hospitals for 1976 through 1982. To determine its effect for nontrauma patients, the annual totals for 1980 through 1982 for each of the five trauma hospitals were corrected by subtracting the number of designated trauma patients. The results were used to evaluate the percentages of market share and the differences in growth rate following implementation for nondesignated hospitals and trauma hospitals.

The annual percentage of market share of hospital days for the trauma hospitals was determined by dividing the total number of hospital days for the five trauma hospitals by the total number of hospital days for all 35 hospitals. The percentages for 1976 through 1979, which preceded implementation, were analyzed using linear regression; the percentages expected if no trauma system had existed were projected for 1980, 1981, and 1982 using the standard error of the forecast. The actual and projected percentages for 1980, 1981, and 1982 were compared, and probabilities were calculated.

The difference in growth rate of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

tals. This volume, which is less than the total annual trauma patient volume projection of one patient per 1,000 population, is calculated by reducing the total volume projection by those patients who die at the accident scene or in nondesignated hospitals.

Following system implementation a retrospective audit should be performed on each trauma patient dying in a nondesignated hospital to document compliance with system criteria. In the event a significant trend of undertriage is identified, the criteria should be modified accordingly.

ED Visits

As competition for patients intensifies, EDs are experiencing increasing pressure from primary care alternatives such as freestanding emergency clinics and from tertiary care systems such as trauma systems.

In the only published study of the effect of freestanding emergency centers on EDs, however, Ferber and Becker concluded that they did not lead to a decline in ED visits in the same service areas.[19]

Concerns also have been expressed regarding the effect of trauma systems on EDs. While trauma regionalization should result in a redistribution of only seriously injured patients, fears persist that it also might result in redistribution of patients with minor injuries or with nontraumatic conditions.[2,4] The latter problem, characterized as a ripple effect, potentially could result from inadequate medical direction of prehospital triage or from inappropriate utilization of trauma hospitals by ambulatory patients.

In the only previously published report on the effect of regionalization on EDs, Metzmaker and Folse concluded that there was no evidence that trauma hospital designation had a significant direct or indirect effect on the number of visits.[8] In this context our findings are of particular interest because they demonstrate that following trauma system implementation, trauma hospitals actually experienced a minor decrease in nontrauma ED patients compared to their projected percentage of market share. In fact, even after inclusion of the designated trauma patients, the trauma hospitals still experienced a slight loss. Possibly ambulatory patients perceive trauma hospital EDs as too busy to provide prompt attention for minor problems.

Hospital Days

Concerns expressed about the potential effect of trauma systems on ED visits, including direct and indirect redistribution of patients, have also been voiced about hospital days.[2,4]

In contrast to our findings regarding ED visits, following trauma system implementation the trauma hospitals experienced a minor increase in hospital days for nontrauma patients compared to their projected percentage of market share. Like the change in ED visits, however, it remained insignificant even after inclusion of the designated trauma patients.

Factors under physician control that might have contributed to this rise include increased numbers of elective nontrauma admissions to trauma hospitals by trauma team physicians who find it difficult to practice in multiple hospitals, and selection of trauma hospitals by new physicians who look for institutions oriented toward acute care. Conversely, a factor under patient control might be voluntary selection of a trauma hospital for elective surgical or nonsurgical care because of its reputation for trauma care.

Although the concurrent findings of a decrease in the trauma hospitals' percentage of market share of ED volume and an increase in their share of hospital days suggest an increase in patient acuity, we were unable to determine whether they were associated with changes in medical or surgical admissions because data on elective and emergency surgeries were unavailable for the period under consideration.

The economic implications of our observations have not been studied.

CONCLUSIONS

Utilization of ambulances, EDs, and hospitals was studied before and after implementation of a regional trauma system. Each year serious injury affects approximately one of every 1,000 persons and accounts for approximately one of every 250 ED visits, one of every 100 hospital days, and one of every 20 ambulance transports. Following system implementation, insignificant short-term changes were observed in utilization of EDs and hospitals. Implementation of a medically directed regional trauma system has been associated with minimal, predictable changes in utilization of medical care. The long-term and economic implications of our observations remain to be studied.

Seattle, WA 98104

Dear Glen,

In response to your August 7, 1987 request, here are my responses to Liz Anderson's comments:

#70 -- 1986 Transports to Children's: a total of 183 patients were transported to Children's through referral by King County Medic Units (South King County, Bellevue FD, Shoreline FD, and Evergreen). Thirteen of these transports were by helicopter.

#72 -- The statement that "under no circumstances should there be a delay at the scene waiting for a ride from the helicopter" is intended to reinforce the general policy that there should be no unnecessary delays in transporting patients to the appropriate medical facility. Since air transport is in most circumstances used to move patients to tertiary care facilities in Seattle, paramedic personnel are expected to exercise judgment regarding total transport time to such a facility, As a result, waiting for air transport may be appropriate in some instances if total transport time is still less than ground transport to the same facility.

#75 -- The rationale for directing paramedics not to ask for comparative estimated time of arrival (ETA) for MAST and Airlift Northwest is clear when this protocol is considered in the context of the EMS policy memorandum dated February 12, 1986. As stated in the second paragraph, "The underlying principle that should be considered when ordering air transportation is not so much that the patient gets to a hospital fast, but that it is a rapid method of getting medical help to the patient. Therefore, the primary concern for EMS is to focus on patient care and utilizing the type of service and transport that is most appropriate for the patient. " In other words, the quickest air transport service (shortest ETA) is not alway the most appropriate.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

However, if the first service of choice is not available, then the second helicopter service can be requested.

#82 -- The following physicians provided factual information about their facilities:

Robert Scherz, M.D., President, Medical Affairs, Mary Bridge Children's Health Center
John Coombs, M.D., Vice President, Medical Affairs, Tacoma General Hospital
John Mulligan, M.D., NICU, Mary Bridge Children's Health Center
John Neff, M.D., Medical Director, Children's Hospital and Medical Center

In his letter of October 24, 1985, Dr. Lothar Pinkers provided information about a number of helistop-related issues to Dr. Nicola. A copy of this letter was published the draft EIS. Dr. Nicola also spoke with a number of other physicians about the medical need for a helistop at Children's; these physicians requested anonymity.

I have also reviewed your responses to Anita Francis' comments 16 and 17, and Liz Anderson's comments 71 and 74. They're fine.

In response to your "miscellaneous" questions, I do not believe that Dr. Nicola reviewed the 9/5/86 article you attached, or contacted Dr. Ronald Stewart about his statements on helicopters presenting a risk to the patient. I will pass the article along to him and forward any comments he may have.

If you have any further questions, please call me at 344-4293.

Sincerely,

Steven Call
Manager

Dear Mr. Doan:

For the past three years I have been in contact with your office and many others and it seems that no one is listening or protecting high-density, residential neighborhoods from helicopter landings.

These landings involve not only individual homes and condominiums but also an elementary school in the case of Children's Hospital.

I know you have the power to recommend against this kind of land use (or abuse). Please so act in favor of the hundreds of lives endangered each landing as evidenced by recorded high incidence of medical helicopter crashes.

Thank you.

Sincerely,

Helen Newman

Dear Ms. Spangler:

Thank you for the letter of September 3, 1987, regarding helicopter landings at Children's Hospital.

I recently replaced Julia Gibb as the Land Use Specialist responsible for preparing the DCLU recommendation on the requested helistop. However, Holly Miller remains the DCLU Director and is ultimately responsible for the final DCLU recommendations to the City Council.

When just assigned to this project, I read the entire file (which occupies an entire file cabinet drawer) in order to understand the concerns previously voiced by neighbors and others writing to the City. I recall reading several letters from you specifically.

In addition to reading through the file, I have also reviewed the many stories that have appeared in the press about EMS helicopters. Although I have not seen a helicopter landing at CHMC, I have seen the area at CHMC where the helistop is proposed and have watched a helicopter land at Harborview Hospital. I know that Holly Miller and Katy Chaney, Director of the Land Use Division, have kept similarly informed on these issues.

We have been working closely with a consultant preparing the Final Environmental Impact Statement (EIS). Because the issues of noise, safety and medical need are so complicated, the EIS has taken quite a while to complete, but it is necessary in order for us, the Hearing Examiner and the City Council to make a sound decision.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I encourage you to remain interested and informed. If you have any questions please call me at 684-8875.

Sincerely,

HOLLY MILLER,
Director

DEPT. OF CONSTRUCTION & LAND USE

Dear Mr. Doan:

As newly appointed Director of DCLU, I wish to congratulate you and wish you well.

Since November, 1984 through March, 1987, I have been in correspondence with the directors and others in your office related to helicopter landings in high-density, residential neighborhoods, especially at Children's Hospital -- proposed landing site contiguous to single-family homes as well as Laurelon Terrace Condominiums.

I have these questions at this time to ask you personally:

1) Are you familiar with the whole subject of medical helicopter landings and the records of their high incidence of crashes?

2) Have you visited the proposed site at Children's Hospital, which is currently and frequently used for landings without permit and without landing pad and without concern for the hundreds of lives endangered each landing?

3) Have you read my previous correspondence on the proposed helipad at Children's? Is it still in your files? Please read it carefully. If not available, I will provide you with copies of my previous letters.

Please do all within your power to stop a helipad from being allowed at Children's Hospital, and please stop all flights at this hospital.

Thank you.

Sincerely,
Maryann E. Spangler

Dear Councilman Kraabel:

During the Dedication Ceremony of the Terry Pettus Park, it was stated that you had exhibited strong interest in the preservation of the integrity of neighborhoods within the city of Seattle.

It appears that our neighborhood is in jeopardy in two areas and we are requesting your help in our preservation.

As you are no doubt aware, the Childrens Hospital is seeking permission to construct a Heliport right in our neighborhood.

We strongly believe that such activity in this area would certainly not enhance the neighborhood and in conjunction with that, the personal safety of all the residents is definitely a risk.

We recognize that helicopter service in emergency situations may be a factor in saving a child's life and do appreciate that fact. We do, however, believe that the University Intramural Field has proven very satisfactory in the past as a helicopter landing sight. As it is only 3 minutes away from Childrens Hospital by ambulance, that 3 minutes additional time to the hospital would be of minimal consequence. Also it should be considered that the very poor safety record of Medivac Helicopters is a factor that must be given strong consideration, particularly in view of the density of population surrounding Childrens Hospital. Also it is to be remembered that Laurelhurst Elementary School is within this same area.

The helicopter approach to the University Intramural Field is all over water and would endanger no one.

Also it occurs to us that the University Hospital desires helicopter service and Harborview does have this service. We would question how many other hospitals desire this service also. It would appear that this is the time to control the situation before it sets too much of a precedence.

The thought of the recent helicopter accident at Green Lake certainly gives reason for additional concern. We are thankful that his power failure occurred when he was at 1000 feet altitude and he was able to attain a safe landing in an open area. Had this situation occurred at less than minimum altitude, it is probable that the accident would have had far more ser ious consequences.

We are requesting that you weigh all of these factors and give thought to the fact that the safety of many is being sacrificed to help one person if the Childrens Hospital is allowed to establish a heliport on its ground within the neighborhood.

Thank you for your attention to this matter.

Sincerely,

Harold Pate
Millard Finch

RE: Helipad at Children's Hospital

Dear Ms. Stimson:

Thank you for your letter of January 26, 1987, regarding the proposed helipad at Children's Hospital. Your letter raises a number of valid concerns about the use of helicopters in dense urban areas.

The City of Seattle is currently reviewing a request for a conditional use permit from the Hospital to build a helipad. Dr. Bud Nicola, Director of the Seattle-King County Department of Public Health, has been asked to comment on Children's Hospital's Environmental Impact Statement. I have shared your letter with Dr. Nicola and am confident he will take your concerns into consideration in his comments.

The King County Board of Health, of which I am a member, held a public hearing on the issue of air ambulance services in early December. At that meeting we endorsed a number of recommendations, including one calling for the State of Washington to plan, and if necessary, to regulate air ambulance services. I support such action by the State and have directed my staff to work to address these issues.

Thank you again for your letter.

Sincerely,

Tim Hill
King County Executive

Seattle, Washington 98105

Dear Ms. Scott:

Mayor Royer has asked me to respond to your March 11, 1987 letter about the proposed helistop at Children's Hospital and Medical Center (CHMC).

The hospital has applied to the City for a Council Conditional Use approval to construct and operate a helistop on their property. The Department of Construction and Land Use (DCLU) is the City agency evaluating the hospital's application with the ultimate decision being made by the City Council. We asked CHMC to prepare an Environmental Impact Statement (EIS) addressing factors including noise, safety and cumulative impacts which could result from the helipad. A partial list of landings from August 1985 to June 1986 is included in the Draft EIS. The Draft EIS was out for public review and comment during September, 1986. The Final EIS is now being prepared and will address the comments received on the Draft EIS. It should be released sometime in May. DCLU will then prepare a recommendation on the proposal to the City Hearing Examiner who in turn will make a recommendation to the City Council to make the final decision.

The hospital does not have permission to land helicopters and has been cited for these landings without the appropriate permit. The date for compliance in the Notice of Violation has been extended to April 30, 1987 to allow for the preparation of the EIS and the City Council's decision on the permit application. The extension of the compliance date does not give the hospital permission to land the helicopters, but it does postpone enforcement action on the part of this department until the compliance date is reached.

As with all enforcement actions, we hold the property owner and other responsible parties accountable for compliance with the City ordinances. In the event of an accident, we expect the same rules would apply.

Dear Mr. Kraabel,

This letter of information request and citizen comment is based on two statements in the enclosed February 25, 1987 letter from COH to its neighbors.

1."...the process regarding our request for a conditional land use permit for the helipad,..." (underline mine)

2."...we are in no way assuming the outcome of the conditional land use process."(underline COH)

I request the following information.

1. what is the process regarding the COH request for a conditional land use permit for the helipad?

The above statements from the COH letter indicate that COH has indeed applied for a conditional land use permit, but that, in the meantime, they hardly need to assume the outcome of the request process for they will land helicopters whenever they deem necessary. This is flatly illegal.

2. Who is responsible, in the event of an accident, for the payment of lawsuits that would surely occur in this illegal situation? The hospital? Air Northwest? The City of Seattle?

3. What monitoring arrangement covers the current illegal helicopter landings at COH? That is, is there a public log containing such information as time, number, and documented purpose of each flight?

These questions are only a few of those that must be answered--not only for the enlightenment of the people who live near the hospital but for the acknowledgment by all parties involved of the potentially explosive situation that is created by the illegal landings of helicopters at COH.

I appreciate your time in answering the above questions!

Sincerely,

Enclosure COH letter

February 25, 1987

Dear Laurelhurst Neighbor:

I would like to let you know that Children's is altering the landscaping near the present helicopter landing site to ensure the safest temporary landing conditions for all concerned.

At the request of Airlift Northwest pilots, we are altering the site as follows:

1. Four standing lamps that line the walkway to the Emergency Room are being removed and replaced with surface-mounted fixtures on the west wall that leads to the Emergency Room.

2. Three trees on the grounds are being removed: the cypress near the foot of the driveway and two Norway spruce west of the cypress.

Please know that we are acting out of the utmost concern for the safety and welfare of our patients, staff and neighbors. The ongoing, though infrequent, necessity of landing patients near our Emergency Room, coupled with the unanticipated length of the process regarding our request for a conditional land use permit for the helipad, have prompted us to make these alterations. In making these alterations we are in no way assuming the outcome of the conditional land use process. In addition, we remain committed to following through with the process as outlined by the city.

If you have any questions about these plans, please feel free to contact Nancy Greenawalt, Director of Government Affairs, at 526-2505.

Sincerely,

Treuman Katz

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Katy Chaney
Seattle Department of Construction and Land Use
400 Municipal Building
Seattle WA 98104

Dear Katy:

I am a pilot and a reporter for KING-1090 who is incensed about the controversy surrounding the proposed helipad at Childrens' Hospital. However, please accept these comments as from a private citizen, because I don't believe they represent those of the management of KING Broadcasting.

Last week, after yet another story in the paper containing assumpitons, mis-conclusions and erroneous information about helicopters and helicopter ambulance services, I did a little digging and confirmed a few facts about such services which I would like to pass to you.

ITEM: Neighbors of Childrens' who are opposed to the helipad state that, in 1986, there were 31 crashes resulting in 21 fatalities involving helicopter ambulance services.
CONCLUSION: They're not safe.
FACT: The raw numbers don't tell the whole story. Of the 31 crashes, all but one minor accident resulting in property damage only happened either en route or at a remote pick-up site. ALL the fatalities occurred away from the hospitals.

Inasmuch as helicopter ambulances are, by their very nature, called to rugged scenes where unknown hazards can and do lurk unseen, accidents of this nature can be expected from time to time. However, the risk of such are balanced by the benefit of more speedily getting medical care.

Further, any hazards at an approved, established helipad would be identified and indicated by lights and/or alternative red and white stripes.

ITEM: Neighbors are fond of invoking concerns about the children at a school near the hospital.
FACT: The Laurelhurst Elementary School is well east of the hospital. Established approach and departure corridors keep helicopters to the southwest and west of the hospital at all times.
CONCLUSION: The school concern is moot.

That, Katy, leaves noise as the only concern.

My question is: Does not the health and well-being of the children of our community warrant the potential of disturbances two to three times a month, or are the well-heeled people of the Laurelhurst and View Ridge areas exempt from social responsibility because of their social standing?

I respectfully ask you to consider these findings when considering the application for a helipad at Childrens', and I urge you to approve that application.

Sincerely,

Carl R. Dombek

Re: Helipad for Children's Hospital

Dear Councilman Kraabel:

Regarding the Helipad for Children's Hospital, it is true that helicopters are noisy, but so are fire engines, ambulances and police cars. However, the personnel in each of those noisy machines perform an invaluable service in caring for people during emergencies. One cannot equate the need for a critically ill child to have immediate care with the inconvenience of the noise factor some of Children's neighbors may experience on occasion.

As neighbors of Children's ourselves, we received a letter from Treuman Katz describing changes in landscaping near the present helicopter landing site. These changes are being made to "ensure the safest temporary landing conditions for all concerned." We want to go on record in urging your Council to make it the safest permanent landing site.

We are as near to the hospital as some of the protestants to the helipad, and the whirring sound of the helicopter would be reassuring in knowing that the pilot is delivering a child or baby in a life and death situation to one of the finest children's hospitals on the West Coast.

Dear Ms. Gibb:

I am writing in support of Children's Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am a volunteer worker for the hospital and member a hospital auxiliary and therefore have an opportunity to see the need for such an undertaking. It is vital that babies and children with critical traumas be given the prompt attention that a helistop will provide.

I understand the concerns of those who are objecting, but I have heard the helicopter and do not believe that concerns about noise and safety outweigh the good that will be realized.

Thank you for the opportunity to comment and please convey my opinions to the Seattle City Council.

Dear Ms. Hyatt:

Thank you for sending me your thoughts about the proposed helipad at Children's Hospital and Medical Center (CHMC).

The Department of Construction and Land Use (DCLU) is the City agency responsible for evaluating that application, with the ultimate decision being made by the City Council. CHMC has prepared a Draft Environmental Impact Statement (EIS) which addresses factors including noise, safety, and cumulative impacts which could result from the helipad. The EIS has been circulated for public review and comment. DCLU expects to soon publish a final version of the EIS, which will include responses to those public comments.

John Doan of DCLU is working on this issue. He can be reached at 625-4509 if you have further questions about the decision process on the helipad.

I assure you that we will take the concerns of the CHMC neighbors, like yourself, into account when making a decision.

Sincerely,

Charles Royer

MAR 09 1987
PAUL KRAABEL
SEATTLE CITY COUNCIL

Dear

The safety issue of medical helicopters has been and continues to be a prime concern to many in Seattle as well as across the nation. Aviation experts, pilots, the medical profession, and citizens are raising questions as to the advisability of air ambulance helicopter services within city limits.

The enclosed copy of an article in the Seattle Post-Intelligencer, 1-27-87, addresses some of the issues and some of the concerns. It also raises serious questions. May we draw your attention to specific points as follows:

1. "Children's has budgeted for 675 air ambulance transports ...."

   In the draft EIS by Children's, the estimate was 80 flights per month. In their newsletter, 1-87, they changed their estimate to 2 flights per month, which figure was to be incorporated into the final EIS.

   This reduction from 80 to 2 was so great that Children's lost credibility completely in the area of need for a helipad. (COH has refused consistently to comply with requirements for a Certificate of Need review.) We question need based on the estimate of 2 flights, and wihout this review.

2. Significant differences appear as to number of flights and charges for University Hospital, Children's Hospital, and Harborview. In this article, for example: Number of flights: Children's - 675; University - 126; Harborview - 543. Children's has budgeted for more than either of the other two; and, more than the other two hospitals combined!

   "Children's budget indicates it will charge $1,643 per ambulance transport, while University Hospital will charge $3,822 per trip." It is stated that Children's and University do not subsidize air ambulance transports as does Harborview, whose charge is $1,428. What do these differences represent?

   We question who will pay for Children's flights? Who will pay the insurance? What is the amount and kind and extent of coverage of insurance? Liability insurance has limits and thus would not begin to cover adequately lives and property involved.

3. "The helicopter ambulance accident rate is three times that of non-ambulance commercial helicopter services." Lead pilot for Airlift Northwest is quoted: "I think some of the programs are operating marginally. We think the FAA should take a closer look at what everybody is doing."

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Hundreds of lives are endangered for each of the 4 flights per emergency at Children's Hospital, located in a high-density residential neighborhood. Residents in Laurelon Terrace Condominiums contiguous to site where helipad is proposed, residents in adjacent Laurelhurst single-family homes surrounding hospital property, residents in the duplex-triplexes in Windermere Circle, children at Laurelhurst Elementary School a block from site, and patients and personnel at the hospital.

A visit to the proposed site will underscore these proximities and dangers.

4. Another paragraph in this article focuses on an additional issue: "In Spokane, two hospitals that operate competing helicopter ambulance services recently were threatened with fines of $1,000 per day and injunctions from the Washington state Attorney General's office if they continue to subsidize the cost of helicopter transport with fees paid by patients who don't use the service. The hospitals have agreed to stop subsidizing the service."

   Again we question: Who pays for the flights at Children's? Who pays for the insurance? Rising costs for all hospitalization has increased steadily in the past several years and continues to do so. Rising insurance rates reflect these increases. Marketing tools such as helicopters contribute to these increases.

5. No regulations exist to govern number of flights and/or need of helicopter transport to hospitals. Once costly helipads have been installed and services engaged, flights may escalate to help defray expenses as competition among hospitals increases.

Please review this article. Please review the mass of correspondence and public testimony on record regarding opposition to a helicopter site at Children's Hospital. Please stop a tragedy from occurring before it happens!

Thank you.

Sincerely,

GILBERT W ARIAS P-I

Dan Davidson, lead pilot for Airlift Northwest, is ready to fly with his helicopter ambulance at Harborview Medical Center. Davidson, who welcomes an FAA investigation, says his service already meets standards well above the FAA's.

FAA to probe helicopter ambulances but Seattle's looks better than most

By Rita Hibbard
P-I Reporter

Airlift Northwest, the air ambulance service operated by a group of Seattle hospitals, is among about 165 emergency medical service helicopter programs nationwide that will be investigated by the Federal Aviation Administration.

But the service, which includes a helicopter and airplane, already meets standards well above those now established by the FAA, said lead pilot Dan Davidson.

Spurred by a high accident rate among helicopter ambulance programs, the FAA this week began a review of all helicopter ambulance programs in the nation. Last year, there were 31 helicopter ambulance accidents that resulted in 21 deaths. So far this year, there have been six deaths from air ambulance crashes, said Seattle FAA spokesman Dick Meyer.

Only one of the accidents occurred in the Pacific Northwest. Last December, a pilot, paramedic and flight nurse were killed when a Pendleton, Ore., medical transport helicopter crashed just west of that city.

The helicopter ambulance accident rate is three times that of non-ambulance commercial helicopter services.

Davidson said he welcomes the FAA investigation.

"I think some of the programs are operating marginally," he said. "We think the FAA should take a closer look at what everybody is doing."

Depending on what the investigations turns up, the FAA could issue new or revised regulations to govern helicopter ambulance programs, Meyer said.

Airlift Northwest's helicopter is twin-engine and equipped for instrument flying in bad weather or darkness, Davidson said. Its pilots must be instrument-rated, and are required to have at least 3,000 hours of flying time experience. Perhaps most importantly, it employs four, full-time helicopter pilots, which means each pilot works

See **FAA**, Page E3

P.I. FEB 27 '87

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FAA: Probe of helicopter ambulances

From Page E1

12-hour shifts, five days on and five days off, Davidson said.

Helicopter ambulances are not required to have twin engines or be instrument-equipped, he said. Most helicopter ambulance services operate with three pilots, who are on duty for 24 hours, then off duty for 24 hours, Davidson said. The FAA requires only that any commercial helicopter pilot have no fewer than 200 hours of flying experience.

The only requirement the FAA makes for helicopter ambulance services that distinguishes them from other sorts of helicopter services is that sleeping quarters be available when the crews are on standby, Meyer said.

Davidson said the Airlift Northwest program is safer than many other helicopter services.

"Our company would like to see the FAA set guidelines that the national EMS (Emergency Medical Service) Pilots Association came out with last summer," said Davidson. Those guidelines call for four pilots and instrument-flight capability.

Instrument-flight capability is important because many air ambulances make night flights, fly in bad weather and land in places not designed for aircraft landings, he said.

Helicopter ambulances have become increasingly popular in recent years, particularly as a marketing tool for hospitals.

In Seattle, the three hospitals that budgeted money for Airlift Northwest this year anticipate making 1,344 air transports in 1987, compared with 455 in 1984. The participating hospitals are Children's Hospital and Medical Center, University Hospital and Harborview Medical Center.

Many people who live near Children's Hospital and Medical Center in Laurelhurst are bitterly opposed to the hospital's plans to build a helipad there, claiming the landings and takeoffs are unsafe in a residential neighborhood. The hospital's permit application to build the helipad is pending before the city Department of Construction and Land Use.

In Spokane, two hospitals that operate competing helicopter ambulance services recently were threatened with fines of $1,000 per day and injunctions from the Washington state Attorney General's office if they continue to subsidize the cost of helicopter transport with fees paid by patients who don't use the service. The hospitals have agreed to stop subsidizing the service.

Harborview also subsidizes air ambulance transports, said state Hospital Commission analyst Tom Muller, although Children's and University do not.

Harborview's budget submitted to the commission indicates that the hospital charges $1,428 per trip, which is about 35 percent short of covering the true cost, Muller said. Harborview, however, received approval to cross-subsidize in several departments because it is facing a loss this year, Muller said.

Children's budget indicates it will charge $1,643 per air ambulance transport, while University Hospital will charge $3,822 per trip.

Muller said the three hospitals show different costs per trip because each anticipates a different number of trips. Children's has budgeted for 675 air ambulance transports, compared with 543 for Harborview and only 126 for University. The costs include both airplane and helicopter transports.

January 26, 1987

Dear Mr. Hill,

I live one half block northeast Of Children's Hospital. I have watched the helicopters land and take off for the last year. Recently I read the enclosed article from the AMA News and I must urge you to oppose the proposed helipad at the hospital. This community was here long before Children's Hospital was and the residents have a right to privacy and safety in their community.

Since Children's lobbied against having to prove Certificate of Medical Need in Olympia, I can only assume it is because they can

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

can not prove helicopter transport saves lives. Therefore, the only reason they must want this helipad on their campus is to use it for a marketing tool — to make money. At what cost to the community do we allow Children's to make money?

According to the enclosed article, over one half of the accidents in 1986 of medical helicopters occured on take off, landing or hovering, all of which happen over and around this community. The proposed site is surrounded by homes, condos, businesses, churches, schools, trees & powerlines. This is no place for a helipad.

This helicopter service is entirely unregulated and the accident rate is so high, we can not allow this helipad to be constructed in our neighborhood.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. Please, do not allow Childrens Hospital to build this helipad on their campus for the safety of this community and for the precedent it will set for the safety of other neighborhoods.

Sincerely,
Kay Stimson

4715 - 45th Avenue N. E.
Seattle, Washington 98105

March 28, 1987

Dear Ms. North,

Thank you for your response of February 6, 1987 to my letter. Your mention of the proposed legislation, House Bill #65, is encouraging, although from what I understand, this will not affect anyone who has applied or obtained a conditional land use permit for an emergency landing site prior to December 1, 1984. This means the current proposed legislation would not apply to Harborview or Children's Hospital. If these two hospitals are excluded from being regulated by this legislation, then this legislation is basically null and void.

RECEIVED

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We need to have this bill cover ~~Everyone~~ who is landing or anticipates landing a helicopter at their facility.

Please, urge this legislature to correct this grave error and make it include everyone that will be operating an emergency medical helicopter in this state.

Thank you,

Sincerely,
Kay Stinson

Aeromedical helicopter accident rate 'devastating'

The accident rates of aeromedical helicopters showed no signs of improving in 1986, with numerous accidents causing 15 deaths, including seven in one day.

The rate of fatal accidents was seven per 100,000 hours of flight, the same as was recorded in 1985, according to the Aviation Safety Institute (ASI) of Worthington, Ohio. Furthermore, if injuries are included in the accident rate, the ratio soars to 12 per 100,000 hours of flight, a figure ASI calls "devastating."

Tom Einhorn, a co-founder of the National EMS Pilots Assn. (NEMSPA), and an aeromedical helicopter pilot, says: "It is an industry in distress. We are experiencing the worst accident rate in modern aviation history right now."

While aeromedical helicopters are among the newest and fastest growing segment of the health care industry, with close to 150 programs operating currently, their high accident rate is drawing increasing attention and alarm.

WITH THE CRASH of two aeromedical helicopters resulting in seven fatalities, including one patient, on Dec. 3 last year, the problem has received national attention, and several congressmen have called for a congressional investigation.

In a recently released report studying aeromedical crashes since 1975, ASI warns that "unless the aeromedical helicopter community resolves its differences and reaches compromises on how its helicopters should be operated, the Federal Aviation Administration and/or the insurance industry will step in to curtail some aspects of this business."

When the aeromedical helicopter industry trade group, the American Society of Hospital Based Emergency Aeromedical Services (ASHBEAMS), announced that it was going to tighten its safety guidelines after an October meeting, Einhorn of the pilots association was immediately critical.

"Their new guidelines are things we called for two years ago," said Einhorn, adding, "besides, how can a bunch of nurses and administrators decide flight safety when it is the pilots who know it best?"

IN ITS REPORT, ASI cites several causes for the accidents. These include:

- Obstruction strikes. Close to half of all of the accidents AFI studied involved helicopters striking such things as power lines, guy wires, trees, terrain, light poles, and a wind sock. Many of the strikes occurred at night and in the rural areas in which the helicopters frequently operate.
- Meteorological conditions. The study shows a continuing rise in the number of accidents occurring at night and in marginal weather conditions and notes that part of the problem is that pilots are not properly trained for the missions on which they go, and the "incomplete or inaccurate knowledge of weather conditions along the route of flight." Of the two most recent crashes Dec. 3, one happened at night, and the other happened in fog.
- Mechanical failures. One-third of the accidents in the study were due to mechanical problems, with engine failures causing several fatal crashes. Several other accidents were caused by less serious problems such as engine cowlings and doors falling off while the helicopters were flying.

IT IS WIDELY AGREED that another source of accidents is pilot fatigue, which can exacerbate the above causes. This factor is not easily quantified, however. For a long time, the pilots association has been fighting for a four-pilot-per-helicopter minimum standard for the industry. Yet many programs continue to get by with two or sometimes three pilots — the number recommended by ASHBEAMS in its latest standards. This can lead to pilots being on duty more than 80 hours per week.

Einhorn cites a case in Phoenix, Ariz., in which several pilots quit a program because of "fatigue and exhaustion." The program, Samaritan Air Evac, recently announced that it was going to the four-pilot standard and admitted that, before this, pilots were "working a minimum of 55.5 hours per week and often more because of late flights. Under the new staffing arrangement, pilots will work 41.5 scheduled hours per week."

Writing in their association's newsletter, Einhorn and NEMSPA co-founder Don Wright are critical of ASHBEAMS' recent recommendation of only three pilots per helicopter, saying: "This has been an industry-wide recommendation for more than three years," adding, "No hospital in America staffs a full-time position with less than 4.5 full-time equivalents, yet it is an uphill battle to get three pilots on a schedule where fatigue poses a far more serious penalty."

—Ryan Ver Berkmoes

Accidents killed 15 in 1986

Twenty-two medical helicopters were involved in significant accidents in 1986, causing 15 deaths and 18 injuries, as reported by various sources to the National EMS Pilots Assn. and the Aviation Safety Institute. The list does not include a U.S. Coast Guard helicopter on an aeromedical mission when it crashed in Kodiak, Alaska, on Nov. 2, killing six. Locations are where the helicopter was based, not necessarily where the accident occurred.

1. Jan. 19, Baltimore. Crashed into trees, killing two.
2. Jan. 26, Santa Ana, Calif. Struck wires on takeoff. Minor injuries to four.
3. Jan. 27, Missoula, Mont. Struck building on takeoff. No injuries.
4. April 5, Pittsburgh. Power loss on takeoff. No injuries.
5. April 19, Los Angeles. Propeller struck unknown object while hovering. No injuries.
6. April 25, Chicago. Tail rotor struck building on takeoff. No injuries.
7. May 9, San Diego. Power loss at takeoff. One injured.
8. May 22, Norcross, Ga. Power loss in flight. No injuries.
9. June 2, Jackson, Miss. Struck wire, killing three.
10. July 8, Houston. Propeller struck unknown object while hovering. No injuries.
11. July 10, Augusta, Ga. Struck wire at takeoff. No injuries.
12. July 21, Durham, N.C. Power loss in flight. Five minor injuries.
13. July 25, Greenville, N.C. Hydraulic failure in flight. No injuries.
14. Aug. 10, Missoula, Mont. Struck ground at takeoff. Four injuries.
15. Aug. 23, Tyler, Texas. Struck wire at takeoff. No injuries.
16. Aug. 23, Ann Arbor, Mich. Engine failure at takeoff. No injuries.
17. Aug. 29, Pensacola, Fla. Engine failure during landing. No injuries.
18. Sept. 23, Winston-Salem, N.C. Struck ridge in flight, killing three.
19. Nov. 5, Lewistown, Pa. Struck bird in flight. One minor injury.
20. Nov. 7, Billings, Mont. Tail rotor struck unknown object. Three injuries, two serious.
21. Dec. 3, Nashville. Struck ground, killing four.
22. Dec. 3, Pendleton, Ore. Struck ground, killing three.

Wreckage of a medical helicopter crash that killed four people in North Carolina.

Helicopter crash kills 4 in N. Carolina

The new year started off badly for aeromedical helicopters with the crash of one 20 miles north of Camp Lejeune, a Marine base in North Carolina. The three people and infant aboard died in the accident, which occurred Jan. 8.

The helicopter crashed into heavy underbrush shortly after the pilot radioed, "Mayday, mayday, we have a fire on board and are going down." Most of the craft was destroyed by fire, and the bodies of the victims were severely burned.

The baby had been suffering uncontrollable epileptic seizures and was being taken from Camp Lejeune Naval Hospital to the pediatric intensive care unit at Pitt County Memorial Hospital, which owned the helicopter. Rescue crews took about an hour to reach the wreckage because they had to cut their way through heavy brush.

Besides the infant, the crash killed pilot Perry Reynolds, and flight nurses Mike McGinnis and Pam Demaree.

Tom Einhorn of the National EMS Pilot's Assn. commented on the crash and said he knew Reynolds. "He was the program's chief pilot and probably about the most safety-conscious pilot around. It's a real loss."

THE NATIONAL Transportation Safety Board and the Federal Aviation Administration are investigating the crash, but so far will not speculate on a cause.

Einhorn, who has flown aeromedical helicopters for several years, said: "A fire in flight is very bad. It could have been caused by a number of things like an oxygen explosion or an electric heater." He noted that the crew had jettisoned the craft's doors before the crash, indicating they may have been hoping to have a survivable landing and then leap to safety.

John B. Galipault of the Aviation Safety Institute said the company the hospital had contracted with to operate the helicopter, Omni Flight, "runs a pretty clean operation" from a safety standpoint.

Officials at the hospital said the crash was the first for the hospital's air ambulance service, which operates in conjunction with the East Carolina U. Medical School.

Dave McRae, hospital senior vice president, said, "Many things will have to be looked at before the hospital decides whether the program will be continued and how. If it is continued, it will have to be restructured because key people were killed."

In another accident the same day in North Carolina, an aeromedical helicopter belonging to the hospital at Duke U. in Durham crashed while on a training flight. Fortunately, the accident occurred while the craft was landing and neither of the two pilots aboard was seriously injured, though the helicopter was damaged.

Last year, 15 people died and 18 others were injured in aeromedical helicopter accidents in the United States.

EDITORIAL

Efficacy, Cost, and Safety of Hospital-Based Emergency Aeromedical Programs

The number of hospital-based helicopter programs in the United States continues to grow rapidly, the number of helicopters in service even more. Approximately 20 new programs were added this year to the 130 already active, while many programs that started with one helicopter now have two or three in service. Although some states, such as New Jersey, have recently enacted strong legislation designating a limited number of air medical programs for the state, this has been the exception rather than the rule. In most states, government has been more permissive or loopholes have been found that have allowed programs to be started outside of certificate of need (CON) laws. Virtually every large metropolitan area now supports at least one program, and many small, rural cities of 100,000 or less find themselves with competing programs. There are now 31 hospital based helicopters in metropolitan Los Angeles.

Hospital-based aeromedical programs look as if they are here to stay. What do we know about the efficacy, cost, and safety of this flashy new resource being offered by hospitals around the country?

EFFICACY

Persons involved in aeromedical programs are convinced of their value for patient care. Rapid air transport with skilled personnel certainly has the potential to save lives, reduce morbidity, and enhance regionalization of care requiring special resources. Yet proving the efficacy of these programs remains an elusive goal.

In such states as Massachusetts and Wisconsin, which have strong CON procedures requiring programs to show that flights are meeting stipulated criteria for necessity, 90% compliance has been demonstrated for CON review. In a collaborative study in which five university hospital based programs examined more than 1,000 flights on the basis of a score that quantified intensity of services provided patients after transport, approximately 75% of flights were appropriate.[1] Trauma patients transported by helicopter appeared to do better than those transported by ground,[2] and better than expected based on national statistics.[3] Yet, the literature is sparse, and critics are skeptical of the motives and objectivity of the studies, such as these, that have been done.

As with many advances in technology, however, while the skeptics are arguing over whether we should have it at all, its widespread application has led to new and unanticipated uses. Helicopter transport has been used with great effectiveness to transport patients with acute myocardial infarction for treatment with new thrombolytic agents and/or angioplasty, for example, by Duke University and the University of Michigan, among others.[4] It has become the standard of care for the transport of critically ill or injured patients requiring special services not available locally, making regional trauma centers a reality. Ground transport is simply too slow to permit either the safe transport of ventilator- or pressor-dependent patients or, perhaps more importantly, the efficient use of skilled transport teams providing this kind of care.

Moreover, the more one examines aeromedical programs and determines the role that each plays in relation to its hospital's need and its community and regional needs, one is struck by the versatility that is exhibited. This is why it is difficult to generalize about programs in a prescriptive way, what they should do, how they should be staffed, how many there should be. Each may play a somewhat different role, depending on the location and population it serves, the characteristics and resources of the hospital at which it is based, and the availability and expertise of the emergency medical services system in its locale.

PROGRAM COSTS

The current cost of operating a hospital-based aeromedical program is estimated at between $1.0 and $1.3 million per aircraft.[5] Current cost estimates are understated, however, and total program costs can be expected to increase steadily in the next few years. There are a number of reasons for this. There has been a glut in the helicopter market as a result of a collapse in oil exploration, which has used helicopters intensively, and some vendors have been willing to lease aircraft at or below cost. This has encouraged hospitals to start new programs. The cost of obtaining aircraft can be expected to increase as the hospital helicopter market expands and this glut is eliminated. Whether for reasons of safety, convenience, or prestige, many programs are selecting larger aircraft than were in common use few years ago, and this will increase program costs as well.

Costs for personnel have been relatively low because of an excess of pilots, and because benefit packages for pilots are relatively poor compared to other hospital workers. Flight programs are viewed by critical care nurses and paramedics as a relatively glamorous new field to enter, and recruitment has not been difficult. As programs mature, and competition increases, personnel costs can be expected to rise. Finally, until now, availability and cost of insurance has not been a problem. Insurance costs have just now begun to respond to the increasing number of accidents by adjusting their rates upward.

Actual charges to patients also vary widely. In Michigan, for example, aeromedical programs are reimbursed for mileage charges by most payors at the same rate as a ground ambulance. Costs of medical care delivered may or may not be covered, depending on the insurer. In other states, a separate schedule of fees for air transport has been developed by the state agency regulating ambulances. It is also not uncommon for a hospital to help offset program costs by charging a delivery fee to hospitals other than the base hospital that receives patients. But these revenues are not expected to offset operating expenses. The majority of costs, if they are recovered at all, are derived from the inpatient revenues generated by the patient's hospital stay. In most in-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

stances, hospitals appear to be willing to subsidize an medical programs to keep beds occupied, to maintain their referral bases, or to develop new markets in an era of intense competition for patients. A helicopter is a strong and immediately identifiable symbol perceived as having tremendous public relations value.

An alternative means of financing helicopter operations is consortium approach, in which hospitals with different referral bases or specialty services, each of which by itself could not support an aeromedical service, jointly underwrite program costs. All hospitals then may share in the patient delivery and public relations value of the program if it is successful and if all hospitals receive patients.

Aeromedical programs are costly, but they do not seem to be thought of as expensive by the hospitals operating them when compared to overall hospital budgets and to the costs of such other new technologies as lithotripsy and magnetic resonance imaging that hospitals are being pressed to acquire. Just how much helicopter programs are actually adding to overall health care costs is impossible to determine because it is impossible to estimate the savings that might result from their activity as a result of more efficient care, reduced morbidity, and better regionalization of expensive services. Proponents of the competition ethic currently in vogue at many levels of government believe that the marketplace will determine the optimal number of programs. Others, believing this has not worked for any other aspects of the health care system, think the money spent on excess helicopters could be better spent elsewhere, and that more careful scrutiny and regulation are in order.

PROGRAM SAFETY

Recent articles in *The Wall Street Journal* and *American Medical News* have called attention to what appears to be an increasingly poor safety record among emergency air medical programs across the country. The safety record in 1985 was a dismal one, with 14 accidents and 13 fatalities, mostly pilots and medical personnel, reported to the National Transportation Safety Board. These 14 accidents represent 25% of all accidents reported during the last ten years from hospital-based air medical programs. The 13 deaths in 1985 are 28% of the 46 deaths that have occurred in the past ten years. The 1985 accident rate was approximately 20 per 100,000 flying hours, twice the general aviation rate of 9.5 and 100 times the scheduled airline rate of 0.26.

The record in 1986 was not much better, with 21 accidents and 11 deaths reported through October involving EMS helicopters, which include both hospital based and public safety programs.[6]

At the recent meeting of the American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS), a voluntary association of hospitals that operate aeromedical programs, to which virtually all programs belong, safety was a leading topic of discussion by administrators, pilots, nurses, and physicians. A report to the ASHBEAMS Safety Committee by Gabe Martyak, DO, assistant director of the Life Flight program at Geisinger Medical Center in Danville, Pennsylvania, examined structural causes of accidents, such as aircraft type, weather, pilot experience, and time of day. The findings confirmed what most program operations should already know. Most fatal accidents occurred at night, in marginal weather, in unfamiliar terrain, and were attributable to pilot error. Thirty percent resulted from mechanical failures.

Possibly more revealing was an abstract in the scientific session of the same meeting that examined the possible effect on safety of operational policies, such as ceiling and visibility minimums, adherence to written standards and protocols, and working hours.[7] One third of the 84 programs surveyed had had an accident, 13% had had more than one. Most surprising, only 49% of the 84 programs reported using explicit weather minimums, although 80% reported using FAA standards. Thirty-five percent of programs surveyed reported that a go/no go decision regarding weather was not made before ascertaining medical information that might bias judgment. While it is not possible in such a survey to determine the contribution of unmeasurable factors, such as attitudes toward safety and risk, adherence to operational standards and enforcement of policies designed to promote safe operations, programs obviously need to pay attention to such matters.

There are some simple things that every program could do and should consider to improve safety. First, ceiling and visibility minimums should be established for each program that are terrain and weather specific, and should be strictly adhered to regardless of the nature of the request. Second, twin-engine aircraft, which provide a margin of safety over single engine aircraft, should be used for patient care flights. Although you cannot fly for any significant distance when one of the two engines is out, landing with one engine is safer than autorotation. Attempts to gain a competitive edge by flying when your competition is not is foolhardy and dangerous. Third, there should be at least three pilots per aircraft in any 24-hour program. Duty time must be monitored carefully and relief provided so that pilots do not exceed allowable hours of flight time. Busy single-helicopter programs will need four pilots.

Fourth, scene responses at night should be restricted as much as possible if the landing zone is not well illuminated. Search and rescue missions should be left to public safety agencies who practice these full time. Fifth, instrument flight rating (IFR) of pilots should be encouraged. IFR training is helpful during night flying and when unexpectedly poor weather is encountered, because these conditions are similar to IFR conditions.

ASHBEAMS has proposed a new safety standard required of members that would mandate explicit minimums for ceiling and visibility, require a designated safety officer in each program, and assure sufficient pilots and assignment of shift hours to avoid fatigue, among other things. This is a step in the right direction.

COMMENT

For better or worse, aeromedical programs have become an integral part of the medical care system across the country. Are they effective? Clearly they are from the perspective of the hospitals that operate them. Are they from the public

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

perspective? Who can say? There are no criteria, and little if any data required of most programs, from which such a judgment can be made. Are they costly? Yes, $150 million this year will be spent on aeromedical operations. Are they safe? Yes, as long as standards of safety are strictly adhered to and enforced.

What then should be our attitude toward aeromedical programs? We can ask of them what we ask of other providers of medical care, that they behave with integrity, that they put the safety of the crew (which guarantees the safety of the patient) first, that they keep accurate medical records, that they open the results of their activity to public scrutiny, that they are truthful in their public pronouncements, and that they demand the highest standards of professionalism from their pilots, nurses, paramedics, and physicians. To do less is to betray the public that they, and the hospitals that support them, purport to serve.

Richard E Burney, MD

Seattle, Washington 98105

Dear Mr. Klug:

Thank you for the letter commenting on Dr. Nicola's revised memo about Medical Need. Because we agree that the issues you raise are important and we have many of the same concerns, we will be following up with Dr. Nicola to determine what additional information is necessary and how it can be obtained. We continue to feel that having answers to the questions in my December 24, 1986 memo is important.

John Doan of my staff will contact you or one of your club members when we receive additional information. If you have any questions, John can be reached at 684-8875.

Sincerely,

Holly Miller

RECEIVED
APR 22 1987
DEPT. OF CONST. & LAND USE

Holly Miller, Director
Department of Construction and Land Use
Municipal Building
Seattle, Washington 98104

Dear Ms. Miller:

We are disappointed with Dr. Nicola's letter of March 25, 1987, which is an updated response to the request of the Department of Construction and Land Use for an opinion about the medical need for a helipad at Childrens Hospital. The chief problems we note are as follows.

1. Dr. Nicola's review of the medical records of children who had been transported by helicopter to Childrens was a primary basis for his opinion that some cases, though few in number, need to land at the door of the hospital. As he says (page 6), 'There is very little (information)in the (medical research) literature corcerning the interhospital transfer of non-trauma patients." The focus of Children's proposed helicopter service is interhospital transport of non-trauma patients. Since Dr. Nicola's review of cases is a primary source of information for his opinion, it is a serious lapse in his letter that he did not give examples of when the transfer at the field would have been detrimental. Specifically, what were the medical considerations that led to his particular judgements? There are numerous physicians, nurses, medical technicians and other concerned citizens, who would be more likely to be convinced of the correctness of his judgement if he would share the evidence with us. Only pertinent medical facts would be needed and this information should be provided so that reviewers can judge the appropriateness of his conclusions.

2. Dr. Nicola does not address a major issue that has been raised repeatedly, namely, that some of the cases would have received care more promptly at hospitals other than Childrens, hospitals which are fully equipped to care for these patients, according to expert medical opinion. Some physicians, having reviewed the flight log in the Draft Environmental Impact Statement, estimate that about 40% of cases which landed at Childrens could have been cared for at a hospital which was closer to the referral site. If time is such a vital factor that patients cannot be transferred from the UW playing fields merely 5 minutes away, then why aren't they taken to the nearest hospital that can care for them? How can we believe that the use of the service to date has been appropriate, as Dr. Nicola alleges, when so many patients have been flown over an appropriate hospital to a more distant one? Dr. Nicola has not addressed this problem but it is a very important one.

3. Dr. Nicola dismisses the need for scientific data because he's just giving his opinion, he says. Because of the serious nature of this helipad proposal, which involves frequent flights of a dangerous machine over and into a residential neighborhood, the only physician (a public health officer) who is called upon to voice his opinion owes more than that to the people he is called upon to serve. Control of bias is not some arcane bit of scientific mumbo-jumbo. Use of the "scientific" approach requires an application of common sense. Control of bias in this situation means doing such things as

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

talking with physicians who have other views than those held by the helipad proponents, weighing the evidence pro and con in an open manner, and reviewing the cases "blind" without knowing where they landed, deciding which landing site would have been appropriate, and then determining how many in fact landed at the appropriate site. An informed opinion, such as Dr. Nicola claims to provide, would seek in these ways to offset the bias inherent in talking mainly with proponents. His opinion, the only possibility we have for objective input from a public official on the medical aspects of this proposal and which for that reason carry an inordinate amount of weight, should be based on a vigorous effort to seek to counter bias. Apparently, Dr. Nicola would agree that his opinion might well be biased in favor of the proponent and therefore must be viewed with much skepticism.

4. In a memorandum from you to Dr. Nicola dated December 24, 1986, a number of questions were asked and points were raised which Dr. Nicola has failed to address. We agree with you that these are important questions and ask that they be addressed. Your questions and our comments are listed here:

Page 1, item 2. "The report should expand upon this information to detail the specifics of the people who were contacted (this could be done by appending a reference section.)" A list of names and identifying institutions is called for here. If there is some reason Dr. Nicola feels he cannot reveal with whom he has conferred, that should be clearly stated and the reasons given. An opinion that is as important as his should not be made without as full disclosure of facts as possible.

Page 3, item 5. "Particularly for those patients within a 70 mile radius identified in the first report, how does one strike a balance between transport time and transport distance?" This is an important item, which Dr. Nicola does not address.

Page 4, item 5. "Has the introduction of helicopter transport of non-traumatized patients, whether pediatric or not, established a new standard of care?" Dr. Nicola did not answer this, but it is an important question in order to consider how much pressure there will be on referring physicians to use helicopter services instead of ground transport to avoid potential malpractice litigation.

Page 4, item 7. "What areas of uncertainty exist in the overall opinion/report?" Not answered by Dr. Nicola, but obviously an important item.

Page 5, item 8. "Do you maintain your recommendation for a review panel? If so, what should their mission be? Who should be represented on the panel?" Not answered by Dr. Nicola but a critically important item that is not easily resolved. A review panel would be needed whether a permit is granted for a helipad at Childrens Hospital or at the UW playing field.

5. In a letter to Ms. Julia Gibb, Department of Construction and Land Use, October 15, 1986, Jay M. Kranz, M.D., Chairman,MAST Coordinating Committee, stated that he reviewed all MAST flights for the past ten years and on only one occasion was it necessary to land an infant directly at the Hospital's door rather than landing at Graves' Field. He queried the Seattle Fire Department and Shapard Ambulance personnel as to whether they knew of any bad outcomes occurring during the transport of pediatric patients from a MAST helicopter at Graves' Field to Childrens Hospital. He states, "Neither activity knew of any bad results at that time." How does Dr. Nicola interpret this long-range historical "data"? It seems very relevant to this debate and yet is totally ignored in Dr. Nicola's reports. (For your reference a copy of Dr. Kranz' letter is enclosed.)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. Underlying this entire debate is the fact that the question of medical need here has not been proven. As Dr. Thomas A. Bell, M.D.. M.P.H. (a pediatrician), stated in a letter to you on October 16, 1986 (enclosed), "...while it may seem intuitively obvious that faster transport will enhance survival, this is not necessarily the case and should be documented with good scientific studies. Judging by Dr. Nicola's recent excellent review of the literature on this issue, there are none. A possibly analogous example of the misuse of technology is the situation with monitoring of near-term fetuses, where the use of electronic monitors increases the rate of Cesarean sections but does not necessarily enhance rates of survival of infants. Ground transportation has advantages over air transportation..."

Dr. Bell goes on the say, "Regarding the community, are they being protected from the strictly entrepreneurial interests of Airlift Northwest and Childrens Hospital ? What mechanism is there to prevent the abusive use of helicopter transport for all sorts of medically unnecessary purposes?...Will the city allow the proverbial fox to guard the henhouse? What disinterested party is going to monitor the use of a heliport if it is constructed?..."
We think that Dr. Bell raises some important issues that must be addressed.

Citizens concerned about this issue have been raising the above questions and issues for about two years now and have yet to receive answers. We agree with you that these are important questions and support you in your efforts to obtain answers to them.

Sincerely,

Robert N Klug

A RESOLUTION

The following resolution was passed by the Laurelhurst Community Club at its regular meeting on April 13, 1987. This resolution reflects opinion based on the most recent information available regarding helicopter services and Childrens Hospital's proposed helipad.

It is resolved by the Laurelhurst Community Club that the Seattle Department of Construction and Land Use be requested not to approve Childrens Hospital's request for a permit to construct and operate a helipad at the Hospital.

The following information provides support for the position taken in this resolution:

1. The current safety record of the Emergency Medical Services helicopter industry has been found to be the worst in modern aviation history.
2. The primary cause of EMS helicopter accidents is "pilot error".
3. Paul Pussell of Tamjoy Enterprises, a marine and aviation consulting firm, has determined that the Childrens Hospital site is unsafe for the following reasons:
   a. exceedingly tight turn southward over the parking garage;
   b. rising terrain on approach to landing;
   c. helipad is not visible until final moments of descent;
   d. landing site is restricted by existing and proposed buildings;
   e. site located too close to residences.
4. Additional concerns, raised in the Russell report, further question the safety of the Childrens Hospital helipad proposal. These are:
   a. there are no standards or guidelines that apply to this industry;
   b. its safety record is currently under FAA investigation;
   c. Childrens Hospital has no control over aircraft landing at its campus;
   d. there is no radio contact between the helicopter and Childrens Hospital;
   e. there is no weather observer located at Childrens Hospital.
5. According to Jay Kranz, M.D., Chairman, MAST Coordinating Committee, the medical benefits to the patients landing at the Childrens Hospital site do not outweigh the safety risks to the community.

This resolution is further supported by the City Code regarding conditional use permit for a helistop: "The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas".

Seattle, Washington 98104

Dear Ms. Miller:

The University of Washington is in the process of completing a Draft Supplemental Environmental Impact Statement (DSEIS) for the proposed University Hospital Helistop project. The University expects to publish a Draft SEIS in August, 1987.

The Department of Construction and Land Use (DCLU) has indicated previously that the City of Seattle's Land Use Code permits the establishment of a helistop at a major institution like the University as a conditional use, if the City Council finds that a) the helistop is needed to save lives, b) the helistop is located so as to minimize impacts upon surrounding residential property, and c) use of the helistop will be restricted to occurrences involving life-threatening emergencies.

We are aware that in order to evaluate these criteria, DCLU recently requested that the Director of Seattle-King County Public Health, Bud Nicola, review the Childrens Hospital and Medical Center (CHMC) proposal to establish a helistop. As the University Hospital's proposal resembles that of CHMC, we anticipate that a similar review process will be required.

It would be greatly appreciated if your office would respond with a statement as to what the review process will involve and what additional information will be necessary, as well as with instructions on initiating the review.

Thank you for your help in expediting this matter.

Sincerely,

Rolfe P. Kellor

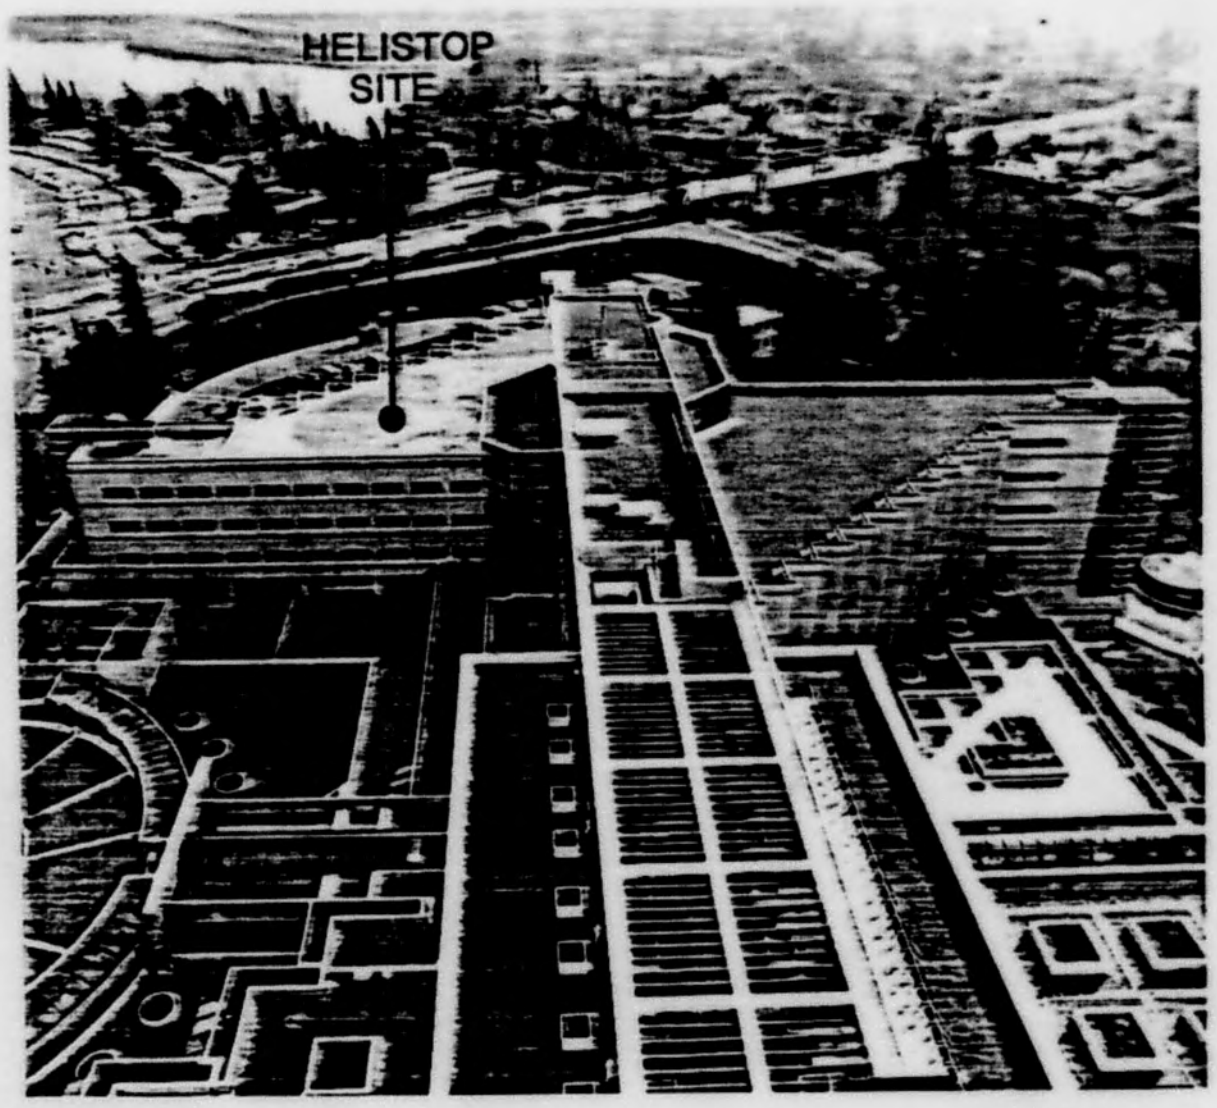
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

To All Interested Agencies and Individuals:

In July, 1986, the University of Washington issued a Scoping Notice to inform the public of its plan to prepare an Environmental Impact Statement (EIS) on the use of a helistop at University Hospital. Comments on the scope of the EIS were requested, and several were received. Among the concerns raised were those relating to an alternative helistop location in the University's East Campus playfield area for helicopters transporting patients destined for Childrens Hospital Medical Center (CHMC) as well as University Hospital.

As a result of these comments, the University considered the potential for a shared helistop and discussed the issue with representatives of CHMC, the community, and the City. Based on these discussions, the University determined that development of a permanent East Campus helistop was feasible for use by both Hospitals when immediate access to helistops at each Hospital was not essential for patient well-being.



The University is now proceeding with the preparation of the EIS on its proposal for two University helistops - one on the roof of the new east wing of University Hospital (Attachment A) and one in the East Campus at the intersection of Clark and Walla Walla Roads (Attachment B). (The Final EIS for the proposed helistop at CHMC is being prepared by CHMC as a separate document.) Shapiro and Assosiates has been hired to prepare the University's EIS, and a document is expected to be available for review by late February. The EIS will address issues of noise and vibration, safety and risk of upset, recreation, wildlife, light and glare, air quality, and land use. In addition, medical need will be assessed as part of the City of Seattle's review for a conditional use permit.

Additional information can be obtained from Sally Marks, Environmental Planner, Campus Planning Office, FJ-05, University of Washington, Seattle, WA 98195, 543-9071.

January 31, 1986

Beatrice Farrar Ryan, Interim Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

RE: Scope of the EIS of Proposed Helistop at 4800 Sand Point Way

Dear Ms. Ryan:

We understand from discussion with Department staff that the EIS for the proposed helistop will cover a minimum of four areas: noise, vibration, safety and alternatives. Further, we understand that the term alternatives is not to be limited to alternative landing sites but that service alternatives will be considered as well. We appreciate the opportunity to comment on the proposed scope.

We ask that two additional areas be addressed: the cumulative impact which can be expected if a permit for the proposed helistop is granted and the effect on air quality.

Establishing a helistop at COH would set a precedent of City approval for onsite landings for interhospital transfers. The precedent can be expected to apply to all hospitals. As you know, the University Hospital is actively preparing a request for approval of a helistop. To compete, other hospitals will have to provide this service also. The areawide implications of an initial approval of onsite helicopter landings are significant.

Helicopters require several times the quantity of air polluting fuel as the alternative ground transportation vehicles. The Council should be aware of the effects of jet exhaust gases on the neighborhoods in making its decision on the helistop proposal.

The validity of the projections of environmental impacts will depend upon the accuracy of the proponent's projections for use. We look to the environmental impact statement for a definition and projection of the proposed use. The project's objective and criteria for use should include a list of limitations which would be imposed and a plan for the monitoring and enforcement of those limitations.

Reasonable limitations might include that the helistop would not be used: for transfer of patients who could be safely transferred by ground; or for transfer flights originating within seventy or outside one hundred and fifty miles of the hospital, or for flights where the origin is closer to another hospital qualified to treat the patient; or for trauma or burn patients which will go to Harborview, or for necnatal cases unless University Hospital beds are not available; or for any purpose other than transport of patients to the hospital; or for landing heavy or inadequately maintained equipment.

The limitations on use must be clarified. The effects on the community of one landing a year are quite different from those of one thousand landings. With the use defined, the number of expected occurrences can be derived from pertinent data on the population and area which would be served. We expect to see that data and the proponent's criteria for use discussed as it relates to the area's land use and environmental policies and to City goals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In addition, the validity of the projections of environmental impact is also dependent on the hospital's future growth and program development. For the Council to adequately assess the effect of the proposed helistop, the hospital's five, ten and twenty year plans for development should be included. The environmental consequences would be quite different if projected from a COH plan to return to its original objective of providing for chronically ill children than they would be if the plan is to evolve as a trauma center.

We expect your experienced staff to fully anticipate the needed scope and content requirements. We do have one special request. We would like the analysis to include the potential impacts on the children and staff in the hospital. The quasi-public nature of the hospital's work make this consideration both reasonable and responsible.

We know that you are committed to preparing a professional analysis and unbiased document. If it is appropriate and allowable, we would like a representative from our community present at the scoping meeting. Otherwise, we would like to review minutes of the meeting when they are available.

Sincerely,

Robert N Klug

LAURELON TERRACE ASSOCIATION
OF APARTMENT OWNERS, INC.

RECEIVED
MAY 20 1986
DEPT. OF CONST. & LAND USE

Ms. Holly Miller, Director
Department of Construction
and Land Use
Room 400 Municipal Building
Seattle, Washington 98104

The following resolution concerning the siting of heliports for emergency medical care is endorsed by the Board of Directors of Laurelon Terrace Association of Apartment Owners, Inc.:

The Board of Trustees of the Laurelhurst Community Club supports the development of a regional plan for the siting of heliports for emergency medical care. This plan should be based on an annalysis of the medical need, the potential adverse impacts on communities, and the costs of helicopter services.

The designation of sites should be limited to the minimum necessary to meet the needs of the region. Where there is choice, the location of the heliports should be limited to sites where overflights and landings will have least impact on residential communities.

Criteria for use must be established in the regional plan so that helicopter service is limited to emergencies. These criteria should define conditions, such as difficulty of access, time constraints, and life-threatening situations, which make helicopter transport the only reasonable choice.

The Hospital's projections for helicopter use and its contract for services with Airlift Northwest indicate the proposal is for a commercial transportation service which is costly, may not be limited to medical emergencies, and includes financial incentives for overuse.

Qualicy emergency care has been satisfactorally provided by helicopter transport to the University's intramural field and Harborview's trauma center. At this time, the Board of Trustees of the Laurelhurst Community Club opposes the approval of a helistop at Children's Orthopedic Hospital until a medical need for the helistop on campus is substantiated.

Bud Nicola, M.D., M.H.S.A.
Director of Public Health
Seattle-King County Health Department
Seventh Floor
400 Yesler Building
Seattle, Washington 98104

Dear Bud:

Enclosed, as I promised, is a proposal for an intensive planning activity leading to policies which will shape the appropriate development of air ambulance services. Based on our prior discussion, I understood that a detailed proposal turned back around to you quickly was in order given the increasing gravity of the EMS situation and necessary approval lead times.

I do not have addresses for attendees at the February 5 meeting. Could you forward this proposal to them? Also, it was my understanding that you would be responsible for preparing any necessary internal reviews and ordinances. Needless to say, we are quite willing to discuss modifications or other related issues.

As you will note, this proposal has been developed at a very reasonable cost. PSHSA shares the City and County's interest in effectuating an early improvement in the development of this service.

Sincerely,

Larry A. Thompson

PROPOSAL FOR THE DEVELOPMENT OF AIR AMBULANCE SERVICES IN KING COUNTY AND THE CITY OF SEATTLE

Puget Sound Health Systems Agency

PROPOSAL FOR THE DEVELOPMENT OF AIR AMBULANCE SERVICES IN KING COUNTY AND THE CITY OF SEATTLE

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

PROJECT GOALS

To develop a plan and implement strategies which will best assure the rational integration and coordination of air ambulance services with the EMS system of King County and the City of Seattle. The plan is to be developed using the advice, guidance, and involvement of affected parties, and the implementation strategies are to consider region-wide and state-level alternatives and impacts.

PROJECT OBJECTIVES

1. Assess the current status of air ambulance services in King County and describe the development trend of this service in other locations across the nation.

2. Identify and assess current and projected problems and service needs with respect to air ambulance services.

3. Develop goals for development of this service and criteria for evaluation.

4. Identify and assess a series of alternatives to meet identified problems and needs.

5. Evaluate and select from among various policy options available for implementing the plan.

PHASES OF THE PROJECT

Phase I: Preliminary Organization

The first phase of the project will allow the Puget Sound Health Systems Agency (PSHSA) to meet with the County and City to finalize the project work plan including agreed-upon methods for involving affected parties in the execution of this project. The appropriate structure for a project steering committee will be agreed upon. In addition, details of governmental agencies' involvement will be finalized.

Tasks

1-1 Review scope of the project and establish precise definitions for which the plan is being prepared with the sponsors.

1-2 Review and agree upon tasks outlined in the proposal.

1-3 Establish role and membership of steering committee.

1-4 Establish review and comment procedures.

1-5 Clarify relationship between the affected parties, the steering committee, PSHSA as contractor, and the county and city as sponsors.

1-6 Compile an affected parties list and identify liaison persons.

1-7 Recruit and orient steering committee members.

Phase II: Develop Goals and Criteria

The first objective of this phase is to establish a statement of goals for air ambulance services which identifies the general direction and intent of the service. Second, a set of criteria will be developed which operationally defines the intended results described in the goal statement and permits the measurement of effectiveness of the service.

Tasks

2-1 Draft goal statements for air ambulance services.

2-2 Draft a set of criteria to measure the effectiveness of air ambulance services.

2-3 Conduct a review with affected parties.

2-4 Conduct steering committee review, modification and adoptions of the criteria and goals.

Phase III: Conduct Inventory and Analysis

The third phase of the project will establish an inventory of current service providers and baseline information with respect to the air ambulance services.

Tasks

3-1 Identify current service providers including modalities offered and geographic coverage.

3-2 Review transport records to determine patterns of use, numbers and types of transports, costs of service.

3-3 Review transport records from selected locations outside of King County to establish use patterns from outlying areas.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3-4 Analyze the information gathered through the inventory and establish baseline information on air ambulance services.

Phase IV: Identify Problems and Conduct a Needs Assessment

The first objective of this phase is to identify problems with the current system especially the existing relationships of air ambulance services to the County/City EMS system and the total health care system. Second, a needs assessment to determine the gaps in service will be conducted. To accomplish this objective a review of literature and existing systems throughout the country will be completed. Third, a method to assess the needs of the city and county's population will be developed. Finally, using a "key informant" survey, local key problems and issues will be identified.

Tasks

4-1 Review industry and clinical literature.

4-2 Assess and/or shape local clinical consensus on indications for air transport.

4-3 Develop need projection model and make preliminary estimate of need for services.

4-4 Conduct a key informant survey to identify local problems.

4-5 Using literature review, key informant survey, and needs assessment, develop a listing of key problems and policy issues involving air ambulance services.

4-6 Steering committee review of problems and needs assessment.

Phase V: Development and Analysis of Alternatives

The objective of this phase is to identify a series of policy alternatives which could address the problems and goals identified through earlier casks in this planning process. Examples of such alternatives might include various types of franchising, licensure and certification laws, land use controls and influence over third-party reimbursement.

Alternatives will be analyzed in terms of their probable short and long range impact and in view of their political and technical feasibility. Competing and complementary alternatives will then be screened in view of their desirability as measured by the project's adopted criteria.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Tasks

5-1 Develop alternatives through discussion with various regulatory and non-regulatory authorities and with affected parties.

5-2 Measure each alternative against the established criteria and analyze the effect of each alternative.

5-3 Steering committee selects desired alternatives.

Phase VI: Develop and Adopt Plan for Air Ambulance Services

The objective of this phase is to bring together in a comprehensive plan all of the information gathered on the current situation and projected needs; the identified problems and potential strategies with policy implications; and the desired alternatives with rationale. Time has been allocated during this phase for review by both the affected parties and the general public.

Tasks

6-1 Combine information and decisions from prior steps in a draft plan.

6-2 Steering committee review of draft plan.

6-3 Release draft plan for public review.

6-4 Conduct public hearing and consider comments received.

6-5 Steering committee approves redrafted plan.

6-6 City and County comment and propose revisions.

6-7 Final adoption by steering committee.

6-8 Plan transmitted to city and county for policy use.

Phase VII: Develop Implementation Action Plan

The objective of this phase is to make specific suggestions about who should be responsible for implementing the plan and what action steps will be needed in order to implement the plan.

Tasks

7-1 Identify organizations which are responsible for implementing each of the principal recommendations in the plan.

7-2 Discuss recommendations with each organization, discuss implementation and suggest assignment of roles for implementing.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7-3 For each recommendation develop a time line and action steps.

7-4 Present the implementation action plan to the city and county for follow-up and evaluation.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

BUDGET

Professional Fees	Billable Hours	Budget	
Phase I Activities	37	$ 1,387.50	
Phase II Activities	38	1,425.00	
Phase III Activities	140	5,250.00	
Phase IV Activities	306	11,475.00	
Phase V Activities	178	6,675.00	
Phase VI Activities	76	2,850.00	
Phase VII Activities	130	4,875.00	
	Subtotal		$33,937.50

Material Costs*		
Printing/Copying, Postage	$ 860.00	
Public Notices	150.00	
Travel Expenses	250.00	
Computer Time	380.00	
Subtotal		$ 1,640.00
Total		$35,577.50

* The costs shown in this section are extraordinary costs associated with steering committee activity, affected party review, analysis and development of projection method and public review. All other associated project costs are included in the hourly billing rate.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ASSUMPTIONS MADE IN THE BUDGET

1. PSHSA will coordinate meetings and agendas for six (6) meetings of the Steering Committee. Coordination will include developing and sending the agenda; setting up meeting sites; recording and distributing meeting summaries. It is assumed that there will be between seven (7) and twelve (12) members on the Steering Committee. If PSHSA is asked to conduct additional meetings of the Steering Committee the estimated cost is $560 per meeting.

2. Budget estimates are based on involvement of affected parties during key points in the project. It is assumed that there will be approximately twenty (20) liaison individuals on the affected party list. Affected party reviews will be held three times during the project. Cost of each additional affected party review is approximately $275.

3. Budget estimates include interviews with 20 key informants to assist with problem identification. Additional key informants could be added to the survey at a cost of $87.50 per individual. If desirable a phone survey of community representatives could be included during the problem identification phase; details and costs would have to be discussed.

4. PSHSA will rely on a locally selected Technical Advisory Group (TAG) to develop the local clinical consensus on indicators for air ambulance services. The TAG will meet twice and issue a report to be used by the Steering Committee. Extensive involvement of the TAG in modifications to the report (i.e., additional TAG meetings) will require additional resources. Cost is estimated at $167.50.

5. The need projection model developed in the course of this project is not intended to be used as an air ambulance need method. Therefore the model is not intended to be used, as developed, in the Certificate of Need or regulatory review process. The development of such a need method would involve extensive involvement of the health planning community and is outside the scope of this project. The model would be an essential starting point toward the development of a need method.

6. Budget estimates are based on one (1) public review period of thirty (30) days and one (1) public hearing on the Draft Plan for Air Ambulance Services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

391[illegible] 48th Place N.E.
Seattle, Washington 98105
January 17, 1986

Mr. Jim Street
600 - 4th Avenue
11th Floor, Municipal Building
Seattle, Washington 98104

Dear Mr. Street:

As a Laurelhurst property owner, I wish to express my views on the land-use issue to be considered soon by the City Council concerning the construction of a helipad by Children's Orthopedic Hospital and Medical Center.

I urge the council to approve the hospital's request for a conditional land use permit. The concerns which I have heard and read on the part of some Laurelhurst residents seem to focus primarily on noise and safety. It seems to me that a few minutes of helicopter noise occasionally is a minor matter when the life of a child may depend upon the utmost speed. As for safety, I'm sure we face far more danger daily from automobiles, pollution, and criminals than from the possibility of a crash by Airlift Northwest's helicopter.

It is proper and natural for residents of any community to be actively concerned about any proposal which alters zoning and land use. However, this request does not seem out of line. When one buys property near a hospital, one should expect the noise of ambulances, increased traffic and parking problems, and possibly the transport of emergency cases by airplane. I believe that those opposing this request represent a highly vocal minority.

Sincerely,

Carolyn S.R.B. Scott

Carolyn S.R.B. Scott

Seattle, Washington 98104

Dear Ms. Gibb:

I am writing to give my support to Children's Hospital and Medical Center's request for a conditional land use permit to build a landing port for a helicopter outside their emergency room.

As a mother of children that would use Children's Hospital and as a guild member of a guild in Woodinville, I feel that the use of a helicopter by the Hospital is of upmost importance. To be able to transport a critically ill child to the Hospital as quickly and a safely as possible is a vital requirement of a high technological Medical Center. I would hope that such as service would be available to all children that would need it.

I understand the concerns and worries of those who oppose such a service. However, I feel that the Hospital has recognized these concerns and has addressed them with options that would provide workable alternatives, that would alleviate some of the noise and safety questions. The benefit of having the helicopter land at the Hospital far outweights the dangers in my opinion.

Thank you very much for letting me state my opinions and would you please convey them to the rest of the Council.

Sincerely,

Carole McConnell

Anita M. Francis
5003 45th Avenue Northeast
Seattle, Washington 98105

Dear Ms. Francis:

This letter responds to your recent request that Children's Orthopedic Hospital be required to prepare a Master Plan because of the development known as Kids Bowling for Kids.

This development was authorized in February 1982 as part of a Planned Unit Development (PUD) and site plan for the 20-acre site on Sand Point Way Northeast formerly owned by the U. S. Coast Guard. Planning and EIS review took place from 1978 to 1982.

The PUD included Ronald McDonald House, and what was then designated as "Children's Orthopedic Hospital Parent Housing." The latter is currently referred to as Kids Bowling for Kids development.

The following is an excerpt from the 1981 DCLU recommendation on the PUD:

> The Ronald McDonald House and the two COH-Parent Housing buildings must be considered to be hospital uses since these facilities are only available to relatives of the patients of the hospital. Hospital uses are permitted in the zone and may be permitted as a part of the PUD.

The development in question, then, was considered to be a "hospital use" and was approved for development in February 1982.

Although construction of this development occurred in 1985 after the adoption of the Major Institution Code, development was approved at the time of PUD authorization. Thus the development received land use approval and SEPA review before adoption of the Major Institution Code. It would not now be considered as a new development which triggers Section 23.80.30B.2.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

DCLU has determined that Kids Bowling for Kids development does constitute replacement housing under 23.80.30B.3 even though it is an institution-related use. Part of the reasoning for this is that the same code section would allow change of use of a residential structure to institutional housing without triggering a Master Plan. We believe the code requirement for dwelling unit replacement is satisfied with institution-related housing such as Kids Bowling for Kids.

The larger issue of this institution's development plans remains an important one to DCLU. I am discussing the general question of master plan development with Children's Hospital officials in light of the various development actions which COH has proposed within the past several years.

If you have questions, please contact Julia Gibb of my staff at 625-4509.

Sincerely,

Holly Miller

DEPT. OF CONST. & LAND USE

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Bldg.
Seattle, WA 98104

Dear Ms. Miller:

Pursuant to the Seattle Municipal Code mandate for a Master Plan to be prepared when a major institution expands its use within one mile of its boundaries (SMC 23.80.30B2), you are required to direct the Children's Orthopedic Hospital to apply for Master Plan approval.

The institutional development known as Kids Bowling for Kids is a ten-unit plus caretaker project to serve families of patients of the hospital. The facility was processed by the Department under permit number 620878. An examination of your files should clarify that this is an institutional use developed by COH within one mile of the institution's boundaries.

A recent ruling by the Department found that this new institutional facility constitutes replacement housing to allow a change of use from residential to institutional which occurred after the adoption of the Code. Then this facility must also constitute a development which occurred after the adoption of the Code and within one mile of the Institution's boundaries. A Master Plan is required.

Our community recognizes that the purpose of a Master Plan is to analyze existing and future physical development of a major institution, provide community involvement during the preliminary stages of the institution's planning process, and provide predictability for a major institution and its surrounding neighborhood. We look to the development of a plan as a positive and necessary step in assuring a forum for constructive communication with the Hospital of mutual development goals. We look forward to a favorable ruling consistent with the City's policy to encourage Master Plans.

Sincerely,

JIM STREET
SEATTLE CITY COUNCIL MEMBER

Dear Sirs:

I was pleased to learn that DCLU has ruled that Children's Orthopedic Hospital must file an environmental impact statement before proceeding with plans for a helicopter landing pad at the hospital. This will allow the significant aspects of noise, vibration, safety, alternative sites and shared usage to be explored in detail before a decision is made.

Our house is located approximately two blocks North and one block East of the proposed landing site. On December 6, 1985, the MAST helicopter elected to land at the hospital instead of at Graves Field. Every part of our house shook terribly for several minutes while the helicopter made its approach to the landing site. I can well imagine the structural damage to our house if this were to become a regular practice.

I believe the location of such a helicopter landing site in close proximity to a residential neighborhood and school would severely impact the safety of the surrounding neighborhood. The enclosed article from the Seattle Times (Dec 11, 1985) shows the consequences of a helicopter crash. It is easy to visualize a number of homes in the area of such a crash being demolished, along with the attendant loss of life to people on the ground as well as the flight crew and patient.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Statistics relating the time between such incidents are typical average values. Also, it is well known that the most critical times for such an incident are during the take-off and landing phase (i.e., near the hospital). The point is that such a crash will happen and cause extensive property damage and loss of life. The question is not "if" it will happen, only "when".

The headlines of an article in the Nov 16, 1985 Seattle Times by Dr. John Neff, Medical Director of COH, posed the question - "If the Helipad saves the life of just one critically ill child, then won't it be worth it?". I would turn the question around and ask - "Is the improvement in life saving capability (compared to the current MAST helicopter/ambulance system) worth subjecting the surrounding community to a sure loss of life and property at some point in time?". The answer, for those of us living under the proposed flight path, is a resounding "NO!".

I strongly urge you to: 1) Consider the shared usage of Graves Intramural Field to serve University and Children's Hospitals and 2) Deny issuance of a helicopter landing permit at COH. If required, the site at Graves Field could be improved to provide an all-weather landing site. In addition, if the facilities aboard the MAST helicopter need upgrading in order to protect infants during transport, then this would be a logical area for improvement. This solution would have minimal impact on single family neighborhoods in Seattle and represent the safest approach to continued helicopter service for both Children's and University Hospitals.

cc: 1) Charles Royer, Mayor
2) Jim Street, Chairman
City Council Land Use
Committee

Very Truly Yours,

Pilot and doctor killed in crash of emergency medical copter

Rescue craft flying in dense fog hits tree

ADDISON, Mich. (UPI) — Two people were killed yesterday when an emergency medical helicopter on its way to pick up a traffic-accident victim at a hospital crashed in dense fog just short of its destination yesterday.

The wreckage of the Life Flight helicopter from St. Vincent Medical Center in Toledo, Ohio, was found in a wooded area near Devil's Lake about a mile southeast of Addison in Lenawee County, police said.

The pilot, John Harrison, 39, and doctor, Jean Hollister, 27, both of Toledo, were killed.

The only survivor, flight nurse Julie Miller, 28, also of Toledo, was taken to St. Vincent for surgery.

Hospital officials said the helicopter left Toledo at 3:49 a.m. in rain and fog for the 35-mile flight to Addison Community Hospital to pick up the traffic victim. The patient was taken to Foote Hospital in Jackson, Mich., when the helicopter failed to arrive as scheduled.

The helicoper's last radio transmission was heard at 4:02 a.m. The wreckage was found six hours later.

Deputy Capt. Robert Sinks of the Lenawee County Sheriff's Department said it appeared the pilot was making a banking turn when the helicopter struck a large tree and skidded into the woods.

The first person to see the wreckage was Otis Chatfield, a 71-year-old farmer who heard the helicopter go by and was later told by a neighbor that it had crashed about a mile east of Chatfield's home.

When he saw the wreckage, Chatfield called out, asking if anybody was inside. He said a woman shouted back that she was inside with a broken leg. Chatfield said he found Miller in the center portion of the helicopter.

Hospital officials said the Life Flight service — the only such service in the Toledo area — has flown more than 5,000 missions since 1979 without a serious accident before yesterday's crash.

The Federal Aviation Administration was investigating the cause of the crash.

The wreckage of a relief helicopter rests in dense woods.

Subject: Childrens Orthopedic Hospital Heliport

Dear Herb:

My family and I have lived in the Laurelhurst community for 35 years.

We have raised three children, all of whom have been treated at the Childrens Orthopedic Hospital.

My wife and I have raised money for COH, we have worked in auctions, I have spoken in behalf of the Orthopedic (I drive by the hospital complex five to six times daily), have held meetings in their auditorium, a grandson spent two weeks in intensive car; Tom Young, Sr., the senior partner of the architectural firm who designed Childrens Orthopedic to be a small, well integrated, but complimentary to the neighborhood facility, was a three-door neighbor, and an early director, Dr. Doctor, was a four-door neighbor.

I guess what I am saying is that the Orthopedic Hospital has been a close and good neighbor of my family.

Therefore, I take issue with the Childrens Orthopedic Hospital's Heliport plan.

I have an 85 year old mother, who lives in the shadow of Childrens Orthopedic, in the Laurelon condominium. She is extremely hard of hearing but can feel and hear the vibration of a helicopter, when it lands at COH.... and it troubles her and other seniors living there.

This area is single dwelling, duo apartment living, and the city derives a handsome tax base from the Laurelhurst, Windermere, Hawthorne Hills, and immediate areas.

If the preponderance of high pitched noise and the insecurity of low flying helicopters over our homes and families cause a decay in the neighborhood, then even the

city loses, as neighbors have, if we are forced to move to a less dense community.

Helicopters have been known to crash, especially upon take-off and landing, and we have a strong concern that the Laurelhurst School is one block away, with classrooms filled with our children. What a tragic fate to injure or kill a number of children by a helicopter crash while it was landing at COH with one child aboard for treatment.

We are but a few neighbors, not necessarily affluent, who live with the Childrens Orthopedic's continuing expansion into a larger institution ..... no longer small and nestled appropriately into the community surrounding it.

Thank you for listening.

Sincerely,

M. O. Christman

RE: Children's Orthopedic Hospital Medical Ce[illegible]pad Request

IMPACTS and ISSUES WHICH SHOULD BE ADDRESSED:

Overuse of air-space - This area is already subjected to frequent noisy airliner approach into Sea-Tac Airport and Boing Field as well as helicopter landings at Sandpoint Naval Station. The EIS should take into account how many hospitals in the Seattle area are going to be wanting their own helicopter landing sites.

Danger of Crash - The proposed helipad is located within two blocks of an elementary school and two churches. On three sides of the hospital grounds are high-density apartment complexes -- the fourth side is single-family residence fairly close together. Would insurance cover crash loss? Danger also to hospital population.

Noise - An independent study should be directed to noise levels within the hospital instead of leaving that to the hospital administration to determine since they have a vested interest.

The noise effect on nearby residents is very disturbing, especially for elderly persons in the apartment complex immediately below the proposed landing pad. At least twice in the last few months large MAST helicopters have landed on the hopsital grounds despite the COH promise that these helicopters would never be used on the proposed landing pad. The last one circled several times directly over our house before landing. How often will this happen?

Effect on Property Values - Will the increase of noisy flights and the danger of crash have an adverse effect on residential property values.

Alternative Sites - Are there better alternative sites which would create less noise disturbance and less risk? Does the hospital gain enough added benefit by having the helipad on their grounds rather than at the U.W. field now in use as the landing site?

The COHMC has been steadily eroding the quality of the environment around it ever since it moved into this residential area. The request for the helipad needs to be considered in conjunction with the future plans of the hospital, which they refuse to divulge to residents who neighbor their grounds.

RE: Helipad, 4800 Sandpoint Way N.E. PROJ #8495870/Kroll

I have lived in Laurelon Terrace (at two different addresses) since 1955. I am a Medical Technologist (recently retired) and have worked at the University of Washington in medical research for 25 years, followed by 10½ years as supervisor of a division in the clinical laboratory. Thus I have some background, knowledge and understanding of: (1.) the development and past changes in the residential area surrounding Children's Orthopedic Hospital and (2.) the changing patterns and pressures of health care and health care delivery.

I have attended every meeting regarding the helipad issue for the past two years and, though I feel well informed on the pros and cons of the issue, I do still have some concerns:

Laurelon Terrace is a condominium of 136 units covering a three block area immediately west of COH. The buildings were built in the late 1940's (prior to COH's move into the area) and converted to a condominium in 1978, well in advance of any public knowledge that a helipad might be in the picture.

The enclosed map shows the 19 buildings that comprise Laurelon Terrace and demonstrate its proximity to the hospital. Also, the complex is downgrade from the hospital (separated only by a firelane) so that the helicopter approach to the proposed pad has a significant bearing on the noise level, vibration and safety hazard to various homeowners.

There have been at least seven unauthorized landings at COH since November. Instead of the helicopter following the prescribed flight path---which we understand to be over Sandpoint Way NE and up the COH drive to the 'Kitchen Garden"---it has been coming in LOW at an agle over buildings 13, 14, 9, 10 and 18. Again, because of the topography, when the helicopter comes in so low it is not only much more dangerous to us, but the reverberations are intensified! From talking with some people at the hospital we understand: (1.) the new helicopter does not have to circle; it can come in high and drop straight down to the pad; (2.) there is no reason for the pilot not to take the prescribed route over Sandpoint Way rather than over residences.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The items we feel should be addressed in the Environmental Impact Statement are:

1. NEED. If the community could be assured that the helicopter would be used only for truly critcal cases, we would live with that. At the same time, if the pad permit is granted we request that there be a workable, effective and timely process to assure the helicopter is not being misused. There should be knowledgeable community representatives included in any such "Peer .Review" committee.

2. FREQUENCY: This is an adjunct of 'Need'. One can predict that if there are 15 flights the first year, the number of flights in subsequent years will increase even if the tool is not abused, simply because of increasing advances in technology. This expected growth underlines the importance of only one flight per patient, having the medical crew picked up either at the 'soccer field' or at Harborview (rather than the possible two flights per case into COH).

3. FLIGHT PATH: We strongly urge the pilots be instructed to adhere to the prescribed flight path, and come in high rather than almost level with our roofs which has happened on several recent occasions. The solid red line on the enclosed map indicates the presecribed flight path; the broken red line denotes the path taken by 5 of the last 7 flights. We realize that adhering to the Sandpoint Way route may impact other neighbors. We have no desire to better our situation at the expense of others. The chosen route should take all residents' situations into account. We do feel, however, that our topography makes it mandatory that the helicopter come in high!

4. SAFETY: Helicopters, unfortunately, do crash. The hospital assures us that the statistics indicate there would be only one crash in 64 years. Please note the recent crash of a medical emergency helicopter (in another state) 5 minutes from its landing. Who is going to pay for this insurance? Even without helicopter hazards the current state of insurance premiums is a disaster in itself! Another strong point, we think, for restricted flights and controlled flight paths.

5. VIABLE ALTERNATIVES: The UW 'soccer field' has served for some years as an emergency landing field for both UW and COH. Here the approach can be over water, marsh, parking lots---not homes. Rather than say the field is too soggy, a decent, lighted helipad could be constructed here to serve both institutions. Helipads should be looked at as regional facilities--- no matter what the future medical technology, can we afford to have the service at every hospital?

Enclosure

Bellevue, Washington 98006

Dear Mr. Hansen:

Thank you for your thoughtful letter about Children's Orthopedic Hospital's helistop proposal. We have received many letters expressing strong feelings about this application.

I wish it were easier to decide whether to allow this helistop, but the law requires us to make sure the helistop proposal conforms to the criteria set down in the Land Use Code. These include examination of alternative locations including sites outside the hospital boundaries.

You are right; we can all be proud of Seattle. We all have the opportunity to voice our opinions and cooperate in keeping our city, its institutions and neighborhoods as sources of pride. Striking a working balance among our community's numerous and various goals is an important responsibility of city government, and I am confident the decision made on this permit application will be one which acknowledges both the medical needs of our children and the concerns of residents.

You can keep track of the decision process on the helistop by calling Julia Gibb, Land Use Specialist, Department of Construction and Land Use, at 625-4509.

Sincerely,

(SGD) CHARLES ROYER

4800 Sand Point Way N.E.
Seattle, Washington 98105

Dear Ms. Greenawalt:

Based upon the Department's analysis and upon letters received during the scoping comment period, our scoping determination for the Environmental Impact Statement for your application for a helistop permit is as follows:

AREAS OF IMPACT

Noise
Vibrations
Safety
Cumulative land use impacts of emergency medical transport by helicopter in the Seattle-King County region
Alternatives
- alternative sites off-campus, including UW Graves Field (soccer field)
- shared usage of sites
- no action alternative

MITIGATION MEASURES

Possible mitigation measures discussed in the EIS shall include the following:
- flight paths
- number of flights
- usage and location of U. S. Army (M.A.S.T.) or other agency helicopter landings
- off-campus pick-up of medical teams
- liability insurance
- criteria for use of helicopters
- plan for monitoring use

Comment letters should be carefully reviewed by the consultants preparing the EIS. The letters contain concerns regarding background data, impacts, study methodology and possible mitigation measures, within the scope of the EIS just outlined.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If you have questions on this scoping determination, please call me at 625-4509.

RE: The Environmental Impact Statement for the Emergency Helistop Facility at Children's Orthopedic Hospital, 4800 Sand Point Way, Seattle, Washington

The members of the Board of Directors of The Laurelon Terrace Condominium Homeowner's Association are the elected representatives of the owners of 136 family dwelling units located on the West boundary of The Children's Orthopedic Hospital.

Recently, there have been several (5-10) unauthorized helicopter landings at the hospital. The flight paths for most of the landings were low angle approaches over several of the Laurelon Terrace Condominium residences. The extreme noise and reverberations generated during these flights, has been stressful to elderly residents and the night flights have been especially so, due to the anxiety of waiting for the helicopter to depart.

We respectfully request your thorough investigation of the following:

1. MEDICAL NEED:

Is there truly a medical need for a helicopter landing site at Children's Orthopedic Hospital? Would the site be used only for bona fide critical cases and not for "marketing" purposes?

2. SAFETY:

Can there be assurances that the flight path for all landing would be a route that would minimize danger and noise for the surrounding community of homes, schools and businesses?

3. FREQUENCY OF FLIGHTS:

At least some of the recent flights were actually two trips (four over-flights) for one patient. One flight to pick up a medical team and another to deliver the patient to the hospital. There are many conflicting accounts of the anticipated number of flights per month and the costs associated therewith.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Director, Dept. of Construction and Land Use January 30, 1986

4. ALTERNATE SITES:

The present landing site at the nearby soccer field has served well for many years. Is it actually no longer a suitable landing site? If not, why not? Is there a medically acceptable alternate landing site? The approach to a landing site at The Sand Point Naval Station could be mostly over water. There is presently a landing site at Harbor View Hospital and may soon be a landing site at University Hospital which is even closer than the Sandpoint Naval Station or Harbor View. Perhaps Seattle's Medic I, with the best response record in the nation, could be utilized.

5. COST:

We do not wish to imply that a dollar value be placed on a human life. Common sense, however, requires that initial and recurring costs be considered as a vital part of your investigation. Duplication of services would not be cost effective and should be avoided.

6. QUALITY OF LIFE:

The residents of Laurelon Terrace have always supported the Children's Hospital and will continue to support this outstanding institution with both money and voluntary service. The surrounding community is entitled to health, safety and tranquillity, rights which should not be ignored, but have been abridged by the hospital in their endeavor to institute emergency helicopter service.

Thank you for the opportunity to express our concern in this matter. Please notify us of the time, date and place of any public hearing regarding this project.

Re: COHMC Helistop

Dear Ms Farrar:

1- We are concerned about the use of helicopters over two schools, thickly populated residential areas and a much used city playfield.

2- What rights and protection do home owners have in protecting <u>their quality of life</u> from constant zoning exceptions and changes being made.

3- The present Mast system and its location serves two hospitals, U of W and COHMC. Is the competition for business between hospitals going to be allowed to impact everybodys lives?

4. We are concerned about duplication of services. Will each hospital want their own helicopter service? This needs to be studied and controls be established. The Trauma center at Harborview Hospital has an excellent record for treating children and adults - treating - stabilizing and then transporting children to COHMC by ground service.

5- We attended the September 9, 1985 meeting called by the Health and Human Services Committee of the Washington State Legislature. It was our understanding that the <u>Free</u> service Mast provides will not be able to continue to serve the area if a private helicopter service is established. (They cannot compete with private business) Who then will pay the bill? The patient?

6- We understand that the Doctors are divided on the issue of necessity.

7- We are concerned about the abuse of the use of the helicopter service. This is a big concern. Who will monitor and decide what is or isn't an emergency. Once the service is allowed to begin and the six month trial period is over, who willthen monitor to see if the system is being abused.

over use ka X

8- With helicopters, traffic watch planes and the constant sea-plane activity over the area, it indicates to us that some form of control of air traffic over residential areas is necessary.

Yours truly

Patricia O. Wright

January 13 1986

NOTICE OF DECISION (DECLARATION OF SIGNIFICANCE & SCOPING)

The Director of the Department of Construction and Land Use has reviewed the Master Use Permit application described below and has issued a Declaration of Significance (DS) on this project.
The public is invited to identify specific significant environmental impacts and issues which should be addressed in the Environmental Impact Statement.
If an EIS is prepared, you will be notified of the time date and place of the public hearing.

See attached

Comments on the scope of the Environmental Impact Statement are to be sent to the following address by FEBRUARY 03, 1986 :

Director
Department of Construction and Land Use
Room 400 Municipal Building
Seattle, Washington 98104

The Declaration of Significance is a part of the file on this matter and is available for public viewing in Room 408 of the Seattle Municipal Building

Dear Ms. Gibb:

I am writing to give my support to Children's Hospital and Medical Center's request for a conditional land use permit to build a landing port for a helicopter outside their emergency room.

I am a mother of small children and a member of a guild in Woodinville. It would ease my mind to know that my child, as well as any child, could be transported safely as well as quickly to Children's Hospital if such an emergency should arise.

I understand the concerns of those people who are objecting but feel that those concerns about noise and safety are far outweighted by the good that will be realized if the helicopter is used.

Thank you for the opportunity to state my opinion. Please let the rest of the Seattle City Council know of my concern.

Sincerely,

Kim Chastain

Dear Mrs. Gibb -

I am writing in support of childrens Orthopedic Hospital + Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am a parent and a community member who feels very strongly that our first consideration should be to provide the fastest + best possible medical attention to those in need. The value of a helistop at other hospitals (such as in Portland) has been proven.

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely
Anne Peff

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I'm concerned about the proposal to build a heli-stop at Children's Hospital. The helicopters fly directly over my home on its descent. My condo complex is surrounded by trees and telephone wires. Aside from the noise, the physical obstructions for the helicopters make it an extremely unnerving experience.

I've seen helicopters unloading patients on one of the U.W. athletic fields, and understand discussions are underway between Children's and the University for construction of a permanent helistop. I strongly urg that this be the course taken.

Per. No. 8225

7. "COH's response to the competition and cutback in need is to market its service to a larger area, in part through fixed wing."

7. Our patients have historically come from a four-state region, as well as from every state in the union. While we provide a wide range of children's medical services, our reputation has been based on the fact that there is no other place within our region to care for pediatric critical cases. The availability of a helicopter has only strengthened our existing transport system of fixed wing and ground because we are able to reach patients who might not otherwise be able to access the care they need.

8. "The need must be justified and standards set. ...The State's Attorney General...succeeded in getting the Certificate of Need requirement dropped."

8. Certificate of need (CON) review is a state-mandated process imposed on hospitals and nursing homes in Washington and other states to assure the public that unneeded health facility buildings and beds are kept out of the system. There are two conditions which trigger the need for CON review:

(1) The health care facilities proposal will exceed $1 million.
(2) The proposal represents a substantial change in service.

Our proposed helistop will cost $60,000 to build. Secondly, Children's has been treating helicopter-transferred patients for several years. Therefore, the requirement for CON review was never dropped. It just was never called for under the law.

The state has just issued a letter to the hospital which reiterates that the hospital has no legal requirement to go through a CON review.

8 continued

Considering Dr. Nicola's report supporting a medical need for the helicopter, coupled with the statement within a position paper of the Puget Sound Health Systems Agency that Children's would most likely be identified as a Seattle-area hospital that should have a helipad for medical emergencies, we cannot justify the cost and delay associated with the CON process.

9. "Hospital helicopters are overused by a factor of 90%, according to studies noted in a recent report of the Washington Hospital Commission."

9. The Washington State Hospital Commission did not state that hospital helicopters are overused by 90%, but rather that in 90% of all cases requiring transport to a hospital, a helicopter is not always the best means, a statement with which we agree.

10. "We have asked COH to spell out its proposed conditions of use and to justify the need. ... Because helicopters operate most effectively in a regional area, it is necessary for planning to occur on a regional basis."

10. Representatives from the hospital board and administration have met numerous times to discuss this proposal and many other concerns of the neighbors. We have answered questions and presented proposals verbally and in writing. We have taken neighbors through the hospital and explained the medical conditions of the children transported by helicopter.
Airlift Northwest is already operating on a cooperative basis among the four hospitals. It was begun in an effort to effectively provide emergency air transportation on a non-competitive, shared basis. Airlift is a model of regional planning that was conceived, developed and implemented in the best interests of residents of the Pacific Northwest.

The Hospital's helipad proposal has been carefully thought out and prepared in the interest of improving the lives of children - that is our obligation as the primary regional pediatric medical center. We have studied with care the issues of noise and safety. We believe our information to be complete. It is important to note that there are other statements contained in the Laurelhurst Newsletter that are untrue, which we did not respond to.

If you would like more information, or if you have questions about the facts presented, please call Nancy Greenawalt, Director of Government Affairs, at 526-2505. Your knowledge and accurate understanding of our proposal are important to us.

Sincerely,

Mary Jane Anderson

July 25, 1986

Dear Neighbor:

It has come to our attention at Children's Hospital and Medical Center, that you may have recently received a mailing from the Laurelhurst Community Club containing excerpts from their presentation regarding our proposal to build a helistop on the campus of Children's Hospital. We feel, that as a neighbor of the Hospital, it is important for you to know the facts and our position on them.

In October 1984, Children's Hospital and Medical Center applied to the City of Seattle for permission to build a landing pad for helicopters next to the emergency room. In May 1985, Airlift Northwest, a consortium of our hospitals - Children's, Harborview, Provident and University - provided emergency air transportation by leasing a state-of-the art helicopter that could safely land outside the emergency room.

Because of our concern about the environmental impacts on the neighborhood, we hired consultants to study noise and safety issues. We submitted a report on those issues to the City in the fall of 1985. At that same time, Dr. Bud Nicola, the Public Health Director for Seattle-King County, reviewed all documentation of the helicopter flights that had landed directly at the Hospital. Dr. Nicola also conducted a public hearing to determine whether there was a medical need for Children's to have a landing pad on its campus. In December 1985, Dr. Nicola issued his report, which concluded that there is a medical need.

In January 1986, the City requested that we complete a more extensive analysis of environmental impacts. That report, called a draft EIS, will be publicly issued at the end of July. The City will have copies available for public review, and there will also be copies available for your review at the hospital.

The following statements are excerpts from the recent Laurelhurst Newsletter accompanied by the facts.

LAURELHURST LETTER	FACTS
1. "(Helicopter) service is used almost exclusively for interhospital transfers of stabilized patients."	1. Most of the patients come from another hospital where the condition of the patient has overwhelmed the resources and experience of the personnel. Every attempt is made to stabilize very unstable patients prior to the helicopter leaving the ground. Examples of patients transported directly to Children's include: • extremely premature babies weighing between 2 and 4 lbs • children whose lungs collapsed in flight • children with increasing swelling and pressure on their brain • children with uncontrolled seizures • near drownings • chemical poisonings
2. "The use of helicopters for interhospital transfers is a service which replaces ground ambulance transportation."	2. Seattle--King County has a nationally recognized emergency medical system. Helicopter service is but one component of that system. Children's proposes to land the helicopter on its campus only in life threatening situations where: • due to medical factors the time gained would improve the outcome. • due to environmental factors such as traffic, weather conditions, and distance the helicopter would be a better choice than ground transportation. • The combination of technological advances, including the sophistication of the helicopter and the medical team on board, provide the optimal chance of saving or enhancing the quality of life.
3. "In 1986, it (Children's) is moving to become a regional pediatric trauma center."	3. Only Harborview Medical Center is staffed and equipped 24 hours a day to meet the accepted definition of trauma center. Children's now is not staffed nor does it plan to staff 24 hours per day to meet trauma center criteria. These statements are clearly written in the draft EIS and were made verbally and in writing to representatives of the Laurelhurst Community Club Board.
4. "There are no conditions established for the use of the Airlift Northwest helicopter."	4. As one of the four member hospitals of Airlift, Children's has asked for the city's approval to land at the hospital only those children who are in a life-threatening situation. In addition, Dr. Bud Nicola's report issued in January (referenced earlier) determined the medical need at the request of the city.
5. "The safety issue is not insignificant..."	5. Using the worst case experience for single-and-twin-engine helicopters, the projections are one accident per 5,459 transports that could occur anywhere along the flight path which translates into about one accident every 23 years. In addition, Airlift has personnel levels (pilots per aircraft) as well as a minimum experience requirement and ongoing certification for pilot hiring that exceed industry standards. Finally, Airlift's policy for ongoing training for pilots and medical team personnel serves as a model for guidelines and standards that are being developed by the industry. There are over 20 pages on helicopter safety in the draft EIS which very plainly demonstrate that safety is not a significant factor for the neighborhood and the hospital.
6. "The adverse effects of noise on human health are well-documented...We are understandably concerned with safety and with the adverse effects of noise on the children and the elderly."	6. The draft EIS also contains a very thorough study of the noise created by the helicopter and its potential effects on our neighborhood. A helicopter landing at the proposed site near the emergency room is no louder or no more disturbing than a diesel truck along Sand Point Way according to the studies done for the EIS. Noise levels measured at five sites surrounding the hospital are not of sufficient volume to cause adverse health effects on humans.

Dear Ms. Gibb:

I am writing to give my support to Children's Hospital and Medical Center's request for a conditional land use permit to build a landing port for a helicopter outside their emergency room.

As a mother of children that would use Children's Hospital and as a guild member of a guild in Woodinville, I feel that the use of a helicopter by the Hospital is of upmost importance. To be able to transport a critically ill child to the Hospital as quickly and a safely as possible is a vital requirement of a high technological Medical Center. I would hope that such as service would be available to all children that would need it.

I understand the concerns and worries of those who oppose such a service. However, I feel that the Hospital has recognized these concerns and has addressed them with options that would provide workable alternatives, that would alleviate some of the noise and safety questions. The benefit of having the helicopter land at the Hospital far outweights the dangers in my opinion.

Thank you very much for letting me state my opinions and would you please convey them to the rest of the Council.

Sincerely,

Linda Loyden

Dear Ms. Gibb:

I am writing to give my support to Children's Hospital and Medical Center's request for a conditional land use permit to build a landing port for a helicopter outside their emergency room.

I am a mother of small children and a member of a guild in Woodinville. It would ease my mind to know that my child, as well as any child, could be transported safely as well as quickly to Children's Hospital if such an emergency should arise.

I understand the concerns of those people who are objecting but feel that those concerns about noise and safety are far outweighted by the good that will be realized if the helicopter is used.

Thank you for the opportunity to state my opinion. Please let the rest of the Seattle City Council know of my concern.

Sincerely,

Diane Cuthbertson

ATTN: Ray Sachs

Dear Mr. Sachs:

This letter is in response to your letter to me of December 29, 1986 wherein you requested further input regarding the proposed helistop at Children's Hospital.

1. I have personally inspected the proposed site many times including several views from overhead in a helicopter.

2. You have asked for an analysis of one site relative to others re: COH facility, UW HospitaL, and the UW Soccer field.

Given the hyopothetical of a helicopter approaching over an open area and landing in a soccer field versus an approach and landing over a congested area one would have to surmise there is no risk to persons or property on the surface regarding the first instance: This is by virtue of the fact, it is a complete open area.

The site of the U of W proposed helistop was evaluated and inspected by me. In my view it is slightly different in that much of the ingress and egress can be accomplished over a more open area.

The helistop sites (3) near the Space Needle downtown are significantly more hazardous to persons and property on the surface, relatively speaking. Approaches and departures are over very busy streets at these locations.

I believe we must consider what is an acceptable level of safety. Certainly having a car manned by some unknown person coming head on to you at 60 MPH ten feet away is not my idea of being safe but in today's life it's accepted because of necessity.

In 11 years at this office I'm not aware of any incidents or accidents at helistops. I am not aware of any accidents at Boeing Field by helicopters that were in a normal take off or landing phase. Boeing has numerous daily helicopter operations.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In comparing the aforementioned sites one also needs to consider factors such as frequency of operations, re: emergency only, and twin engine helicopters.

The acceptable level of safety is extremely high at the COH facility, U. W. facility and the soccer field.

It is true EMES helicopters have had accidents however, almost all have been at remote locations where hazards are numerous, re: unlighted night landings, unfamiliar area, mountainous terrain, excitable inexperienced ground personnel, trees and obstructions surrounding the pick up site and weather factors.

Lastly you asked about pilot qualifications Basic Licensed Commercial pilots are required to have a minimum of 150 hours by the Federal Aviation Administration. This would allow him to recieve compensation for such operations as aerial survey, photo and scenic flights, pipeline patrol but excludes carrying passengers for hire. The minimum FAA requirements are 500 hours of flight time in order to transport people or cargo for hire.

No insurance company will insure a pilot for air taxi operations with these minimums. They place much higher experience requirements on the pilots. You can verify this by calling 503-640-4686, the Westmiller Insurance Company.

Commercial pilots engaged in Air Taxi EMES operations are required to pass oral and flight test each 12 months by the FAA.

Commercial pilots engaged in the less restrictive operations mentioned earlier are not required to pass any FAA test after original certification.

I hope I've been of some help. If you need anything further please call my new number 431-1386.

Sincerely,

Frank G. Benedict
Principal Aviation Safety Inspector

From: Laurelhurst School P.T.A. Board

Re: Hearing on Draft Environmental Impact Statement of Children's Hospital and Medical Center Helistop

Date: September 23, 1986

We, the Laurelhurst School P.T.A. Board, come before you this evening primarily in the interest of the children who attend this public school. Our interest does extend beyond the school as well. We represent the board only, not the whole Laurelhurst School Parent-Teacher Association. At this time, we are merely familiar with the major arguments for and against the proposed helistop. We wish to express in brief our concerns, and we wish to ask some questions for which we could not find answers in the Draft E. I. S.

While the school is normally occupied between 9:00 A.M. and 3:00 P.M. five days a week, children and staff arrive on foot, by car and by bus as early as 7:30 A.M. (some for day care). Children leave at 3:00 P.M. to walk or ride home, but some stay as late as 6:00 P.M. (until picked up by parents). Staff leave at differing times in the afternoon. Outdoor playtimes include A.M. and P.M. recesses, post-lunch recesses and some physical education classes. Many children play and participate in activities at the adjacent Laurelhurst Park. On several occasions there are evening events sponsored by the P.T.A. which draw students, their families and staff. In addition, some Laurelhurst Park Department classes are taught in the school. It is safe to say that the school is unoccupied between 10:00 P.M. and 7:00 A.M.

We are concerned, therefore, about the impact of noise and vibration on Laurelhurst School. It is noted in the Draft E. I. S. that "helicopter noise could and probably would be disruptive of some adjacent residents' lives." (pg. 92) Would the impact be greater for the secondary approach-departure path, which covers the area over Laurelhurst School? What would the impact of noise and vibration mean to daily instruction in the classroom, study in the library, instrumental music lessons in the auditorium, individualized teaching on the second floor or programs in the gymnasium? We are concerned about the frequency of flights, given that every instance requires two approaches and departures each.

In regard to the flight path, the Draft E. I. S. says, "a secondary approach-departure path would be used during northwesterly winds that are in excess of approximately 17 knots. Based on surface wind data for Sand Point this latter situation is expected approximately 0.2% of the time, and would be most likely to occur during the winter months (U.S. National Climatic Center, 1982)." (pg. 45) We are concerned about these statistics, since the school and hospital are sited in a more hilly location than Sand Point, 17 knots indicates a moderate breeze ~~and 0.2% of the time may only amount to once a year.~~ and Seattle has many of these.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It would seem that there would be a frequent use of the secondary approach-departure path. Who determines the weather conditions and their suitability to flight paths? Who is responsible for these decisions? Who can elect to make flight path deviations? Who takes responsibility for them?

In consideration of the possibility of helicopter accidents, we notefrom the Draft E. I. S. that "a worst case scenario was generated using the overall accident rate for E.M.S. helicopters. Under this scenario, a flight involving a Children's-destined patient would have a statistical probability of an accident one in 5,459 transports. The accident could occur at any point on the four segments of each flight." (pg. 72) While this is a favorable statistic for the projections of flight frequency given, any accident is of concern to us. Who is responsible in the event of an accident? What if an accident occurred on or near the school grounds, during recess when many children are playing out of doors or after school hours when children are walking home? If the City of Seattle issues a use permit, will the city provide all of the necessary services in the event of bodily harm and/or property damage?

Laurelhurst School has been considered for closure by the Seattle School Board on more than one occasion. Parents from the surrounding neighborhood as well as those from many other Seattle neighborhoods whose children attend this school consider it imperative that this school stay open. We are concerned that the installation of the proposed helistop, whose siting raises serious questions, could jeopardize the ~~future~~ viability of Laurelhurst School. The alternative possibility of a helistop at the Intramural Field bordering N. E. 45th Street is not ruled out as a satisfactory site in the Draft E. I. S. Will the final E. I. S. contain an evaluation of the impacts regarding the public school which is only two blocks away? We hope it does.

Thank you.

Barbara Droker
PTA Board (DM)

MONTLAKE COMMUNITY CLUB

"Cooperating to maintain a fine Montlake Residential District"

TESTIMONY AT PUBLIC HEARING, SEPTEMBER 23, 1986, ON CHILDREN'S HOSPITAL HELISTOP

I am Doris Baxter Burns, 2511 West Montlake Place East, Seattle 98112, President of the Montlake Community Club. We will present some of our comments at this time with more detailed concerns in writing before the October 2nd deadline.

First of all, we must protest your mailing list which contains not a single community council. Allied Arts may well be concerned about the helipad, but why are University District, University Park, Laurelhurst, Green Lake, Montlake, Wallingford, Ravenna-Bryant, Eastlake, Portage Bay-Roanoke, Capitol Hill and other communities well within the flight paths ignored? Some of these community groups may not be aware of the publication of this Draft Environmental Impact Statement and thus miss the deadline for reply about their just concerns. An honest attempt should be made to rectify this error. It certainly is a grave one that should be remedied by notification of the concerned groups and extension of the reply time.

Secondly, cumulative impact must be discussed more adequately. No man is an island, and no institution exists in splendid isolation. Airlift Northwest is a consortium of four hospitals. Providence and Harborview share a helipad which is located on a parking lot at Harborview. University and Children's want individual landing pads: one atop the hospital and the other outside the emergency room. University Hospital manages Harborview and has intimate ties to Children's. The close proximity of University and Children's Hospitals demands that the cumulative impact of landings at both helipads must be considered in this DEIS. Children's Hospital claims only 17% of the helicopter flights. How many will land at University Hospital? You state that other helicopters will be allowed to land at the hospital. It is necessary to provide at least some indication of the numbers of such flights to both hospitals. Additionally, how many MAST flights will continue to both hospitals and where are they expected to land? How do you expect to enforce your flight patterns on emergency medical helicopters other than Airlift Northwest? One recently flew over my home which is some distance from I-5. Indeed, Airlift Northwest flights will operate at pilot's discretion also.

Other aircraft that must be considered are the traffic advisory planes and helicopters which patrol I-5, SR 520 and the Montlake Cut. Private planes of the fixed wing variety abound in this area. Float planes fly over Capitol Hill, swoop down over SR 520 and land on Portage Bay. Lake Union is also a favorite destination. During football games at Husky Stadium, planes trailing advertizing slogans circle the area. All these flying vehicles appear to be completely unregulated. Add to this a proliferation of emergency medical helicopters whose safety record as a class leaves much to be desired. The cumulative impact of all planes, fixed wing or rotor propelled, must be considered in your

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

analysis of cumulative impact on the densely populated area over which the helicopters will fly.

In conclusion, we find this a most inadequate document that raises more questions than it answers. Hopefully the FEIS will be more satisfactory.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5405870 Submitted as testimony of Albert Feldman @ DEIS pub. hrg. 9-23-86

High Aeromedical Helicopter Crash Rate Tied to Pilot Fatigue

Washington—The U. S. aeromedical helicopter crash rate is running triple that of commercial helicopter operators, and concern is growing among safety experts that long pilot duty shifts are compromising safety.

The nonfatal crash of an aeromedical helicopter in Idaho Aug. 10 has brought the number of confirmed U. S. aeromedical crashes this year to 20, five more than in all of 1985. Two of this year's crashes were fatal, killing two pilots and three on-board crew.

On June 2, near Hueytown, Ala., a Messerschmitt-Boelkow-Blohm BO. 105 returning to its hospital base after a successful patient transfer mission hit a wire and dropped into the Warrior River, killing a pilot and two medical crew. In January, a Maryland State Police Bell 206 JetRanger crashed at night in trees while returning from a mission to its base near Baltimore, Md., killing a state police pilot and emergency medical technician/observer (AW&ST Apr. 21, p. 63; Mar. 24, p. 30).

In the Idaho crash, which occurred at approximately 9:30 p. m., the Bell LongRanger 206 hit trees while lifting off a mountain ridge at 8,400 ft. after rescuing an injured aircraft crash victim.

Pilot error has been a factor in about 90% of the accidents, according to John B. Galipault, president of the Aviation Safety Institute in Worthington, Ohio, and Donald Wright, president of the National Emergency Medical Service Pilots' Assn., near Houston, Tex. Their organizations monitor flight safety and compile records on aeromedical helicopter accidents.

Galipault and Wright believe that duty shifts frequently averaging 12 hr. and more, combined with rotating day and night workweeks, are contributing to the problem by fostering pilot fatigue.

"The average hospital-based helicopter operation with 24-hr. coverage has a staff of three pilots, which, when you divide it up, results in six 40-hr. workweeks a month per pilot," Wright said. "Those flying in two-pilot operations work the equivalent of almost nine 40-hr. weeks a month.

"When you're tired, your judgment is affected and you make bad decisions, like continuing to fly into bad weather . . . and in case of emergency your reaction time is slow," he said.

The aeromedical helicopter departments in the Alabama and Idaho crashes were two-pilot operations, with two pilots responsible for covering a 24-hr. duty day. It is believed that fatigue was a factor in at least one of the crashes. □

Airline Observer

Air Line Pilots Assn. has hired Future Aviation Professionals of America to provide counseling and job searching for 566 pilots out of work after the bankruptcy at Frontier Airlines. Unlike the situation in which Braniff pilots were looking for cockpit positions in 1981, those Frontier cockpit crewmembers willing to take flight engineer and junior copilot jobs could be flying within the next three months. It required almost three years for the airlines to absorb the unemployed Braniff pilots. A number of the larger carriers are willing to hire pilots in their 50s, and more than 15 will hire cockpit crewmembers beyond the age of 40, because of the strong demand for qualified pilots. American Airlines already is interviewing former Frontier pilots and United, Federal Express and Piedmont Airlines are showing an interest in the same group.

Short-range transports will continue to dominate the production line, according to McDonnell Douglas' 1986-2000 commercial aircraft outlook. The company projects demand for 1,166 aircraft seating 110 passengers and 1,786 aircraft seating 160 passengers in the short-range category. Airlines in the U. S. would buy 39% of the 110-passenger airplanes and 54% of the larger capacity aircraft, with orders concentrating during 1991-1995, according to the forecast.

Canada's Air Transport Assn. is encouraging travelers not to smoke on board aircraft but does not support a smoking ban on all flights, citing determined opposition to a ban and the risk to safety of covert smoking. In a statement, ATAC welcomed the prohibition against smoking on limited duration flights in Canada and noted that such prohibitions on transborder and international flights require international agreement.

Major carriers shopping around for a stronger western foothold are considering acquisition of AirCal, Pacific Southwest Airlines and Alaska Airlines, according to industry sources. The Delta Air Lines acquisition of Los Angeles-based Western has put pressure on other majors to align themselves with West Coast carriers that serve a significant market share. Of the majors, United Airlines has the strongest service in the West, but American Airlines' and Trans World Airlines' route systems may need to be reinforced.

Airframe manufacturers are keeping in mind requirements for more sophisticated forms of in-flight entertainment systems when developing designs for new transport aircraft, according to in-flight entertainment industry officials. Flat screen displays installed in seat backs and over-water satellite communications for conducting passenger business activities as well as airline operations could be possible within the next five years.

Strong summer traffic, coupled with strengthening yields and reduced unit costs, could produce a $1-billion plus operating profit for U. S. airlines in the third quarter. The earnings would compare with a $700-million operating profit in last year's third quarter. Airline Economics, Inc., Washington, D. C., forecast the turnaround, and now is being joined in the positive forecast by Wall Street analysts.

Tampa Bay area authorities decided to give up Tampa's dormant authority as gateway to London, supporting a shift of that authority to Charlotte, N. C., and supporting Piedmont Airlines as the carrier to London. Piedmont has pledged to originate and terminate its transatlantic service at Tampa, with Charlotte as a stop en route. Tampa Mayor Sandy Freedman said one-stop London service was better than no service, and Tampa civic parties said there was little time to find an airline to use the Tampa authority in response to a Transportation Dept. order asking why the authority should not be removed. Piedmont ranks second with 31 daily departures at Tampa.

From: Laurelhurst School P.T.A. Board

Re: Hearing on Draft Environmental Impact Statement of Children's Hospital and Medical Center Helistop

Date: September 23, 1986

We, the Laurelhurst School P.T.A. Board, come before you this evening primarily in the interest of the children who attend this public school. Our interest does extend beyond the school as well. We represent the board only, not the whole Laurelhurst School Parent-Teacher Association. At this time, we are merely familiar with the major arguments for and against the proposed helistop. We wish to express in brief our concerns, and we wish to ask some questions for which we could not find answers in the Draft E. I. S.

While the school is normally occupied between 9:00 A.M. and 3:00 P.M. five days a week, children and staff arrive on foot, by car and by bus as early as 7:30 A.M. (some for day care). Children leave at 3:00 P.M. to walk or ride home, but some stay as late as 6:00 P.M. (until picked up by parents). Staff leave at differing times in the afternoon. Outdoor playtimes include A.M. and P.M. recesses, post-lunch recesses and some physical education classes. Many children play and participate in activities at the adjacent Laurelhurst Park. On several occasions there are evening events sponsored by the P.T.A. which draw students, their families and staff. In addition, some Laurelhurst Park Department classes are taught in the school. It is safe to say that the school is unoccupied between 10:00 P.M. and 7:00 A.M.

We are concerned, therefore, about the impact of noise and vibration on Laurelhurst School. It is noted in the Draft E. I. S. that "helicopter noise could and probably would be disruptive of some adjacent residents' lives." (pg. 92) Would the impact be greater for the secondary approach-departure path, which covers the area over Laurelhurst School? What would the impact of noise and vibration mean to daily instruction in the classroom, study in the library, instrumental music lessons in the auditorium, individualized teaching on the second floor or programs in the gymnasium? We are concerned about the frequency of flights, given that every instance requires two approaches and departures each.

In regard to the flight path, the Draft E. I. S. says, "a secondary approach-departure path would be used during northwesterly winds that are in excess of approximately 17 knots. Based on surface wind data for Sand Point this latter situation is expected approximately 0.2% of the time, and would be most likely to occur during the winter months (U.S. National Climatic Center, 1982)." (pg. 45) We are concerned about these statistics, since the school and hospital are sited in a more hilly location than Sand Point, 17 knots indicates a moderate breeze and 0.2% of the time may only amount to once a year.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It would seem that there would be a frequent use of the secondary approach-departure path. Who determines the weather conditions and their suitability to flight paths? Who is responsible for these decisions? Who can elect to make flight path deviations? Who takes responsibility for them?

In consideration of the possibility of helicopter accidents, we notefrom the Draft E. I. S. that "a worst case scenario was generated using the overall accident rate for E.M.S. helicopters. Under this scenario, a flight involving a Children's-destined patient would have a statistical probability of an accident one in 5,459 transports. The accident could occur at any point on the four segments of each flight." (pg. 72) While this is a favorable statistic for the projections of flight frequency given, any accident is of concern to us. Who is responsible in the event of an accident? What if an accident occurred on or near the school grounds, during recess when many children are playing out of doors or after school hours when children are walking home? If the City of Seattle issues a use permit, will the city provide all of the necessary services in the event of bodily harm and/or property damage?

Laurelhurst School has been considered for closure by the Seattle School Board on more than one occasion. Parents from the surrounding neighborhood as well as those from many other Seattle neighborhoods whose children attend this school consider it imperative that this school stay open. We are concerned that the installation of the proposed helistop, whose siting raises serious questions, could jeopardize the future of Laurelhurst School. The alternative possibility of a helistop at the Intramural Field bordering N. E. 45th Street is not ruled out as a satisfactory site in the Draft E. I. S. Will the final E. I. S. contain an evaluation of the impacts regarding the public school which is only two blocks away? We hop it does.

Thank you.

Sept. 22, 1986

Dear Julia

Pursuant to SEPA ordinance 25.05.'155'7
I am requesting a 15 day extension
of the comment period established
by DCLU with regard to COH's DEIS
on the proposed hilistop. It is crucial
that we have sufficient time to
distribute copies of the DEIS to those
neighboring community councils
which did not receive it. Such as
Montlake, View Ridge, Hawthorne Hills,
Ravenna Bryant, University District,
Windermere, and Blaine Terrace.
These communities surround COH and
will be significantly impacted by
this project and should have adequate
time to respond to the DEIS. In addition
we have been forced to seek additional
comments on the DEIS from impartial
sources outside of Washington State
because of local physicians and pilots
desire and dignity. Nationally
recognized experts on various aspects
of EIHS transport reside in other
parts of the country and consequently
there is a significant time delay
in receiving their DEIS comments.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please notify us as to your decision regarding this request.

Sincerely,

Liz Anderson
CCHT
and Lauralhurst Community Club

COHMC STRATEGIC DIRECTIONS STUDY

Presented by David Hunter
January 22, 1986

I. Description of the strategic directions study process, a review of internal and external environments (the truth about the healthcare environment as it presently exists inside and outside of the hospital.

A. External - What is happening in and to the healthcare environment in general?

. financing crisis
  - decrease in federal and state revenues
  - decrease in insurance coverage especially for dependents
  - increasing capital needs
  - decrease in philanthropy, although not at COH
  - unavailability of cross subsidization
. alternative delivery mechanisms
. mergers, acquisitions, etc.
. emphasis on competition vs. regulatory protection
. focus on outpatient
. general aging of the population

B. Internal - Uniqueness of pediatric health care and Children's Orthopedic Hospital

. focus on outpatient, few children require hospitalization
. children hospitalized are very sick, require intensive care
. higher staff to patient ratios than adult
. specializations require maximum patient volume to maintain quality (regionalism)
. unique equipment needs
. inpatient pediatric care expensive; however, more cost effective given the patient's predicted productive life span

II. Demographic Profile - general description

A. Population trends

B. General aging of population

C. COHMC service areas

III. COHMC Mission

A. Pediatric patient care

. community hospital
. regional health center

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. Teaching

. University of Washington
Pediatric graduate medical education

C. Research

. attract and maintain quality staff
. need for research and clinical areas on same campus

IV. Future Planning Parameters

A. Solutions/plans must be fluid

B. Problems in Master Planning

C. Strategic Planning more difficult than in past regulatory environment

V. Strategic Directions - plans which encourage the operation of a fiscally sound organization that maintain quality tertiary care (including teaching and research) with the capability to provide total pediatric healthcare needs for the children of the Pacific Northwest.

A. Networking

. emergency transportation system (ground, fixed wing and rotary) to COHMC as well as back to community of origin
. decentralization
. management of pediatric care
. evaluation of partnerships with organized multi-hospital systems
. national networking

B. Research/Teaching

. Medical Office Building
. Community Education

C. Preferred Provider arrangements

SEPT 23, 1986

I WOULD APPRECIATE THE FOLLOWING QUESTIONS BEING RAISED/ANSWERED AT THE SEPT 23 DCLU HELISTOP HEARING. THE QUESTIONS PERTAIN TO STATEMENTS IN THE COH DRAFT E.I.S. REGARDING HELICOPTER OPERATIONS.

1. Pg 45, para 2 : WILL THERE BE NIGHT LANDINGS AT COH?
   para 3 : SURFACE WIND DATA FOR LANDINGS AT COH SHOULD NOT APPLY AS SANDPOINT IS APPROX 1½ MILES N.E. ON FLAT TERRAIN. WILL AIRLIFT NORTHWEST OR COH HAVE A TRAINED WEATHER OBSERVER AT THE HOSPITAL TO ACCURATELY REPORT ACTUAL WEATHER CONDITIONS AT THE HELIPAD DURING ADVERSE WEATHER? IF NOT, WHY NOT?

   ARE ALL AIRLIFT NORTHWEST PILOTS INSTRUMENT QUALIFIED? I.E. "IFR RATED" PILOTS.

2. pg 67, para 3 : WHY DO AN PILOTS HAVE THE "OPTION" OF USING FAA WEATHER MINIMUMS OR A.N. WEATHER MINIMUMS? TWO SETS OF STANDARDS MAY LEAD PILOTS TO FEEL PRESSURE TO FLY UNDER MARGINAL WEATHER CONDITIONS.

3. pg 68, para 1 : "AIRLIFT NORTHWEST WOULD ONLY LAND AT COH IN CONDITIONS OF GOOD VISIBILITY." WHAT EXACTLY DOES A.N. CONSIDER "GOOD VISIBILITY"? CEILING AND HORIZONTAL VISIBILITY?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Pg 69 para 3 : EIS STATES THAT "AIR TAXI HELICOPTERS ARE EXAMINED AND FLIGHT TESTED BY THE FAA AT LEAST ANNUALLY." THIS STATEMENT IS INCORRECT. FAA DOES NOT FLIGHT TEST HELICOPTERS ANNUALLY. AIRLIFT NORTHWEST SHOULD CLARIFY THIS STATEMENT.

THANK YOU.

RICHARD L. MERRELL

Dear Mr. Merrell,

Thanks for your helpful comments to the Laurelhurst Letter Opinion Poll.

Here is a copy of the draft environmental impact statement (DEIS) for the proposed helipad for Children's Hospital. A DEIS hearing is scheduled for September 23 at 6 p.m. at the Laurelhurst Elementary School (N.E.45th at 46th N.E.). Written comments are due by October 2.

We are particularly interested in having comments related to the Intramural Field Alternative (page 49) and the Limited Landing Alternative (page 55).

A noise expert is reviewing this DEIS and we are searching for an expert to review safety factors. A recent AMA News article and a CBS t.v. news item have brought the safety problems of hospital based helicopters to public attention.

Any ideas here?

Any comments you might come up with would be greatly appreciated. If you don't want to submit them in your name, please send them to me. We appreciate any insights you might have. There is so much "hoopla" surrounding this issue, that we are grateful for any careful, considered views on this subject.

Thanks for your help.

Sincerely,

Jerry

Julia Gibb
City of Seattle Department
of Construction and Land Use
Room 408
Municipal Building
Seattle, Wa

Dear Ms. Gibb:

For six years I was a Search and Rescue pilot for the U. S. Coast Guard. I also served for three more years as the Senior Controller in the Coast Guard's Rescue Coordination Center located atop the Federal Office Building downtown. I was responsible for information processing, planning, and launching helicopters from Astoria, North Bend, and Port Angeles, and fixed-wing aircraft from Sacramento and Kodiak. I have worked extensively with MAST, the National Guard, Navy helicopters from Whidbey Island, and the Air Force in conjunction with the National SAR Plan. I am a graduate of the National Search and Rescue School in New York. I have personally been involved in hundreds of search and rescue operations and medical evacuations on both coasts, the Caribbean, Mexico, Alaska, and the South Pacific. I am currently a Captain for Alaska Airlines. I am the 737 Safety Representative for the Airline Pilots Association, and recently completed the Association's Accident Investigation School in San Diego, California.

It is my professional opinion that the Children's Hospital and Medical Center Helistop Proposal is neither necessary nor safe.

It takes 2½ minutes, in rush hour traffic, to drive from the University of Washington Intramural Field to the door of the Emergency Room at Children's Orthopedic Hospital. On Table 2 (p. 14) of the DEIS, from August, 1985 thru June, 1986, the average one-way flight time (from pick-up of the patient to arrival at COH) was one hour and four minutes (1+04). If two of the longer flights are excluded, the average flight time is 46 minutes. The total mission time, including flight time from Boeing Field to COH to pick up the Medical Team, flight time to arrive at the accident scene or the referring hospital, and return to COH, is at least twice the amount of time reported in the DEIS. This does not take into account the initial medical evaluation time, the decision making process, notification, flight planning, and the preflight checks of the aircraft. The time frame we are discussing is obviously not minutes and seconds. In nine years of hands-on operations, I never, ever saw the outcome of a single mission determined by 2½ minutes.

The DEIS would have you believe that the jostling sustained in the transfer from helicopter to ambulance might be dangerous to a critically ill child. Turbulance is primarily caused by low

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

level winds. Even light winds, when associated with buildings, hills, or trees can cause moderate to severe turbulance from the surface up to 2000 or 3000 feet in altitude. This, of course, is exactly the operating regime of most helicopters.

I can personally guarantee that the smoothest part of a child's ride will be when it is carefully lifted by the paramedics from the helicopter and placed in the ambulance. To assert that a professional medical team will jostle a small child more than a 46 minute helicopter ride is nonsense.

While the necessity of the proposal seems contrived at best, the safety issues are very real.

The current helicopter landing sight at the University of Washington Intramural Field allows a wide-open, normal, controlled approach profile from all quadrants with no obstructions. The proposed helicopter landing sight at COH is surrounded by hills, tall trees, power lines, tall buildings, an elementary school and a densely populated residential area.

The approach profile proposed by Airlift Northwest calls for a 1500 ft/min rate of descent. A normal approach by a commercial jet aircraft is based on a 500-700 ft/min rate of descent. Remember how that feels on your ears and sinuses and thentry to appreciate the damage possible to a small child with a descent rate three times as great.

The proposed flight path also calls for excessive maneuvering in downwind landing situations. This is always a critical maneuver, but is made more so by the lack of escape routes from the proposed landing sight. A helicopter simply does not enter or sustain hover as well downwind, and a downwind departure with full fuel tanks, medical personnel, and at maximum gross weight, could be particularly demanding.

Emergency Medical Operations are conducted under the rules of Part 135 of the Federal Aviation Regulations. When operating under the Visual Flight Rules of this Part, helicopters must maintain 300 ft altitude over congested areas except in the landing environment. They must not operate under Visual Flight Rules when the in-flight visibility, as observed by the pilot, is less that one-half mile. Contrary to the testimony of the Airlift Northwest pilot in the DEIS, there is no FAA minimum ceiling specified for helicopters.

There are no FAA weather minimums, other than visibility and icing that are restrictions on Part 135 helicopter operations and inflight visibility is determined by the pilot and if the pilot, based on his observation of the weather, believes there might not be icing conditions, regardless of forecasts, then this restriction does not apply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FAR Part 135.213(a) states that for operation under VFR, the pilot in command may, if a National Weather Service weather report is not available,"use weather information based on the pilots own observations...."

Under Part 135, and EMS pilot is limited to eight hours flight time in a twenty-four hour period, except in the event of bad weather when there is no restriction.

It is reasonable to assume that a helicopter pilot will do everything in his power to transport a critically ill child, even into a marginal landing environment.

Given a single piloted aircraft, such as the Agusta, in marginal weather conditions, the pilot must not only maintain aircraft speed, altitude, and attitude monitor critical engine operating parameters, and maintain navigational guidance by reference to his instruments, but he must also maintain visual reference with the surface, all the while talking on the radios and maneuvering his aircraft to avoid obstacles such as hills, trees, power lines, tall buildings. and elementary schools.

There is no question that helicopters play a vital role in the transport of critically ill patients.

I would only ask that you consider the following. First, the need for a helicopter landing site 2½ minutes closer to Children's Orthopedic Hospital is negligible.
Second, the shift from a wide open, inherently safe landing site, to a congested, difficult, and demanding landing site invites incident ranging from the merely injurious, to the catastrophic.

If for some profit motive or marketing consideration this proposal is considered favorably and is brought to fruition, and if one small child dies or is seriously injured as a result of this senseless plan, this community and the city of Seattle should be morally outraged.

Sincerely,

Bart E. Baxter

RE: Comments on Draft Environmental Impact Statement (DEIS)
For Children's Hospital Helistop

Frank Chestnut, Director
Certificate of Need Program ET-33
Department of Social and Health Services
Olympia, Washington 98504

Dear Mr. Chestnut:

Our comment period for public and agency comments on this document has been extended until October 17.

We held a hearing on the DEIS on September 23 and took testimony from a number of individuals, agency representatives and legislators. Numerous written comments have also been received on issues of medical need for the helistop, noise, safety, alternative sites, cumulative effects and other topics.

Because your agency is one with some expertise and/or jurisdiction over medical emergency transport matters, we believe the DEIS will benefit from your review and comments to us.

Thank you for your consideration of this request. If you have questions please feel free to call Julia Gibb at 625-4509.

Sincerely,

HOLLY MILLER

Larry Thompson, Executive Director
Puget Sound Health Systems Agency
601 Valley Street
Seattle, Washington 98109

Dear Larry:

I am writing to give you my comments on the Puget Sound Health Systems Agency's proposed plan for air ambulance (helicopter) services. First, let me apologize for the delay in responding. In the last month, my staff and I have had an opportunity to review the proposal and the issue generally with County Executive Tim Hill, representatives of the Mayor's Office and key County Council members. I would summarize our general comments as follows:

1) There is a consensus on the need to develop such a plan. We are on the threshold of a major change in pre-hospital emergency medical services and in the relationship between providers and the hospital community. In addition, inter-hospital relationships are being affected by the introduction of air ambulance services. The relationship of local community hospitals throughout the Puget Sound basin to the tertiary care centers in the Seattle-Tacoma metropolitan area may be the major factor influencing the development of air ambulance services.

2) There is a need to coordinate the development of such a plan with others who are already working on this issue. The Washington State Medical Association Emergency Medical Services Standards Committee has appointed a special Task Force to deal with helicopter medical standards. Their charge is to develop medical indications or "user guidelines" for the use of helicopters in patient transportation. I have attached for your information a memorandum from Lothar Pinkers, M.D., dated February 21, 1986, that outlines the Task Force's agenda.

   The WSMA Task Force will be addressing many of the items identified in your proposal. I believe they will be establishing a framework for further planning. They are hoping to have a final report by June, 1986.

   There is also talk of incorporating air ambulance service planning into a statewide EMS planning effort.

400 Yesler Building Seventh Floor Seattle, Washington 98104 (206) 587-4600

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3) It seems essential that any planning effort be broader in scope than just Seattle and King County. I realize this is a change from what we discussed previously, but upon further reflection, it just does not seem realistic to focus on Seattle and King County when the operation of air ambulance services will undoubtably be multi-county in scope. If the planning process is too narrow, it will lack credibility with other potential users on our borders and beyond.

In summary, it is my recommendation that the Puget Sound Health Systems Agency look to broadening the geographical scope of a plan for air ambulance services. It is imperative that those entities outside of Seattle and King County with an interest in such a plan be included in the process from the beginning. Secondly, the Health Systems Agency's planning effort should compliment the Washington State Medical Association's activities. In fact, it should probably follow and expand upon their work.

Finally, I understand your agency is involved in reviewing a Certificate of Need for helicopter services in Bellingham. How does that fit into this evolving situation?

I would ask that you contact Steve Call, Manager of the Emergency Medical Services Division, at 344-4293, to schedule a meeting to discuss where we go from here.

Thanks for your efforts to date. I look forward to working with you.

Sincerely,

Bud

MEMO TO: MEMBERS, WSMA EMERGENCY MEDICAL SERVICES STANDARDS COMMITTEE

FROM: LOTHAR H. PINKERS, MD, CHAIRMAN

SUBJECT: APPOINTMENT OF TASK FORCE MEMBERS -- NON-MEMBERS, FOR INFORMATION ONLY

Following the instructions of the committee at its last meeting, I am asking the following physicians to meet as a special committee dealing with helicopter medical standards: Drs. Gregory Brown, Michael Copass, Michael Carlson, Mark Jergens, Jay Kranz, Marvin Wayne, and Ron Richeson. Dr. Richeson will be chairman.

The charge to the subcommittee is to develop medical indications or "user guidelines" for the use of helicopters in patient transportation. They should consider at least the following items:

1. The medical indications for prehospital transfer.

2. The medical indications for interhospital transfer, including the use of rotary as opposed to fixed-wing aircraft.

3. Develop descriptions for flight crews and indications for the use of the various levels. For instance, flight paramedics, flight nurses, flight physicians.

4. Effective interaction between air and land services. Among these, they need to consider:

   A. The need to have land units financially survive (they are needed to provide backup when air units cannot fly and for primary patient care before flying).

   B. The development and designation of land-air transfer points in order to reduce total flight time and total patient care time; that is, having land-based units run from an area of origination and meet with an outward-bound air transfer unit somewhere in between.

   C. Patient survival and safety specs for either roundtrip pick-up and return by the flight crew coming from their area of origin versus one-way flight from the hospital or patient origin with perhaps a slightly different level of flight crew availability.

There are several givens in this discussion. One of these is that helicopters are a useful instrument in patient care. Two is that they are expensive to operate and maintain. Three, patient care protocols must be designed such that the MAST continues to function in Western Washington.

I would like to set a tentative reporting schedule of progress report at the end of April 1986 and a final report to the whole committee in June 1986.

Bud Nicola, M.D., M.H.S.A.
Director of Public Health
Seattle-King County Health Department
Seventh Floor
400 Yesler Building
Seattle, Washington 98104

Dear Bud:

Enclosed, as I promised, is a proposal for an intensive planning activity leading to policies which will shape the appropriate development of air ambulance services. Based on our prior discussion, I understood that a detailed proposal turned back around to you quickly was in order given the increasing gravity of the EMS situation and necessary approval lead times.

I do not have addresses for attendees at the February 5 meeting. Could you forward this proposal to them? Also, it was my understanding that you would be responsible for preparing any necessary internal reviews and ordinances. Needless to say, we are quite willing to discuss modifications or other related issues.

As you will note, this proposal has been developed at a very reasonable cost. PSHSA shares the City and County's interest in effectuating an early improvement in the development of this service.

Sincerely,

Larry A. Thompson

PROPOSAL FOR THE DEVELOPMENT OF AIR AMBULANCE
SERVICES IN KING COUNTY AND THE CITY OF SEATTLE

PROJECT GOALS

To develop a plan and implement strategies which will best assure the rational integration and coordination of air ambulance services with the EMS system of King County and the City of Seattle. The plan is to be developed using the advice, guidance, and involvement of affected parties, and the implementation strategies are to consider region-wide and state-level alternatives and impacts.

PROJECT OBJECTIVES

1. Assess the current status of air ambulance services in King County and describe the development trend of this service in other locations across the nation.

2. Identify and assess current and projected problems and service needs with respect to air ambulance services.

3. Develop goals for development of this service and criteria for evaluation.

4. Identify and assess a series of alternatives to meet identified problems and needs.

5. Evaluate and select from among various policy options available for implementing the plan.

PHASES OF THE PROJECT

Phase I: Preliminary Organization

The first phase of the project will allow the Puget Sound Health Systems Agency (PSHSA) to meet with the County and City to finalize the project work plan including agreed-upon methods for involving affected parties in the execution of this project. The appropriate structure for a project steering committee will be agreed upon. In addition, details of governmental agencies' involvement will be finalized.

Tasks

1-1 Review scope of the project and establish precise definitions for which the plan is being prepared with the sponsors.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1-2 Review and agree upon tasks outlined in the proposal.

1-3 Establish role and membership of steering committee.

1-4 Establish review and comment procedures.

1-5 Clarify relationship between the affected parties, e steering committee, PSHSA as contractor, and the county and city as sponsors.

1-6 Compile an affected parties list and identify liaison persons.

1-7 Recruit and orient steering committee members.

Phase II: Develop Goals and Criteria

The first objective of this phase is to establish a statement of goals for air ambulance services which identifies the general direction and intent of the service. Second, a set of criteria will be developed which operationally defines the intended results described in the goal statement and permits the measurement of effectiveness of the service.

Tasks

2-1 Draft goal statements for air ambulance services.

2-2 Draft a set of criteria to measure the effectiveness of air ambulance services.

2-3 Conduct a review with affected parties.

2-4 Conduct steering committee review, modification and adoptions of the criteria and goals.

Phase III: Conduct Inventory and Analysis

The third phase of the project will establish an inventory of current service providers and baseline information with respect to the air ambulance services.

Tasks

3-1 Identify current service providers including modalities offered and geographic coverage.

3-2 Review transport records to determine patterns of use, numbers and types of transports, costs of service.

3-3 Review transport records from selected locations outside of King County to establish use patterns from outlying areas.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3-4 Analyze the information gathered through the inventory and establish baseline information on air ambulance services.

Phase IV: Identify Problems and Conduct a Needs Assessment

The first objective of this phase is to identify problems with the current system especially the existing relationships of air ambulance services to the County/City EMS system and the total health care system. Second, a needs assessment to determine the gaps in service will be conducted. To accomplish this objective a review of literature and existing systems throughout the country will be completed. Third, a method to assess the needs of the city and county's population will be developed. Finally, using a "key informant" survey, local key problems and issues will be identified.

Tasks

4-1 Review industry and clinical literature.

4-2 Assess and/or shape local clinical consensus on indications for air transport.

4-3 Develop need projection model and make preliminary estimate of need for services.

4-4 Conduct a key informant survey to identify local problems.

4-5 Using literature review, key informant survey, and needs assessment, develop a listing of key problems and policy issues involving air ambulance services.

4-6 Steering committee review of problems and needs assessment.

Phase V: Development and Analysis of Alternatives

The objective of this phase is to identify a series of policy alternatives which could address the problems and goals identified through earlier tasks in this planning process. Examples of such alternatives might include various types of franchising, licensure and certification laws, land use controls and influence over third-party reimbursement.

Alternatives will be analyzed in terms of their probable short and long range impact and in view of their political and technical feasibility. Competing and complementary alternatives will then be screened in view of their desirability as measured by the project's adopted criteria.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Tasks

5-1 Develop alternatives through discussion with various regulatory and non-regulatory authorities and with affected parties.

5-2 Measure each alternative against the established criteria and analyze the effect of each alternative.

5-3 Steering committee selects desired alternatives.

Phase VI: Develop and Adopt Plan for Air Ambulance Services

The objective of this phase is to bring together in a comprehensive plan all of the information gathered on the current situation and projected needs; the identified problems and potential strategies with policy implications; and the desired alternatives with rationale. Time has been allocated during this phase for review by both the affected parties and the general public.

Tasks

6-1 Combine information and decisions from prior steps in a draft plan.

6-2 Steering committee review of draft plan.

6-3 Release draft plan for public review.

6-4 Conduct public hearing and consider comments received.

6-5 Steering committee approves redrafted plan.

6-6 City and County comment and propose revisions.

6-7 Final adoption by steering committee.

6-8 Plan transmitted to city and county for policy use.

Phase VII: Develop Implementation Action Plan

The objective of this phase is to make specific suggestions about who should be responsible for implementing the plan and what action steps will be needed in order to implement the plan.

Tasks

7-1 Identify organizations which are responsible for implementing each of the principal recommendations in the plan.

7-2 Discuss recommendations with each organization, discuss implementation and suggest assignment of roles for implementing.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7-3 For each recommendation develop a time line and action steps.

7-4 Present the implementation action plan to the city and county for follow-up and evaluation.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

BUDGET

Professional Fees	Billable Hours	Budget	
Phase I Activities	37	$ 1,387.50	
Phase II Activities	38	1,425.00	
Phase III Activities	140	5,250.00	
Phase IV Activities	306	11,475.00	
Phase V Activities	178	6,675.00	
Phase VI Activities	76	2,850.00	
Phase VII Activities	130	4,875.00	
	Subtotal		$33,937.50

Material Costs*		
Printing/Copying, Postage	$ 860.00	
Public Notices	150.00	
Travel Expenses	250.00	
Computer Time	380.00	
Subtotal		$ 1,640.00
Total		$35,577.50

* The costs shown in this section are extraordinary costs associated with steering committee activity, affected party review, analysis and development of projection method and public review. All other associated project costs are included in the hourly billing rate.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ASSUMPTIONS MADE IN THE BUDGET

1. PSHSA will coordinate meetings and agendas for six (6) meetings of the Steering Committee. Coordination will include developing and sending the agenda; setting up meeting sites; recording and distributing meeting summaries. It is assumed that there will be between seven (7) and twelve (12) members on the Steering Committee. If PSHSA is asked to conduct additional meetings of the Steering Committee the estimated cost is $560 per meeting.

2. Budget estimates are based on involvement of affected parties during key points in the project. It is assumed that there will be approximately twenty (20) liaison individuals on the affected party list. Affected party reviews will be held three times during the project. Cost of each additional affected party review is approximately $275.

3. Budget estimates include interviews with 20 key informants to assist with problem identification. Additional key informants could be added to the survey at a cost of $87.50 per individual. If desirable a phone survey of community representatives could be included during the problem identification phase; details and costs would have to be discussed.

4. PSHSA will rely on a locally selected Technical Advisory Group (TAG) to develop the local clinical consensus on indicators for air ambulance services. The TAG will meet twice and issue a report to be used by the Steering Committee. Extensive involvement of the TAG in modifications to the report (i.e., additional TAG meetings) will require additional resources. Cost is estimated at $167.50.

5. The need projection model developed in the course of this project is not intended to be used as an air ambulance need method. Therefore the model is not intended to be used, as developed, in the Certificate of Need or regulatory review process. The development of such a need method would involve extensive involvement of the health planning community and is outside the scope of this project. The model would be an essential starting point toward the development of a need method.

6. Budget estimates are based on one (1) public review period of thirty (30) days and one (1) public hearing on the Draft Plan for Air Ambulance Services.

Re: Children's Hospital & Medical Center -- Timetable for Helistop Conditional Use Permit Application

Dear Julia:

This letter will follow-up on and confirm the agreements reached at our meeting of August 13, 1986, relating to the timetable for proceeding with the processing of CHMC's Helistop conditional use permit application through both the EIS and Hearing Examiner hearing.

First, we agreed that the City and CHMC agree to adhere to the enclosed timetable for processing this application. In connection with the processing of this application, CHMC will mail notices relating to the draft EIS publication, the issuance of the final EIS and the hearing date for the Hearing Examiner's hearing.

Second, we will now seek agreement from both DCLU and the Hearing Examiner's office that the dates proposed for the hearings are reserved now so that they will be available for these hearings.

I also wanted to make one comment about the handling of the Environmental Impact Statement and the Environmental Impact Statement hearing. My understanding is that the determination of whether the project is permitted as a Council conditional use because it affects persons in "life threatening" emergencies is primarily an issue for the Hearing Examiner's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

hearing during the week of January 5, 1987, and that it is not an environmental issue.

In closing, I would ask that at any time during the schedule when it would be possible to expedite the proceedings, that those steps be undertaken; you can be assured that we will also do so.

I think it is only fair to both the applicant and those who are truly interested in a resolution of the issue to obtain a prompt and full determination.

Very truly yours,

DAVIS WRIGHT & JONES

Ms. Susan Killen
Shapiro & Associates
Smith Tower Bldg, Suite 1812
506 Second Ave
Seattle, WA 98104

Dear Ms. Killen:

I have reviewed the forthcoming helicopter landing pad at the Childrens' Orthopedic Hospital and your request to get our comments on the natural gas facilities located in the area adjacent to the proposed helipad. Washington Natural Gas Company has an existing 4-inch main located three feet south of the asphalt driveway coming easterly from Sandpoint Way NE towards the meter house at Childrens' Orthopedic Hospital. Our line does have a shut-off valve where the natural gas system can be shut off at a point on the west side of Sandpoint Way NE. The proposed helicopter pad does not appear to cause a great deal of concern as far as the location in relationship to existing meter house. The line from the meter house to the hospital is the property of the hospital, and if your plans are to install a 60-inch thick cement pad, it would be advisable to explore the relocation of the hospital's fuel line to clear the pad. WNG's responsibility is from the main in Sandpoint Way NE, up to our meter located at the meter house.

Enclosed please find a copy of our print showing the natural gas underground facilities in this immediate area.

If I can be of further assistance, please contact me at 622-6767, Ext. 250.

Sincerely,

Joe Jainga

Treuman Katz
Chief Executive Officer
Children's Hospital and Medical Center
PO Box C-5371 ZC-10
4800 Sand Point Way NE
Seattle, WA 98105

Dear Treuman:

I am writing in response to the alternative cited in your E.I.S. for University Hospital (U.H.) to serve as a helicopter landing site for C.O.H. Critically ill children landing in helicopters at U.H. to be transferred via land vehicle to the Children's Hospital would not be a feasible alternative. As you are aware, the traffic volume in front of the hospital on Pacific Ave. N.E., and that which comes north off the Montlake Bridge past the stadium is frequently extremely heavy, which would impose a transfer problem from U.H. to Childrens. This is obviously not in the best interest of a child in need of acute and emergent medical care which is dictating the need for the air transport in the first place.

I would strongly urge that this alternative not be further considered.

Sincerely,

Irma Goertzen
Administrator

UNIVERSITY OF WASHINGTON
SEATTLE, WASHINGTON 98195

Office of the Vice President for Finance and Administration

July 2, 1986

Mr. Trueman Katz
Childrens' Orthopedic Hospital
and Medical Center
4800 Sand Point Way Northeast
Seattle, Washington 98105

Dear Mr. Katz:

The University of Washington has reviewed the alternatives section of the Childrens' Orthopedic Hospital (COH) preliminary draft Environmental Impact Statement for use of a helipad at COH. One of the alternatives considered is use by COH of a permanent helipad to be constructed in the University's playfield. The University cannot support this alternative.

For a number of years, and for primarily humanitarian reasons, the University has permitted occasional and informal use of its playfields for helicopter landing of COH-bound patients. However, this location is far from ideal, and the University is anxious to regain its playfields for their intended purpose. The University has resisted numerous attempts to utilize the playfields for non-athletic purposes, and our long-range plans call for continued use of the fields for sports activities.

We urge that no further consideration be given to use of the University's playfields as a site for a permanent COH helipad. While we understand that consideration of alternatives is an important element of the review process, the University's position is that continued use of our fields, or construction of a helipad on them, are not feasible alternatives.

If you have any questions, please contact Sally Marks of our Campus Planning Office at 543-9071.

Sincerely,

Tallman Trask III

NG

UNIVERSITY OF WASHINGTON
SEATTLE, WASHINGTON 98195

Office of the Vice President for Finance and Administration

August 28, 1986

Mr. Robert Klug
President, Laurelhurst Community Club
4326 N.E. 42nd
Seattle, Washington 98105

Dear Mr. Klug:

Thank you for your August 13 letter regarding a helipad in the University of Washington east campus area.

My July 2, 1986 letter to Mr. Katz of Children's Orthopedic Hospital (COH) was intended only to address the issue of a permanent helipad for COH on a University playfield. That question arose because a preliminary draft of the COH Environmental Impact Statement (EIS) for a helipad at the hospital discussed as an alternative a "Graves Field Helistop." My letter urged simply that "no further consideration be given to use of the University's playfields as a site for a permanent COH helipad"; it was not intended to necessarily rule out other sites in the east campus area, which might be used for patient transfers headed to COH, or University Hospital.

As you know, the University has begun the process of preparing an EIS on use of the helipad on the roof of the new east wing of University Hospital. That EIS will, of course, address alternatives. During our early work on the EIS, comments were received which requested specific consideration of an east campus alternative, which we will do. We now anticipate publication of the University's EIS by January 1987.

I should note, however, that some of the sites suggested in your letter do not appear to meet all the criteria for a permanent helipad. For example, sites 3, 4, and 5 are located within 1,000 feet of University housing at Laurel Village. It is also not clear that a site large enough to accommodate MAST helicopters could be provided on site 4 without encroaching on the adjacent playfield. Other considerations will have to be taken into account, including impact on the ecological research and wildlife areas, impact on the Center for Urban Horticulture, parking loss, and space demands of other University units.

306 Administration Building, AH-05 / Telephone: (206) 543-6410

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Work is proceeding on the University's EIS, but a determination of the site-specific alternatives to be considered probably cannot be made before the September 8 meeting of the Laurelhurst Community Club Board. I regret that a previous engagement will not permit me to attend that meeting, but I have asked Sedge Thomson to be there to answer any questions your group may have. We will keep you informed of our progress and notify you of the alternatives selected for discussion in the EIS as soon as that determination has been made.

I hope you find this letter responsive to your concerns. If you have any questions, please let me know, or call Sedge Thomson (543-4828) or Sally Marks (543-9071).

Sincerely,

Tallman Trask III
Vice President for Finance
and Administration

August 13, 1986

Tallman Trask III
Vice President for Finance
and Administration
University of Washington
Seattle, Washington 98195

VICE PRESIDENT FOR
FINANCE AND ADMINISTRATION

AUG 19 1986

Dear Mr. Trask:

The Laurelhurst Community Club Board of Trustees has reviewed your letter of July 2, 1986 to Treuman Katz, Chief Executive Officer of Children's Hospital, regarding the possibility of locating a helipad in the Graves Field area to serve Children's Hospital needs. In your letter, we see no evidence that the University has closely examined some possible locations for a helipad that would meet Children's needs. Children's needs a paved, lighted and secure helipad that can be reached over a paved road. Further, the helipad should not be clearly visible from any heavily travelled road, should not be on a playing field, should not be closer than about 1000 feet to any residential buildings and should be easy to land on and take-off from in all types of weather.

We have identified five locations that appear to satisfy these criteria on enclosure I. The black circle represents approximately the area needed for a helipad (i.e., a circle with a radius of 30-40 feet). We would greatly appreciate it if the University could take a close look at these five locations to see which of them would be the best location for a helipad for Children's Hospital. If the University would allow Children's to construct a helipad on one of these locations, at its expense, it would greatly assist the solution of this issue which has generated a lot of conflict between the Laurelhurst community and Children's. Further, we think that Children's should pay the University a landing fee each time it uses the helipad to help defray the cost to the University of providing University police services as required for the safe operation of the helipad. Children's should also be responsible for maintenance or pay the University to do this for them.

Our review of the University of Washington General Physical Development Plan indicates that the outdoor storage yard in Sector E8 is to be phased out and turned into open space (see enclosure II and page 102). This proposed action would appear to make the location of a permanent helipad in this area even more feasible in the future. Flight paths could be designed over the playing fields so that the noise and vibration impact in the wildlife areas would be minimized.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

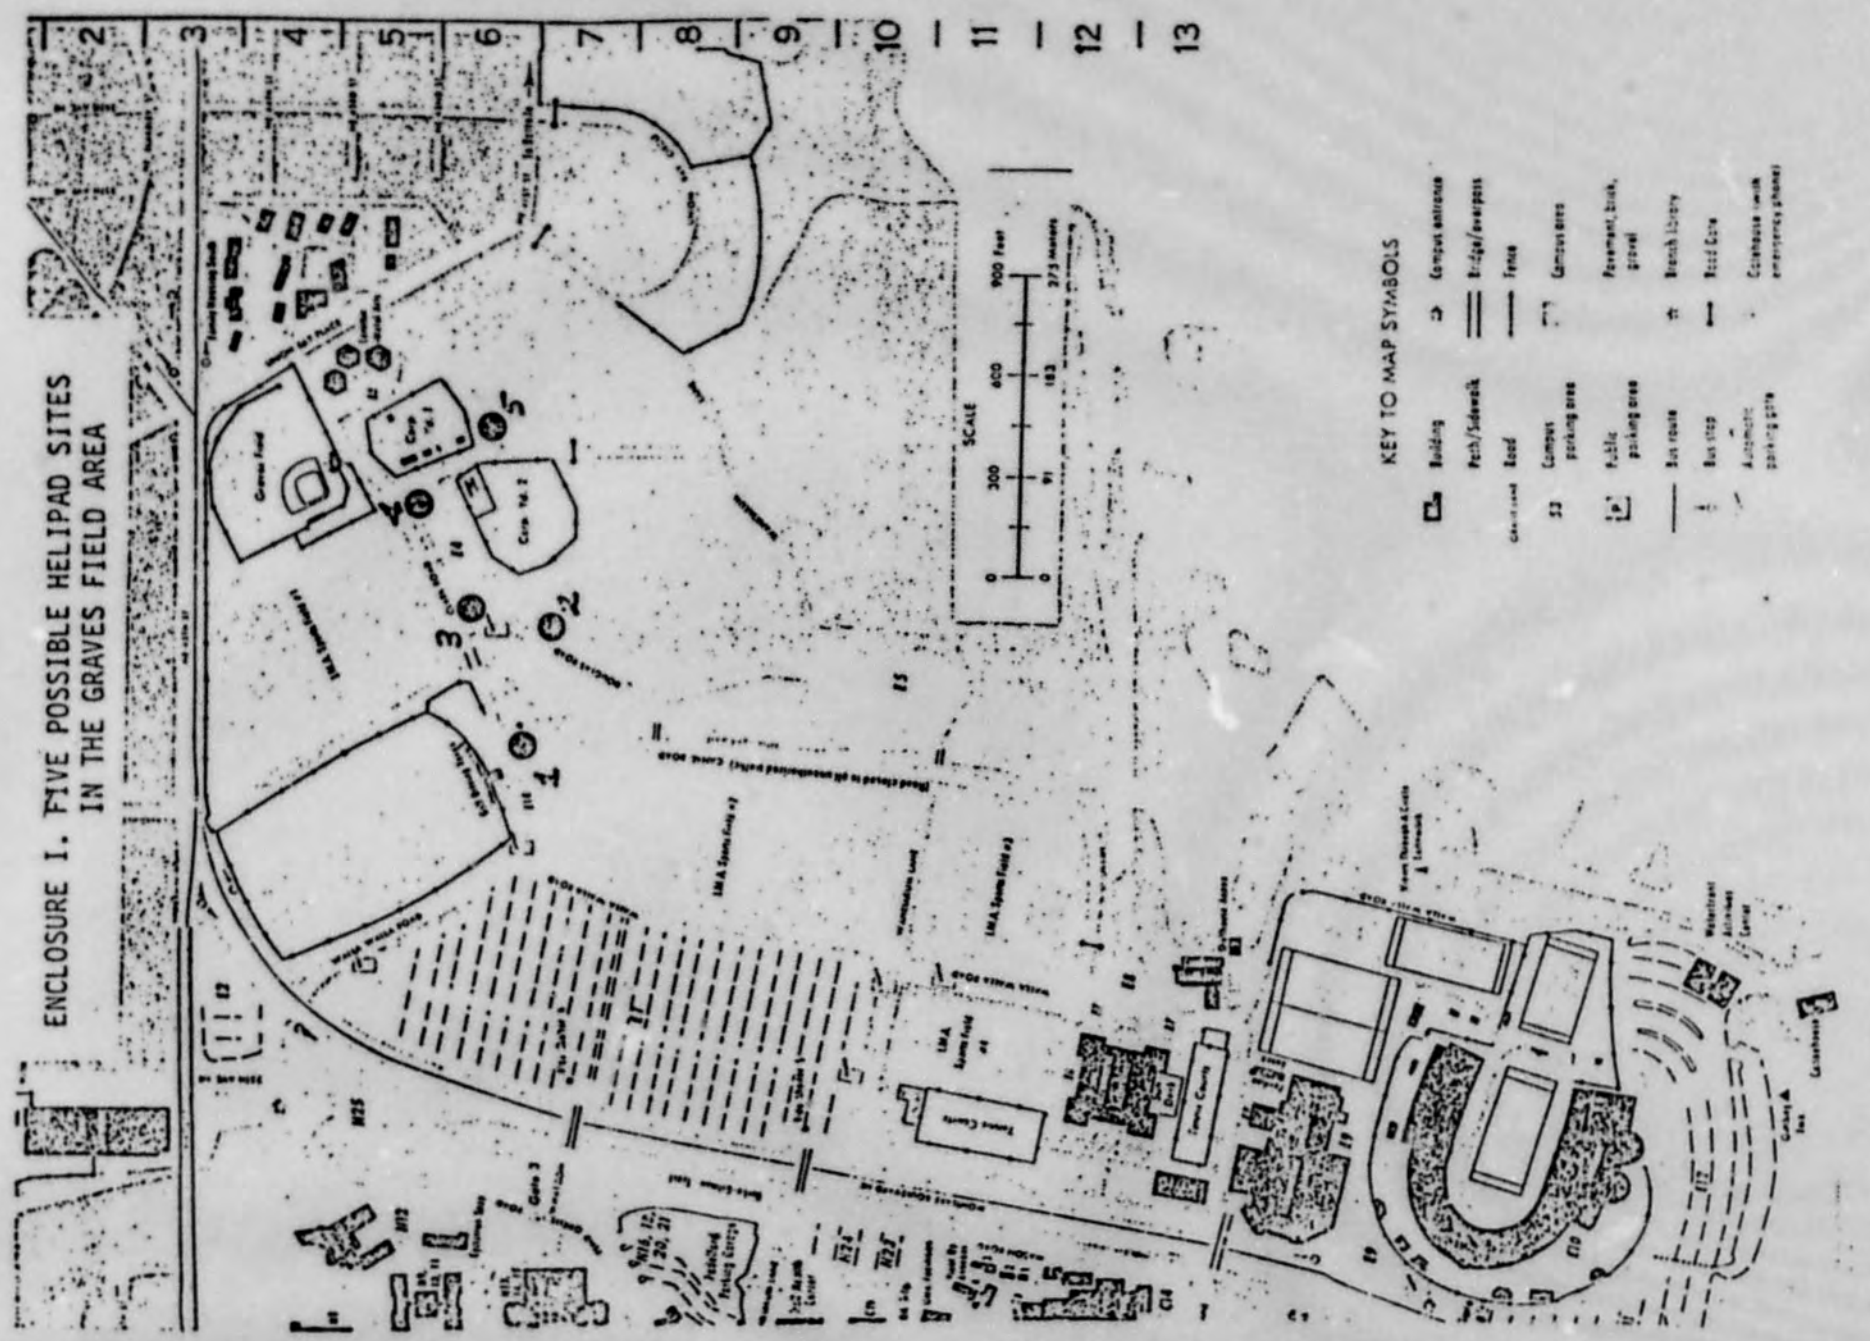
We expect that Children's will continue to land helicopters on its campus, when absolutely necessary, as they do now. For cases where time is not so critical, we would like them to land at Graves Field and transfer the patient to an ambulance for a 3 minute ride to the hospital. As you may know, all patients who arrive at Harborview by helicopter now are transferred to an ambulance for a short trip to the Harborview emergency room or to other nearby hospitals. During the past 12 months, there have been 85 helicopter flights made by Airlift Northwest with patients bound for Children's Hospital. About 70 of these landed at Harborview and the patient was then brought to Children's by ground ambulance (a 20-30 minute trip). Current projections are that the number of helicopter flights to Children's could rise to 35-40 per month by 1990. Some would still land at Harborview, others at Graves Field and a few, really critical cases, would be landed at the Children's campus as they do now.

Another reason to have a helipad constructed in the Graves Field area is to provide a safe and adequate landing facility for MAST helicopters. MAST and other military helicopters have been landing infrequently on this area for the past 11 years and should be allowed to continue to do so. MAST hopes to obtain new Blackhawk helicopters in the near future. These machines are much larger than the "Hueys" currently in use. It is probably inappropriate, because of weight and size, for MAST to land on the University Hospital's rooftop helipad. It is clearly inappropriate for them to land at Children's proposed helipad on their campus. MAST landings in the Graves Field area have sometimes been hindered by muddy conditions. They, too, have an obvious need for a paved, lighted, and secure helipad.

We believe that allowing Children's to build and use a helipad at Graves Field would be consistent with the long history of cooperation between Children's and University Hospitals, the desire of the University to be a good neighbor, and the clear need for a helipad that can be used by MAST helicopters bringing critically ill patients to both Children's and University Hospitals.

We invite you to respond to this letter by presenting your findings to our Board at its next meeting on September 8, 1986. Please let me know if you will be able to do so as soon as possible. I can be reached at 447-4054 (office) or 527-4892 (home).

Sincerely,



Robert N. Klug

Ambulance Accidents within
Seattle City Limits

Dear Mr. Sachs:

As you requested in your letter of September 18, we are enclosing a listing of reported accidents involving ambulances in the city of Seattle from January 1, 1977 to May 31, 1986.

The records show a total of 46 accidents, resulting in 34 injuries and no fatalities, during the approximate 9-1/2 year period.

We do not carry in our computer system the location of accidents which occur on city streets; consequently, we are only able to indicate the location of state highway accidents.

None of the ambulance accidents appear to be within one mile of the Children's Orthopedic Hospital. As a point of reference, the SR 520 interchange on I-5 is located at Milepost 167.80 to Milepost 168.83, and the N. E. 45th Street interchange on I-5 is located at Milepost 169.02 to Milepost 169.93.

Should you need the location of those accidents which occurred on city streets, we suggest you contact either the City of Seattle Engineering Department at 625-2000 or Dave Bozak, of the Washington State Patrol Accident Records Section, at 753-5161. The accident report number on the listing we are providing you is used by the State Patrol to retrieve a copy of the accident report.

If we can be of further assistance, please contact Brian Limotti at 753-2935.

Sincerely,

DUANE BERENTSON
Secretary of Transportation

RE: Childrens' Orthopedic Hospital Master Use Permit Application
Described as "NORTHEAST -- 4800 SAND POINT WAY NE, ZONE I-4/1-2/SF
5 PROJ *3405870/KROLL 16W TO CONSTRUCT AN EMERGENCY HELISTOP
FACILITY ACCESSORY TO AN EXISTING HOSPITAL/MEDICAL CENTER

Gentlemen:

This letter is written in response to your notice, dated January 13, 1986, inviting the public to specify specific environmental impacts and issues which should be addressed in the environmental impact statement in connection with the referenced project.

In actual fact, operation of the proposed helistop would involve a "trade-off" between an alleged improvement in the lifesaving capabilities of Childrens' Orthopedic Hospital in emergency cases involving children, on the one hand, and a detriment to the mental and physical health and well-being of the senior occupants of the Laurelon Condominium Apartments, and perhaps to their longevity, on the other hand.

The Laurelon Condominium Apartments, located less than a few hundred feet from the proposed helistop facility, contains an unusually large concentration of senior citizens, including occupants who are in their seventies, eighties and nineties. Those occupants have been residents of the Laurelon Condominium Apartments for twenty years and longer. For even more years than that, the Laurelon Apartments have served in fact as a retirement village.

The extreme noise and vibration levels which would be incident to the operation of the proposed helistop facility would have a serious detrimental effect on all nearby residents of the proposed helistop, but would have an especially serious and adverse impact on the mental and physical health and well-being of the Laurelon Condominium Apartments' senior residents, who, because of their age, are especially susceptible to those adverse impacts.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The detrimental effect of operation of the proposed helistop on such senior citizens is a specific significant environmental impact, an issue which should be addressed in the environmental impact statement.

I have personal experience with helicopter operations as the result of my past military experience. In addition, and more recently, in October or November of 1985 I personally experienced, in the Laurelon Condominium Apartments, the effects of an actual helicopter operation at the proposed Childrens' Orthopedic Hospital helistop facility. To my recollection, extensive federal, state and local governmental studies were made in the 1960's and 1970's as to the adverse health effects of airport landing and takeoff noise. Those studies were considered in connection with the expansion of the SeaTac Airport and other airports in this country. If my memory serves me correctly, those studies were instrumental in the Port of Seattle's subsequent program under which it acquired, by condemnation and negotiated purchases under threat of condemnation, residential properties adjacent to SeaTac Airport. Presumably those governmental studies were expressed in terms of decibel levels and the correlation between such decibel levels and public health and safety of nearby residents. Presumably those studies would be meaningful and helpful in considering the present helistop facility application of the Childrens' Orthopedic Hospital. The Seattle Department of Construction and Land Use should research to locate existing governmental studies of the adverse impact of airport and other noise sources on the health of nearby residents, should require the Childrens' Orthopedic Hospital to present information in substantiation of any claim that the proposed helistop would improve the lifesaving capabilities of the Childrens' Orthopedic Hospital, and should compare and evaluate the alleged capability on the one hand with the detrimental impact on the senior residents of the Laurelon Condominium Apartments and other nearby residents.

I believe that there are published studies concerning the adverse impact on the health, well-being and longevity of senior citizens who are forced, for one reason or another, to move out of their long-term residences. Such studies should also be researched and made part of the environmental impact statement because of the high probability that if the helistop facility permit were issued, a number of the senior residents of the Laurelon Condominium Apartments would subsequently find it necessary to move out of their homes because they found the noise and vibration of the helistop facility operation unbearable.

If the Seattle Department of Construction and Land Use is not responsible for either performing, or requiring that the Childrens' Orthopedic Hospital perform the research and evaluations which I have discussed, above, then I would appreciate your advising me of that fact at your earliest convenience. In that case, I will attempt to research the issues myself, and submit them to your department.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

My immediate concern and reason for interest in this application is the fact that my mother is a resident of the Laurelon Condominium Apartments, is 90 years of age, and has been successfully living on her own in those apartments for over 18 years.

Very truly yours,

Herman S. Siqueland

Re: Helistop- Children's Orthopedic Hospital

Dear DIRECTOR:

Thank you for your notice of decision, dated 1-13-86 and opportunity to address the issue of environmental impact of the proposed helistop at COH.

My first letter related to the helicopter site at COH was written 11-15-84 to the president of the Board of Trustees at COH. Subsequently I have written dozens of letters and copies which have been sent to city, county, state officials and departments and which should be on file in the various offices. I have copies of these letters. I have attended many, many meetings.

I am a member of the Board of Trustees of Laurelhurst Community Club and the Laurelon Terrace Homeowners Board of Trustees; but I speak as a concerned, individual citizen here. (I have lived in Laurelhurst since 1953.)

My concerns, which I suggest ought to be included in the environmental impact statement, are as follows:

1. Safety - Let's stop tragedy from occurring before it happens. We read about helicopters and other small planes crashing within city neighborhoods across our nation. The COH helipad site is within a high density residential neighborhood. Approximately 150 feet from Laurelon Terrace condominium complex, consisting of 136 units, the flight pattern will cut a diagonal path across these condos. It is within 1½ blocks of an elementary school as well as a block from many single family residences. Site allows no margin of error--engine failure, malfunction, poor weather conditions (visibility), etc. These residents are not expendable.

2. Vibration and noise factors - Low-flying and landing helicopters cause very real disturbance and pose unhealthy conditions as noise decibels are well above acceptable level for healthful endurance. Vibrations are felt and are disturbing especially to all within the flight pattern across Laurelon Terrace but also to all nearby residents. Flights will be anytime during day or night disrupting not only peace of mind but sleep, too.

3. MAST helicopters - The proposed site is not large enough to accommodate these large planes. On 12-6-85 at 10:17 a.m., a low-flying (approximately 200 feet) MAST helicopter circled several times over the Laurelhurst area, the Laurelon Terrace Condominium area, and the Laurelhurst Elementary School. School was in session. Hundreds of children's lives were endangered as well as hundreds of residents' lives. The MAST helicopter could not land on site repeatedly used by other helicopters at COH because of inadequate space; therefore, it landed in the parking area after circling several times. Time was lost and extra transfer of patient required.

4. Alternate sites - Several other sites are available and adequate. There are no problems on record, no loss of life has been documented for landings (past and present) at UW soccer field with transfer by ambulance within two minutes from COH. Another site is Sand Point Naval Station which is just five minutes from COH. In addition, a helipad is to be soon in place at University Hospital a short distance from COH, also.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The quality of life, the health and safety of residents whose homes are contiguous to COH and those within a block or two ought to be considered as high priority. For many residents the helicopter landing at COH would be like it landing on their roof top or in their front yard. Is COH, is the City of Seattle prepared to take responsibility and pay for loss of life and property in case of crash? The rights of these residents are being abridged and/or ignored.

Within the past five to six months, repeated helicopter landings have occurred and have been documented by residents. These landings have occurred without permit; these landings are illegal. The impact has been felt.

Please consider the above-mentioned factors carefully. This institutional encroachment in a densely populated residential neighborhood is a clear endangerment of life, property, and environment. Of course, it likewise is a horrendous duplication and excessive expenditure -- these impacts are economic and must be considered by another department as rise in medical costs escalates.

Thank you.

Sincerely,

Maryann E. Spangler

To Whom It May Concern:

I strongly recommend that you allow the Children's Orthopedic Hospital to construct an emergency helistop facility accessory to the hospital. When patients need helicopter transportation time is of the essence. An ambulance ride from Harborview to 4800 Sandpoint Way may well mean death, rather than life, for the child. I would much rather hear the helicopter now and then rather than delay treatment for a sick patient.

I wonder if the people who are trying to prevent the construction of the helistop facility lived where they now live when the Naval Air Station was active and Friday nights & Saturday nights for years lines of planes practiced landing and immediate takeoff on the north end of Lake Washington-weekend after weekend. No one asked us whether we'd approved. I worked full time 5 days a week and part-time Saturdays and Sundays. Many weekends I was

Dear Sir:

On Dec 6th, 1985 at about 10 A.M. a large med helicopter flew directly over house, even circled around the area twice before landing at the Childrens Orthopedic Hospital. The noise and vibration was very disturbing.

We ask you to take into consideration the impact on the neighborhood as well as the young patients in the hospital of a srvice like that.

Yours truly -

To Whom it May Concern;

I certainly do believe that Children's Orthopedic Hospital should have a helipad for transporting children in critical or acute condition. I cannot imagine anyone objecting if it were their child or grandchild, where minutes count.

Fire engines, ambulances and Medic One are noisy too, but they do save lives. It is a very poor trade-off when the noise consideration comes first!

Re: COHMC Helicop

Dear Ms Farrar:

1- We are concerned about the use of helicopters over two schools, thickly populated residential areas and a much used city playfield.

2. What rights and protection do home owners have in protecting their quality of life from constant zoning exceptions and changes being made.

3- The present Mast system and its location serves two hospitals, U of W and COHMC. Is the competition for business between hospitals going to be allowed to impact everybodys lives?

4. We are concerned about duplication of services. Will each hospital want their own helicopter service? This needs to be studied and controls be established. The Trauma center at Harborview Hospital has an excellent record for treating children and adults - treating - stabilizing and then transporting children to COHMC by ground service.

by

5- We attended the September 9, 1985 meeting called/the Health and Human Services Committee of the Washington State Legislature. It was our understanding that the Free service Mast provides will not be able to continue to serve the area if a private helicopter service is established. (They cannot compete with private business) Who then will pay the bill? The patient?

6- We understand that the Doctors are divided on the issue of necessity.

7- We are concerned about the abuse of the use of the helicopter service. This is a big concern. Who will monitor and decide what is or isn't an emergency. Once the service is allowed to begin and the six month trial period is over, who willthen monitor to see if the system is being abused.

8- With helicopters, traffic watch planes and the constant sea-plane activity over the area, it indicates to us that some form of control of air traffic over residential areas is necessary.

Yours truly

Dear Director:

As an across-the-street neighbor of the Childrens Orthopedic Hospital I wish to record my strong opposition to the construction of a helipad and the introduction of regular helicopter service by the COH. I have had no part in the actions of the Laurelhurst Community Club; hence my opinion is not a repetition, but an independent and additional expression of opposition.

If the helipad is constructed, it is perfectly obvious what will happen: (1) after that expenditure, there will never be a subsequent vote of disapproval; and (2) the expenditure will have to be justified by maximizing the use of helicopters. Whatever the Hospital people may say now, and may honestly believe, all the psychological forces will be toward increased use of helicopters for all kinds of purposes. There will be no way of monitoring these flights. There will inevitably be a very bad effect on a residential neighborhood already suffereing from the constantly increasing density of traffic generated by hospital business.

Please note this: some time ago a hospital employee was heard to remark that she hoped the helicopter flights would soon be in so that she could use them for commuter service to Sea-Tac airport. That is precisely the kind of thing that there will be no way of stopping if helicopters are ever permitted.

There has been a great deal of doomsday talk about "saving a life." Even the hospital, however, though it is given to translating things into life-and-death terms, has not claimed that a life has ever been lost under the present system. The present system has obviously worked very well indeed. The desire for helicopter landings here clearly reflects, though the motive may be unconscious, not a dire need but a desire for, and a fascination by, new techniques, mechanical aids, sheer convenience, etc.

"Saving a life" is simply not relevant. But talk about it obscures another value which gets lost in the excitement--namely, the quality of life for hundreds, and probably thousands, of people in a residential neighborhood which should be saved from further inroads of a business-and-industry way of life.

I hope that your division will rule against the construction of the helipad.

Sincerely yours,

Robert B. Heilman

RE: Helipad, 4800 Sandpoint Way N.E. PROJ #8495870/Kroll

I have lived in Laurelon Terrace (at two different addresses) since 1955. I am a Medical Technologist (recently retired) and have worked at the University of Washington in medical research for 25 years, followed by 10½ years as supervisor of a division in the clinical laboratory. Thus I have some background, knowledge and understanding of: (1.) the development and past changes in the residential area surrounding Children's Orthopedic Hospital and (2.) the changing patterns and pressures of health care and health care delivery.

I have attended every meeting regarding the helipad issue for the past two years and, though I feel well informed on the pros and cons of the issue, I do still have some concerns:

Laurelon Terrace is a condominium of 136 units covering a three block area immediately west of COH. The buildings were built in the late 1940's (prior to COH's move into the area) and converted to a condominium in 1978, well in advance of any public knowledge that a helipad might be in the picture.

The enclosed map shows the 19 buildings that comprise Laurelon Terrace and demonstrate its proximity to the hospital. Also, the complex is downgrade from the hospital (separated only by a firelane) so that the helicopter approach to the proposed pad has a significant bearing on the noise level, vibration and safety hazard to various homeowners.

There have been at least seven unauthorized landings at COH since November. Instead of the helicopter following the prescribed flight path---which we understand to be over Sandpoint Way NE and up the COH drive to the 'Kitchen Garden"---it has been coming in LOW at an agle over buildings 13, 14, 9, 10 and 18. Again, because of the topography, when the helicopter comes in so low it is not only much more dangerous to us, but the reverberations are intensified! From talking with some people at the hospital we understand: (1.) the new helicopter does not have to circle; it can come in high and drop straight down to the pad; (2.) there is no reason for the pilot not to take the prescribed route over Sandpoint Way rather than over residences.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The items we feel should be addressed in the Environmental Impact Statement are:

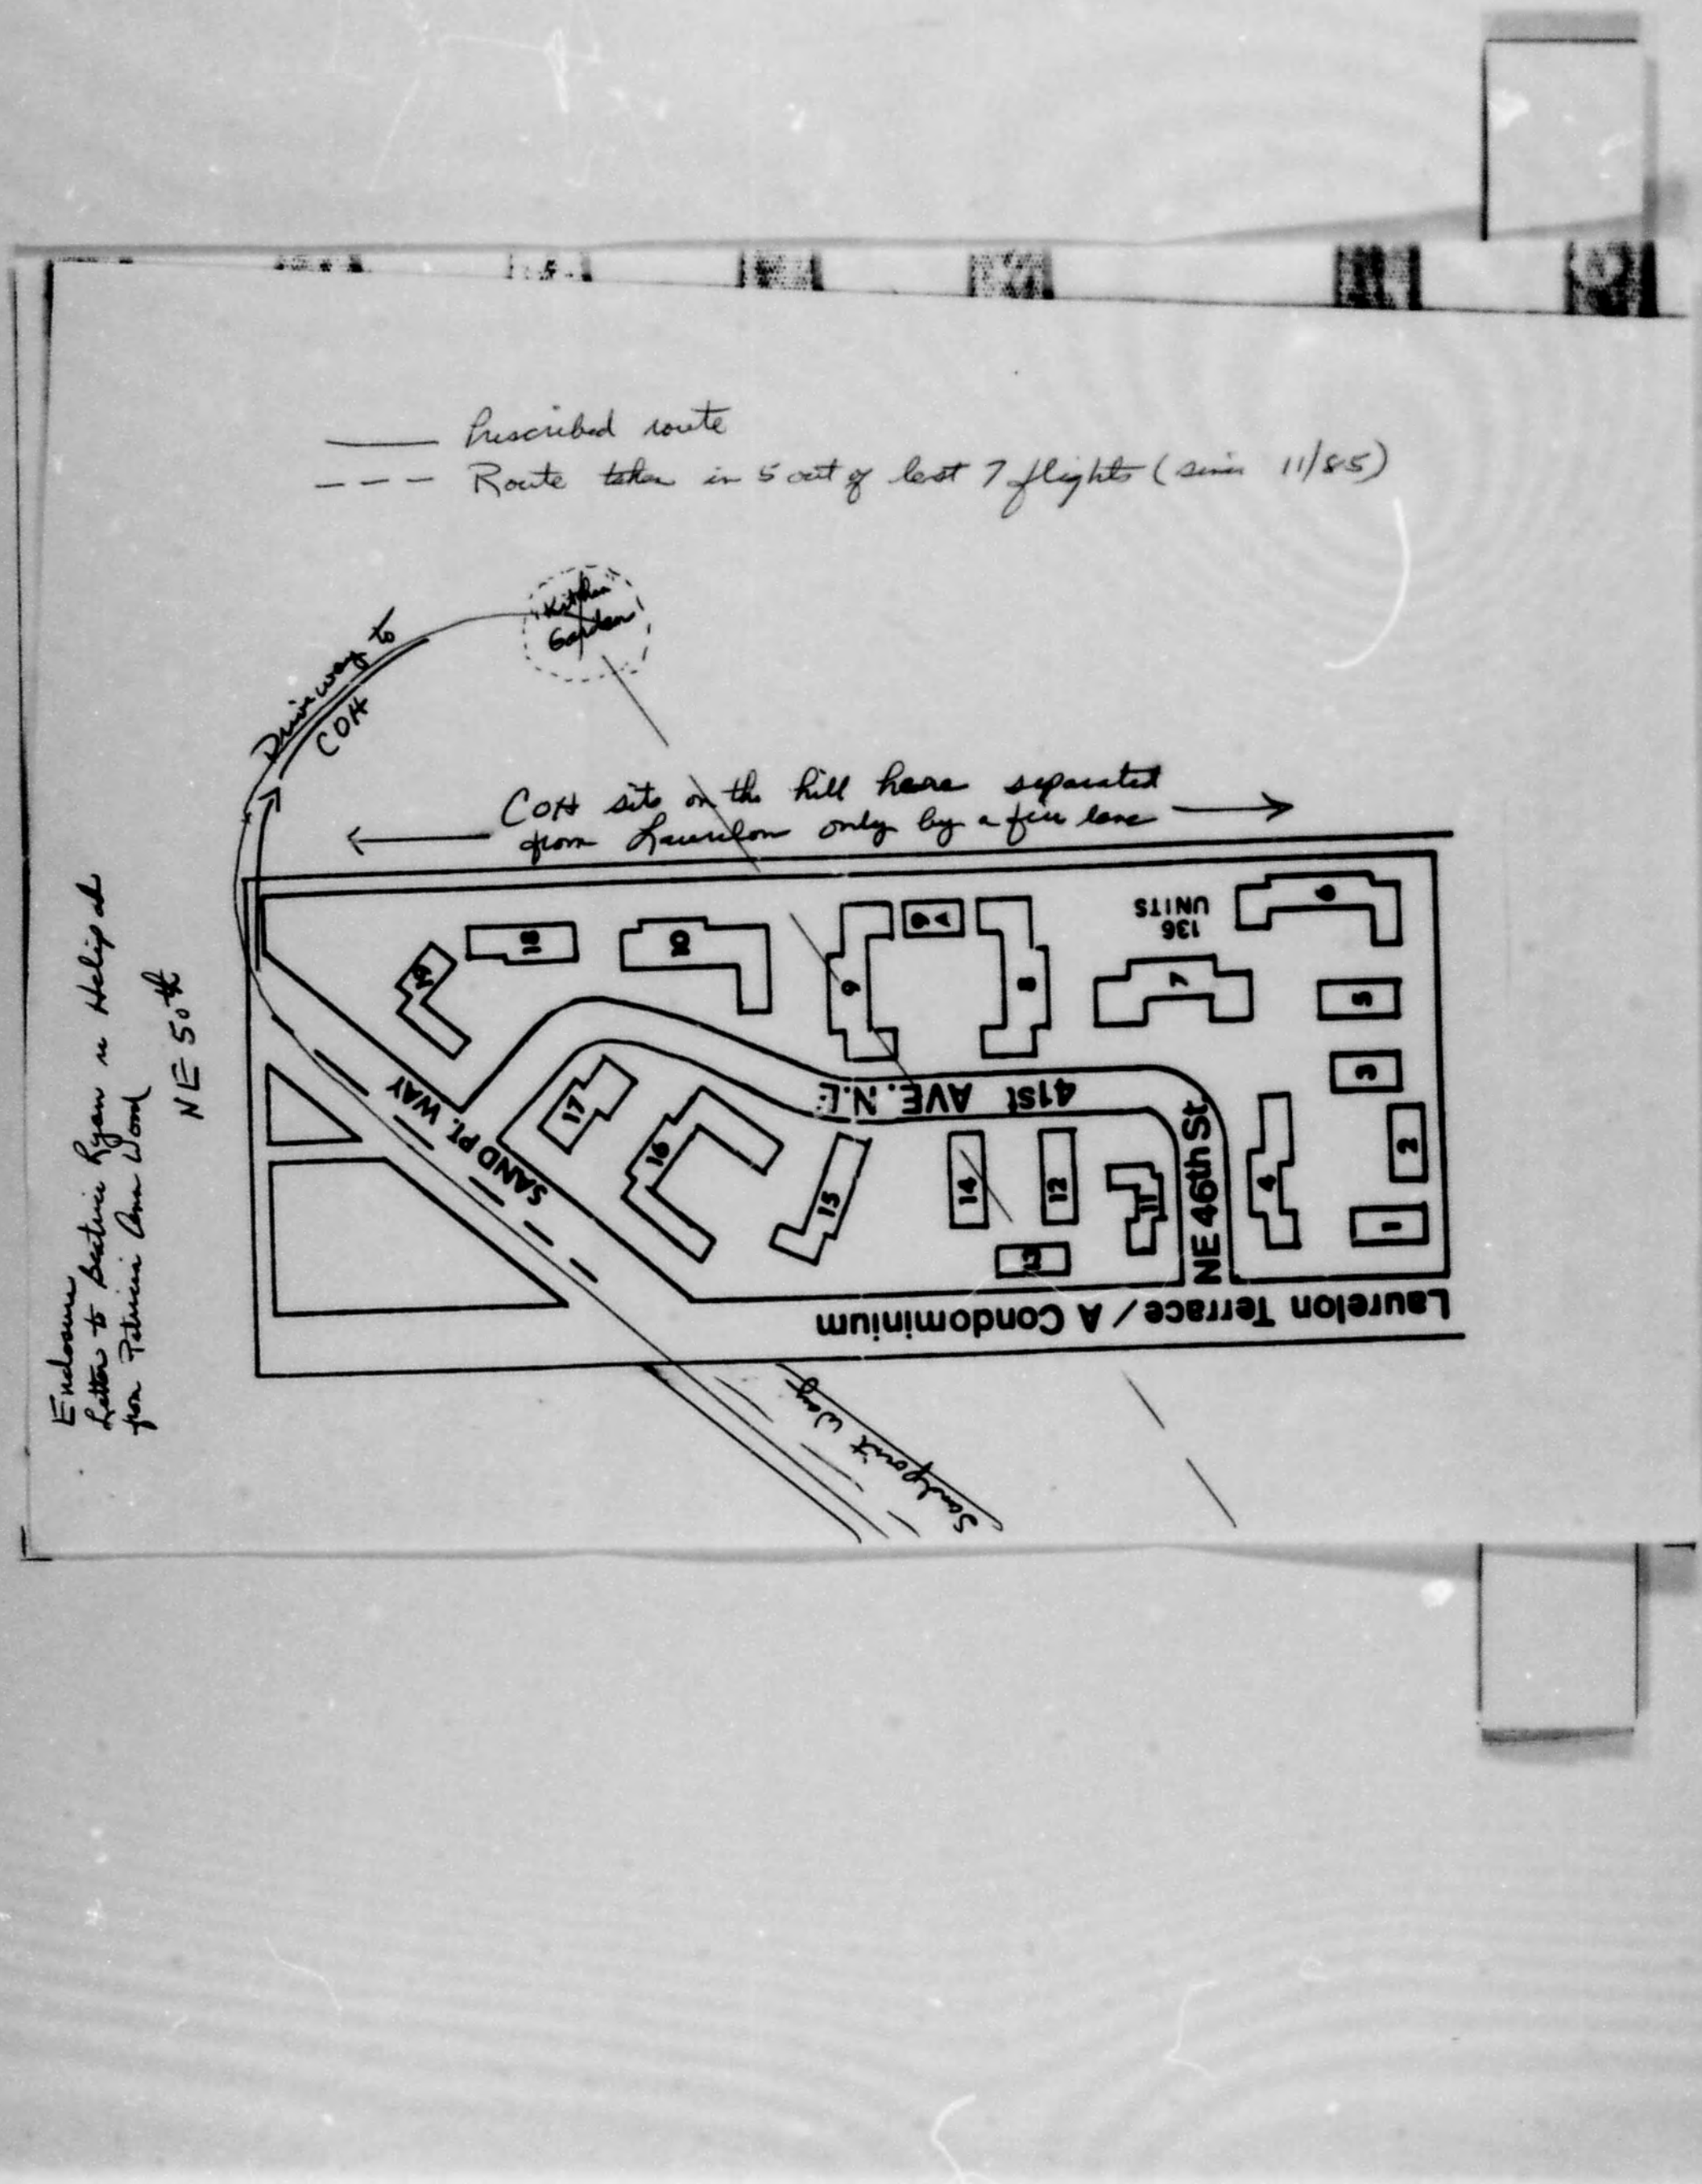
1. NEED. If the community could be assured that the helicopter would be used only for truly critcal cases, we would live with that. At the same time, if the pad permit is granted we request that there be a workable, effective and timely process to assure the helicopter is not being misused. There should be knowledgeable community representatives included in any such "Peer Review" committee.

2. FREQUENCY: This is an adjunct of 'Need'. One can predict that if there are 15 flights the first year, the number of flights in subsequent years will increase even if the tool is not abused, simply because of increasing advances in technology. This expected growth underlines the importance of only one flight per patient, having the medical crew picked up either at the 'soccer field' or at Harborview (rather than the possible two flights per case into COH).

3. FLIGHT PATH: We strongly urge the pilots be instructed to adhere to the prescribed flight path, and come in high rather than almost level with our roofs which has happened on several recent occasions. The solid red line on the enclosed map indicates the presecribed flight path; the broken red line denotes the path taken by 5 of the last 7 flights. We realize that adhering to the Sandpoint Way route may impact other neighbors. We have no desire to better our situation at the expense of others. The chosen route should take all residents' situations into account. We do feel, however, that our topography makes it mandatory that the helicopter come in high!

4. SAFETY: Helicopters, unfortunately, do crash. The hospital assures us that the statistics indicate there would be only one crash in 64 years. Please note the recent crash of a medical emergency helicopter (in another state) 5 minutes from its landing. Who is going to pay for is insurance? Even without helicopter hazards the current state of insurance premiums is a disaster in itself! Another strong point, we think, for restricted flights and controlled flight paths.

5. VIABLE ALTERNATIVES: The UW 'soccer field' has served for some years as an emergency landing field for both UW and COH. Here the approach can be over water, marsh, parking lots---not homes. Rather than say the field is too soggy, a decent, lighted helipad could be constructed here to serve both institutions. Helipads should be looked at as regional facilities---no matter what the future medical technology, can we afford to have the service at every hospital?



Enclosure

Sincerely

Patricia Ann Wood

RECEIVED
JAN 30 1986
DEPT. OF CONST. & LAND USE

Dear Ms. Ryan,

The purpose of this letter is suggest a scope and content for the Environmental Impact Statement that DCLU has asked Children's Hospital to prepare in connection with its application to construct a helistop on its campus. These suggestions have been developed by several members of Citizens Concerned about Helicopter Transportation and represent the views of those living in the impacted neighborhoods. We believe that the EIS should cover five areas: noise, vibration, safety, air quality and alternatives. Further, we believe that the term alternatives should not to be limited only to landing sites but that alternative service alternatives should be considered as well. We urge DCLU to include the following requirements in their definition of the scope and content of this EIS:

1. The noise measurements should be made at several different landing sites and should include several landings at each site. One needs several landings in order to get enought data to derive statistically significant results. All types of helicopters that might be using the landing sites should have their noise measured. This is especially true for the Huey and Blackhawk helicopters that are now being (or are likely to be) operated by MAST. The background noise measurements at each site should be made at homesites in the neighborhoods directly adjacent to the proposed landing sites, not by busy adjacent arterials. Several noise measurement instruments should be used to record the noise instead of using just one and extrapolating its results to other locations. The number of people living within various contour levels of noise should be determined for each alternative landing site. The demographic characteristics of these people should be determined. The flight path and landing profile to be used by the helicopters during the noise testing should be carefully worked out and strictly adhered to. A noise expert from the Seattle-King County Health Department should be present as an observer during all noise tests and should approve the procedures to be used before they are implemented. The residents of the impacted neighborhoods should be given at least two days advance notice as to when the noise tests are to be conducted and should be invited to observe them as well. The helicopters should be loaded in the same way that they will be loaded when flying actual missions. Fuel levels, a full medical team and special equipment should be on board during the noise tests.

2. All vibration measurements should be conducted at the same time as the noise tests are made. Suitable instruments should be placed in several homes in adjacent impacted neighborhoods and vibration levels recorded during multiple landings at each of the proposed sites. Background vibration measurements should also be made at each of the residential sites to provide baseline data.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. The safety analysis should be customized to each proposed landing site as each will have special characteristics that need to be taken into account. Safety levels are closely associated with the frequency of flights and the types of helicopters and pilots used. Estimates of the number of flights to be made should be based on a careful analysis of the population that can be served better by helicopters than by ground transport or fixed-wing transport. To do this, one must first estimate the number of people that live in areas that can be served better and faster with ground transport. Then one needs to add those that are beyond the flying range of each of the helicopters that are likely to be used. The remainder is the population that could benefit from helicopter transport and appropriate incidence ratios can be applied to them to derive estimates of flight frequencies. Once these are known for 5 and 10 years in the future, some risk factors can be derived that can define the safety levels associated with each alternative site. Other factors that should be investigated include pilot capabilities and training, the availability of specialized equipment for dealing with adverse weather conditions, appropriate communications equipment, suitable levels of liability insurance and definitions of the parties that are responsible for any accidents that may occur.

4. One can expect that there will be significant amounts of jet engine exhaust gases blown into the surrounding neighborhoods while the helicopter is landing, running on the ground and taking off. We know from observing landings at the intramural field and at COH that these gases smell very bad and presume that they can be expected to have some adverse health effects. What is the content of the exhaust gases from twin jet engines like those on the Agusta and MAST helicopters? What are the likely health effects of these exhaust gases on the residents of the neighborhood? These estimates should be based on the projections of use and detailed analyses of jet engine exhaust gases from the machines most likely to be used at the various alternative sites. A model of dispersion should be used to estimate how the gases can be expected to move from the landing site into the neighborhoods.

5. There are several alternatives that should be investigated as follows:

a. The do-nothing alternative. A clear and detailed description of the way that MAST helicopter service has been provided to COH during the past five years should be presented to provide baseline data to use in the evaluation of the do-something alternatives. The benefits, costs and impacts of continuing past practices for another 10 years should be presented in this section.

b. Landing MAST and Airlift Northwest helicopters at the UW intramural field. There are several suboptions under this general heading. They involve locating a site suitable for all-weather operations that have good access to ground transportation vehicles. Careful noise and vibration measurements need to be made at all alternative landing site locations in this area. The University of Washington should be an active participant in these investigations because of the UW's responsibility for the safety of the people that are often involved in sports activities at their intramural fields. This section should describe the benefits, costs and environmental impacts of using

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE IT IS DUE TO THE QUALITY OF THE DOCUMENT.

feasible intramural field sites for landing helicopters.

c. Landing MAST and Airlift Northwest helicopters at Children's Hospital. There are two suboptions under this general heading. One would be to land on the roof of the hospital and the other would be to land on a specially constructed helipad located near the entrance to the emergency room on the north side of the COH complex. Extensive noise and vibration studies should be conducted at both sites. Since a helicopter cannot presently land on the roof of the hospital, such landings should be simulated as closely as possible in order to get adequate noise, vibration and safety data.

d. Landing MAST and Airlift Northwest helicopters at a site at the Sandpoint Naval Support Facility There are several landing site options that should be investigated by the applicant at the Sandpoint NSF. Extensive noise and vibration studies should be conducted at all sites found to be feasible at the NSF.

e. Concentrating all initial care for critically ill neonates and children at Harborview Hospital. This alternative would assume that all children arriving by helicopter be seen first at Harborview and then be transferred to COH or other locations by ground ambulance if appropriate. Such an arrangement would concentrate all helicopter landing activity at Harborview and eliminate the problem at COH and University Hospitals. A careful investigation of this alternative is needed to determine its benefits, costs and environmental impacts to both providers and consumers of emergency medical services.

It is recognized that the University Hospital intends to operate a helicopter service with a landing site on the roof of its new East Wing in the near future. We believe that it would be beneficial for all concerned to have both of these proposals revieved concurrently. If this is not possible, the COH EIS should contain as complete a description of the proposed UW helicopter service and its relationships to the service proposed by COH. If any way can be found for the two hospitals to share a helistop, such an alternative should be given careful study.

Yours sincerely,

Jerry Schneider Anita Francis

Dear Sirs:

This is to protest the permit for a Heliotop at the Orthopedic Hospital at 4800 Sand Point Way N.E. Zone 1-4-1-2/SF 5 Dvaj + 8405870/K Roll-14 W

We are concerned not only about the noise, but also about the fact that they sometimes crash. Just last week a helicopter crashed at the Meat Packing Plant in Austin, Minn.

They have been flying very low here right over our apartment.

I sincerely hope you will consider the plight of all the people who live here as it is a high density population area.

Very truly yours,
Anil G. Nelson

Seattle, Washington 98104

Dear Ms Ryan:

Thank you very much for being as watchful as you are over the proceedings Children's Orthopedic Hospital is using to get permission to construct a helipad. A private helicopter service in any residential neighborhood should always be looked at very carefully before permission is granted. We urge you to include in the environmental impact statement considerations regarding noise, safety of the area residents, and the increased fire hazard that a low flying aircraft would surely bring with it. I am not against helicopter service for sick children. I have lived in this neighborhood for five years and have been awakened by the MAST helicopter many times as it brings sick children to the emergency room. To the best of my knowledge, this service has worked admirably over the last ten years and I believe that no child's life has ever been lost in the three minute transfer between the playing field at UW and the emergency room at COH. I am convinced that no other means of emergency transport is needed and I hope your department will scrutinize this issue very carefully.

Sincerely yours,

Carolyn Margon

Dear Mr. Street,

This letter is to express the grave concern of the entire neighborhood regarding the extreme danger of helicopter landings at Childrens' Orthopedic Hospital (COH).

It has been determined after exhaustive study by experts that a helipad at COH is entirely unnecessary, that it would duplicate services already being provided. Our apprehension is for the safety of people living in the proximity of the hospital whose homes, limbs and very lives are at risk every time a helicopter attempts to land or take off .This area is zoned First Class Residential and there are children playing nearby. Laurelhurst Elementary School is just 2 blocks from COH.

There have been several extremely noisy helicopter landings in the past few months, hazardously close to houses and trees. The helicopters have not followed a previously prescribed landing approach. Their landings have been haphazard, unpredictable, sometimes 50 feet above a house. Thus far they have not been impacted by wind. However, sudden downdrafts caused by a south wind over COH could have disastrous consequences as the helicopted approaches the pad. Let's not create "an accident waiting to happen"!

Please take immediate action to permanently deny a permit for a helipad at COH.

Urgently,

Helen and David Belvin

Dear Mr. and Ms. Belvin:

Thank you for your recent letter regarding the Children's Orthopedic Hospital heliport application.

The application is for a Council Conditional Use permit and at present is being reviewed by the Director of the Department of Construction and Land Use (DCLU). Her recommendation will be reviewed by the Hearing Examiner who will conduct a public hearing and prepare a recommendation for the City Council. A record is now being formed, and I am forwarding your correspondence to DCLU so that it may be included in that record. The Council will take it into consideration when we come to review this application.

I appreciate your interest. Thank you for taking the time to write.

Respectfully,

November 13, 1985

Mr. Herb Robinson
Editorial Page Editor
Seattle Times
Seattle, WA. 98111

Subject: Childrens Orthopedic Hospital Heliport

Dear Herb:

My family and I have lived in the Laurelhurst community for 35 years.

We have raised three children, all of whom have been treated at the Childrens Orthopedic Hospital.

My wife and I have raised money for COH, we have worked in auctions, I have spoken in behalf of the Orthopedic (I drive by the hospital complex five to six times daily), have held meetings in their auditorium, a grandson spent two weeks in intensive car; Tom Young, Sr., the senior partner of the architectural firm who designed Childrens Orthopedic to be a small, well integrated, but complimentary to the neighborhood facility, was a three-door neighbor, and an early director, Dr. Doctor, was a four-door neighbor.

I guess what I am saying is that the Orthopedic Hospital has been a close and good neighbor of my family.

Therefore, I take issue with the Childrens Orthopedic Hospital's Heliport plan.

I have an 85 year old mother, who lives in the shadow of Childrens Orthopedic, in the Laurelon condominium. She is extremely hard of hearing but can feel and hear the vibration of a helicopter, when it lands at COH.... and it troubles her and other seniors living there.

This area is single dwelling, duo apartment living, and the city derives a handsome tax base from the Laurelhurst, Windermere, Hawthorne Hills, and immediate areas.

If the preponderance of high pitched noise and the insecurity of low flying helicopters over our homes and families cause a decay in the neighborhood, then even the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

city loses, as neighbors have, if we are forced to move to a less dense community.

Helicopters have been known to crash, especially upon take-off and landing, and we have a strong concern that the Laurelhurst School is one block away, with classrooms filled with our children. What a tragic fate to injure or kill a number of children by a helicopter crash while it was landing at COH with one child aboard for treatment.

We are but a few neighbors, not necessarily affluent, who live with the Childrens Orthopedic's continuing expansion into a larger institution ..... no longer small and nestled appropriately into the community surrounding it.

Thank you for listening.

Sincerely,

M. O. Christman
President

Sir:

As Vicepresident of the Laurelcrest Condominium Owners Association I speak for eighty (80) families in identifying significant issues involved in the planned construction of a helistop facility on the grounds of Childrens Orthopedic Hospital and Medical Center.I was also present at the public hearing conducted by Dr. Nicola,City Health Officer,on October 24. 1985.

1. At no time during 1½ hours of testimony did spokesmen for Childrens Orthopedic Hospital present evidence that one single life was endangered, let alone lost,by landing a helicopter at the nearby University of Washington field and transferring the patient by ambulance to the hospital less than 2 miles away.Arguments about landing difficulties at night,or in inclement weather,totally ignored the existence of a heliport at the nearby Sandpoint Naval Base,available for such emergencies.

2. The numerous occasions during the past three months when helicopters landed on the hospital grounds,in violation of city ordinances,at all hours demonstrated just how bad the noise level is.The fact that within the same time period two helicopters carrying patients to hospitals crashed, killing patients and crew,demonstrates that such disasters are not so farfetched and are most likely to occur during inclement weather.

3. The public declaration by an administrative officerof Childrens Orthopedic Hospital that the hospital must fulfil its mission as regional resource, which is more important than any significant environmental impact on the residents of the surrounding area,makes any promise to use the planned helistop for emergencies only quite suspect.Misrepresentation of the costs of the helicopter service by Childrens Orthopedic Hospital,to avoid having to apply for a Certificate of Need ,is another proof of its bad faith.

The Board of the Laurelcrest Condominium Owners Association strongly opposes any permission by the Department of Construction and Land Use to construct an emergency helistop facility accessory to Childrens Orthopedic Hospital and Medical Center.

Sincerely yours
Albert A Feldmann

Dear Miss Gibb:

I am a resident of Seattle (Wallingford District). I have been reading with interest all of the editorials and letters to the Seattle Times editor with respect to the emergency helicopter flights landing at Children's Hospital. One thought strikes me: Why do the residents of the Laurelhurst area not complain so bitterly when media and traffic helicopters from KING, KOMO, or KIRO stations randomly fly over all of the city at all hours of the day and night?

Interestingly enough, I am sure that each of these media flights can be explained in a business sense. However, I can think of no other local air carrier, other than Airlift Northwest, the clearinghouse for all emergency flights, that can justify emergency flights and landings other than for life-saving purposes.

Seattle is a city that has always taken immense pride in its emergency services. We pioneered Medic I; and the Trauma and Burn Centers at Harborview are unexcelled anywhere. Those residents of Laurelhurst who oppose these emergency landings (and, I assure you, not all of them do!) are attempting to prevent the final leg of Seattle's emergency services from being successfully completed. Landing on a hospital campus is the natural progression of an emergency flight carrier. Denying this possibility is equivalent to purposefully withholding medical services in an emergency room once an accident victim gets there.

It has been proven time and again that Airlift Northwest helicopter flights are necessary and justified. I applaud Airlift Northwest for the service it provides. However, I especially applaud Children's Hospital for standing up to the only principle it has maintained is the issue here, and that is that these landings on its campus can hopefully save even one child's life. That cannot happen if these helicopter flights are not allowed to land directly at that (or any) hospital's emergency entrance.

Thank you for your time and for the opportunity to present my views.

Sincerely,

Diane Kanning

Dear Ms. Gibb,

As the communications director for Children's, I tend to speak out on issues very rarely. Most of my work entails coordinating and facilitating communications within and outside the hospital. However, my close association with the issues and concerns over the hospital's request for a permit to build a helipad outside the emergency room compels me to write in support of this project. We have been delayed in our process for more than a year and a half, and while I can understand the concerns of those who object to the helipad, those concerns are outweighed by the medical necessity that has repeatedly been demonstrated.

As a major regional referral center for pediatrics, Children's needs a landing pad for those few but critical cases where time and speed make the difference. Rural hospitals count on being able to have helicopters land on site to pick up and transfer patients to the hospitals in Seattle that are equipped to care for their patients. Children's cannot effectively meet its medical obligations until a helipad is built on site.

There has been much concern over noise and safety, factors which the hospital has considered and resolved, to my knowledge, for the benefit of neighbors and our patients. There is concern about marketing the hospital once we have a helipad. The truth is that we do not need to market this service. Patients would come to us anyway because there is no place else for them to be treated--what suffers now is the quality of their lives in cases where transport by helicopter could make the difference.

Progress at Children's has always been carefully planned to meet the medical needs of the community and the region we serve. Seattle is fortunate to have one of the finest pediatric medical facilities in the country. The addition of a helipad to what is now a two-part transport program--ground and fixed-wing--will only enhance the services that we are obligated to provide our children.

Thank you for the opportunity to comment. I would appreciate having my opinions related to the Seattle City Council.

Sincerely,

Susan Macek
Director of Communications
Children's Hospital and Medical Center

Dear Ms. Gibb:

Though I am sensitive to the concerns of those who are pro-active against the helicopter landings at Children's Orthopedic Hospital in Seattle (having read much in the papers and seen several segments on TV), I am writing in favor of the Hospital's request for a permit to build a helistop on its campus.

As a grandmother, and concerned citizen, the case of the Federal Way child, who might have been another drowning statistic, and was saved because of the immediacy of treatment at this Children's Medical Center, brought home to me most vividly the necessity for the fastest possible transport of a child or baby (in critical cases) to a medical facility. The Federal Way child would have died, had the helicopter not been available. I would hope that any Snohomish County child would have the same access to such air transport to a children's medical center.

Please urge the City Council to grant the permit for a land use permit for the helistop — so that in emergency situations the helicopter will have a safe place in which to land, instead of having to pick out a green spot on the ground, adding to the already existing stress of the situation. I cannot believe the concerns about noise (there are many other aircraft above Laurelhurst, I am sure) or safety (when I am sure stringent route regulations must be adhered to) outweigh the porential of saving a child's life.

Dear Madam:

I must tell you that I feel the helistop right at the emergency room at Children's orthopedic Hospital is so important when seconds count for a life saving chance for these youngsters.

I understand that the need for this is perhaps once a month or so, and I find it difficult to understand the neighborhood's expressing their "trauma," when compared to the importance of seconds in helping an emergency case.

As an orthopedic Guild member I wished to add my comments.

Sincerely, Betty Girdler

Dear Ms. Gibb:

I am writing in support of the Children's Hospital request for a helipad outside the emergency room.

I am a pediatric resident in my third year of training at Children's Hospital. I am also a resident of Laurelhurst, living on Sand Point Way about one block from the hospital. As a physician at the Children's Hospital I have spent a great deal of time caring for critically ill children. I have also had considerable experience transporting sick children and infants as a member of the Infant Transport Team and as a flight physician for Airlift Northwest.

There are numerous occasions when the ability to land directly at the hospital can be potentially life saving for a desperately ill child. The ability to land directly at the hospital saves precious minutes and minimizes the number transfers of a patient from one mode of transport to another. I have personally had the experience of having a child arrest (his heart stopping) in the back of an ambulance enroute to the hospital, this child died. If we had the child in the hospital several minutes sooner, where a complete team of physicians, nurses, and technicians were waiting, he might have lived. The ability to care for a sick child in any transport vehicle is limited and must be minimized when possible.

I do appreciate the concern of my neighbors about the potential noise, but, having worked near and in the helicopters used for transporting sick children, I believe this problem is far outweighed by the good that having a helipad will provide. Living within a block of the hospital I have been at home during several of the landings at the emergency room and have found them no more disturbing than the sound of sirens of ambulances, police cars, and fire trucks that pass frequently.

Thank you for the opportunity to comment. Please convey my opinions to those who will be deciding this important issue.

Sincerely,

Thomas P. Strandjord, M.D.

SEATTLE CITY COUNCIL

Council Conditional Use Application of Childrens Orthopedic Hospital

May 20, 1986

Mr. Bill Reams, Councilman
King County Council
King County Court House
Seattle, WA. 98104

Dear Councilman Reams:

As you may be aware, there has been increasing focus by the City of Seattle on the use of helicopter transport and landing at Childrens Orthopaedic Hospital in Seattle. The resulting furor from a small group in the nearby neighborhood of Laurelhurst has so far managed to sidetrack formal approval by the Seattle City Council for a helicopter landing facility at C.O.H. We find the Laurelhurst community position to be incredulous in thier disregard for common human decency and the value of a human life.

As things stand now every time the Airlift Northwest helicopter lands at C.O.H. they are fined by the City of Seattle for an unauthorized landing. Airlift Northwest only lands at C.O.H. when it is a life threatening emergency that cannot be safely delayed using the current makeshift landing area at the University of Washington ball field and the transport being completed by Ambulance or Medic unit.

not true dlg

As we see it, the City of Seattle is at this point deciding that offering the immediate advanced capabilities of Childrens Orthopaedic Hospital should be only available to those who can survive the drive to the front door. In effect this area encompasses only the City of Seattle and it's close northern border areas. For those of us on the Eastside this makes C.O.H. all that more inaccessable, or accessable only with great delay. Even though Evergreen Hospital in Kirkland does have an advanced Level Two Nursery facility there are still patients that do need to go directly to C.O.H. and with the lake bridges almost impassable at rush hour and slow the rest of the time, the availability of rapid helicopter transport is a quantam leap forward in emergency medical care of the pediatric and other patients.

For those of us living in the eastern part of King County the use of the Airlift Northwest helicopter would reduce the transport time to C.O.H. to about 10 minutes from as much as 45 minutes or longer depending upon the bridge traffic. This reduction in transport time could truly mean the difference between life and death for some of the patients we see on the Eastside even though Airlift may take them to an Eastside Hospital rather than to a downtown facility.

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am a nurse and resident of south Seattle and am well aware of the driving time to Children's Orthopedic Hospital from our area and the very common traffic congestion problems the University area, bridges, and rush-hour traffic pose. I cannot fathom objections posed by residents of the area who would so infrequently have their privacy invaded by helicopter noise that they value this above the healthcare of seriously ill children.

I have lived near air bases, airports, and freeways in the past and know very well that constant noise can be troublesome, however, in this case, the helicopter noise would be minimal, infrequent and understandable when the needs of ill children are concerned.

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Roger Monson

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

As a parent, I am concerned that children in areas other that the Hospital, especially out of state, must receive the most efficient means of transport for emergency care that is facilitated by C.O.H.M.C.

I understand the concerns of those who are objecting, but I feel that our number one concern should be that of those who are in need of this most valuable service--the children. This need far outweighs those concerns of noise that seems to be occupying the minds and time of people in the surrounding area of the hospital. When we speak of the value of human life and the care we should have for each other, it saddens me to think the objectors can only think of noise!

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Dear Julia

I find it hard to believe that there are actual people who could careless about the life of a infant or child. The helicopter service is such a plus for COH, it gives nothing more than prompt care for that sick child.

A few of our members from our guild had a tour of the hospital at which time we were told that the helicopter only landed 4 time last year. Seems like a minor inconvenience on the surrounding residence, when it's all for a life.

incorrect JIK.

I wonder if these people have thought that maybe it could be them, that have only minutes before death or some other serious injury. Of course when one talks of themselves it would be nothing but the best, so these infants and children who are hanging onto their lives with possibly only minutes to spare, should not be given the best treatment, or should they too be given nothing but the best and if the best means bringing them to COH via helicopter, then that option should be available.

I SUPPORT THE HELICOPTER SERVICE FOR COH. I wish you the best of luck in the dispute against some very selfish residence.

Sincerely

Christopher Funk Guild

Jan I. Kipperberg

P.S. We have army helicopters fly over our house every evening for several minutes like 30 and we seem to survive, the word is flexibility. The COH helicopter is not a everyday occurance but if need daily should also be accepted.

Dear Ms. Gibb,

I live near Children's Orthopedic Hospital, and I am writing to you to let you know I support the Helistop that COH wants at the hospital. I have heard the helicopters on their trips already, and though I understand that other neighbors object to the noise, it is of such short duration that I have never been "disturbed" by them.

I must admit that I have a 7 year-old daughter, and I can only be grateful that the airlift service is available in case some day she might need it.

I hope you can approve the continued use of the helistop at Children's. It definitely fills a community need.

Dear Ms. Gibb,

I am writing to express my support for Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop.

As a Seattle resident, I would hate to see neighborhood pressure prevent construction of a life-saving heliport. I feel that if any child's life were saved as a result of this, it would be worth any amount of noise. I am sure any other neighborhood in Seattle would not hesitate to permit construction of a heliport.

I am also an employee of the hospital who has seen and heard the helicopters land. The noise has been minimal.

We all understand the issues regarding neighborhood noise, etc, but the facts far outweigh these issues. These helistops do save lives. This is the issue for me.

Thank you for allowing me to comment. I would appreciate your relaying this information to the City Council.

Very sincerely,

Dear Ms. Gibb:

I suppoort Children's Hospital's request to build a helicopter landing pad next to their emergency room.

Easy for me to say, I live thirty miles from the noise, right? But as the parent of two small children, that distance is exactly the reason I'd like to see it built. I want to know that when seconds count, I could get my kids to the miracle workers at Children's without delay.

I understand the concerns of the nearby residents. But in my opinion, the good outweighs the bad.

Dear Ms. Gibb:

I am writing you to express my support of Children's Orthopedic Hospital and Medical Center in their effort to build a heliport on their campus. As both a nurse and a very soon to be parent, I feel this service is essential to the community. I can understand that the neighborhood may object to the noise and potential danger, but feel that COHMC and Airlift Northwest have more than answered these concerns with the traffic patterns they use, the most modern and safe equipment and their committment to using hospital landings as emergency rather than convenience. I have personally been at COHMC during many on the landings and not realized they occurred until someone later told me. This means to me, that while the noise may be inconvenient, it is not overwhelming.

As a parent, I want this available for my child should an emergency occur. I have seen instances where time and movement have meant the difference between life and death. We often have children who are too unstable to move down the hallway for a special test. How ludicrous to think they should be able to survive being stuck in the mud in

Dear Ms Gibb:

I am writing to you in support of the request by Children's Orthopedic Hospital for a conditional landuse permit to build a helistop adjacent to the emergency room.

I support this request for the following reasons:

① I'm the parent of an infant who needed emergency transportation to Children's some years ago but it was not possible because this service did not exist then. I know the value of this service from very personal experience.

② I now am an employee here at Children's for the Chief of emergency services. I have personally witnessed take offs & landings of Airlift N.W. It is not an offensive carrier whatsoever - either noisewise or esthetically.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

③ Most importantly, it is saving children's lives. I wasn't so lucky. My daughter died.

④ The fact that Children's has joined with 3 other major medical facilities: Harborview M.C.
Providence M.C.
and University of Wash. Hospital to provide this service, and the fact that they have left the decision as to which children are transported by Airlift N.W. directly here to C.O.H. to another source other than our Staff Physicians speaks well for the Hospitals intent to only transport children who have life-threatened conditions best taken care of here.

I urge you to convey my message to the Seattle City Council.

Sincerely,
Mrs. Lota J. Waller

Attention: Julia Gibb

Dear Ms. Gibb:

As a long-term resident of Montlake and pediatrician at COH&MC, I am familiar with "both sides" of the arguments about the proposed helipad at COH.

I krow from my own experience that residing next to any institution - the Museum of History and Industry, the University of Washington's hospital or football stadium, or COH&MC - creates some special problems. At times, there is real conflict between the interests of these institutions and the residential communities which surround them. There should be very careful scrutiny of such institutions' plans to assure that when tney adversely impact residential communities, their proposed activities are consistent with their proper missions and that steps are taken to minimize negative consequences for the community.

I believe that COH&MC requires a helipad to fulfill its mission of making specialized medical services available to children throughout the Northwest. A helipad will allow prompt, safe transportation of critically ill children. While I am confident that economic factors alone would limit its use to those who require it, I believe that careful monitoring of utilization by the city and Laurelhurst community is appropriate.

I have watched helicopters fly over my home in Montlake en route to the hospital. I have participated in the care of children transported by helicopter, have ridden with critically ill infants,transported by helicopter to the athletic field, during their transport by ambulance to COH&MC. I believe COH's application for a helipad should be approved.

Sincerely,

Edgar K. Marcuse, M.D.

Seattle, WA 98104

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helipad outside their emergency room.

I am an RN, employed by COHMC and am also the former Flight Nurse Coordinator for the hospital. I have had opportunity to visit several other flight programs in Spokane, WA, Denver, CO and Salt Lake City, UT.

I understand the concerns of those who are objecting, but I know from experience there is a definite need for a helicopter service in the transport of critically ill infants and children. Naturally, rapid transport is important as time is a critical factor for some of the children, especially those with surgical emergencies. Another factor that often gets overlooked is the decreased amount of patient handling and transfers by utilizing a vehicle that pick a critical child up at their referral hospital or an accident scene and deliver them to our emergency room with essentially only 2 transfers. When the helicopter lands some place other than the ER, it adds 2 additional transfers. The mere handling can cause significant problems for many of the patients that we service as well as tack on several minutes.

I am aware that some institutions around the country, namely California, have abused air transport with rotary wing craft. The fact that we are invovled in a city wide consortium of hospitals sharing an air service and have agreed to let our helicopter transports be monitored by outside medical experts demonstrates to me that the hospital does not have marketing or financial gain in mind.

Thank you for the opportunity to express my opinions. Please convey my comments to the Seattle City Council.

Sincerely,

Rita S McClarty

Land Use
400 Municipal Building
Seattle, WA 98104

Dear Ms. Gibb:

I am writing to you on the issue of the accessibility to COH by helicopter. In the management of public affairs, generally, all issues tend to involve weighing the welfare of the public at large versus the situation of a considerably smaller segment of society. Access to health facilities (and access which is quick enough to accomplish the intended objective) should be a mainstay of public policy planning. If we were writing on a "blank tablet", and we knew then what we know now, it might not have been the wisest choice to place the COH on the edge of an up-scale and well-to-do residential neighborhood. That choice, however, was made long ago and there is nothing (practically) that we can do about that now.

Despite the choice that was made, long ago, regarding the location of COH, we must do everything, today, to ensure that those in need of quick and speedy medical care at its fine facilities, can have the access that is necessary to obtain the treatment. In many situations, given the distance from which patients come for the specialized treatment which COH offers, helicopter offers the best, the fastest, the most reasonable and the most appropriate way in which to transport the patient to the care site. The minor disruption that the helicopter fly-over may pose to those in the gardens of Laurelhurst should not be allowed to stand in the way of the public good.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Health care is something that all in our society, regardless of political affiliation, or ideological association, regard as an essential benefit which must be available. When children are involved the need becomes even more manifest.

I urge your department to approve necessary access to COH by helicopter. If I can speak with anyone in your department about this issue, in order to elaborate my views, or be of any assistance in your decision making, please do not hesitate to contact me (624-1040).

Yours very truly,

Meade Emory

Dear Ms. Gibb:

We request that DCLU include in the environmental impact statement being prepared on the Children's Hospital helipad proposal an evaluation of the alternative that would have all helicopter-transported patients delivered to Harborview Hospital for initial diagnosis and treatment. This is a reasonable and logical alternative to additional hospital helistops such as the one proposed at COH.

Harborview Hospital is recognized as the regional trauma center. If need be, equipment could be added to deal with the requirements of neonatal cases and very young children. Personnel from COH and University Hospital pediatrics and neonatal departments could support the Harborview emergency care on those few occasions when they were needed. If they were dispatched at the same time as the helicopter was launched they would arrive at Harborview before the patient.

The literature on emergency care is clear on one point: Good trauma care is possible only in places where the volume of patients is high enough to provide the caregivers with the opportunity to develop and maintain their special skills. If Dr. Nicola's estimate of 2 emergency pediatric cases per month is correct, it is only prudent to have them go to Harborview for diagnosis and initial treatment.

As you know, a development proposal for a regional plan for emergency medical services in the Central Puget Sound area has been drafted by the Puget Sound Health Systems Agency. We expect that this study will give serious consideration to centralizing hospital-based helicopter operations as a means of assuring quality medical care and controlling costs, both financial and environmental. The City should examine this alternative in the EIS as well.

We look forward to reviewing the draft EIS.

Sincerely,

Jerry B. Schneider

Dear Ms. Gibb:

The issue of the approval of a helistop for Children's Orthopedic Hospital and Medical Center is an issue which has too long been held prisoner to the vocal minority in the Laurelhurst Community. The various smoke screens held up by this group such as noise levels, safety issues and the potential use of an extremely expensive emergency service as a marketing frill have been answered many times over. The time to make an affirmative decision is now.

The implicit and explicit threats of the Laurelhurst partisans must finally be dealt with. No sensible person could argue with the need for a safe place to land critically ill children. The delay in creating such a place is more of a safety hazard than all the issues raised by the opponents of this plan.

I urge you to make the only decision possible for the health and safety of the children of the Northwest. What is clear is that this decision will save young lives. To make any other choice might cut-off a young life. Please make your final decision quickly so that we may move on to other issues and cease the histrionics of a small group determined to delay and oppose any issue of safety and progress.

Thank you,

Ira M. Duden

Dear Ms. Gibb:

I am writing to register my support of the request of Children's Orthopedic Hospital and Medical Center to build a helipad on the hospital campus.

As the mother of a seven-month old girl, I am deeply concerned about the quality of pediatric care in the Northwest. If my daughter's life or health were in danger, I would want her transported to COHMC as quickly and safely as possible. If a helicopter were needed, I would want it to be able to land at the hospital if that should be medically necessary.

As a grantwriter for the Children's Orthopedic Hospital Foundation, I frequently see the premature infants in the Intensive Care Unit, with tubes and wires attached to every part of their tiny bodies, struggling for breath or lying so still it is hard to believe they are alive. It is easy to see that any extra motion could endanger the lives of some of these infants.

While it is true that the University of Washington soccer field is not far from the hospital, the difference between a landing at the field and a landing at the emergency room door can be more than a few minutes' drive. Most critical is the fact that the drive necessitates an extra transfer of the patient--from helicopter to ambulance and from ambulance to emergency room--before the child can reach the hospital. This means disconnecting and reconnecting the life support systems an extra time. A child could die or suffer permanent brain damage in the process.

I can understand why no one wants to live next to a helipad. But if the neighbors who worry about helicopter noise could see what fragile lives hang in the balance, I am sure they would be willing to put up with a little inconvenience for the sake of these children and their families. If even one child is saved from death or brain damage because of the helipad, its construction will have been worthwhile.

Please add my name to the list of supporters of COHMC's request when this issue comes before the Seattle City Council.

Sincerely,

Goodwin S. Deacon

Dear Ms Gibb

I am a critical care nurse in the Pediatric Intensive Care Unit at Children's Orthopedic Hospital. I am writing in support of COHMC's request for a conditional land use permit to build a helistop outside the ER.

I am also a long term resident, actually native of Seattle. The Childrens Hospital has for over 75 years offered specialized care for the sick infants and children from all our our state and those around us and some even from international countries. We have an obligation to provide tertiary care to those who come through our doors because we are a regional medical center. It is our responsibility to offer and deliver the best possible care we can provide. I am also a member of the code team and respond to those emergencies of respiratory and cardiac failure. I am in the ER when these critically unstable children arrive. I know what it is like to take care of children who have not been initially assessed, properly treated and stabilized prior to arrival at our hospital. I have participated as an active team member of both the neonatal & pediatric ground (ambulance) transport teams. Time is of the absolute essential, along with the expertise of trained personnel to care for this special population.

I understand the concerns of those who are objecting but I took care of the 19 month old near drowning victim as she arrived via chopper to our doors. Had it not been for that decision there would have been the valuable time wasted to further stabilize, get her immediately to the operating room for treating her head swelling. It was, she has lived and survived remarkably from this tragic accident because she was able to land directly at our hospital. I believe that

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

physicians involved weigh all the odds and make the appropriate decisions, that sometimes necessitates the helicopter landing at our ER

To continue to provide this critically valuable service we need to have the ability to bring only those children who require the specialized and emergency treatments to our front door.

Thank you for the opportunity to comment. All you need to see is the interaction of those children reunited with their families to know that what we are attempting to do is so very important. How would you feel if we airlifted a child and the parents asked (or answer) you "well, you are going directly to the hospital, aren't you?" !! Please convey this thought and these feelings to the Seattle City Council.

Sincerely,
Sue Ferrell RN

Dear Ms. Gibb:

I am writing in response to and support of the issue regarding COHMC's request for a conditional land use permit for the helicopter landing outside the Emergency Room.

As a Pediatric nurse of over 10 years and an employee of Children's Orthopedic Hospital and Medical Center I feel such a landing permit is essential to the patients being transported here. As a person who lives in a rural community and abhors noisiness, I have stood in the street at COHMC as a helicopter has approached and landed. The noise is not loud standing outside and lasts only 20-30 seconds.

Please submit my support to the Seattle City Council.

Dear Ms. Anderson:

I am happy to hear that the Laurelhurst Community Club is working with Children's Orthopedic Hospital on development issues.

When the City adopted the major institution zones, our Department requested each major institution to complete and return to us a Baseline Data sheet; a copy of Children's Orthopedic Hospital's Baseline Data sheet is enclosed for your information. The Baseline Data sheet indicates that as of June 1, 1983, their gross floor area was 418,67[illegible] Sq. Ft. and their lot coverage was 115,236 Sq.Ft. or 12.17% of their lot area.

The information provided on the Baseline Data sheet has not been verified by survey but is based solely on the information as provided by an administrator at the hospital. We would not ask for a survey or verification unless questions were apparent or we were otherwise informed that the information submitted was erroneous.

If we can be of further assistance, please call Alan Oiye at 625-2781.

Dear Ms. Miller:

The Laurelhurst Community Club's Land Use Committee is working with the Children's Orthopedic Hospital on a number of development issues. We are anxious to have the Hospital disclose its master plan for development so that we can understand the big picture and avoid reacting inappropriately to piecemeal development projects which may not be a problem.

We are requesting the verified data on gross floor area and lot coverage as it existed on June 2, 1983. We understand this data will be used as a baseline for DCLU determinations of whether or not specific projects will trigger the requirement of a masterplan.

We are concerned that there may have been no survey of the property to satisfy the need for accurate data. Please reassure us on this point as soon as possible.

Sincerely,

Liz Anderson

Jim Street, Chairman
Land Use Committee
Seattle City Council
1100 Seattle Municipal Building
Seattle, WA 98104

Dear Councilmember Street:

At its last Board meeting, the Laurelhurst Community Club adopted a resolution supporting amendments to the Land Use Code which would implement the City's objectives to decentralize development of uses not essential to the performance of the basic mission of the institution, would set development standards for preserving open space on the campus, and would encourage development of a master plan in which the height, bulk and setback standards are tailored to the surrounding neighborhood.

It has been a year since we requested Committee review of the Code provisions regulating major institutions. While we realize that the Committee has been very busy with other important issues, we need to remind you that the major institutions zoning has been declared unconstitutional. We recognize it to be a serious threat to our community.

Please schedule reconsideration of the zoning as soon as possible. Let us know what we can do to help identify the problems and effect solutions.

Dear Ms. Stern:

Thank you for your letter commenting upon statements made by Citizens Concerned About Helicopter Transport (CCAHT). As your letter suggests, many differing points of view are strongly held concerning this proposal.

The City is closely reviewing the proposal and letters such as yours raise important issues which are being carefully considered. The Department of Construction and Land Use (DCLU) will be applying the State Environmental Policy Act (SEPA) and provisions of the Land Use Code to make a decision. These laws require DCLU to evaluate land use and environmental impacts, the issue of medical need, and the implications of this specific proposal for future hospital development.

Beatrice Ryan, Interim Director of DCLU, tells me that her staff is currently reviewing the proposal and will soon make a threshold determination under SEPA on whether there is a need for further environmental review. DCLU has also issued a Notice of Violation to COH for landing helicopters without a permit.

I appreciate you sharing your comments with me. Your letter will be included in the file, and you will be notified of future public hearing schedules and decisions. If you have questions, please call Julia Gibb, Land Use Specialist, at 625-4509.

Sincerely,

Charles Royer

Re: Heliport
Children's Orthopedic Hospital

Dear Mayor Royer:

The Washington State Department of Transportation is concerned that emotional and irrational statements are being put forward by the Citizens Concerned About Helicopter Transport (CCAHT) to defeat a proposal by Children's Orthopedc Hospital (COH) to establish a heliport on their property.

In a letter to the Department of Construction and Land Use (DCLU) dated November 15, CCAHT has attacked several aspects of a study done for COH by Shapiro and Associates. As an example of some of their misleading statements relating to the use of the helicopter they state:

1) That the noise monitoring locations do not measure the noise in the residential areas they are concerned with. They fail, however, to recognize that the helicopter noise will be higher at these monitoring sites and will diminish to lower readings in a measureable amount (similar to the stated background noises) in the residential areas of concern.

2) They question a one landing test and accuse Airlift Northwest of causing false results because a patient was not onboard and full fuel "may" not have been used. Their weight calculations are wrong because an Agusta does not use aviation gas and normally would not operate with full fuel. The difference in noise measurement at any weight would be negligible.

3) MAST helicopters are noisier, but their use is limited, by statute, to critical life threatening emergencies where no alternative exists. Their criticism of their occasional use completely ignores the concern for patient survival.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4) Their criticism of future expansions of COH does not logically relate to the helicopter proposal since they will occur even if no heliport is provided. They should be disregarded in your decision.

5) CCAHT criticizes the use of air taxi accident figures from the National Transportation Safety Board, but Airlift Northwest is a Part 135 air taxi operation. For this reason the rest of their argument, especially relating to search and rescue is non-sensical. They obviously have no knowledge of what is involved in search and rescue operation versus Airlift Northwest's operation.

6) CCAHT states that the FAA only monitors the safety of Airlift Northwest operations on a "limited basis". This is totally untrue. The FAA aggressively monitors the safety, training and maintenance of Part 135 operators.

7) CCAHT illogically states that the insurers required $20,000,000 insurance. As everyone who has bought insurance knows, it is the insured that sets the limit to be purchased. An examination of relative premiums charged would be the only basis for assessing risk.

Throughout the narrative supplied by CCAHT, there is a constant thread of accusation that ignores common sense and demonstrates no concern for the needs of children in need of critical transport. Helicopter transport services have gained nationwide popularity because they have demonstrated their worth in saving lives.

Children's Orthopedic should be supported in its decision to provide this vital service at a very small cost to the local residents.

Sincerely,

Bernice Stern

Dear Mayor Royer,

At the November 20, 1985, meeting of the View Ridge Community Club, the Board of Trustees of the Club passed a unanimous resolution supporting regional planning of all emergency helicopter transfer services. This resolution grew out of concern over proposed heliports at Children's Orthopedic Hospital (COH) and University Hospital -- hospitals that are less than a mile apart.

The Trustees also spoke in favor of having citizen participation on any Review Board which will oversee emergency helicopter transfer operations; such participation would inspire citizen confidence that such service was only being used in true emergencies. (We understand that this procedure has been adopted by a helicopter service which serves the eastern Pennsylvania region.)

View Ridge's concern over the heliport issue dates back to the fall when, at our September meeting, a majority of the Board of Trustees adopted a resolution opposing the COH heliport until a medical need was demonstrated. The Trustees also commissioned a poll of the residents of View Ridge to learn their opinions of the proposed heliport. (I am enclosing a copy of the information which was sent to all the residents informing them of the Club's resolution and soliciting their response.) Of the 277 responses returned to the Club, 196 supported the Club's resolution., opposing the heliport until a need for it was proved.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If such a need is demonstrated, we urge that regional planning precede approvals of applications for such helicopter service, to avoid its unnecessary proliferation. We also urge that operational guidelines be adopted to ensure that this service is used only in emergencies and that adequate citizen participation is assured so that the interests of those living near the heliports and those in the flight path of the helicopters are given appropriate attention.

Thank you for your attention.

Sincerely yours,

Victoria A. King, President

VIEW RIDGE COMMUNITY CLUB, Inc.

"For the Community and by the Community"

The COH Heliport, the VRCC and You

At the September 18, 1985, monthly meeting of the VRCC Board of Trustees, a majority of the trustees adopted the following resolution:

> The Board of Trustees of the VRCC opposes the COH heliport until a medical need has been demonstrated.

The issue of the heliport is not simply a question of noise pollution vs. saving lives of critically-ill children. The trustees would like to share with you the reasoning which led to their adoption of this resolution.

Medical Need: In general trustees felt that helicopters should not be permitted in residential areas. Those in the flight path and residents nearby the landing site, in this case including an elementary school, are all put at additional risk. If there were overwhelming medical need for such a service, then we as citizens might decide the additional risk was justified. Unfortunately the State process (called the Certificate of Need process) which might have established an overwhelming need was avoided by COH and thus there has been no determination at the state level that there is a medical need to justify a heliport at COH. Such a determination will have to be made instead by Seattle's Department of Construction and Land Use which can grant a permit for the heliport only if the heliport is clearly needed to save lives. (UW Hospital is also trying to secure a heliport using the same procedure that COH has.)

Economic considerations: Private medical helicopter service, which provides transfer service between hospitals not from accident scenes, is very expensive (the helicopter portion of Airlift NW's annual budget is just under half, or $375,000 of $800,000), with individual flights costing patients an average of $1500-1900. These helicopter services across the country are, with rare exceptions, unable to operate in the black and must be subsidized by the hospitals which use them. This raises the question of what services COH will have to cut back or eliminate if it decides to subsidize this very expensive new service. Furthermore, since this service becomes cheaper the more it is used, what safeguards or operational guidelines are there to ensure that this service will only be used in true emergencies?

MAST (Military Assistance to Safety and Traffic): This service is currently provided free of charge in our area. (Helicopters land at Graves field on the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

UW intramural fields and patients are then transported to COH or UW via ground transport.) It has a very good safety record and a study of its service over the most recent three years indicates that it has not resulted in any fatalities. However, by military rules, MAST cannot compete with private entrepreneurs; so, if there are additional companies set up to operate medical helicopter transfer service, MAST must abandon its civilian medical transfer operations.

The Club is asking your response to this action for two reasons. First, the heliport has been the subject of great controversy, and we want to make sure that the trustees are, in fact, representing your views. Second, the Club (a volunteer organization with admittedly limited manpower and resources) has by tradition not taken stands on issues which have not had some direct impact on View Ridge and its residents.

The heliport is not, of course, within our boundaries but a majority of the trustees felt that what happens along Sand Point (one of the main approaches to our community) and in nearby communities does have an impact on us and that we should extend our purview in such cases. Moreover, COH now owns property in View Ridge (at NE 70th and Sand Point) and we of course will be concerned if and when COH decides to develop that property. A strong minority of trustees opposed the Club's taking a position in this instance, because they felt that we did not know how the community as a whole felt about this issue; moreover they questioned whether the heliport would have a significant impact on View Ridge. However, having adopted the resolution, all of the trustees thought it essential to poll the community to learn your opinion.

The strength of the VRCC derives from the fact that it reflects the consensus of View Ridge's residents on issues. To maintain this tradition, we are offering you an opportunity to register your feelings both on the resolution itself and on the broader question of the range and breadth of issues which you want your Club to consider.

Responses will be gathered through October 16 (Candidates' Night). You may return them by mail, by giving them to your block trustee or by bringing them to Candidates' Night.

Seattle, Washington 98115

Dear Ms. King:

Thank you for writing me about the Children's Orthopedic Hospital application for a helistop permit. Beatrice Ryan, Interim Director of the Department of Construction and Land Use (DCLU), tells me that her staff are considering the suggestions in your letter.

I have enclosed a copy of the report of Dr. Bud Nicola, Director of the Seattle-King County Department of Public Health, on the issue of medical need.

Thank you for keeping me informed of the View Ridge Community Club's comments and concerns about this proposal. I appreciate the View Ridge Community's support for regional planning for all emergency helicopter services, for operational guidelines and for citizen participation in the process.

If you have questions, please call Julia Gibb, Land Use Specialist, at 625-4509.

Sincerely,

Charles Royer

LAND USE DIVISION

Dear Sirs:

I was pleased to learn that DCLU has ruled that Children's Orthopedic Hospital must file an environmental impact statement before proceeding with plans for a helicopter landing pad at the hospital. This will allow the significant aspects of noise, vibration, safety, alternative sites and shared usage to be explored in detail before a decision is made.

Our house is located approximately two blocks North and one block East of the proposed landing site. On December 6, 1985, the MAST helicopter elected to land at the hospital instead of at Graves Field. Every part of our house shook terribly for several minutes while the helicopter made its approach to the landing site. I can well imagine the structural damage to our house if this were to become a regular practice.

I believe the location of such a helicopter landing site in close proximity to a residential neighborhood and school would severely impact the safety of the surrounding neighborhood. The enclosed article from the Seattle Times (Dec 11, 1985) shows the consequences of a helicopter crash. It is easy to visualize a number of homes in the area of such a crash being demolished, along with the attendant loss of life to people on the ground as well as the flight crew and patient.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Statistics relating the time between such incidents are typical average values. Also, it is well known that the most critical times for such an incident are during the take-off and landing phase (i.e., near the hospital). The point is that such a crash will happen and cause extensive property damage and loss of life. The question is not "if" it will happen, only "when".

The headlines of an article in the Nov 16, 1985 Seattle Times by Dr. John Neff, Medical Director of COH, posed the question - "If the Helipad saves the life of just one critically ill child, then won't it be worth it?". I would turn the question around and ask - "Is the improvement in life saving capability (compared to the current MAST helicopter/ambulance system) worth subjecting the surrounding community to a sure loss of life and property at some point in time?". The answer, for those of us living under the proposed flight path, is a resounding "NO!".

I strongly urge you to: 1) Consider the shared usage of Graves Intramural Field to serve University and Children's Hospitals and 2) Deny issuance of a helicopter landing permit at COH. If required, the site at Graves Field could be improved to provide an all-weather landing site. In addition, if the facilities aboard the MAST helicopter need upgrading in order to protect infants during transport, then this would be a logical area for improvement. This solution would have minimal impact on single family neighborhoods in Seattle and represent the safest approach to continued helicopter service for both Children's and University Hospitals.

cc: 1) Charles Royer, Mayor

Pilot and doctor killed in crash of emergency medical copter

Rescue craft flying in dense fog hits tree

ADDISON, Mich. (UPI) — Two people were killed yesterday when an emergency medical helicopter on its way to pick up a traffic-accident victim at a hospital crashed in dense fog just short of its destination yesterday.

The wreckage of the Life Flight helicopter from St. Vincent Medical Center in Toledo, Ohio, was found in a wooded area near Devil's Lake about a mile southeast of Addison in Lenawee County, police said.

The pilot, John Harrison, 39, and doctor, Jean Hollister, 27, both of Toledo, were killed.

The only survivor, flight nurse Julie Miller, 28, also of Toledo, was taken to St. Vincent for surgery.

Hospital officials said the helicopter left Toledo at 3:49 a.m. in rain and fog for the 35-mile flight to Addison Community Hospital to pick up the traffic victim. The patient was taken to Foote Hospital in Jackson, Mich., when the helicopter failed to arrive as scheduled.

The helicoper's last radio transmission was heard at 4:02 a.m. The wreckage was found six hours later.

Deputy Capt. Robert Sinks of the Lenawee County Sheriff's Department said it appeared the pilot was making a banking turn when the helicopter struck a large tree and skidded into the woods.

The first person to see the wreckage was Otis Chatfield, a 71-year-old farmer who heard the helicopter go by and was later told by a neighbor that it had crashed about a mile east of Chatfield's home.

When he saw the wreckage, Chatfield called out, asking if anybody was inside. He said a woman shouted back that she was inside with a broken leg. Chatfield said he found Miller in the center portion of the helicopter.

Hospital officials said the Life Flight service — the only such service in the Toledo area — has flown more than 5,000 missions since 1979 without a serious accident before yesterday's crash.

The Federal Aviation Administration was investigating the cause of the crash.

The wreckage of a relief helicopter rests in dense woods.

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Dear Beatrice Farrar Ryan,

I am writing to you concerning the environmental impact statement Childrens Orthopedic Hospital is required to complete before they can construct their proposed helipad.

My home is located on the hillside overlooking the present landing site at the University. Two things have always bothered me about the way the helicopters use this area not whether they use it. The approach of the craft could be over essentially non-residential areas, such as the lake from the north or south, or the Montlake cut from the east or west. The irritating thing is they come over the tree tops disregarding their effect on people and buildings. Rattling dishes, shivering walls & buzzing windows are not needed to get a craft, as capable of vertical flight as they are, safely to the ground. People don't need to be shaked, rattled & rolled to adequately address speedy delivery of needy patients to the hospital. The second aspect, particularly acute at nighttime is how long the helicopter remains idling their noisy engine after delivering their patient. I have been kept awake for over 1½ hrs. waiting for the craft to depart so I could fall asleep. It seems reasonable if there is a need to remain on site they could shut the engine down. These craft are extremely noisy in their designed use & I encourage you to define standards stringent enough to control

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the very intrusive nature of their use.

In all the arguments I have read & heard discussed I am not convinced of the <u>general</u> need for helicopters to provide life saving intervention to patients. I am convinced the hospital is trying to keep up with the "latest" developments in <u>attracting new patients</u>.

In all your consideration of the problems involved please reflect on the effect your decisions have on all people - patients <u>and</u> residents.

Sincerely,

Greg Schell

JAG
Jan. 25/86

Dear Mr. Portman-

I wish to state my objections to the use of helicopters at COH.

They have been using Graves field which is not directly within a residential area. They have not had any deaths related to the 3 to 5 min drive to COH from this site, which I believe is much safer.

I live within 300 ft. of the main parking lot. I've seen the helicopters land and take off. The take off usually takes place over the filled parking lot. I believe the safety of this is questionable.

Also the noise! One would gladly put up with it in a life or death situation but I do not believe this is the case. This will be made moe of to the extent that it is financially rewarding, and I resent the use of Childrens lives to promote its approval

Holly Miller, Director
Charles Royer, Mayor

MEMORANDUM

TO: Dr. Bud Nicola, Director
Seattle-King County Health District

FROM: Holly Miller, Director Holly Miller

DATE: December 24, 1986

SUBJECT: Comments on Your December 4, 1985 Report to DCLU
- Children's Hospital's Helistop Application,
MUP 8405870

The enclosed set of comments, suggestions and questions on your report to Beatrice Ryan (dated December 4, 1985) have been derived by assembling the comments of a number of sources. These include comments from:

- Children's medical and administrative staffs
- Individuals who have been assisting COHMC in preparing the Environmental Impact Statement (EIS)
- Representatives of the City of Seattle
- The community at large (both in letters to DCLU as well as letters and testimony received during the public comment period following the issuance of the Draft (D) EIS)

General Comments on Report

1. Please append B. Ryan's letter of 8/30/85 so that the reader has a context for considering the results of this report. State the qualification of the author(s) in preparing the report. Identify or refer to the land use standards used for the consideration of the conditional use permit application.

2. The second paragraph contains an introduction to the report methodology. The report should expand upon this information to detail the specifics of the people who were contacted (this could be done by appending a reference section).

   The survey technique used to interview the various resource people should be identified (i.e., a listing of the questions that were asked and the measures taken to control bias).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The public hearing should be identified as a fact-finding tool. The recording of the testimony and its availability should be noted.

Section - Existing Pediatric EMS System in Seattle

1. First paragraph: Explain the capabilities affiliated with the Mary Bridge NICU beds. Is there a duplication of service with those offered by COHMC?

   In what service capabilities should there be overlap? Are unique services offered by COHMC? by Mary Bridge?

2. Second paragraph: Should this paragraph be the introductory paragraph for this section of the report?

   COHMC can be called out as a tertiary care center. Nancy Greenawalt of COHMC can provide source materials that indicate that COHMC is a tertiary care center.

3. The referral program, whereby a patient is referred to medical institution, should be explained to the lay reader.

Section - Helicopter Transport

1. Comment: Nancy Greenawalt can provide an updated summary of the conditions of patients being transported via helicopter directly to COHMC (see Table 2 on pages 14-16 of the DEIS). She can also make available a medical description of all patients destined for COHMC that are being flown to Harborview and then being ground transported to COHMC. Additional information on the specific care (both during and after transport) can be made available as well--either in summary form or in the case file for each patient. Please let Nancy know what specific information you will require (Nancy's number is 526-2505).

2. The journal article, "Guidelines for Air and Ground Transportation of Pediatric Patients," from the American Academy of Pediatrics should be reviewed for applicability to this report. (Provided to Steve Call.)

   The references section of the article should be reviewed for additional sources of information or contact people who may be able to lend a different perspective. (SHAPIRO is securing the referenced articles for Steve.)

3. The status of Dr. Pinkers' Subcommittee Guidelines should be updated.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. What types of patients warrant the use of air transport, as opposed to ground transport? That is, in addition to trauma patients, what categories of presenting conditions and/or illnesses are candidates for helicopter transport?

5. Particularly for those patients within the 70-mile radius identified in the first report, how does one strike a balance between transport time and transport distance?

6. Much of the existing data appears to be based on literature that deals primarily with aeromedical transport of trauma patients. We understand that this is attributable to the fact that there is little published information on non-trauma cases. Does a more recent literature search confirm this? What can be concluded from a review of the existing ALNW flight logs?

   Can conclusions from a review of literature on trauma patients be drawn and applied to neonatal and pediatric populations? to patients with presenting conditions identified in question 4 above?

7. The last sentence of this section assumes that for patients being airlifted to Intramural Field and then ground transported to Children's, there would be a 3-5 minute delay in treatment at COHMC. Rose Andrews, ALNW's Chief Flight Nurse, estimated that because of transfer time, this delay is longer (a total delay of about 10 minutes; see pages 53-53 of the DEIS). This change in assumption should be confirmed and examined for its potential influence on the conclusions.

<u>Section - Current Data</u>

1. The first paragraph can be updated to reflect more current information. Nancy Greenawalt can provide you with this information as soon as it becomes available.

2. Similarly, the second paragraph can be updated to reflect up-to-date information.

<u>Section - Recommendations</u>

1. In Glen Bachman's interview of you and Steve Call, you and Steve spoke extensively of the need for guidelines, not criteria, to assist medical personnel in making the decision to helitransport or not helitransport. That is, the medical team may be confronted with a complex set of conditions with a given patient. In a situation where life and death decisions are being made, is it important that the medical personnel's judgment be used--and that their authority to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

make decisions not be diluted by guidelines that would reduce their ability to take action swiftly?

Steve also pointed out that the number of separate presenting conditions is enormous. The potential number of combinations of presenting conditions is even greater, such that to create clear criteria could be overly restrictive, and not provide the medical personnel with the flexibility they require. The report may need to articulate this issue more clearly.

2. Again, please review assumption regarding 3-5 minute transfer time.

3. Second paragraph: Clarify what 5-10% refers to. Is it helicopter-transported children?

4. It is estimated that somewhere between 15-20 children per month will be transported by helicopter. These transports would involve 30-40 flights: one flight in and out for the pickup of the pediatric medical transport team, and a second flight in and out for the delivery of the patient. Children's is in the process of designing a "hybrid" alternative, whereby the medical team would be picked up either at Harborview or (if built and if allowed by the University) at the Intramural Field). Most airlifted patients would be brought to Harborview or Intramural Field--only the most serious (an estimated 3-5) patients would be landed outside the Emergency Room Entrance at COHMC.

   A point of note is that it has been difficult to derive reliable estimates of total numbers of patients who would be transported by helicopter. The numbers presented in the DEIS reflect estimates from both COHMC and ALNW medical and administrative staffs. They should be considered as advisory--in part because of uncertainty whether a medical breakthrough, catastrophe, addition of competing helicopter service, or some other situation would alter these estimates.

5. Has the introduction of helicopter transport of non-traumatized patients, whether pediatric or not, established a new standard of care?

6. Fourth paragraph: Has any other source (apart from the literature review) supported the conclusion that "there are no definitive predictive clinical indicators of prognosis . . . ."?

7. What areas of uncertainty exist in the overall opinion/report?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

8. Do you maintain your recommendation for a review panel? If so, what should their mission be? Who should be represented on the panel?

Addenda

1. Attachments 1 and 2: Should be updated; source(s) should be identified.

2. The time and cost analysis provided by Craig Jackson to Lothar Pinkers is valuable; however, the economic analysis may be too discrete for inferential purposes. COHMC believes that there is an ultimate economic benefit to heli-transported patients because of diminished medical care requirements and shorter stays. This issue could be explored if you think it is appropriate.

Thank you so much for your consideration of these items. Please feel free to telephone Glen Bachman or Julia Gibb at 625-4509 with any questions.

Re: COH's Proposed Helipad Draft Environmental Impact Statement

Dear Ms. Miller:

One environmental impact that should be addressed, because it is of great concern to the city and its people, is the liability incurred by the City if the Impact statement were approved.

Does the City have liability insurance? Would the insurance premiums rise if the Helipad goes into operation? Would the city incur liability in case an accident occurred -- liability because the City failed to enforce its laws on land use.

I believe the City may currently be exposed to great risk of liability because knowledge of risk exists but landings are now taking place. Even if permits were issued, the City would still be at risk because it could be argued that the City was negligent in issuing a permit. Just what is the City's exposure and what is its insurance situation?

These questions should be addressed and brought to the attention of those responsible for making decisions about land use.

Sincerely yours,

Robert Haney Scott

Dear Julia:

Thank you for meeting with John Keegan, Glenn Bachman and me on Wednesday, November 19 to discuss the time frame for completing the final environmental impact statement (FEIS). Basically, it is our understanding that we will continue to use the timetable and events as specified in Mitch Olejko's letter to you of August 22, 1986 (attached) with the addition of one month to the November 24 FEIS issue date. This additional time will accomodate the extension of the DEIS comment period by two weeks and two weeks to clarify and expand Nicola's recommendations on medical need. Correspondingly, the Director's report and Hearing Examiner decision will also be delayed by one month.

If this is not your understanding, please contact me at 526-2505.

Page 14. Field Transport. This section contains two minor errors in describing hospitals in King County. The sentence preceding the list of hospitals and their location states that paramedics are based in seven area hospitals. The listed hospitals serve as "base hospitals" for paramedic units operating in King County. Paramedic units are not, in every instance, physically based in those hospitals. It would be more accurate to state that in King County, seven area hospitals provide medical control to paramedics.

In the last paragraph on page 14, the statement is made that King County EMS classifies hospitals according to the services they provide. King County EMS does not classify hospitals. The scheme of hospital classification reflected in the Patient Distribution Guide was developed in 1977-78 by the Seattle Area Hospital Council, the King County Medical Society, the King County Emergency Medical Society, the King County Emergency Medical Services Coordinating Council and the EMS Division. The King County Medical Society has assumed responsibility for periodically updating the Guide. The EMS Division has assumed responsibility for distribution of the Guide to all pre-hospital emergency medical providers and it has been incorporated into King County's patient care protocols.

Page 25. The reference to Dr. Nicola's response to DCLU contains the statement that he concluded ". . . that of the ten patients that he estimated would be transported to Children's by helicopter each month, three or four "may have a medical need for helicopter transport to the doors of the hospital."

Page 55. The statement is made that, "Nicola estimates that three or four would have a clear medical need for direct transport to Children's Emergency Room entrance--such that delays or transfers could affect patient outcome."

It must be understood that the estimate of three to four patients per month was not definitive. The following paragraph in Dr. Nicola's recommendation to DCLU states that, "The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any number would have to include an additional number of patients whose condition at time of referral was appropriate for air transport . . .".

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The number of patients for whom the most appropriate method of transport at time of referral is judged to be a helicopter may be greater. Other factors that may impact the number of patients transported by helicopter include changing hospital referral patterns and changing capabilities of community hospitals resulting in increased reliance on tertiary centers throughout the Puget Sound region.

Pages 43 & 44. The status of the Puget Sound Health Systems Agency proposal to investigate issues regarding helicopter transport is unclear at this time. The State of Washington's commitment to participate in the development of the PSHSA proposal has been withdrawn. Apparently, the State has decided to pursue a more cautious approach to the development of policies regarding air ambulance services.

The Seattle-King County Department of Public Health is prepared to work with the PSHSA to gather and analyze data regarding the potential need and impact of expanded EMS helicopter transport in the Puget Sound region. The State of Washington (DSHS) has indicated a willingness to cooperate in that effort.

Information regarding the impacts of noise from locating a helipad at Children's is accurate and factual. The resultant noise levels described in the document would present no known health hazard.

RE: Draft Environmental Impact Statement on Air Ambulance Service at Children's Orthopedic Hospital

Dear Holly:

The King County Board of Public Health had a public hearing on December 2, 1986, regarding the full range of issues involving air ambulances in King County.

Based on testimony we received, the Board will be making recommendations to the Department of Social and Health Services with regards to the need for state-wide planning to govern effectively the regulation of air ambulance services. I believe, however, that the information gained at our hearing may be pertinent to several of the issues posed in your environmental review of Children's Orthopedic Hospital's proposed establishment of a helipad. Attached for your review and consideration is a summary of the public testimony that the Board heard on December 2, 1986.

I would also note that subsequent to the County's hearings, the National Transportation Safety Board announced that it would conduct a year long study evaluating Emergency Medical EVAC, with the intention of establishing standards for operation. The City of Seattle may wish to have the results of such study prior to any final long term decision of their own. I hope the public testimony that we have heard may prove of some use to you.

Sincerely,

Cynthia

Cynthia Sullivan

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pursuant to the public hearing held on December 2, 1986, chaired by King County Councilwoman Cynthia Sullivan and attended by Board of Health members, King County Executive Tim Hill, and Councilwoman Lois North, a public hearing was held for public comment on air ambulance services in King County. The following is a summary of the testimony presented:

1. There is a need for a statewide plan and the Washington State Department of Social and Health Services is the appropriate agency pursuant to RCW 18.73 to carry out such a plan.

2. At present there is an absence of effective and comprehensive regulation of air ambulance services.

   A. While the Federal Aeronautics Aviation approves flight paths, it does not monitor compliance and there are concerns that general aviation rules may not be appropriate for the typical aeromedical mission.

   B. The Department of DSHS in its responsibility to license helicopters for patient transport appears to have standards which are too low.

   C. DSHS establishes threshold for certificates of need which hospitals must meet before receiving air ambulance services, but these requirements are perceived to be easily circumvented.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

D. The City of Seattle requires hospitals to obtain conditional use permits, but in the past the City has not always effectively enforced the requirement.

E. The Washington State Medical Association has formed an emergency medical services commitee to develop user guidelines for air ambulance services and at present there are no enforcement provisions.

3. As a consequence of the lack of integration with emergency medical system,

A. There is the risk of competition between ground and air transport for patients.

B. There is confusion in the public over which service to call in an emergency.

C. There could be a decrease in public support for EMS.

D. There is an absence of quality insurance.

4. There is the possibility of overuse of the air ambulance service.

A. The overuse could reach a factor of 10.

B. It is undisputed that the cost per flight decreases as the number of flight hours increase.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

C. Physicians may be pressured into defensive medicine and order helicopters to avoid malpractice suits.

D. Helicopters may function as flying advertising for hospitals.

E. The helicopters allow hospitals to receive the most severely injured and ill patients which increase the revenue.

F. Hospital competition motivates purchases of such services even if not essential for quality medical care.

5. There is a potential for misuse of air ambulance services.

A. Time is a critical factor in necessitating the use of air ambulance, but the hospitals closest to the referring hospital and the patient's origins are not always being utilized and in the past, up to 40% of the patients flown to COH could have received care at the Mary Bridge Hospital in Tacoma.

B. The medical effectiveness of air transport only benefits the worst trauma patients and some patients could even be harmed by air transport.

6. The costs of air transport are extremely high and nearly all operate at a loss. The cost of medical care for all consumers could rise both in hospital services and insurance rates. Other hospital services could experience budget cuts to subsidize helicopter services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7. There are a number of Safety issues.

A. Hospital based helicopters have a higher rate of fatal accidents compared to commercial flying; 6.5 lives lost per 100,000 flying hours compared to 2.2 lives lost per 100,000 flying hours.

B. In 1985, 1 out of 10 aeromedical helicopters lifted off had a reportable accident.

C. Between 1980 and 1985, 55 people were killed in such accidents.

D. 80% of the accidents occurred during limited visibility.

E. Weather reports come from Boeing Field or Seatac and may not be accurate for the area of transport.

F. No national operating standards govern when conditions are suitable for flight. The flights are made at the discretion of the pilot and there may be pressure from medical professionals to fly despite safety considerations.

G. There is no national training standards for aeromedical pilots and the commercial/military experience may be inadequate.

H. Most hospitals are located in urban and/or residential areas, and noise under these circumstances may constitute a significant disturbance to the neighboring community.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Recommendations Suggested at the Hearing

A. Develop a state-wide plan for cohesive and effective system of licensing, regulating and enforcing standards for air ambulance services.

B. Integrate with the existing EMS system.

C. Develop medical/surgical criteria for determining when air vs. ground transport is necessary.

D. Determine time and distance relationships to compare the efficacy of air compared to ground transport to facilitate the use of the nearest hospitals when air transport is used.

E. Develop operating standards for determining when weather conditions are suitable for flight.

F. Require aeromedical training for pilots. — developed by the N.T.S.B.

G. Require safety standards ~~be~~ adhered to. and siting of helitop
including but not limited to issues ① lighting ~~② helitop~~
② on site weather observer

G. Conduct regular audits to assure quality and cost-effectiveness of service.

H. Explore alternatives.

Subject: Comments on the Draft Environmental Impact Statement for Children's Hospital and Medical Center Helistop

Thank you for the opportunity to comment on the Draft EIS for the Children's Hospital and Medical Center helistop. The department has the following comments.

Certificate of Need Process

The EIS states that a proliferation of helistop requests will not occur due to the rigidity of the Certificate of Need process from which the Children's Hospital helistop has been exempted. The Final EIS should state why this helistop is exempt from that process and why other hospital facilities would not have many of the same reasons for a helistop as Children's Hospital and Medical Center.

Flight Path

The Draft EIS uses the flight path for the helistop as a mitigating measure for the on-site location. That flight path is subject to FAA approval. What assurances does Children's Hospital have that the flight paths used within the SEPA process will be approved, as stated, by the FAA.

Cumulative Projects

It is the department's understanding that University Hospital is also in the process of studying the potential of a helistop. Due to the close proximity of these institutions, it would make sense to look at a common site for both. The University Hospital site may not be the most desirable site due to potential traffic impacts; therefore, the Graves field site may be the best for both. Perhaps this decision should be combined with the University's need in order to reduce the possible duplication of a helistop.

Ms. Julia Gibb
Department of Construction and Land Use
City of Seattle
Seattle, WA 98104

Dear Julia:

Enclosed is a set of comments, thoughts and suggestions on Dr. Nicola's December 4, 1985 report. Steve Call has met with Dr. Nicola on at least one occasion to review and discuss a preliminary draft of the comments. In addition, Steve, Jane Gladstone and I met to talk through some of the issues raised in the earlier draft. I told Steve after that meeting that I would submit the comments to you for your consideration. It was Steve's and my belief that DCLU should probably formally (in writing) request Dr. Nicola to consider the comments and revise the December 4 report.

Steve raised two points that warrant consideration:

1. What is the Department of Public Health (DPH) and the City's potential liability associated with preparation of the revised report?

2. B. Ryan originally requested that Dr. Nicola provide an opinion regarding medical issues on the proposed helistop at Children's. Dr. Nicola responded with an informal opinion, which is different than an expert opinion, the distinction being a result of the fact that Dr. Nicola is not a neonatologist, pediatric specialist or specialist in emergency medicine. It is my understanding that DPH wants to be certain that any new (revised) report provide sufficient information to enable a recommendation to be made regarding the two medical criteria of the Conditional Use Permit. If DCLU is satisfied that an informal opinion would suffice in making a judgment, then DPH is prepared to tackle the report. If, however, an expert opinion is required, then it is my understanding that DPH would like to defer to an "outside" expert.

Steve indicated that he would be contacting you to resolve these issues so that the process can proceed expeditiously. I'll call you later this week to discuss these issues--particularly the issue of whether Dr. Nicola should proceed with the revision to his informal opinion or whether an outside expert should be hired by DCLU to render an expert opinion.

Sincerely,

COMMENTS ON DR. NICOLA'S
DECEMBER 4, 1986, REPORT TO DCLU

The enclosed set of comments, suggestions and questions on Dr. Nicola's report to Beatrice Ryan (dated December 4, 1985) have been derived by assembling the comments of a number of sources. These include comments from:

- Children's medical and administrative staffs
- Individuals who have been assisting COHMC in preparing the Environmental Impact Statement (EIS)
- Representatives of the City of Seattle
- The community at large (both in letters to DCLU as well as letters and testimony received during the public comment period following the issuance of the Draft (D)EIS)

I have also taken the liberty of reviewing a copy of the tape from the public hearing that Dr. Nicola conducted in preparation for his determination.

The comments below reflect the discussions held at a meeting in the King County EMS offices on November 20. Those in attendance were Steve Call and Jane Gladstone of KC EMS, Patrick Dougherty and Julia Gibb of DCLU, Nancy Greenawalt of COHMC, and Glenn Bachman of Shapiro and Associates, Inc. Steve also met with Dr. Nicola following that meeting and then, along with Jane, met again with Glenn.

General Comments on Report

1. Please append B. Ryan's letter of 8/30/85 so that the reader has a context for considering the results of this report. State the qualification of the author(s) in preparing the report. Identify or refer to the land use standards used for the consideration of the conditional use permit application.

2. The second paragraph contains an introduction to the report mehodology. The report should expand upon this information to detail the specifics of the people who were contacted (this could be done by appending a reference section).

   The survey technique used to interview the various resource people should be identified (i.e., a listing of the questions that were asked and the measures taken to control bias).

   The public hearing should be identified as a fact-finding tool. The recording of the testimony and its availability should be noted.

NOTICE: IF T DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT DUE TO THE QUALITY OF THE DOCUMENT.

Section - Existing Pediatric EMS System in Seattle

1. First paragraph: Explain the capabilities affiliated wih he Mary Bridge NICU beds. Is there a duplication of service with those offered by COHMC?

   In what service capabilities would there be overlap? What unique services are offered by COHMC? by Mary Bridge?

2. Second paragraph: Should this paragraph be the introductory paragraph for this section of the report?

   COHMC should be called out as a tertiary care center. Nancy Greenawalt of COHMC can provide credible source materials that indicate htat COHMC is a tertiary care center.

3. The referral program, whereby a patient is referred to medical institution, should be explained to the lay reader.

Section - Helicopter Transport

1. Comment: Nancy Greenawalt can provide you with an updated summary of the conditions of patients being transported via helicopter directly to COHMC (see Table 2 on pages 14-16 of the DEIS). She can also make available a medical description of <u>all</u> patients destined for COHMC that are being flown to Harborview and then being ground transported to COHMC. Additional information on the specific care (both during and after transport) can be made available as well--either in summary form or in the case file for each patient. Please let Nancy know what specific information you will require (Nancy's number is 526-2505).

2. The journal article, "Guidelines for Air and Ground Transportation of Pediatric Patients," from the American Academy of Pediatrics, should be reviewed for applicability to this report. (Provided to Steve Cal.)

   The references section of the article should be reviewed for additional sources of information or contact people who may be able to lend a different perspective. (SHAPIRO is securing the referenced articles for Steve.)

3. The status of Dr. Pinkers' Subcommittee's Guidelines should be updated.

4. What types of patients warrant the use of air transport, as opposed to ground transport? That is, in addition to trauma patients, what categories of presenting conditions and/or illnesses candidates for helicopter transport?

5. Particularly for those patients within the 70-mile radius identified in the first report, how does one strike a balance between transport time and transport distance?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. Much of the existing data appears to be base on literaure that deals primarily with aeromedical transport of trauma patients. We understand that this is attributable to the fact that there is little published information on non-trauma cases. Does a more recent literature search confirm this? What can be concluded from a review of the existing ALNW flight logs?

   What conclusions from a review of literature on trauma patients can be drawn and applied to neonatal and pediatric populations? to patients with presenting conditions identified in question 4 above?

7. The last sentence of this section assumes that for patients being airlifted to the Intramural Field and then ground transported to Children's, there would be a 3-5 minute delay in treatment at COHMC. Rose Andrews, ALNW'S Chief Flight Nurse, estimated tha because of transfer time, this delay is longer (a total delay of about 10 minutes; see pages 52-53 of the DEIS). This change in assumption should be confirmed and examined for its potenial influence on the conclusions.

Section - Current Data

1. The first paragraph can be updated to reflect more current information. Nancy Greenawalt can provide you wih this information as soon as it becomes available.

2. Similarly, the second paragraph can be updated to reflect up-to-date information.

Section - Recommendations

1. In my interview of Bud Nicola/Steve Call, they spoke extensively of the need for guidelines, not criteria, to assist medical personnel in making the decision to helitransport or not to helitransport. As I understand the rationale, the medical team may be confronted with a complex set of conditions with a given patient. In a situation where life and death decisions are being made, it is crucial that the medical personnel's judgment be used--and that their authority to make decisions should not be diluted by guidelines that would reduce their ability to take action swiftly. As I recall, Steve also pointed out that the number of separate presenting conditions is enormous. The potential number of combinations of presenting conditions is even greater, such that to create clear criteria could be overly restrictive, and not provide the medical personnel with the flexibility that they require. I believe that the report needs to articulate this issue more clearly.

2. Again, assumption regarding 3-5 minute transfer time.

3. Second paragraph: Clarify what 5-10% refers to. I assume it is helicopter-transported children.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. It is estimated that somewnere between 15-20 children per month will be transported by helicopter. These transports would involve 30-40 flights: one flight in and out for the pickup of the pediatric medical transport team, and a second flight in and out for the delivery of the patient. Children's is in the process of designing a "hybrid" alternative, whereby the medical team would be picked up either at Harborview (of if built and if allowed by the University, than at the Intramural Field). Most airlifted patients would be brought to Harborview or Intramural Field--only the most serious (an estimated 3-5) patients would be landed outside the Emergency Room Entrance at COHMC.

   A point of note is that it has been difficult to derive reliable estimates of total numbers of patients who would be transported by helicopter. The numbers presented in the DEIS reflect estimates from both COHMC and ALNW medical and administrative staffs. They should be considered as advisory--in part because of uncertainty whether a medical breakthrough, catastrophe, addition of competing helicopter service, or some other situation would alter these estimates.

4. Has the introduction of helicopter transport of non-traumatized patients, whether pediatric or not, established a new standard of care?

5. Fourth paragraph: Has any other source (apart from the literature review) supported the conclusion that "there are no definitive predictive clinical indicators of prognosis..."?

6. What areas of uncertainty exist in the overall opinion/report.

7. Does Dr. Nicola maintain his recommendation for a review panel? If so, what should their mission be? Who should be represented on the panel?

Addenda

1. Attachments 1 and 2: Should be updated; source(s) should be identified.

2. The time and cost analysis provided by Craig Jackson to Lothar Pinkers is valuable; however, the economic analysis is too discrete for inferential purposes. COHMC believes that there is an ultimate economic benefit to helitransported patients because of diminished medical care requirements and shorter stays. This issue could be explored.

Attention: Mr. Jerry Schneider
Subject: Children's Hospital and Medical Center Helistop
Review of Noise & Vibration Studies

Gentlemen:

At your request I have reviewed the following documents relative to the previous noise studies prepared for the subject project:

Helipad Noise Evaluation for Children's Orthopedic Hospital
prepared by: Seton, Johnson & Odell, Inc.
dated: October 8, 1985.

Children's Hospital and Medical Center Helistop
Draft Environmental Impact Statement, Chapter IV, pp. 74-89
prepared by: Towne, Richards, & Chaudiere, Inc.
dated: September 1986.

Based upon this review, I have the following comments:

1. Determination of the existing ambient noise characteristics of the residential properties affected by the project is inadequate to accurately determine the acoustical impact. There are several reasons for this:

   a. The instrumentation used in the measurements is not suitable for determining the acoustical parameters of interest (i.e. Leq and Lmax). The B&K 2209 sound level meter can only display the instantaneous sound pressure level (slow or fast response); it is up to the operator to view the indicating needle and estimate "by eye" the average and maximum noise levels during the measurement period.

   b. The measurement period at each location is inadequate to determine the necessary acoustical parameters with the required degree of accuracy. For this type of project the absolute minimum monitoring period should be 24 continuous hours at each location. The recommended monitoring period is 3 days at each location. The 10 to 15 minute measurement period used by Seton, Johnson & Odell cannot even begin to determine

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the necessary statistics about the existing Lmax levels in the area. The existing and predicted Lmax levels in the adjacent residential community is one of the most important parameters necessary to evaluate impact (particularly sleep interference). The DEIS suggests that existing Lmax levels are in the 75 to 85 dBA range. This should be verified by direct measurement. The short measurement period (along with the improper instrumentation) also lends considerable doubt to the accuracy of the Leq values reported. It is certainly presumptuous (and misleading) to publish an estimated monthly Ldn based upon less than 2 hours of data.

c. The ambient noise measurement locations are not adequately specified in either of the reviewed reports. The precise location of the microphone should be specified at each measurement location. From the verbal description presented in the Seton, Johnson & Odell report it appears that some of the measurement locations were inappropriate. For example, site 1 is said to be "in the parking strip on the east side of 44th Ave. N.E. between N.E. 47th St. and N.E. 50th St." Ambient noise measurements should **never** be made this close to a street because of the effect of street traffic. It is a well known fact that the Leq and Lmax levels close to the street are not representative of the levels which occur at typical house setbacks. I suspect that this same problem occurs with all of the five sites reported in the DEIS.

2. Presumably, the helicopter noise tests conducted in May of 1985 were run to determine the pertinent helicopter noise descriptors as they pertain to the impact on the adjacent residential property. Unfortunately, the measurements were taken at only one point with only one landing/take-off, and the data was not analyzed for frequency content. The frequency content of the noise is critical if projections of interior noise levels are to be made. The interior/exterior noise reduction estimates presented in the DEIS and the Seton, Johnson & Odell report are taken from the EPA Noise Guidelines Document which is based on a national average for all types of noise. It is a well known fact that typical exterior construction provides more noise reduction at high frequencies (above 500 Hz) than low frequencies. The fact that helicopter noise has more low frequency energy than typical traffic noise would suggest that the interior/exterior A-weighted noise reduction values for helicopter noise would be below that of the national average for all types of noise. The only way to legitimately estimate the interior noise levels (without direct measurement, which is the preferred technique) is to measure the frequency content of the helicopter noise at carefully selected receiving locations as the helicopter goes through its typical operating maneuvers. From these data it is possible to calculate the interior noise levels as a function of frequency assuming typical exterior building construction for the residential area in question. A minimum of three landing/take-offs should have been measured (and tape recorded) in order to get an estimate of the frequency content and range of noise levels created by the helicopter due to slight changes in flight path, approach rate, and altitude.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Estimates of the average exterior Ldn from helicopter traffic using the proposed helistop are based upon FAA noise test data which provides Lmax and SEL statistics for various maneuvers with the Agusta A109 Mark II. All noise level predictions are apparently based upon 100% use of this aircraft. If other aircraft are expected to use the facility, the noise levels and percentage of use for each of these aircraft should be factored into the analysis if an accurate assessment of the impact is to be made possible.

4. Estimates of the maximum exterior noise levels from helicopter traffic are based upon the field test conducted in May 1985 as well as the FAA data on the Agusta A109 Mark II. Unfortunately, the maximum noise levels presented in this report are not clearly reported. There are three different maximum noise level statistics in common use:

   i) Lmax (slow response). This is the maximum sound pressure level detected during a measurement period with the sound level meter time weighting factor set to "slow response". The "slow response" setting causes the meter needle to respond slowly to rapid changes in the noise level (missing the true maxima) and it is normally used to determine compliance with environmental noise ordinances. It should not be used to estimate actual maximum noise levels when sleep interference is an issue. It is commonly used with non-integrating sound level meters (such as the Bruel & Kjaer 2209 which was used by Seton, Johnson & Odell) because the indicating needle movement is too rapid to follow with the eye using other settings.

   ii) Lmax (fast response). This reading is similar except the meter time weighting is set to "fast response". Lmax values determined with the "fast response" setting are almost always higher than those taken with the "slow response" setting, and the difference between the two depends upon the nature of the noise.

   iii) Lmax (peak detector). This reading bypasses the rms detector circuit in the sound level meter and captures the true "peak" sound pressure level. This setting is normally used to measure impulsive noise, but it is of interest here because some researchers have conducted laboratory sleep interference studies using the peak A-weighted sound pressure level as the primary control variable.

   There is a significant difference between each of these noise descriptors (as much as 15 dBA between Lmax (slow) and Lmax (peak) for any one single event), and unless the existing and predicted future Lmax levels are based upon the same time weighting factor, it is not possible to assess the impact.

5. The methodology used to evaluate impact in the DEIS is generally appropriate, but there are two major omissions:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a. The DEIS fails to compensate for the character of the helicopter noise. It is a well known fact that some types of sound create higher levels of annoyance than others even if the A-weighted sound pressure level of the two sounds is the same. Sounds containing single frequency components (tones) and impulsive sounds generally fall into this category. Helicopter noise is known to possess both of these characteristics. The City of Seattle Noise Ordinance accounts for this fact by applying a 5 dBA penalty in determining compliance. Even though emergency helicopters are exempt from meeting the requirements of the noise ordinance, it would be necessary to apply a similar penalty if the intent of the study is to determine true impact by the use of Lmax and Ldn noise descriptors.

b. The DEIS fails to provide a projected helicopter noise contour map and a discussion regarding the geographical area of impact. Reading these reports one gets the impression that the helicopter noise will impact only the front row of houses directly adjacent to the helistop. This is probably not the case, and in fact, if a significant or moderate impact is expected at Site 1, I would expect the impacted area to include most of the homes bounded by N.E. 50th St. on the north, 46th Ave. N.E. on the east, and N.E. 45th St. on the south.

In summary, my opinion is that these noise studies rely too much on general data and not enough on information which is specific and relevant to the project in question. This is sometimes the case for an environmental checklist report, but it is not at all appropriate for an environmental impact statement.

If you have any questions regarding these comments, or if I can be of any further assistance, please give me a call.

Very truly yours,
JGL Acoustics, Inc.

Re: Helipad proposal at
Children's Orthopedic
Hospital (COH)

Dear Ms. Miller & Gibbs:

I am enclosing my correspondence with Dr. Nicola to show you my concern about disrespecting the health and lives of a whole neighborhood, including two schools, apartment buildings which border the proposed helipad site at COH. Also, electrical wiring is overhead on the parking lots of COH and a park with high trees and a substation on it is nearby.

Dr. Nicola could not or did not volunteer even how many lives were saved in endangering us all. As a matter of fact, he gave the hospital permission to land up to eight times per month, which the hospital finds unsatisfactory. They want about 50-60 landings a month. I call this an airport. And all this without knowledge of how many lives are saved.

This is incredible carelessness of the appointed health directors and shows lack of investigation into the situation.

I hope you all will intervene to make a bad situation better.

Thanks for listening.

Sincerely,

Helen Newman

Seattle, Washington 98105

Ms. Helen Newman:

In your letter of August 23, 1986, you asked me to respond to three specific questions regarding the transport of patients to Children's Orthopedic Hospital by helicopter: 1) How many children have been helped by helicopter transport?; 2) How many children have died?; and, 3) What medical problems have there been with landings at the nearby soccer fields?

When I was asked by the Department of Construction and Land Use to comment on the medical need for helicopters at Children's Orthopedic Hospital, I reviewed the previous year's transport records of Airlift Northwest, talked to transporting physicians, and witnessed the helicopter and emergency department staff in operation. All of the six patients per month transported to Children's Orthopedic Hospital by helicopter during 1985 were "helped."

Was a landing at the hospital parking lot rather than the soccer field the difference between life and death? This question is not possible to answer given the number of variables involved in the care of an acutely ill or injured child. We do know that time is an extremely critical variable in determining the outcome of persons acutely ill or injured. As a generalization, helicopter transport can reduce the time for a patient to receive definitive medical care.

It is my opinion after reviewing the diagnoses of the ill children transported by helicopter and speaking to their attending physicians that one might expect 5% of comparable cases to develop life threatening complications during flight where several minutes difference in reaching care may indeed be the difference between life and death or severe disability.

400 Yesler Building Seventh Floor Seattle, Washington 98104 (206) 587-4600

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The main problem associated with landing at the soccer field has been the trauma involved on a fragile incubator baby in making mechanical connections with oxygen, ventilator, intravenous equipment between the helicopter and the ambulance in an open field. This is one more variable which may increase the risk of problems in an ill baby. I do not have sufficient information to answer your questions more definitively.

I would reiterate that the Draft Environmental Impact Statement to be released by the City of Seattle Department of Construction and Land Use addresses many of the questions you have raised.

Thank you again for writing.

UNIVERSITY OF WASHINGTON
SEATTLE, WASHINGTON 98195

Office of the Vice President for Finance and Administration

August 28, 1986

RECEIVED

SEP 05 1986

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Mr. Robert Klug
President, Laurelhurst Community Club
4326 N.E. 42nd
Seattle, Washington 98105

Dear Mr. Klug:

Thank you for your August 13 letter regarding a helipad in the University of Washington east campus area.

My July 2, 1986 letter to Mr. Katz of Children's Orthopedic Hospital (COH) was intended only to address the issue of a permanent helipad for COH on a University playfield. That question arose because a preliminary draft of the COH Environmental Impact Statement (EIS) for a helipad at the hospital discussed as an alternative a "Graves Field Helistop." My letter urged simply that "no further consideration be given to use of the University's playfields as a site for a permanent COH helipad"; it was not intended to necessarily rule out other sites in the east campus area, which might be used for patient transfers headed to COH, or University Hospital.

As you know, the University has begun the process of preparing an EIS on use of the helipad on the roof of the new east wing of University Hospital. That EIS will, of course, address alternatives. During our early work on the EIS, comments were received which requested specific consideration of an east campus alternative, which we will do. We now anticipate publication of the University's EIS by January 1987.

I should note, however, that some of the sites suggested in your letter do not appear to meet all the criteria for a permanent helipad. For example, sites 3, 4, and 5 are located within 1,000 feet of University housing at Laurel Village. It is also not clear that a site large enough to accommodate MAST helicopters could be provided on site 4 without encroaching on the adjacent playfield. Other considerations will have to be taken into account, including impact on the ecological research and wildlife areas, impact on the Center for Urban Horticulture, parking loss, and space demands of other University units.

306 Administration Building, AH-05 / Telephone: (206) 543-6410

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Work is proceeding on the University's EIS, but a determination of the site-specific alternatives to be considered probably cannot be made before the September 8 meeting of the Laurelhurst Community Club Board. I regret that a previous engagement will not permit me to attend that meeting, but I have asked Sedge Thomson to be there to answer any questions your group may have. We will keep you informed of our progress and notify you of the alternatives selected for discussion in the EIS as soon as that determination has been made.

I hope you find this letter responsive to your concerns. If you have any questions, please let me know, or call Sedge Thomson (543-4828) or Sally Marks (543-9071).

MEMORANDUM

TO: Dr. Bud Nicola, Director
Seattle-King County Health District

FROM: Holly Miller, Director Holly Miller

DATE: December 24, 1986

SUBJECT: Comments on Your December 4, 1985 Report to DCLU - Children's Hospital's Helistop Application, MUP 8405870

The enclosed set of comments, suggestions and questions on your report to Beatrice Ryan (dated December 4, 1985) have been derived by assembling the comments of a number of sources. These include comments from:

- Children's medical and administrative staffs
- Individuals who have been assisting COHMC in preparing the Environmental Impact S atement (EIS)
- Representatives of the City of Seattle
- The community at large (both in letters to DCLU as well as letters and testimony received during the public comment period following the issuance of the Draft (D) EIS)

General Comments on Report

1. Please append B. Ryan's letter of 8/30/85 so that the reader has a context for considering the results of this report. State the qualification of the author(s) in preparing the report. Identify or refer to the land use standards used for the consideration of the conditional use permit application.

2. The second paragraph contains an introduction to the report methodology. The report should expand upon this information to detail the specifics of the people who were contacted (this could be done by appending a reference section).

   The survey technique used to interview the various resource people should be identified (i.e., a listing of the questions that were asked and the measures taken to control bias).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The public hearing should be identified as a fact-finding tool. The recording of the testimony and its availability should be noted.

Section - Existing Pediatric EMS System in Seattle

1. First paragraph: Explain the capabilities affiliated with the Mary Bridge NICU beds. Is there a duplication of service with those offered by COHMC?

   In what service capabilities should there be overlap? Are unique services offered by COHMC? by Mary Bridge?

2. Second paragraph: Should this paragraph be the introductory paragraph for this section of the report?

   COHMC can be called out as a tertiary care center. Nancy Greenawalt of COHMC can provide source materials that indicate that COHMC is a tertiary care center.

3. The referral program, whereby a patient is referred to medical institution, should be explained to the lay reader.

Section - Helicopter Transport

1. Comment: Nancy Greenawalt can provide an updated summary of the conditions of patients being transported via helicopter directly to COHMC (see Table 2 on pages 14-16 of the DEIS). She can also make available a medical description of all patients destined for COHMC that are being flown to Harborview and then being ground transported to COHMC. Additional information on the specific care (both during and after transport) can be made available as well--either in summary form or in the case file for each patient. Please let Nancy know what specific information you will require (Nancy's number is 526-2505).

2. The journal article, "Guidelines for Air and Ground Transportation of Pediatric Patients," from the American Academy of Pediatrics should be reviewed for applicability to this report. (Provided to Steve Call.)

   The references section of the article should be reviewed for additional sources of information or contact people who may be able to lend a different perspective. (SHAPIRO is securing the referenced articles for Steve.)

3. The status of Dr. Pinkers' Subcommittee Guidelines should be updated.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. What types of patients warrant the use of air transport, as opposed to ground transport? That is, in addition to trauma patients, what categories of presenting conditions and/or illnesses are candidates for helicopter transport?

5. Particularly for those patients within the 70-mile radius identified in the first report, how does one strike a balance between transport time and transport distance?

6. Much of the existing data appears to be based on literature that deals primarily with aeromedical transport of trauma patients. We understand that this is attributable to the fact that there is little published information on non-trauma cases. Does a more recent literature search confirm this? What can be concluded from a review of the existing ALNW flight logs?

   Can conclusions from a review of literature on trauma patients be drawn and applied to neonatal and pediatric populations? to patients with presenting conditions identified in question 4 above?

7. The last sentence of this section assumes that for patients being airlifted to Intramural Field and then ground transported to Children's, there would be a 3-5 minute delay in treatment at COHMC. Rose Andrews, ALNW's Chief Flight Nurse, estimated that because of transfer time, this delay is longer (a total delay of about 10 minutes; see pages 53-53 of the DEIS). This change in assumption should be confirmed and examined for its potential influence on the conclusions.

Section - Current Data

1. The first paragraph can be updated to reflect more current information. Nancy Greenawalt can provide you with this information as soon as it becomes available.

2. Similarly, the second paragraph can be updated to reflect up-to-date information.

Section - Recommendations

1. In Glen Bachman's interview of you and Steve Call, you and Steve spoke extensively of the need for guidelines, not criteria, to assist medical personnel in making the decision to helitransport or not helitransport. That is, the medical team may be confronted with a complex set of conditions with a given patient. In a situation where life and death decisions are being made, is it important that the medical personnel's judgment be used--and that their authority to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

make decisions not be diluted by guidelines that would reduce their ability to take action swiftly?

Steve also pointed out that the number of separate presenting conditions is enormous. The potential number of combinations of presenting conditions is even greater, such that to create clear criteria could be overly restrictive, and not provide the medical personnel with the flexibility they require. The report may need to articulate this issue more clearly.

2. Again, please review assumption regarding 3-5 minute transfer time.

3. Second paragraph: Clarify what 5-10% refers to. Is it helicopter-transported children?

4. It is estimated that somewhere between 15-20 children per month will be transported by helicopter. These transports would involve 30-40 flights: one flight in and out for the pickup of the pediatric medical transport team, and a second flight in and out for the delivery of the patient. Children's is in the process of designing a "hybrid" alternative, whereby the medical team would be picked up either at Harborview or (if built and if allowed by the University) at the Intramural Field). Most airlifted patients would be brought to Harborview or Intramural Field--only the most serious (an estimated 3-5) patients would be landed outside the Emergency Room Entrance at COHMC.

   A point of note is that it has been difficult to derive reliable estimates of total numbers of patients who would be transported by helicopter. The numbers presented in the DEIS reflect estimates from both COHMC and ALNW medical and administrative staffs. They should be considered as advisory--in part because of uncertainty whether a medical breakthrough, catastrophe, addition of competing helicopter service, or some other situation would alter these estimates.

5. Has the introduction of helicopter transport of non-traumatized patients, whether pediatric or not, established a new standard of care?

6. Fourth paragraph: Has any other source (apart from the literature review) supported the conclusion that "there are no definitive predictive clinical indicators of prognosis . . . ."?

7. What areas of uncertainty exist in the overall opinion/report?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

8. Do you maintain your recommendation for a review panel? If so, what should their mission be? Who should be represented on the panel?

Addenda

1. Attachments 1 and 2: Should be updated; source(s) should be identified.

2. The time and cost analysis provided by Craig Jackson to Lothar Pinkers is valuable; however, the economic analysis may be too discrete for inferential purposes. COHMC believes that there is an ultimate economic benefit to heli-transported patients because of diminished medical care requirements and shorter stays. This issue could be explored if you think it is appropriate.

Thank you so much for your consideration of these items. Please feel free to telephone Glen Bachman or Julia Gibb at 625-4509 with any questions.

Attention: Julia Gibb

Dear Ms. Miller:

Reference: Draft EIS for Children's Hospital and Medical Center Helistop dated September 1986; our EI 86-306

The Seattle Police Department has reviewed the Draft Environmental Impact Statement for the Children's Hospital and Medical Center Helistop.

We support the location proposed for the following reasons:

1. Transporting critical patients from either of the alternate locations could delay the arrival of the patient due to traffic congestion. If either alternate location is used during football games, the route may, in fact, be impossible.

2. The University Hospital is isolated from Children's Hospital during football and basketball games.

3. A severe impact on travel time must be considered during rush hours.

4. The athletic field complex is situated just south of businesses and a well-traveled road. We would expect an impact on the Seattle Police Department if this location is selected because of on-lookers, sightseers, and people slowing or stopping their vehicles to see what is happening.

For the reasons stated above, the Seattle Police Department favors location of the Helistop at Children's Hospital.

Very truly yours,

PATRICK S. FITZSIMONS
Chief of Police

Re: Comments on DEIS Children's Hospital Heli-Stop

Dear Ms. Gibb:

I have reviewed all MAST Flights for the past ten years as a part of my regular duties with the MAST Coordinating Committee.

On only one occasion, in the winter of 1986, was it necessary to deliver an infant directly to the hospital's door, rather than landing at Graves' Field.

My data shows no other bad patient outcome resulting from landing at the Grave Field site.

Last winter I asked the Seattle Fire Department, Chief Jerry Burt and Shepard Ambulance, Mr. Ken Ruef, if they knew of any bad outcomes occuring during the transport of pediatric patients from a MAST helicopter at Graves' Field to Children's Hospital.

Neither activity knew of any of any bad result at that time.

Warm regards,

Jay M. Kranz, MD., Chairman
MAST Coordinating Committee

Dear Ms. Miller:

I am writing about the proposed helipad at Children's Hospital. I am a pediatrician and on the staff of Children's Hospital, so I am not unsympathetic to the need for efficient and effective transportation of sick children. However, I believe that the current plan proposed by the hospital is insufficient and does not contain adequate safeguards for either the patients or the community.

Regarding the patients, while it may seem intuitively obvious that faster transport will enhance survival, this is not necessarily the case and should be documented with good scientific studies. Judging by Dr. Nicola's recent excellent review of the literature on this issue, there are none. A possibly analagous example of the misuse of technology is the situation with monitoring of near-term fetuses, where the use of electronic monitors increases the rate of Cesarean sections but does not necessarily enhance rates of survival of infants. Ground transportation has advantages over air transportation. The only way to resolve situations in which such uncertainty exists is to perform proper comparisons of the available methods on appropriate subjects. Until such a study is performed, one might be able to draw some tenuous conclusions from a review of data from transports performed during last year's snow. During that time, what was the survival rate of patients in comparison to similar patients transported during better weather? I think that Children's Hospital should be required to provide such data to justify the use of an expensive technology, for which the neighbors, the patients, and society at large must pay. It should be analyzed by a third party.

Regarding the community, are they being protected from the strictly entrepreneurial interests of Airlift Northwest and Children's Hospital? What mechanism is there to prevent the abusive use of helicopter transport for all sorts of medically unnecessary purposes? I have heard stories of Airlift Northwest transporting corpses of children. Why should the community suffer this? Will the city allow the proverbial fox to guard the henhouse? What disinterested party is going to monitor the use of a heliport once it is constructed? Who has verified the hospital's data on noise and other environmental concerns? Rather than belabor the issue with a long litany of possible abuses of the community by entrepreneurs, I will simply urge that this issue be considered in light of the recent history of Children's Hospitals relations with its neighbors.

Sincerely,

Thomas A. Bell, M.D., M.P.H.

Subject: Helipad at Children's Orthopedic Hospital

At the October meeting of the Ravenna Bryant Community Association (10/7/86) concern was expressed for the proposed helicopter landing site at Children's Orthopedic Hospital. Our board has examined the current status of the proposals placed before your agency and we hope to see the strictest review of the proposal by all concerned city, state or federal agencies before approval is considered for the proposal.

A motion was placed before the board and was adopted unanimously. Please enter the motion in your file of testimony and hearings.

RBCA Motion A/10-7-86/Unanimous

Moved: That RBCA support the position of the Laurelhurst Community Club concerning the helicopter landing site proposal of Children's Orthopedic Hospital, in that the Laurelhurst Community Club poll of local residents demonstrates near unanimous concern for the proposed site, in that it is the conviction of RBCA that a statement of need and demonstration of need for air transportation must be provided and approved before our community association would consider approval of the site proposal, and in that RBCA sees the need for a statement of justification and demonstration of why the existing joint use of the University of Washington landing site (shared by the UW and COH for emergency cases) is not a superior and safer alternative for a site location for helicopters.

Please place our association on your mailing list for subsequent matters concerning the COH proposal.

Sincerely yours,

David W. Rigby
President

Comments on the Children's Hospital and Medical Center Helistop
Draft Environmental Impact Statement

Dear Ms Miller,

Our preliminary comments were made at the Public Hearing on September 23, 1986 and concerned the failure to involve any of the community groups which will be impacted by the numerous helicopter flights and the failure to consider the cumulative impact of such flights to/from both Children's and University Hospitals. A copy of the testimony is appended for your convenience.

Environmental Impacts
Why is no attempt made to assess noise and vibration impacts along the entire flight path? Montlake residents are well aware of helicopters over our community. We hear them overhead when we are inside well-built homes and feel the vibration they cause. This is hardly the reaction to a truck going by. You predict 15-20 flights a month which must be doubled due to the medical team pick-up. This means an additional 360 to 480 flights per year to Children's which has only 17% of the flights. How many helicopter flights will have as their destination University Hospital? How will the constant barrage of helicopter noise affect the emotional well-being of Montlake residents and the livibility of our community?

Role of Helicopters
Table 2 lists 21 patients who were transported by helicopter with a mortality rate of 48% and brain damage in other cases. What is the mortality rate for all patients transported by helicopter since May, 1985? Charges have been made that helicopter transport is more traumatic and can cause cerebral hemorrhage in neonatals. Could damage to the patient be caused by helicopter flight?

Table 3 is a purely hypothetical case. Use a real case and take into consideration the time involved when the community doctor calls the medical director for advice, the medical director calls Boeing Field, the helicopter pilot takes off and lands at Children's, the medical team is loaded and the helicopter departs and lands at the community hospital. This time interval was completely absent from Table 3.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Is the increase in use of medical helicopters forcing community-based physicians to send patients who cannot be helped to tertiary care facilities because of the fear of malpractice charges?

Why has Children's Hospital failed to file an updated form 7480 with the FAA?

Is it more than a little premature to plan a relatively massive assault on densely populated areas with medical emergency helicopters before the proposed guidelines and standards are formulated by Puget Sound Health Systems Agency, the Subcommittee on Air Ambulance Medical Standards of the Washington State Medical Association and American Society of Hospital Based Emergency Air Medical Services and National Emergency Medical Services Pilots Association? It appears that a Supplemental Draft Environmental Impact Statement should be completed and offered for additional comments by the public after the reports by the associations are finished and a part of the document.

Will the expanded service of Airlift Northwest and other helicopter services force the curtailment of MAST operations in western Washington? MAST is not allowed to compete with private enterprise.

Helicopter Safety
According to aeromedical experts, hospital-based helicopters crash far more frequently than other helicopters or civil fixed wing aircraft. Therefore it is necessary to examine closely the predicted increase in emergency flights by helicopters which have such abysmal accident records. How many helicopter pilots does Airlift Northwest employ? How many helicopter pilots are on duty at one time? How many hours per day is each helicopter pilot on duty? How many days per week does each helicopter pilot work? Is a helicopter pilot ever required to work extra hours per day, per week, per month?

Part of the arguement for building a secured, lighted pad is the safety factor. Is there any concern for safety when the helicopter lands at a community hospital with no landing pad or at an accident scene on a freeway or in a field?

What kind of insurance does Airlift Northwest carry in case the helicopter crashes in a densely populated area?

Is enough information available to make a convincing case for allowing 80-90 emergency helicopter flights per month in Seattle? In the American Medical News of September 5, 1986, preliminary evidence suggests that helicopter transport may be detrimental to patients' outcomes.

Sincerely,

Doris Baxter Burns

Doris Baxter Burns
President

MONTLAKE COMMUNITY CLUB

"Cooperating to maintain a fine Montlake Residential District"

TESTIMONY AT PUBLIC HEARING, SEPTEMBER 23, 1986, ON CHILDREN'S HOSPITAL HELISTOP

I am Doris Baxter Burns, 2511 West Montlake Place East, Seattle 98112, President of the Montlake Community Club. We will present some of our comments at this time with more detailed concerns in writing before the October 2nd deadline.

First of all, we must protest your mailing list which contains not a single community council. Allied Arts may well be concerned about the helipad, but why are University District, University Park, Laurelhurst, Green Lake, Montlake, Wallingford, Ravenna-Bryant, Eastlake, Portage Bay-Roanoke, Capitol Hill and other communities well within the flight paths ignored? Some of these community groups may not be aware of the publication of this Draft Environmental Impact Statement and thus miss the deadline for reply about their just concerns. An honest attempt should be made to rectify this error. It certainly is a grave one that should be remedied by notification of the concerned groups and extension of the reply time.

Secondly, cumulative impact must be discussed more adequately. No man is an island, and no institution exists in splendid isolation. Airlift Northwest is a consortium of four hospitals. Providence and Harborview share a helipad which is located on a parking lot at Harborview. University and Children's want individual landing pads: one atop the hospital and the other outside the emergency room. University Hospital manages Harborview and has intimate ties to Children's. The close proximity of University and Children's Hospitals demands that the cumulative impact of landings at both helipads must be considered in this DEIS. Children's Hospital claims only 17% of the helicopter flights. How many will land at University Hospital? You state that other helicopters will be allowed to land at the hospital. It is necessary to provide at least some indication of the numbers of such flights to both hospitals. Additionally, how many MAST flights will continue to both hospitals and where are they expected to land? How do you expect to enforce your flight patterns on emergency medical helicopters other than Airlift Northwest? One recently flew over my home which is some distance from I-5. Indeed, Airlift Northwest flights will operate at pilot's discretion also.

Other aircraft that must be considered are the traffic advisory planes and helicopters which patrol I-5, SR 520 and the Montlake Cut. Private planes of the fixed wing variety abound in this area. Float planes fly over Capitol Hill, swoop down over SR 520 and land on Portage Bay. Lake Union is also a favorite destination. During football games at Husky Stadium, planes trailing advertizing slogans circle the area. All these flying vehicles appear to be completely unregulated. Add to this a proliferation of emergency medical helicopters whose safety record as a class leaves much to be desired. The cumulative impact of all planes, fixed wing or rotor propelled, must be considered in your

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

analysis of cumulative impact on the densely populated area over which the helicopters will fly.

In conclusion, we find this a most inadequate document that raises more questions than it answers. Hopefully the FEIS will be more satisfactory.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Re: Helistop, CHMC
4800 Sand Point Way N.E.

Dear Ms. Miller:

The DEIS on CHMC Helistop raises many questions which are not answered sufficiently and ignores many more which have been raised during the hue and cry over this extremely sensitive issue. Time permits me to raise only a few items which bother me.

P.x indicates that only 3 of the 46 Elements of the Environment were reviewed by DCLU. These elements are set forth in the Seattle Municipal Code. Unexplained is who/what the determinant of non-review is/was. Yet, some of these are discussed in the text, but hardly reviewed, since they are "deemed nonsignificant."

The most specious nonsignificant is d.iii. Schools are dismissed as "no significant increase in school population is anticipated from development of this project." Of course not! The obvious significance of schools has been raised in every hearing, newspaper/tv discussion: parents do worry about their children's safety. This safety has threats in any community with accidents, whether by car, bus, bike, playground, now compounded by an omnipresent fear of threat to either Laurelhurst School or the Villa Academy in the immediate vicinity of Children's proposed helistop. If DCLU had reviewed schools, it would have found that parents in neighboring communities worry about the possibility of harm to their schools near the proposed flight patterns depicted in the DEIS. This worry and fear must not be dismissed as irrational nor should DCLU believe that accident rates given in the DEIS immediately calm these worries and fears. Pp. 66 and 67 offer cold comfort with "flew into the ground" statistics predominantly in daytime hours.

DCLU's Distribution List, pp. xiv and xv, shows strange omissions. None of the neighboring community organizations, whether club or council in Montlake, University District, Windemere, Belvedere Terrace, Ravenna-Bryant, Hawthorne Hills, View Ridge, not even Laurelhurst! were included. Also omitted were Seattle School District, Villa Academy, management boards of Burke-Gilman Place, Laurelon Terrace and other living groups, as well as neighborhood businesses and the University Herald. No wonder there are loud outcries.

I question the omission of any statistics for the first alternative, the UW Intramural Field, equivalent to those provided in Table 2, pp. 14-16, for direct landings at CHMC (albeit they are contrary to City regulations).

Other omissions: MAST landings at the UW area have been a long-time emergency provider for the CHMC, yet MAST is summarily treated and dismissed. Nothing is stated, except in an appendix letter about comparative costs of ground travel teams and Airlift Northwest. Presumably, meaning I don't know, costs are billed to parents, hospital involved, medical insurance? Nothing is stated, nor is mention made that MAST traditionally does not charge for its services. Will MAST

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

coexist with Airlift Northwest?

Also omitted is any correlation of jurisdiction over helistop siting and emergency airborne patient services with CHMC's assertion that it will continue to land on its property despite regulations. It cites its authority as WAC 248.18.285 and RCW 7.70.040 yet neither one is presented, pp.41,57. They should be.

It is unclear what medical support is provided to a patient who has been removed from monitoring/sustaining equipment in a helicopter to a gurney for the 120 feet journey to the CHMC Emergency Room.

If the UW Hospital is"unlikely to allow CHMC" use of its proposed building-top helistop, then it ceases to be a feasible alternative and should not be listed as such, p. 53. Conversely, and not addressed, will CHMC allow the UW to use its helistop?

In view of so many omissions (and even commissions) raised above, as those which will be raised by other DEIS readers, I believe a Supplemental EIS is necessary and so request.

Sincerely,

Dorothy McCormick

Re: COH Helicopter Landings

Dear Ms. Miller:

I wish to be on record as opposing the COH application to have helicopter landings at the hospital rather than at the soccer field or the intramural field at U.W.

I am unconvinced of the medical necessity of such a program and fear that it is predominantly a marketing ploy for COH that would put the transported patient, and the surrounding community at an unacceptably high risk for accident.

I urge denial of permits for the on site helicopter pad as unnecessary and dangerous.

Sincerely,

Lawrence R Donohue

OCT 17 1986
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Dear Ms. Miller:

I would like to submit my testimony at the public hearing on September 23, 1986 to serve as my comments on the draft environmental impact statement by Children's Hospital.

"I am here to speak as the president and the representative of the Board of the Laurelhurst Community Club.

In my remarks, I intend to highlight two specific issues (1) the certificate of need (CON) process and the absence or lack of reliable information about the medical need for the proposed helipad and (2) the safety risks of 60 to 80 flights per month into and out of the facility; basically, the probability of a crash with an emergency medical helicopter which makes their use within a single-family neighborhood unacceptable.

Initially, I'd like to talk about the CON process. Children's Hospital has consistently tried to avoid the preparation of a CON application to such an extent that their attorneys filed a lawsuit against the state to prevent it. The Laurelhurst Community Club Board has requested the CON because it is our opinion that it would provide important information to the decision-making process in connection with this conditional use permit request.

In large part, the CON process would provide data or information about need that is not in the draft EIS or the Nicola report. There are 15 specific questions that the CON process would answer and which should be in the final EIS.

1. Identify and analyze the UNMET health services needs which the project would serve.

2. Identify the relationship of the project to the appropriate availability and accessibility sections of the State Health Plan, Health Systems Agency Plan, or the Annual Implementation Plan.

3. Define the population that is expected to be served for the next 10 years and its geographic location, broken down into age and sex categories.

4. Include a patient origin analysis for at least the most recent 3 month period with origins indicated by zipcode.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. Provide information on the availability and accessibility of similar existing services to the defined population expected to be served. Identify all existing providers or services similar to those proposed and include sufficient information to prov that such existing services are not currently available or accessible. Time and distance factors are to be analyzed in detail in this section.

5. Provide utilization forecasts for at least five years following project completion, describe the methodology used to prepare the forecasts, identify and justify all assumptions related to changes in use rate, market share, and intensity of service.

7. Justify why the project does not constitute an unnecessary duplication of services, if existing services are available and accessible to the defined population.

8. Document the manner in which access of low income, racial and ethnic minorities and other underserved groups would be served in relation to their need for them.

9. Break out proposed capital expenditures in detail and explain fully the methods used to calculate them. Document the expected project impacts on capital costs, operating costs, and charges for health services.

10. Indicate the expected sources of financing and the expected sources of revenue associated with the operation of the service. Will cross-subsidies be required? (i.e., will one group of patients be asked to subsidize another group?)

11. Describe the relationship of the project to the appropriate cost sections of the State Health Plan, the HSA Health Plan or Annual Implementation Plan.

12. Show that there will be sufficient numbers of qualified health manpower and management personnel to operate a high quality service.

13. Show that the service will be provided in a manner that ensures safe and adequate care and in accordance with applicable Federal and State laws, rules and regulations.

14. Explore alternatives to the project, including postponing action, shared service arrangements, merger, and contract services. Alternatives should be compared with each other using specific criteria and the manner in which the preferred alternative has been selected should be indicated.

15. Show the specific ways that the project will promote staff or system efficiency or improve productivity.

The LCC Board specifically requests that the city (DCLU), require Children's Hospital to prepare Certificate of Need data within this process and include it in the final EIS

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Safety concerns:

1. Should the data be true that between 1980 and 1985, one of every 10 emergency medical helicoptors in operation crashed, that accident rate is unacceptable. The accident rate suggests that the helipad should not be used in a narrow confined area between houses, apartments, and hospital, but in an area where the flight path is clearand unobstructed.

2. In effect, this proposal to save lives puts more lives at risk.

3. The proposed site is much too close to the houses in this area and to two elementary schools.

Thank you for your attention to these matters.

Sincerely,
Bdo Klug amt

Holly Miller, Director
Department of Construction and Land Use
408 Municipal Building
Seattle, Washington 98104

OCT 17 1986
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Dear Ms. Miller

The following are comments on the Draft Environmental Impact Statement prepared by Children's Hospital as part of its application for a permit to build and operate a helistop on its campus:

1. The DEIS contains information only on those Airlift NW helicopter flights that landed on the CHMC campus. During the past 15 months, the great majority of patients transported to CHMC via helicopter were landed at Harborview's helipad. The FEIS should include a full description of the total travel times (from the time the call for service was received until the patient entered CHMC), the flight times, the origins, the diagnosis and other pertinent characteristics of the patients and the reasons why the patient was not taken to Mary Bridge Children's Hospital for those cases where it was closer than CHMC (for all cases transported by helicopter to CHMC) since the service was initiated by Airlift Northwest. This data should be reviewed by a group of persons not directly connected with any of the actors and institutions involved in providing the transport service to ascertain the appropriateness and effects on the patient of the method of transport in each case. Particular attention should be give to revieving the experience gained with transferring patients at the Harborview helipad as it is expecially relevant to the analysis of the East Campus helipad alternative.

The results of this review should be included in the FEIS as should the basic elements of the data used by the review group. This review would provide a much better basis for making judgments about the need for the proposed helipad and its likely level of use in the future than is currently available.

2. A full discussion of the interrelationships between the medical and research activities at the UW Hospital and CHMC in treating pediatric patients is needed in order to assess the prospects for a helipad that could be used by both hospitals. Such a helipad could be located somewhere in the East Campus area of the UW. Since the UW Hospital is currently preparing a DEIS for a permit to operate a helipad on the roof of its new East Wing building, it is apparent that DCLU should require that both permits be considered jointly rather than sequentially. This is not a new idea. You will find several letters in the file that have suggested that DCLU require that these two permit requests be considered together. The DEIS has not given serious

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

consideration to the alternative that calls for a joint use helipad located somewhere in the East Campus area of the UW. The FEIS should contain a much more detailed investigation of this alternative.

3. The DEIS contains no discussion of the standards and procedures for dispatching the Airlift NW helicopter. Dispatching is a vital part of the operation of any EMS service and can strongly influence the frequency with which the helicopter is used, decisions regarding the use of MAST instead of ALNW helicopters, decisions regarding the use of MEDIC I or private ambulance vehicles instead of the helicopter and the selection of landing sites when a choice exists. Ideally, the dispatching of all EMS services in the Central Puget Sound Region should be centralized and integrated. This is particularly important with regard to helicopters which can range up to 150 miles (i.e. south to Portland and north to the Canadian border). When emergency transport is required, a well-trained dispatcher should be able to quickly determine which EMS service can provide the appropriate assistance at the scene most rapidly so that the patient can be properly stabilized for transport. The DEIS provides no evidence that this most difficult problem has been solved in a way that will assure that the needs of the patient are given top priority. The FEIS should provide such evidence because of the close relationship between dispatching standards and procedures and the prospective use of the proposed helipad.

4. The DEIS does not mention the capabilities of Mary Bridge Children's Hospital to handle emergency pediatric cases. Yet, even the scant data on the actual use of the helicopter shows that many of the patients flown via helicopter to CHMC could have reached the facilities at Mary Bridge Children's Hospital much sooner, even if they had been transported by ground ambulance. A comparison of the capabilities of both hospitals to treat emergency pediatric cases should be included in the FEIS. Without this information, sound judgements about the proper role of each hospital in the care of the emergency pediatric patients that arise in the region cannot be made.

5. Throughout the DEIS, no distinction is drawn between the needs of different kinds of patients. There are at least three types that ought to be recognized: neonates, infants and pediatric patients. Neonates have special problems that most infants and pediatric patients do not have. Yet the discussion of alternatives in the DEIS seems to assume that all patients are alike and have the same problems that neonates have. All patients do not arrive in an isolette and do not have the same intubation problems as premature neonates. Data are needed on the number of emergency cases expected by patient type before one can properly assess many of the questions raised regarding the transfer of the patient from the helicopter to a nearby ground ambulance. This

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

transfer requirement is a key issue in evaluating the East Campus helipad alternative. Neonates are already a very small proportion of the patient population that is expected to transported via helicopter. As the perinatal programs at UW Hospital, Swedish and other regional hospitals grow and develop, one can reasonably expect even fewer premature necnates to arrive by helicopter in the future.

6. An extensive assessment of the noise study included in the DEIS has been prepared by JGL Associates, Inc. located in Redmond, Washington. A copy of this study is enclosed with this letter. Its overall conclusion is that the noise study contained in the DEIS is quite inadequate and should be redone. As noted in the DEIS, there have been 21 landings on the COH campus during the past several months. If acoustical monitors has been installed inside and outside of several of the nearby residences during this period, some substantial amount of data would be available to assess the noise impacts associated with the operation of the Augusta 109. The noise testing accomplished to date by the applicant is clearly insufficient to provide the City Council with the information it needs to make its decision on this issue. This is especially true with regard to the Blackhawk helicopter that MAST expects to be using in the near future.

7. It is the purpose of an EIS to identify and describe the attributes of alternative solutions to the "problem" at some point in the future and then to compare them using a set of evaluation criteria. The results of this comparison provide a basis for the selection of the "preferred alternative" which is then normally discussed in some greater detail. The DEIS contains no such comparison, as the selection of the preferred alternative is identified early on in the document. This choice has not resulted from a careful and through comparison of alternatives. This deficiency should be corrected in the FEIS so that the City Council will have a clear presentation of the reasons why the Preferred Alternative is superior to the other possible solutions to the "problem".

8. The DEIS contains no discussion of the liability of the parties involved in the operation of the helicopter in the event of a crash in a residential or other populated area. It is known that Hospital Air Transport is required to carry liability insurance of $20 million dollars. Does this mean that Hospital Air Transport (headquartered in Beaverton, Oregon) is solely liable? Or, since Hospital Air Transport is a subcontractor to Seattle Jet, does Seattle Jet share in this liability? Are Harborview, Airlift Northwest, the other participating hospitals or the State of Washington liable in the event of a crash? It would be especially helpful to know how the insurer calculated the risk factors used to determine the premiums for this policy and who the insurer is. These questions are relevant to the safety issue and answers should be provided (in depth) in the FEIS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

9. Airlift Nortwest has been bringing patients to COH via helicopter for about 15 months. There have been approximately 100 patients transported during this time. A review of the appropriateness of these transports conducted by an independent review panel should be included in the FEIS. This review should include at a minimum the following items: reason for transport, mechanism of injury or illness, interventions performed or maintained, outcome of patients transported and timeliness of transport. An analysis of these data by a well-qualified and credible panel would provide a much more reasonable basis for making judgments about the medical need and selection of destination hospital questions that are such key elements in matter. A case in point is data on the total travel time involved in these helicopter transports. How can one assess the disutility of the time required for a transfer at the UW East Campus area without being able to compare it with the total travel time involved? Does the transfer add 2%, 5% or some other figure to the total travel time? The DEIS does not contain this vital information. Please ask that it be included in the FEIS.

10. The forecasts of the probable use of the helipad contained in the DEIS are supported by no visible methodology. It is not reasonable to use data for the first 15 months of a start-up operation to extrapolate 10 years into the future. The only reasonable approach to this important problem is to forecast by analogy. This means that other Children's Hospitals that are similarly situated in a metropolitan area of comparable size that have some similarities in terms of topography should be located and their experience with pediatric transports over several years examined. Ideally, a population-based methodology should be developed that could be used to estimate the numbers of emergency cases that can be expected to be generated by a population as it evolves through time in response to the variety of factors that together define its demographic and socioeconomic characteristics. Examples of metropolitan areas that have characteristics similar to Seattle are San Diego, the San Francisco Bay Area, Portland and a few Eastern coastal cities.

11. The DEIS contains no references to the publication entitled Air Ambulance Guidelines published in May 1986 by the U.S. Department of Transportation and the American Medical Association. The FEIS should discuss in detail how the proposed air ambulance service would satisfy these guidelines. A copy of the table of contents of this publication is enclosed with this letter for your interest.

12. The DEIS includes a description of the time required for transport of a patient from Enumclaw to Children's (Table 3, page 18). This illustration should be modified to include the dispatch time for the helicopter which can be considerable. It should also include estimates for transport to Mary Bridge

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's Hospital in Tacoma. If minutes do make a difference, then it may be that this patient would be better off being transported to the closer hospital. Beyond these obvious deficiences of this part of the DEIS lies the larger and more important question of how one defines the appropriate service area for helicopter transport. Dr. Nicola uses a figure of 75 miles as defining the distance from Children's within which ground transport is probably going to be superior. How many times has Airlift Northwest been used to transport patients originating within 75 miles of Children's since June of 1985? The FEIS should contain such data as well as several analyses of the comparative advantages of ground versus helicopter transport from several representative locations in Western Washington. It is obvious that if minutes matter, all but very exceptional patients from Bremerton and other Kitsap County locations should be taken to Mary Bridge Children's hospital via ground ambulance. Yet, the information in the DEIS suggests that just the opposite is happening - they are being taken to Children's via helicopter. Such comparative advantage studies are needed to establish service area boundaries for those few pediatric services available only at Children's and Mary Bridge. Once such service area boundaries are established, population-based forecasting of patient volumes becomes much more feasible and rational planning becomes more possible.

13. A serious deficiency in the DEIS is its total unconcern with where the helicopter is supposed to land when it is sent to some hospital in Western Washington. Since about 90% of the helicopter flights are supposed to be interhospital transfers, one must assume that every hospital in Western Washington will need a helipad. A survey should be conducted that will show how many of these hospitals now have or contemplate having a helipad. For those that do not now have a helipad and have no plans to construct one, some other suitable landing place that has the approval of the FAA and other local and state officials should be identified in the FEIS.

There is much information that is still needed before the City Council can be expected to make an informed decision on this issue and I hope that you will require that the DEIS be largely redone in the near future.

Yours sincerely,

Jerry Schneider

Attention: Mr. Jerry Schneider
Subject: Children's Hospital and Medical Center Helistop
Review of Noise & Vibration Studies

Gentlemen:

At your request I have reviewed the following documents relative to the previous noise studies prepared for the subject project:

> Helipad Noise Evaluation for Children's Orthopedic Hospital
> prepared by: Seton, Johnson & Odell, Inc.
> dated: October 8, 1985.
>
> Children's Hospital and Medical Center Helistop
> Draft Environmental Impact Statement, Chapter IV, pp. 74-89
> prepared by: Towne, Richards, & Chaudiere, Inc.
> dated: September 1986.

Based upon this review, I have the following comments:

1. Determination of the existing ambient noise characteristics of the residential properties affected by the project is inadequate to accurately determine the acoustical impact. There are several reasons for this:

   a. The instrumentation used in the measurements is not suitable for determining the acoustical parameters of interest (i.e. Leq and Lmax). The B&K 2209 sound level meter can only display the instantaneous sound pressure level (slow or fast response) it is up to the operator to view the indicating needle and estimate "by eye" the average and maximum noise levels during the measurement period.

   b. The measurement period at each location is inadequate to determine the necessary acoustical parameters with the required degree of accuracy. For this type of project the absolute minimum monitoring period should be 24 continuous hours at each location. The recommended monitoring period is 3 days at each location. The 10 to 15 minute measurement period used by Seton, Johnson & Odell cannot even begin to determine

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a. The DEIS fails to compensate for the character of the helicopter noise. It is a well known fact that some types of sound create higher levels of annoyance than others even if the A-weighted sound pressure level of the two sounds is the same. Sounds containing single frequency components (tones) and impulsive sounds generally fall into this category. Helicopter noise is known to possess both of these characteristics. The City of Seattle Noise Ordinance accounts for this fact by applying a 5 dBA penalty in determining compliance. Even though emergency helicopters are exempt from meeting the requirements of the noise ordinance, it would be necessary to apply a similar penalty if the intent of the study is to determine true impact by the use of Lmax and Ldn noise descriptors.

b. The DEIS fails to provide a projected helicopter noise contour map and a discussion regarding the geographical area of impact. Reading these reports one gets the impression that the helicopter noise will impact only the front row of houses directly adjacent to the helistop. This is probably not the case, and in fact, if a significant or moderate impact is expected at Site 1, I would expect the impacted area to include most of the homes bounded by N.E. 50th St. on the north, 46th Ave. N.E. on the east, and N.E. 45th St. on the south.

In summary, my opinion is that these noise studies rely too much on general data and not enough on information which is specific and relevant to the project in question. This is sometimes the case for an environmental checklist report, but it is not at all appropriate for an environmental impact statement.

If you have any questions regarding these comments, or if I can be of any further assistance, please give me a call.

Very truly yours,
JGL Acoustics, Inc.

Jerry G. Lilly

Jerry G. Lilly, P.E.
President

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Estimates of the average exterior Ldn from helicopter traffic using the proposed helistop are based upon FAA noise test data which provides Lmax and SEL statistics for various maneuvers with the Agusta A109 Mark II. All noise level predictions are apparently based upon 100% use of this aircraft. If other aircraft are expected to use the facility, the noise levels and percentage of use for each of these aircraft should be factored into the analysis if an accurate assessment of the impact is to be made possible.

4. Estimates of the maximum exterior noise levels from helicopter traffic are based upon the field test conducted in May 1985 as well as the FAA data on the Agusta A109 Mark II. Unfortunately, the maximum noise levels presented in this report are not clearly reported. There are three different maximum noise level statistics in common use:

   i) Lmax (slow response). This is the maximum sound pressure level detected during a measurement period with the sound level meter time weighting factor set to "slow response". The "slow response" setting causes the meter needle to respond slowly to rapid changes in the noise level (missing the true maxima) and it is normally used to determine compliance with environmental noise ordinances. It should not be used to estimate actual maximum noise levels when sleep interference is an issue. It is commonly used with non-integrating sound level meters (such as the Bruel & Kjaer 2209 which was used by Seton, Johnson & Odell) because the indicating needle movement is too rapid to follow with the eye using other settings.

   ii) Lmax (fast response). This reading is similar except the meter time weighting is set to "fast response". Lmax values determined with the "fast response" setting are almost always higher than those taken with the "slow response" setting, and the difference between the two depends upon the nature of the noise.

   iii) Lmax (peak detector). This reading bypasses the rms detector circuit in the sound level meter and captures the true "peak" sound pressure level. This setting is normally used to measure impulsive noise, but it is of interest here because some researchers have conducted laboratory sleep interference studies using the peak A-weighted sound pressure level as the primary control variable.

   There is a significant difference between each of these noise descriptors (as much as 15 dBA between Lmax (slow) and Lmax (peak) for any one single event), and unless the existing and predicted future Lmax levels are based upon the same time weighting factor, it is not possible to assess the impact.

5. The methodology used to evaluate impact in the DEIS is generally appropriate, but there are two major omissions:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the necessary statistics about the existing Lmax levels in the area. The existing and predicted Lmax levels in the adjacent residential community is one of the most important parameters necessary to evaluate impact (particularly sleep interference). The DEIS suggests that existing Lmax levels are in the 75 to 85 dBA range. This should be verified by direct measurement. The short measurement period (along with the improper instrumentation) also lends considerable doubt to the accuracy of the Leq values reported. It is certainly presumptuous (and misleading) to publish an estimated monthly Ldn based upon less than 2 hours of data.

c. The ambient noise measurement locations are not adequately specified in either of the reviewed reports. The precise location of the microphone should be specified at each measurement location. From the verbal description presented in the Seton, Johnson & Odell report it appears that some of the measurement locations were inappropriate. For example, site 1 is said to be "in the parking strip on the east side of 44th Ave. N.E. between N.E. 47th St. and N.E. 50th St." Ambient noise measurements should never be made this close to a street because of the effect of street traffic. It is a well known fact that the Leq and Lmax levels close to the street are not representative of the levels which occur at typical house setbacks. I suspect that this same problem occurs with all of the five sites reported in the DEIS.

2. Presumably, the helicopter noise tests conducted in May of 1985 were run to determine the pertinent helicopter noise descriptors as they pertain to the impact on the adjacent residential property. Unfortunately, the measurements were taken at only one point with only one landing/take-off, and the data was not analyzed for frequency content. The frequency content of the noise is critical if projections of interior noise levels are to be made. The interior/exterior noise reduction estimates presented in the DEIS and the Seton, Johnson & Odell report are taken from the EPA Noise Guidelines Document which is based on a national average for all types of noise. It is a well known fact that typical exterior construction provides more noise reduction at high frequencies (above 500 Hz) than low frequencies. The fact that helicopter noise has more low frequency energy than typical traffic noise would suggest that the interior/exterior A-weighted noise reduction values for helicopter noise would be below that of the national average for all types of noise. The only way to legitimately estimate the interior noise levels (without direct measurement, which is the preferred technique) is to measure the frequency content of the helicopter noise at carefully selected receiving locations as the helicopter goes through its typical operating maneuvers. From these data it is possible to calculate the interior noise levels as a function of frequency assuming typical exterior building construction for the residential area in question. A minimum of three landing/take-offs should have been measured (and tape recorded) in order to get an estimate of the frequency content and range of noise levels created by the helicopter due to slight changes in flight path, approach rate, and altitude.

Seattle

Dear Ms Miller:

It seems apparent that the Helipad concern by Laurelhurst residents, including myself, is great high. In addition it seems questionable as to the benefit it would provide.

I am opposed to this effort: the safety aspect, heightened congestion and noise and questionable benefits, vs all costs, are the reason.

Sincerely -

Douglas B. Nichols

Subject: COH Helipad "Deis"

So much has been said against the COH helipad, I would be repeating what has been said. The exception would be the "DEIS" COH has released. It is nicely prepared with words of motherhood, but loaded with misleading statements and facts. These range from misapplying safety statistics to expanding the time line difference to transport from the playfield aread to COH vs direct flight. An Ambulance should not take any longer time than required to walk the distance. Please count this statement as strongly in opposition to the COH proposal.

Sincerely yours,

David Belvin

Dear Holly Miller,

As you will note by my address below, I live across the street on the south edge of Children's Hospital. I am very much in favor of a helipad at the hospital to help children suffering traumatic health problems. The following are a few of my thoughts:

- Helicopters paths and safety are controlable human factors. If the path is up 45th street at a reasonably high level and a quick decent to the pad, the noise is very briefly heard and safety to residences could not be a concern.
- Helicopter noise from those landing in the past has been no louder at my location than many of the street vehicles that go up and down 45th Street.
- Helicopters are fun to watch even though it would only be a brief time at my location. And it is inspiring to know they are helping Children.
- Please consider the south side of Children's Hospital for the helipad — in the area of the current play yard for children.

I am sorry to be so late with my comments and I was unable to attend the September 23rd hearing. When is the next hearing scheduled? I would like to support the helipad development.

Subject: A JOINT USE HELIPAD IN THE EAST CAMPUS AREA

As you may know, the Board of the Laurelhurst Community Club is actively involved in trying to find a solution to the controversy generated by the proposed helipad at Childrens Orthopedic Hospital. One idea that the Board would like to see explored in detail would involve the construction of a permanent helipad somewhere in the East Campus area that could be shared by University and Childrens Hospital. The facility would be used by MAST, Airlift Northwest, and other helicopters transporting patients to the two hospitals. It is clear that this location offers the safest possible landing area in the immediate vicinity of the two hospitals as well as producing the fewest adverse effects upon the local environment.

We ask that you initiate discussions with the administration of Childrens Hospital on this topic, that you identify and study one or more possible sites in this area, and that you work out a joint operating agreement. We have suggested this idea to the administration, medical staff and Board of Childrens on numerous occasions but they have so far ignored the idea. We would like to see the University take the lead in these discussions so that this safest of all possible solutions receives a full review.

Sincerely,

Robert H. Klug

Dear Ms Miller,

I am writing concerning the helipad issue in regards to Children's Medical Center (C.O.M.) located in Laurelhurst community. I am a great supporter of the hospital and all it seeks to achieve however, I do have some concerns regarding the necessity of a helipad at the hospital. Will there be a weather observer at the hospital to keep pilots informed of prevailing weather conditions? The flight patterns shown in the EIS show a secondary approach which when used in bad weather conditions appears much more dangerous to the pilot and his/her passengers. The existing field at the University of Washington which is used for hospital landings seems a more logical and safer place for all concerned. There are telephone poles, electrical wires,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

homes, schools and many occupants. It is in these dwellings that the pilot must be aware of. In an emergency (ie. unforseen weather problems, engine problems ...) the obstacles one must deal with & potential disasters are fewer if the soccer field approach and landing place were to remain as is. In my dealings with the hospital, (I currently give tours for the hospital + was president of a guild which supports uncompensated care at the Children's Medical Center) I fail to see the critical need for a helipad sight located so far from the entrance to ER as opposed to a safer landing site and short driving distance to the doors of Children's. Do not trauma victims go generally to Harborview for emergency treatment? In conclusion - I must add the statistics printed in the American Medical News journal dated 9-5-86 alarms and frightens me and my neighbors. 21 crashes this past year of medical helicopters is astounding. The secondary flight approach as proposed by the hospital puts the lives of my 4 children and 13 nieces + nephews along with their friends in school at Villa Academy in potential jeapordy. I urge you to consider the existing landing field at U.W. as a safer and better for all concerned place to land Airlift N.W..

Sincerely
Maureen Brotherton

Dear Director:

I am writing to register my comment on the Draft EIS for the Children's Hospital Helipad.

The inadequacies of the DEIS has been pointed out by many residents who testified at the hearing. I simply want to say that the way the document was prepared tends to focus on the helipad rather than on the helicoptors which will use the pad and which are the cause of concern. In other words, the DEIS does not dwell firmly enough on the question of the risk of helicoptor accidents and why the risks are worth-taking.

Also, the DEIS goes through the routing of "addressing" various impacts but totally misses the point.

Examples:

Page xiii, d.i. Fire. "...service not significantly affected."

-- Granted that fire services may not be affected by the HELIPAD. Would the HELICOPTOR not cause additional fire concern?

Schools. "... no significant increase in school population...." Funny! No one has ever raised a school population question here. But we have asked a lot of questions about what happens to the school and students in case of a helicoptor accident. Why not dwell on the impact from the HELICOPTORS instead of HELIPAD?

Similar ironies abound in the DEIS.

In sum, do you really think it is good land-use to introduce emergency helicoptors with their high rate of accidents to a residential neighborhood of mostly wooden-frame houses?

Please address these questions and demonstrate why the Hospital needs such a facility when there is already a good alternative site at the University of Washington grounds ~~five~~ 3 1/2 minutes away.

Dear Ms. Graber:

Thank you for sending me your thoughts about the proposed helipad at Children's Hospital.

The Department of Construction and Land Use (DCLU) is the City agency responsible for evaluating individual applications with the ultimate decision being made by the City Council. They have asked COH to prepare an Environmental Impact Statement addressing factors including noise, safety and cumulative impacts which could result from the helipad.

If you have further questions about the decision process on the helipad, please call Julia Gibb at 625-4509; she will be glad to help you.

I am confident the City's decision on the helipad will acknowledge both the medical needs of children and the concerns of residents in the neighborhood surrounding Children's Hospital.

Sincerely,

Charles Royer

To whom it may concern:

I believe the greatness the helipot at Children Orthopedic Hospital would far outway the noise it would cause to residents around the facility.

There are so many cases of ill or injured children that would benefit from the helicopters transportation because of speed or location.

Thank you for reading my thoughts on this.

Raymond, Wash.
October 15, 1986

To The Seattle City Council

Gentlemen:

Our Pacific County Orthopedic Auxilliary met in Aberdeen, Wash. on Oct 8th for a Round Table discussion with several of the Orthopedic Auxilliaries in the area. Three women, who work for the Hospital spoke to us about the many programs there. We were amazed to hear that some of the residents around the Hospital object to the helicopters landing on the hospital helipad, they say there's too much noise. We understand about twenty-eight trips a year are made to the Hospital on the helipad.

Our views are that the noise is a small thing to have to listen to, when the child that comes to the hospital in a helicopter is either injured or seriously ill, the quicker the medical treatment starts so much better for that child.

We thought you would like to know our views on the matter from the Raymond and South Bend area.

We are also interested in the outcome of this project.

Yours truly

DEPT. OF CONST. & LAND USE

Dear Ms. Miller:

I would like to submit some comments and criticisms on the Draft EIS, submitted for a proposed helistop, by Children's Hospital and Medical Center. Most of my criticisms and suggestions center on the issue of safety; I have also touched upon the issues of alternative sites. Lastly, I comment on the presence of bias in this document. Because of the number of problems in all these areas, I would like to see the next follow-up document be a second, rather than final, draft. In this way, comments could again be taken from the community with the hopes that a better, more credible and complete EIS would be produced.

Thank you for your time and consideration of this matter.

Sincerely,
Ruth Engelberg
Ruth Engelberg

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. A set of standards has been proposed for the EMS industry. These standards should be responded to in the DEIS (Bill Roy, AirNet, May, 1986).A stated, they represent" MINIMUM objective factors which should be present for safe EMS operations:

1. Four pilots serving 12 hour duty periods-- with a mandatory ratio of one day off duty for every half-day worked.

2. Night weather minima outside of metropolitan areas of 1000 ft ceiling and 3 miles visibility.

3. A system of stability augmentation for all night flights that is certified for single-pilot IFR.

4. Lacking stability augmentation, night flights must be flown by two pilots.

5. Four thousand hours total helicopter flying time. More than aircraft handling proficiency is demanded in EMS flying; a well-developed judgement in operational decision-making, based upon long and varied experience, is necessary as well.

6. The EMS pilot must be licensed and recurrently trained in instrument flight proceudres." (Air Net, Hospital Aviation, May, 1986)

It should be noted that these quidelines were to be formally reviewed and released to the industry this past week. While we presently do not have a copy of the regulations passed by NEMPSA, they should be secured and responded to in the EIS.

2. A pamphlet LZ put out by NEMPSA has been described by Helicopter News (12:11), p.65, 1986, as" making a major contribution to safety in EMS missions". Yet, COH's proposal for a helistop is 40x 40 sided; LZ recommends 60x60 sided, with 100x100 sided for night. The Draft should discuss the implications of their reduced size of pad and why they did not feel they needed to comply with LZ standards.There are so few authorities in this field, as noted in DEIS-- shouldn't they have complied with one which has surfaced?

3. Another concern with standards- Gene Hill, an ALNW pilot, states that their (ALNW) standards are stringent (p.69), yet these standards are not included, except for flying conditions (p.45). . In the EIS, therefore, the pilot standards (staffing, training, required hours flying) should be included.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Hill also states that "pilot discretion" is used in marginal weather (p.67). How will pilot decisions in marginal weather be made and assessed? This is particularly important, as a major source of accidents has been found to be pilot error in marginal weather (p.66). Further, NEMPSA contends that EMS safety would be improved if pilot discretion and vulnerability to flying pressures were reduced. This policy does not seem to help the pilot with reducing vulnerability. Could the EIS respond to these concerns? Further, COH itself points out, with references, that "the rash of accidents suggests that one reason for the accidents is the piots' willingness to fly in adverse weather when other commercial helicopter pilots would not fly." As stated by Paul Procter, a business flying editor for Aviation Week and Space Technology, "Those guys asolutely hate the thought of losing a patient because they can't fly"(p.62).

Other pressures noted by NEMPSA- institutional pressures, nursing pressures, financial pressures. The EIS should discuss the chain of command and the safequards which will ensure that safety is a first, not last, consideration. On p.42, the referral chain is indicated. Nowhere in the outline of steps is the pilot's decision concerning whether it is safe or unsafe to fly-- he is told to fly after all medical decisions are made. The next Draft needs to specify when, how, and who makes the safety decisions. In addition, when do these safety decisions come into play in the referral chain?

4. Alternative considerations- this section is very inadequate, particularly regarding the safety advantages of alternate sites. COH needs to answer these concerns.

For example, Bill Roy (AirNet, May 1986) states:"It is commonplace among our pilots that the situation they fear most to be placed in is that of powerless flight at altitudes over a severely restricted landing or takeoff area". Yet the ALNW pilots (and this is the only source) state that there is no advantage to an improved East Campus site(p.73). Are there other sources (objective) who would agree with this appraisal of the equivalent safety characteristics of the COH site vs. East Campus site? With the professional building to the East, the Hospital to the South and West, and residential homes to the North-- this site presents a restricted area. Further, a quote from Benedict in which he says the hospital site is as safe as the downtown sites does not qualify as an assessment of safety for the alternative East Campus site(p.72).Lastly, there are a number of East Campus sites that were not even discussed which might prove desirable alternatives; these sites should be considered, with

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

attention to safety, noise, and cumulative impacts. For example, could the stadium provide a good spot for a shared helipad for COH and UW? It is lighted, big, provides a sound barrier, and is unobstructed. With the exception of football Saturdays (during which time helicopters could land at an alternative site), it represents an important alternative.

5. BIAS: Shouldn't the EIS attempt a little more objectivity? The considerations concerning safety are clouded by the use of biased, non-objective sources. None of these sources would be considered credible by researchers, because of their involvement in the program and a resulting conflict of interest. While there may be different sides to this issue, it is clear that the Draft has done little to illuminate the controversies, differences of opinion, and points of view that characterize the issue. For example, the statements (p.68) from the Agusta marketing representative on the safety of the Agusta is not particularly convincing. Are there other sources that could be used? Further, the statement on p.68 that "there is a general perception ...in the industry... that overall safety has improved" contrasts with other statements from Airnet (January, 1986):"The accident rate we are experiencing in EMS aviation is horrendous". It should be noted that the support for the Draft's statement of improving safety is from Hill, an ALNW pilot. The statements from Poulton and Collette indicate that the industry is committed to improving safety through the new standards from ASHBEAMS and NEMPSA. Is ALNW a member of these organizations? Will/do they comply with their standards--please include in EIS! Lastly, the table on p. 64 should be contrasted with a table from Airnet, January, 1986. The data are not different; they are interpreted differently. From Airnet, the information is more revealing about fatalities and injuries as due to pilot error vs. the interpretation by the Draft as due to mechanical error.

6. Enforcement, jurisdiction and regulation ensuring safety are considerations that have been overlooked in the DEIS. In the "Fly Neighborly" program,sponsored by Helicopter Association international, there are agencies that have been used to set up, monitor, and trouble-shoot helicopter programs, both before and after they are operational. Shouldn't these kinds of organizations be considered in the Draft, as part of the helistop plans? Ex: FAA Rotorcraft Task Force (Houston, 1981), Helicopter Safety Advisory Conference(HSACO), HAI Heliport Development (From Rotor News, May-June, 1981/2), Houston Aircraft Facility Review and Appeals Board.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

OCT 17 1986

Testimony for Hearing on Draft Environmental Impact Statement for

Children's Hospital of Seattle Proposed Helipad

September 23, 1986

I am Anita Francis, A Laurelhurst resident. As a graduate nurse and a medical sociologist I am aware that there are many relevant questions regarding "medical need" that have not been answered in this draft impact statement.

The impact statement refers repeatedly to Dr. Nicola's report as proof that there is a need for the helicopter to land at Children's door instead of the soccer field. But Dr. Nicola does not tell us how he came to his conclusions, what questions he asked, how many physicians were interviewed, or what control of bias was maintained. Also, we need to know, were physicians not affiliated with Children's interviewed, and how were conflicting views handled? Why was not even a retrospective study conducted? Dr. Nicola states that he looked at transport records for one month. This was a month when 6 helicopter flights came in to Children's! How can this be considered an adequate study? He possibly didn't realize the importance of his recommendation.

How valuable are helicopter transports for Children's Hospital patients?

Many of Children's patients are newborn--neonates. These are the ones that COH claims to have trouble with tubes if they land at the soccer field. Well, many neonatologists (physicians who care for newborns) question use of helicopters for these fragile newborn. Some say it is even detrimental.

Here is a statement published in May, 1986 in a professional journal, EMERGENCY MEDICINE, by Dr. Kenneth Mattox, director of emergency surgical services at Ben Taub General Hospital in Houston. He says, "According to some neonatology physicians, a helicopter flight for a premature infant almost guarantees an intracerebral hemorrhage." Other physicians we have talked with have voiced similar concerns.

This doesn't sound like there is universal support for using helicopters for the newborn. Maybe that is why most neonatology hospitals in the U.S. do not use helicopters but use a ground ambulance for transfer instead (from Guidelines for Perinatal Care, American Academy of Pediatrics and American College of Obstetricians and Gynecologists, 1983.)

After all, it is a widely accepted principle that "Stabilization (of the newborn) prior to departure from the referring hospital is the most critical aspect of interhospital transfer because it minimizes subsequent deterioration in an environment that may not permit detection or treatment of problems." (page 193, Guidelines for Perinatal Care, 1983.) So, the most important aspect of care of most neonates is to get the skilled team to the neonate, which then may take 1 to 2 hours to stabilize the patients. Speed in getting to the Children's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Hospital is usually not the most important factor. In fact, one 3 year study of neonatal care in King County found NO deaths during transport using ground ambulance exclusively, during those 3 years.

It appears that the helicopter may be an example of another medical fad whose use should be examined more carefully. As Dr. Mattox says-- "it's an expensive and risky vehicle."

Unfortunately, the safety risk to us in the community will be weighed against the medical need for the helicopter and yet there will be no objective, careful assessment of that need. The information provided on medical need as reported in the DEIS is seriously deficient. For example, Mary Bridge Children's Hospital in Tacoma has neonatal intensive care beds and offers services similar to COH and yet there is no mention of it in the DEIS. At least, the city should solicit the views of people from other hospitals, as we have.

Also, the city should not accept the Nicola report without realizing its serious scientific limitations and the naivete of the recommendations. One recommendation called for was for a 6 month trial period without going through the City's conditional use process. That's not even <u>legal</u> and wasn't done. Similarly, Nicola's call to allow helicopter landings at COH's door 10 times per month is naive--as the hospital states clearly in this DEIS that they "are obligated by state requirements (WAS 248.18.285) to treat all patients brought to the hospital: the hospital construes this statute to mean that no helicopter transporting an emergency patient can be refused permission to land at the proposed helistop, if constructed, or elsewhere on the campus grounds." There is no realistic way, then, of limiting the landings once ANY are allowed.

The main argument for the need to land at the door was for neonates, but, as we have seen, a helicopter is probably not the ideal transport vehicle for them.

We have evidence that many transfers from a helicopter to an ambulance at the soccer field have been made for pediatric patients. There should be proof that transfers are bad, not just anecdotal information. The stakes are too high for that. Indeed, we have heard Dr. Copass state twice that there have been no deaths due to the transfer. Dr. Kranz, Medical Director of MAST(Military Assistance in Safety & Traffic), has also stated that he has not been informed of any particular problems in conducting this transfer at the soccer field.

We know that most consulting hospitals, like Children's, do not have helipads at their door. Dr. Kranz points out that "most Washington hospitals have some sort of tranfer from the helicopter to an ambulance to take patients to the E.R. doors, as Harborview does." <u>Landing at the soccer field, then, is the expected standard, and not the unusual case.</u> The soccer field alternative is sensible, is safer, and has widespread medical support.

Anita Francis

Dear Ms. Miller:

RE: Helipad Proposal for Children's Hospital of Seattle

The Federation members ask that the following topics be covered in the Final Environmental Impact Statement prepared by Children's Hospital.

-The cumulative impact of the University Hospital proposed helipad and the Children's Hospital helipad should be examined jointly and simultaneously. Combined, they will have a greater impact on the adjacent communities than either helipad does alone. They are only one mile from each other. Logic dictates that they should be examined together. The combined impact of their proposed actions will strongly influence actions by other hospitals in the city and region and will largely determine the type and amount of hospital helicopter service Seattle ends up with.

-A regional plan for integrating helicopter and other emergency medial services must be in place before any permits are granted. Once major actors in any plan have their service, it will be impossible to establish a coordinated and effective regional emergency medical services system.

-No permits of any kind should be granted until and unless demonstrably enforceable rules are in place for restricting flights to life-threatening emergencies, as called for in the city code. The history of Children's Hospital does not provide any reason for optimism that they will meet permit conditions. The great difficulty and 4-years of time spent by DCD to obtain compliance by Children's Hospital on the conditions attached to their 1981 permit to build a large parking garage, and the repeated helicopter landings on their campus without a permit are two recent examples which give us reason to be very concerned about compliance and enforcement issues.

Please keep us informed as to your schedule and actions on this matter.

Sincerely,

Beth Means

Seattle, WA 98104

Dear Ms. Miller,

I have just returned to Seattle after nine months of teaching at Shanghai University in China. As on my previous trips to China, I was deeply impressed with the friendliness and perseverance of the Chinese people. But, much more than on my earlier trips, I was impressed with the absolute power of the Chinese government.

I mention the above only because of the resemblance of the methods used by the Chinese government and those methods used by the Children's Orthopedic Hospital in its recent project - the helistop. The methods I mean are secrecy and almost total disregard for the consensus of the citizens concerned.

1. Secrecy - Unlike past COH expansion projects for which somewhat advance notice was given to the community surrounding the hospital, the helistop was shrouded in mystery from the beginning. Only after the understandable indignation of the community was aroused two years ago did COH slowly acknowledge a vague outline of their plans to fly helicopters "a few times a month" into the densely populated area around the hospital. Recently we have been told that the hospital administration has admitted that flights may occur as frequently as 80 times a month.

COH has repeatedly refused to give information or else has given only partial or misleading information to persons asking about the legality and funding of and the adequate exploration of alternatives to the helistop.

2. Disregard for Citizens - After a demonstration flight for which little advance notice was given and in which a light, single-blade helicopter landed at COH, large double-blade helicopters have begun to land at the hospital before even the most preliminary requirements (i.e. the draft EIS) have been considered fully.

The statements above cannot begin to encompass the myriad powers COH has assumed in its campaign to install its helistop. Yet these statements are adequate evidence of the kind of battle being waged by COH with its undisclosed moneys to hire lawyers to try to justify its goal - and all under the guise of helping little children.

A neighbor of mine said recently, "Would it be possible to set up a small airport in downtown Seattle without meeting every require-

Business/Asia
4339 NE 45 Street
Seattle. WA 98105
USA

ment for safety and for environmental concern?" The answer is obvious. Yet this is just what COH is determined to do. And the losers in the establishment of this thinly-veiled marketing device, should a helicopter accident very possibly occur, will be the neighbors along the flight path, the children at nearby elementary schools, and the little patients that COH has promised to protect.

We are not living in China. This is supposedly a free country where the voice of the people counts for a lot. Our city government must realize the truth about a helistop at COH, no matter how smoothly its supporters speak. A helistop at COH is unnnecessary, unjustifiably expensive, and clearly dangerous to the community, most of all to the children in COH itself.

Sincerely,

Joy Scott

Re: Draft Environmental Impact Statement
for Children's Hospital Helistop
4800 Sandpoint Way N. E.
Application #8405870

Dear Director Miller:

I attended the Hearing on September 23, 1986 at the Laurelhurst Elementary School where ample evidence was presented to establish the fact this is only a commercial endeavor by the three hospitals.

I live on 42nd N. E. about half a block directly south of the hospital. The helicopters are presently still making landings in violation of City ordinances. Their approaches are often made directly over our house as they swing around into the hospital grounds.

I have called Ms. Greenawalt at the Hospital and she first tries the tear-jerking need to save lives. When pinned down she will not confirm that an extra ten minutes for the maximum possible use of Graves Field would make any difference.

Then she swings into their usual arrogant explosion of not needing a permit because of their size, and that the citizens of Laurelhurst will just have to put up with the problem.

PLEASE, in the interest of safety for the school, the school children, and home-owners in this area, do NOT issue a permit for this heliport, but leave it at Graves where it has been for many years. Also, be sure that the approaches are restricted to Union Bay and the playfield.

Thank you for your consideration in this very important matter.

Sincerely,

A. WESLEY ROBERTS

Dear Ms. Miller and Ms. Julie Gibbs,

I am writing to you in regards to the proposed helipad at Childrens Orthopedic Hospital. I am particularly concerned about the safety issue. My son attends Villa Academy which is located in the Laurelhurst neighborhood, near Childrens Hospital. My fear is that a helicopter crash could seriously jeopardize the life of my son and other children. The proposed landing site is in a high density, residential neighborhood.

I strongly oppose helicopter landings at COH. I also oppose landings at the University Hospital. I do not believe that helipads have been proven safe or cost effective. We have excellent ambulance transport in Seattle. Let's stay safe and sane.

Thank you.

Sincerely,

Dear Mr Gibb,

I am writing in support of Children's Orthopedic Hospitals request for a conditional land use permit to build a helistop outside their emergency room. I am a grandparent and also care for all children and feel it is important that children who need emergency care in a hurry can land directly at the hospital. A little noise is not important when the life of a child is to be considered.

Sincerely,

Gertrude Schroeder

DEAR DIRECTOR

I AM WRITING TO ~~PROTEST~~ THE HELISTOP PROPOSAL FOR CH MC. THERE IS NO MEDICAL NECESSITY FOR IT: IT IS A PUBLICITY MANEUVER BY THE CH ADMINISTRATION. THEY WANT TO ADVERTISE IT TO HELP FILL BEDS. THE PHYSICIANS KNOW THERE IS NO NEED FOR LANDING ON THE GROUNDS, & SAID SO IN A P.I. INTERVIEW LAST YEAR.

I WORK IN THE NEONATAL ICU AT UNIVERSITY HOSPITAL. WE RECEIVE THE SAME TYPE OF TRANSPORTS, BUT THEY LAND AT HARBORVIEW, OR IN EXTREME EMERGENCIES, AT UW SOCCERFIELDS. THE TRANSPORT BY AMBULANCE IS FAR BETTER FOR THE PATIENT: HELICOPTERS ARE TOO NOISY FOR THE DOCTOR TO HEAR THE HEART & LUNG SOUNDS, WHICH ARE CRUCIAL TOOLS FOR THE CORRECT TREATMENT OF THE BABY.

BUT BEYOND THE FACT OF THE LACK OF NEED FOR THE HELISTOP, IS THE LOCATION. IT IS A SMALL AREA WITH A LOT OF PEDESTRIAN & VEHICULAR TRAFFIC, & IN A HEAVILY POPULATED

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

II

AREA. TO INSIST ON LANDING HELICOPTERS THERE IS TO CREATE POTENTIAL DISASTER. A WITNESS TOLD ME OF ONE INCIDENT WHERE A MAST HELICOPTER WAS UNABLE TO SET DOWN ON THE FIRST TRY, & WENT UP THE HILL TO HOVER OVER THE GRADE SCHOOL & TURN AROUND. CONSIDERING THE HIGH NUMBER OF HELICOPTERS THAT CRASH, I THINK THAT IS NEEDLESSLY ENDANGERING THE SCHOOL CHILDREN — THEY COULD HAVE LANDED ELSEWHERE WITHOUT ENDANGERMENT.

SEVERAL MONTHS AGO I WAS WAKENED @ 3 AM BY ONE FLYING OVER MY HOUSE — I WAS TERRIFIED, AS IT WAS VERY LOW & THERE ARE MANY TALL TREES AROUND HERE. THEN I WAS SO ANGRY I NEVER DID GET BACK TO SLEEP, THEY WEREN'T FOLLOWING THE "APPROVED" ROUTE, WHICH IS OVER THE MONTLAKE FILL & ALONG THE CITY STREETS. THAT WAY, ONLY A HAPLESS MOTORIST OR TWO & A STRAY PEDESTRIAN WILL BE WIPED OUT IN EVENT OF A CRASH. FAR LESS THAN IF THEY CRASH ON A HOUSE OR ONE OF

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

III

THE ADJACENT APARTMENTS & CONDOS. THERE THE EXPLOSION & SUBSEQUENT FIRE CAN TAKE A GREAT MANY LIVES. I JUST DON'T THINK SUCH A DANGEROUS SET-UP SHOULD BE PERMITTED.

THE UH HELIPAD IS NOT IN SUCH A STUPID LOCATION AS THE CH MC, BUT THAT ROOF ISN'T ALL THAT BIG, & I FOR ONE WOULD HATE TO BE BROUGHT IN THAT WAY. LAST YEAR 62 PATIENTS WERE TAKEN TO UH BY AIRLIFT NORTHWEST: ALL LANDED AT HARBORVIEW OR THE IMA FIELD, & SURVIVED INTACT. I DON'T THINK ANY ADDITIONAL HELIPORTS ARE NEEDED.

THANKS FOR YOUR ATTENTION.

Dear Miss Miller,

I die is to inform you of our objection to the proposal by Childrens Orthopedic Hospital to construct & use a helipad at their site. We, as long time residents of this once quiet residential neighborhood, are so very concerned. The objections at the hearing on the D & L were the same as ours:

Safety factor - dangerous flight over school, condominiums & private homes.
Weather factor - Pilot error
Expense to patient - $2000.00 per hour
Need for frequent landings - one to pick up pediatric team, depart, one to land & discharge patient & one to depart.
Threat of turbulence to a newborn baby.
Horrendous noise over neighborhood.

To whom it may concern:

I am concerned about the possibility of small, private helicopters landing in a residential neighborhood within two blocks of an elementary school and several apartment complexes. It is my understanding that the MAST helicopter service which COH has utilized for the past ten years has been more than adequate to cover all emergencies. I question the motivation of people involved in this new project, and I hope you will vote against granting a conditional use permit to Airlift Northwest or any other private company to land on the grounds of COH. I am in favor of continuing the current helicopter service exactly the way it is now operated or constructing a new helipad in a less residential location.

Sincerely yours,

Carolyn Margon

RE: DEIS for Proposed Helipad at Children's Hospital:
Failure to address all issues specified in Feb. 1986 scoping list

The DEIS for the proposed helipad at Children's Hospital fails to address adequately the issues specified in the February 13, 1986, scoping letter from Julia Gibb of DCLU to Nancy Greenawalt of COH. I quote from the scoping letter section regarding mitigating measures:

"MITIGATION MEASURES

Possible mitigation measures discussed in the EIS shall include the following:

- flight paths
- number of flights
- usage and location of U.S. Army (M.A.S.T.) or other agency helicopter landings
- off-campus pick-up of medical teams
- liability insurance
- criteria for use of helicopters
- plan for monitoring use"

Within the DEIS itself, mitigation measures referred to on pages 73 and 88 only address safety and noise impacts, and then only perfunctorily. These short sections in Chapter IV of the DEIS mention specifically only flight paths and number of flights, the first two of the seven topics in the passage quoted above.

Passing references were made in the DEIS to MAST helicopters and possible off-campus pick-up of medical teams, the third and fourth items. References were made obliquely to criteria for use of helicopters and plan for monitoring use (the sixth and seventh topics), but with no specific information given on how mitigation could be accomplished.

Lastly, the fifth item, liability insurance, was not addressed at all in the DEIS. If is most unfortunate that DCLU did not catch this major omission from the DEIS. Please make sure that the final EIS addresses this important topic, and that it also addresses completely and separately the six other mitigating measures included in the February 13, 1986, scoping letter.

Sincerely,

Jane L. Johnson

RE: DEIS for Proposed Helipad at Children's Hospital
Comments due by October 17, 1986

The "Cumulative Impacts" section of the DEIS is deficient, inconsistent, inaccurate, and vague for the following reasons:

- It is deficient in failing to specify how Airlift Northwest and the proposed helipad would be integrated into the proposed Puget Sound Health Systems Agency (PSHSA) regional transport plan. Although the DEIS states on page 31 that the status of the PSHSA proposal is unclear, the DEIS goes on to say on page 91 that Children's would be included in a regional helicopter transport plan. What is the exact relationship between these two statements?

- It is inconsistent in asserting that the City's land use criteria so limit the use of helistops that they will discourage the improper use and proliferation of helicopter service (page 90), when it has previously cited WAC 248-18-285 to mean that a hospital cannot prohibit a helicopter from landing, even if by doing so it would violate land use laws (pages 41, 57). If this were indeed a correct interpretation of the WAC, what is to prevent other hospitals from also construing the WAC as permission to land helicopters and overriding City land use regulations?

- It is inaccurate in stating that University Hospital already has received its Certificate of Need for a helistop (page 90); in fact, UH has not yet prepared its Certificate of Need.

- It is vague in stating throughout that flights would be limited to "critically ill" cases, but that guidelines to restrict landings to critical cases haven't been established. It admits that guidelines are only now being discussed with MAST (page 42), Airlift Northwest (pabe 49) and the Washington State Medical Association (pages 31, 91). The DEIS says that as doctors hear of Airlift Northwest services, they will become more likely to use Airlift for interhospital transfers (page 41), but does not distinguish adequately between cases brought in from "the field" and those brought as interhospital transfers (page 42), and what guidelines would apply to any of these cases.

The Puget Sound Health Systems Agency has expressed concern about the proliferation of helicopter services in the region, and cautioned that there is no agreement on when medical conditions warrant helicopter use, and that triage guidelines have not yet been developed. In a February 1985 report to Major Royer (attached), from which the DEIS quotes on pages 17-19, PSHSA recommended transport to only the most specialized trauma centers in Seattle, namely University Hospital and Harborview, and that consideration of other sites should evaluate community costs and benefits in meeting patient needs. The PSHSA report stated that "...limiting the number of helipads may be an

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

important component in ensuring limits on the growth of helicopter services..." and goes on to say that "...inappropriate use and proliferation of helicopter transport services [should] be discouraged," but that "...unfortunately, we are in the midst of 'air wars'...as hospitals vie with one another to establish helicopter programs."

Bud Nicola, author of the Seattle-King County Department of Public Health assessment of the proposed helipad, also encourages PSHSA to develop a statewide and regional helicopter transport plan. He wrote to PSHSA in April 1986, encouraging that agency to work with the Washington State Medical Association to develop triage guidelines for helicopter transport.

Unfortunately PSHSA's effort to conduct an assessment of helicopter transport and develop a regional plan has been delayed and scaled back. In May 1986 PSHSA proposed to develop a state plan that would integrate helicopter service with the statewide Emergency Medical Services (EMS) system; by September 1986 this proposal had been reduced to a mere data collection effort for King County only.

In order to correct the deficiencies and other problems in the "Cumulative Impacts" section of the DEIS Children's Hospital must:

1. Ascertain the status of the PSHSA proposed state and regional plan, and triage guidelines that will intregrate helicopter services with the existing statewide EMS system.

2. Await the completion of the regional and state plan before finalizing its EIS for its proposed helipad. If the plan and triage guidelines are not to be developed after all, then Children's should under no circumstances be allowed to build a helipad or land helicopters on its campus.

3. Explore jointly with University Hospital the possibility of landing patients at a joint pad in Graves Field, instead of simply assuming that UH would not allow Children's-destined patients to land (p. 53).

4. Demonstrate definitively that WAC 248-18-285 could not be used by other institutions as it has been used by Children's to violate City land use regulations.

5. Include copies of all material cited in the DEIS Bibliography and Personal Communications sections, since discrepancies exist. For example, a 1986 Thompson reference is cited on page 91, whereas the sole Thompson reference in the references sections is 1985. Is this a typographical error or a different reference?

Sincerely,

Jane L. Johnson

Report to Mayor from PSHSA

February 21, 1985

Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

The Puget Sound Health Systems Agency (PSHSA) has prepared the following in response to your questions about the appropriate use of helicopter transport in emergency medical situations.

1. In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?

Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care enroute can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

this much is quoted in DEIS — — p.1719

Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services. The EMS system features substantial ground transport services throughout the northwest region, each of which is capable of responding rapidly to calls in the area it serves. Military Assistance to Safety and Traffic (MAST) helicopters transfer patients from accident sites within a 100-mile radius of Fort Lewis to Harborview in Seattle and to St. Joseph in Tacoma. Interhospital transfers and service to areas outside the range of MAST are provided by the fixed-wing transport of Airlift Northwest. Private helicopter service operating out of Bellingham further supports counties in the northwest section of our region.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The existing EMS system is founded on comprehensive ground transport services and has developed into a well coordinated regional network. As a result, the use of helicopter services can be managed within the present system to better ensure that their use is limited to cases not adequately served by ambulance or plane transport.

2. How frequently is this means of emergency transport required?

Agreement on when medical conditions warrant the use of helicopters has not been reached. The introduction of helicopter transport is so recent that triage guidelines have not yet been developed which might help establish the frequency with which helicopter transport would appropriately be expected.

In the last year MAST completed approximately 220 field trips, most of which were to provide transport of patients from south King, Pierce, and Kitsap counties. Some of these patients were taken to St. Joseph Hospital. Approximately 120 were taken to Seattle hospitals, most of these to Harborview.

The extent to which this level of service approximates the expected need for helicopter transport is not presently known. Efforts are underway to formulate a method to determine the need for helicopter transport and to establish the resources necessary to meet that need. These efforts in Washington and in other parts of the country should be evaluated by clinicians, planners, and administrators in order to prepare guidelines tailored to the special requirements of our region.

3. How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?

Which Seattle hospitals are best suited to meet the medical need?

Helicopter transport is only appropriate for the most critical cases. An evaluation of helicopter transport often cited to support its efficacy in improving outcomes suggests that major improvement occurs only in the more severe classifications representing a fraction of all trauma patients. This study by William G. Baxt and Peggy Moody indicates that helicopter transport is required for only a small subset of trauma patients especially when high quality ground transport systems are available.

MAST helicopters are presently transporting patients within King County directly to Harborview or to University Hospital (and occasionally other hospitals) by way of ambulance from the University of Washington soccer field.

While we cannot confirm that this arrangement is adequate, PSHSA recommends transport to only the most specialized trauma centers in Seattle, of which University and Harborview hospitals are excellent examples. Consideration of additional sites should evaluate not only unmet patient

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

care needs, but also the trade-offs which will result in meeting those needs. Limiting the number of helipads may be an important component in ensuring limits on the growth of helicopter services and in fostering effective and cooperative use of the EMS system as a whole.

It is critical that the inappropriate use and proliferation of helicopter transport services be discouraged. Unfortunately, we are in the midst of "air wars" throughout the country as hospitals vie with one another to establish helicopter programs. The number of programs in the country doubled between 1980 and 1983, and the National Medevac Conference in 1983 opened with spokesmen suggesting that the number of programs would (and should) double again in five years. It is not at all evident, especially in areas served by MAST, that additional programs are needed and the impact of further growth may be adverse for the community as a whole. Particular patient care requirements of an institution may not be sufficient to outweigh the additional direct and indirect costs which may result from expanded helicopter services.

PSHSA is especially concerned that individual institutions will establish helipads and eventually separate helicopter programs in an effort to meet particular patient care objectives which might be met satisfactorily under the current arrangement of emergency services.

A conservative approach to the development of helicopter transport programs is advised for several reasons:

a) The present system is extremely cost-effective. MAST operations are provided at no additional cost to residents above the support of federal tax subsidies.

b) In our region, the need for additional helicopter services which would be sufficient to support such an expensive service at an individual institution is unlikely. To justify the program, transportation services would tend to be over-utilized with transport provided in cases which would more appropriately be handled at other levels in the EMS system.

c) Facility costs would tend to increase since helicopter services are generally "loss leaders," powerful marketing tools which may increase hospital utilization but which would not necessarily guarantee the additional revenues required to cover the additional costs incurred.

d) If unnecessary and used inappropriately, helicopter transport services established outside the current system have the potential to adversely affect the EMS programs now serving the region. The development of private programs could result in the elimination of MAST (as specified in federal guidelines). Second, the ambulance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and plane support systems in place might begin to experience volume reductions which could jeopardize both the quality and financial viability of the services they provide.

In summary, should additional need for helicopter services be found in the area, a consortium approach rather than an institutional approach to the provision of these services is recommended. This approach will avoid duplication, support the development and implementation of appropriate triage guidelines, and encourage continued reliance on a regional EMS system. It will prevent the introduction of such services as marketing tools for individual institutions which needlessly drive the cost of hospital care up while reducing reliance on the existing EMS system.

5. What alternatives are available for transporting patients and what are the medical implications?

Helicopter transport has a vital place in the emergency medical service system. The alternative of not providing such service does not exist. The real alternative is to allow proliferation of helicopter transport services which will unnecessarily increase the cost of hospital care without significantly benefiting the community.

City of Seattle
Charles Royer, Mayor

King County
Tim Hill, *Executive*

Seattle-King County Department of Public Health

Bud Nicola, M.D., M.H.S.A., *Director*

April 25, 1986

Larry Thompson, Executive Director
Puget Sound Health Systems Agency
601 Valley Street
Seattle, Washington 98109

Dear Larry:

I am writing to give you my comments on the Puget Sound Health Systems Agency's proposed plan for air ambulance (helicopter) services. First, let me apologize for the delay in responding. In the last month, my staff and I have had an opportunity to review the proposal and the issue generally with County Executive Tim Hill, representatives of the Mayor's Office and key County Council members. I would summarize our general comments as follows:

1) There is a consensus on the need to develop such a plan. We are on the threshold of a major change in pre-hospital emergency medical services and in the relationship between providers and the hospital community. In addition, inter-hospital relationships are being affected by the introduction of air ambulance services. The relationship of local community hospitals throughout the Puget Sound basin to the tertiary care centers in the Seattle-Tacoma metropolitan area may be the major factor influencing the development of air ambulance services. what is that relationship, & how is it changing?

2) There is a need to coordinate the development of such a plan with others who are already working on this issue. The Washington State Medical Association Emergency Medical Services Standards Committee has appointed a special Task Force to deal with helicopter medical standards. Their charge is to develop medical indications or "user guidelines" for the use of helicopters in patient transportation. I have attached for your information a memorandum from Lothar Pinkers, M.D., dated February 21, 1986, that outlines the Task Force's agenda.

   The WSMA Task Force will be addressing many of the items identified in your proposal. I believe they will be establishing a framework for further planning. They are hoping to have a final report by June, 1986.

   There is also talk of incorporating air ambulance service planning into a statewide EMS planning effort.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3) It seems essential that any planning effort be broader in scope than just Seattle and King County. I realize this is a change from what we discussed previously, but upon further reflection, it just does not seem realistic to focus on Seattle and King County when the operation of air ambulance services will undoubtably be multi-county in scope. If the planning process is too narrow, it will lack credibility with other potential users on our borders and beyond.

In summary, it is my recommendation that the Puget Sound Health Systems Agency look to broadening the geographical scope of a plan for air ambulance services. It is imperative that those entities outside of Seattle and King County with an interest in such a plan be included in the process from the beginning. Secondly, the Health Systems Agency's planning effort should compliment the Washington State Medical Association's activities. In fact, it should probably follow and expand upon their work.

Finally, I understand your agency is involved in reviewing a Certificate of Need for helicopter services in Bellingham. How does that fit into this evolving situation?

I would ask that you contact Steve Call, Manager of the Emergency Medical Services Division, at 344-4293, to schedule a meeting to discuss where we go from here.

Thanks for your efforts to date. I look forward to working with you.

Sincerely,

Bud

Seattle, WA 98104

Dear Ms. Miller,

I attended the public hearing last Tuesday evening on the Draft Environmental Impact Statement for the proposed helipad at Children's Orthopedic Hospital.

As a result of that hearing I ask you, I beg you, to order a new draft that is less full of inaccuracies, specious judgments, undocumented conclusions, and prejudicial statements. I find it impossible to understand why DCL accepts an EIS prepared by a firm employed by one of the conflicting parties. An impartial draft is impossible under such a system.

Since the city bears responsibility for the document, won't you order a new draft in the interest of justice to both sides and urge that it be as accurate and impartial as is possible to obtain under the present system?

Very sincerely yours,

Helen R. Pinkney

Subject: A JOINT USE HELIPAD IN THE EAST CAMPUS AREA

As you may know, the Board of the Laurelhurst Community Club is actively involved in trying to find a solution to the controversy generated by the proposed helipad at Childrens Orthopedic Hospital. One idea that the Board would like to see explored in detail would involve the construction of a permanent helipad somewhere in the East Campus area that could be shared by University and Childrens Hospital. The facility would be used by MAST, Airlift Northwest, and other helicopters transporting patients to the two hospitals. It is clear that this location offers the safest possible landing area in the immediate vicinity of the two hospitals as well as producing the fewest adverse effects upon the local environment.

We ask that you initiate discussions with the administration of Childrens Hospital on this topic, that you identify and study one or more possible sites in this area, and that you work out a joint operating agreement. We have suggested this idea to the administration, medical staff and Board of Childrens on numerous occasions but they have so far ignored the idea. We would like to see the University take the lead in these discussions so that this safest of all possible solutions receives a full review.

Sincerely,

Robert H. Klug

Re: Proposed Helicopter Landing Pad at Children's Orthopedic Hospital

Dear Ms. Miller:

This letter is being sent in opposition to the proposed helicopter landing pad at Children's Orthopedic Hospital. As best I can interpret this situation, it seems that a reasonable alternative of a landing site at University of Washington playfield is a better decision. Not only would the safety of the surrounding neighborhood not be compromised by them landing in a densely populated area, but also the safety of the crew members of the helicopters would be better.

I think it would be appropriate to continue utilizing the University of Washington playfield as has been done and has been shown to have good success in caring for ill children and infants.

Sincerely,

Jack R. Lamey, M.D.

Dear Mr. Smith and City Council Members:

Please allow me to add my voice to many others you must be hearing, in favor of allowing a permanent heliport at Childrens Hospital & Medical Center.

We all already owe you tremendous thanks for permitting helicopters to land at the Hospital during the past year. The privilege was not used more often than absolutely negessary to save a life; and the infrequent landings were neither heard nor noticed by the neighborhood above the usual high-decibel background of daytime city sounds.

Our darling grand-daughter became crucially ill last summer, and was rushed by ferry (which waited!) and by car out to the Hospital in time for her life to be saved. If this emergency had occurred very late when the ferries are several hours apart, we would surely have hired a helicopter, and have been forever grateful that it could take her right out to the Hospital.

We are lucky: our little one is now fine. But we do think about other frantic parents (and grand-parents).

PLEASE DO ALLOW THE PERMANENT HELIPORT.

Very sincerely yours,

Prudence L. Trudgian

SMALL BUSINESS

Farm Woes, Technology Spur Rise in Agricultural Start-Ups

By Steven P. Galante
Staff Reporter of The Wall Street Journal

THE FARM BELT is proving to be fertile ground for a new breed of small business. Companies are carving out niches by adapting new technologies to age-old agricultural problems. Some are using computers and computer modeling to help farmers make better decisions about how to cultivate crops efficiently. Others are tapping biotechnology to develop products that will take much of the guesswork out of farming. "We're trying to turn an art into a science," says Bert G. Giguire, president of Professional Agricultural Management Inc. in Firebaugh, Calif.

The farming industry's financial woes, far from hurting the start-ups' chances, actually are enhancing the prospects of many of them. The industry's ills are forcing a consolidation of ownership. Large farms are snapping up small, financially strapped ones. The owners of these larger farms are usually institutions, such as banks, insurance companies and railroads, which hire professional managers rather than longtime farmers to run the operations. "Modern managers are making a lot of the decisions on farms these days, and modern managers look on technology more favorably than the traditional family farmer," says Richard J. Defieux, general partner in Princeton/Montrose Partners, a Princeton, N.J., venture capital company that has invested heavily in agriculture-related start-ups.

Financial pressures are forcing even traditional farmers to accept new technology. "Any chance they have to improve efficiencies, they have to look at seriously," Mr. Defieux says.

THIS COMBINATION of technological innovation and economic necessity is spurring the creation of new companies. Among them is Earth Resource Data Corp. of Overland Park, Kan., just outside Kansas City. By marrying several technologies—aviation, remote energy sensing and computer analysis—Earth Resource Data has produced an agricultural survey service to help farmers cultivate crops more efficiently.

The company's airplanes, fitted with special sensors, fly over farms to collect data on crop conditions, such as water content and insect infestation. A computer turns this data into color-coded maps, which a farm manager can use to pinpoint where he needs to adjust agricultural inputs, such as increasing irrigation or spraying insecticide. The company says the service can cut costs by allowing a farmer to treat specific areas, instead of an entire field.

Another young company, Mr. Giguire's Professional Agricultural Management, offers a slightly different service. Instead of airplanes, ProAg uses "fieldmen" who visit farms to measure and quantify growing conditions. A computer compares that data with statistical models in ProAg's data base and generates a report the farmer and fieldman use to choose cultivation techniques.

"The whole issue is that agriculture has to be competitive on an international scope," says Mr. Giguire. "To do that, it has to

Medical Airlifts: Rise in Crashes Draws Scrutiny

By Laurie McGinley
Staff Reporter of The Wall Street Journal

Pilot Barry Day and two nurses were on their way to pick up a patient at a hospital in Galax, Va., last month when their helicopter smashed into a foggy peak in the Blue Ridge Mountains of southwest Virginia. All three were killed.

In July, a Duke University medical helicopter carrying a cardiac patient lost engine power and went down in a remote area near Durham, N.C. The five occupants escaped injury. The month before, a medical helicopter crashed into the Black Warrior River in Alabama after delivering a patient to a Birmingham hospital. Two nurses and a pilot were killed.

Serious accidents involving medical helicopters, once rare, have increased sharply in the last two years, raising new questions about the growing use of these air ambulances. Although helicopter safety problems aren't limited to medical aircraft, these programs are attracting special attention because of their rapid growth and the humanitarian nature of the flights.

Hospital-based medical helicopters have carried 300,000 patients since 1972, when the first program started in the U.S. According to industry estimates, roughly 20% would have died without the quick medical attention made possible by the air service. The number of programs is expected to nearly double over the next few years from 150 currently, providing service to tens of thousands of Americans.

A computer compares that data with statistical models in ProAg's data base and generates a report the farmer and fieldman use to choose cultivation techniques.

"The whole issue is that agriculture has to be competitive on an international scope," says Mr. Giguire. "To do that, it has to come out of its traditional style and move into high tech and get the cost of units produced down."

THE FOCUS ON COST-CUTTING is a significant shift in how new companies are marketing agricultural goods and services. "For many years, our answer in American agriculture to being more efficient was to produce more per acre," says Jim Herbert, president of Neogen Corp. in Lansing, Mich. "But obviously that's not the answer," he says, pointing to the commodity glut that has depressed farm prices. "The question is, how do we

Serious accidents involving medical helicopters, once rare, have increased sharply in the last two years, raising new questions about the growing use of these air ambulances. Although helicopter safety problems aren't limited to medical aircraft, these programs are attracting special attention because of their rapid growth and the humanitarian nature of the flights.

Hospital-based medical helicopters have carried 300,000 patients since 1972, when the first program started in the U.S. According to industry estimates, roughly 20% would have died without the quick medical attention made possible by the air service. The number of programs is expected to nearly double over the next few years from 150 currently, providing service to tens of thousands of Americans.

Safety Board Plans Study

The accidents represent a black cloud in an otherwise promising future. Though government statistics are sketchy, John Lauber, a member of the National Transportation Safety Board, calls the industry's accident rate "pretty high" and adds: "Somebody better do something to correct this." The board plans a special study of the problem soon.

ices. For many years, our answer in American agriculture to being more efficient was to produce more per acre," says Jim Herbert, president of Neogen Corp. in Lansing, Mich. "But obviously that's not the answer," he says, pointing to the commodity glut that has depressed farm prices. "The question is, how do we produce the same quantity but produce it more cheaply?"

Neogen's answer has been two technology-based products. One is a miniature weather station that uses a microprocessor to analyze climatic conditions and forecast fungus and insect infestations. The second product uses monoclonal antibody technology to detect dangerous toxins in grains.

Biotechnology is the basis for many of the new agricultural companies. Most of them are experimenting with genetic engineering to produce plants with certain desirable properties. For example, Calgene Inc. of Davis, Calif., is developing tomatoes with a higher percentage of usable solids for Campbell Soup Co.

Calgene and other agricultural biotech companies also are using gene-splicing to develop seeds that will produce plants resistent to insects, fungi and herbicides. Such seeds would end much of the guesswork in farming by eliminating the need to apply precisely correct amounts of agrichemicals.

NOT ALL AGRICULTURAL START-UPS are prospering, of course. Energy Management Corp. of Los Alamitos, Calif., can't find buyers for its computer-controlled irrigation system. "Business isn't very good at this point because farmers don't have the money," says James R. Dunn, president.

Even companies that can find customers are having to make adjustments. Earth Resource Data of Kansas, for example, expects to move its headquarters to California soon. "Recognizing, frankly, the tough economic conditions of the Midwest, we think our initial growth is on the West Coast, where growers are not as affected," says Gus Olson, president.

Yet, despite such obstacles, entrepreneurs see recent technology breakthroughs as creating the best opportunities in decades for agricultural start-ups. "Since the '30s, when combines and tractors were introduced on a large scale in the 'horsepower revolution,' farming hasn't really progressed a lot," says ProAg's Mr. Giguire. "It's the last industry to adopt high tech."

Warning: These Are Professionals: Do Not Try to Do This at Home

By KATHLEEN A. HUGHES
Staff Reporter of THE WALL STREET JOURNAL

LAKE PERRIS, Calif.—Four divers, in black wet suits and carrying knives, disappear beneath the cold murky water.

Their assignment: force a pumpkin to the bottom of the lake and carve a face in 45 minutes.

So begins the second annual Underwater Pumpkin Carving Contest, pitting team No. 1, lifeguards Ron Schafer and Douglas Harding, against team No. 2, mechanic Jim Crawford and travel agent Dick Evangelista. It took place on Saturday—with victory going to the best face.

'Don't Move'

For team No. 2, the competition starts well. They force their small pumpkin to the bottom in one minute. Mr. Crawford climbs on top of the pumpkin and Mr. Evangelista carves a hole, causing a rush of air to bubble to the surface.

Then comes trouble. Mr. Crawford, whose job is to hold the pumpkin steady, bobs up and down, causing his partner to carve two jagged eyebrows and two irregular eyes. And just as Mr. Evangelista starts the nose, Mr. Crawford and the pumpkin rise—and the knife knocks out a big section below the nose.

Meanwhile, team No. 1 rests easily on the lake floor, 25 feet below the surface, with a much larger pumpkin. Their secret: rocks stuffed in their wet suits. But they have another problem: Their pen and pencil float away. Mr. Harding, who planned to draw, and then carve, has to wing it.

After 26 minutes, team No. 2 surfaces carrying a pumpkin with a wild expression. Their opponents emerge 17 minutes later bearing a pumpkin with a neat symmetrical face. Two tiny clam shells are balanced in the triangular eyes. The triangular nose is centered, and the broad smile has seven teeth.

"It's a classic," says Abby Failor, one of two judges, of team No. 1's effort. Turning to team No. 2's pumpkin, she frowns and says, "You can't see the mouth."

Something for the Mantle

A ranger for the Lake Perris State Recreation Area, which hosts the event to draw attention to the lake as a potential diving area, presents Messrs. Schafer and Harding with first-place trophies and kits containing diving accessories. Messrs. Crawford and Evangelista go home with underwater flashlights.

"Naturally, I'm disappointed," says Mr. Crawford. "I would have been happier if the face was higher on the pumpkin." He vows to return next year—this time with his wife as partner. "Next time," he says, "we'll practice the weekend before."

portation Safety Board, calls the industry's accident rate "pretty high" and adds: "Somebody better do something to correct this." The board plans a special study of the problem soon.

Pilots, hospital officials and helicopter operators are now embroiled in a painful, at times fractious, self-critique of patient and flight-crew safety. They want to come up with new industry standards to prevent needless loss of life and, not coincidentally, to forestall stringent federal regulations.

"What's been happening is terribly unfortunate and we can't allow it to continue," says James Smith, president-elect of the American Society of Hospital-Based Emergency Air Medical Services, a San Diego-based industry group. If it does, he warns, "it will hurt every program in the country." Safety, he says, will be the top priority at the group's convention this week in Alexandria, Va.

There is little doubt that air medical programs are an important medical tool. Their quick response means many critically ill or injured patients can receive treatment in what is known as the "golden hour"—the first 60 minutes after an accident or attack—in which proper treatment can substantially increase chances of recovery.

At the same time, the helicopters provide a glamorous marketing tool for hospitals faced with increasing competition. Besides giving a hospital a wider reach, the aircraft pay bonuses in public relations. "There's nothing quite as glitzy as having a helicopter land on the roof," says Nina Merrill, executive director of the San Diego air medical services society.

But behind the glitz lurk allegations that medical pilots are overworked and that they sometimes take unwise risks.

Fatigue and Stress

Don Wright and Tom Einhorn, two pilots who in 1984 founded the National Emergency Medical Services Pilots Association, based in Pearland, Texas, say fatigue and stress, caused partly by understaffing, are two big problems facing pilots. They contend a four-pilot team should be required for each helicopter to ensure adequate rest, especially since pilots can be on call for 24 consecutive hours; many programs operate with three, or even two, pilots for each aircraft. Helicopter operators reply that four pilots are already used on the busiest assignments, and that others don't need that many.

Some safety experts speculate that another factor in the crashes may be dangerous conditions. "These pilots are going out in the middle of the night in bad weather," one safety-board investigator says. "They may land on the highway median strip, and God knows how many ground hazards are in their approach path." Others say pilots accept risky missions because they fear the patient will die if they refuse.

The consequence is a growing concern "that people are going out and trying to complete a mission when they shouldn't," says Mr. Smith of the American Society of Hospital-Based Emergency Air Medical Services. At its convention, the group will propose that members adopt new safety guidelines, including limitations on flying in bad weather.

Says Mr. Smith, "On certain nights, in certain kinds of weather, nobody should fly."

LAURELHURST COMMUNITY CLUB

Serving over 1600 homes.

August 13, 1986

Tallman Trask III
Vice President for Finance
and Administration
University of Washington
Seattle, Washington 98195

RECEIVED

AUG 22 1986

DEPT. OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Dear Mr. Trask:

The Laurelhurst Community Club Board of Trustees has reviewed your letter of July 2, 1986 to Treuman Katz, Chief Executive Officer of Children's Hospital, regarding the possibility of locating a helipad in the Graves Field area to serve Children's Hospital needs. In your letter, we see no evidence that the University has closely examined some possible locations for a helipad that would meet Children's needs. Children's needs a paved, lighted and secure helipad that can be reached over a paved road. Further, the helipad should not be clearly visible from any heavily travelled road, should not be on a playing field, should not be closer than about 1000 feet to any residential buildings and should be easy to land on and take-off from in all types of weather.

We have identified five locations that appear to satisfy these criteria on enclosure I. The black circle represents approximately the area needed for a helipad (i.e., a circle with a radius of 30-40 feet). We would greatly appreciate it if the University could take a close look at these five locations to see which of them would be the best location for a helipad for Children's Hospital. If the University would allow Children's to construct a helipad on one of these locations, at its expense, it would greatly assist the solution of this issue which has generated a lot of conflict between the Laurelhurst community and Children's. Further, we think that Children's should pay the University a landing fee each time it uses the helipad to help defray the cost to the University of providing University police services as required for the safe operation of the helipad. Children's should also be responsible for maintenance or pay the University to do this for them.

Our review of the University of Washington General Physical Development Plan indicates that the outdoor storage yard in Sector E8 is to be phased out and turned into open space (see enclosure II and page 102). This proposed action would appear to make the location of a permanent helipad in this area even more feasible in the future. Flight paths could be designed over the playing fields so that the noise and vibration impact in the wildlife areas would be minimized.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We expect that Children's will continue to land helicopters on its campus, when absolutely necessary, as they do now. For cases where time is not so critical, we would like them to land at Graves Field and transfer the patient to an ambulance for a 3 minute ride to the hospital. As you may know, all patients who arrive at Harborview by helicopter now are transferred to an ambulance for a short trip to the Harborview emergency room or to other nearby hospitals. During the past 12 months, there have been 85 helicopter flights made by Airlift Northwest with patients bound for Children's Hospital. About 70 of these landed at Harborview and the patient was then brought to Children's by ground ambulance (a 20-30 minute trip). Current projections are that the number of helicopter flights to Children's could rise to 35-40 per month by 1990. Some would still land at Harborview, others at Graves Field and a few, really critical cases, would be landed at the Children's campus as they do now.

Another reason to have a helipad constructed in the Graves Field area is to provide a safe and adequate landing facility for MAST helicopters. MAST and other military helicopters have been landing infrequently on this area for the past 11 years and should be allowed to continue to do so. MAST hopes to obtain new Blackhawk helicopters in the near future. These machines are much larger than the "Hueys" currently in use. It is probably inappropriate, because of weight and size, for MAST to land on the University Hospital's rooftop helipad. It is clearly inappropriate for them to land at Children's proposed helipad on their campus. MAST landings in the Graves Field area have sometimes been hindered by muddy conditions. They, too, have an obvious need for a paved, lighted, and secure helipad.

We believe that allowing Children's to build and use a helipad at Graves Field would be consistent with the long history of cooperation between Children's and University Hospitals, the desire of the University to be a good neighbor, and the clear need for a helipad that can be used by MAST helicopters bringing critically ill patients to both Children's and University Hospitals.

We invite you to respond to this letter by presenting your findings to our Board at its next meeting on September 8, 1986. Please let me know if you will be able to do so as soon as possible. I can be reached at 447-4054 (office) or 527-4892 (home).

Sincerely,

Robert N. Klug

American Medical
NEWS
SEPTEMBER 1986

Air rescue threatened by chopper crash rate

Hospital-based helicopters crash far more frequently than other helicopters or civil fixed wing aircraft, according to aeromedical experts at a meeting of emergency medical personnel in San Diego.

The efficacy of hospital-based helicopters also was questioned at the conference, with some expressing doubt that the popular aeromedical

New group for EMS MDs.—page 33

rescue teams are any more effective at saving lives than ground ambulance crews.

"We have a long way to go in justifying the need for these programs in terms of patient outcome, cost, and, most importantly, safety," said Ronald D. Stewart, MD, the president of the conference's sponsor, the National Assn. of EMS Physicians. Dr. Stewart is also a professor at the U. of Pittsburgh, and president and director of the Center for Emergency Medicine of Western Pennsylvania.

The use of hospital helicopters has grown quickly in the past 10 years. There are now 150 hospital aeromedical programs, and some predict that there will be 500 by 1996.

A stinging indictment of hospital helicopter safety came from Tom Einhorn, vice president of a recently formed association of hospital helicopter pilots, the National EMS Pilots Assn. "Hospital-based aeromedical helicopters have the worst accident rate in modern aviation history," Einhorn said.

According to the private, Columbus, Ohio-based Aviation Safety Institute, through 1985, the fatal accident rate for aeromedical flights was 6.5 lives lost per 100,000 flying hours. That is nearly triple that of commercial helicopters in general, which suffered 2.2 lost lives per 100,000 flying hours.

There have been 21 hospital helicopter accidents so far this year, including one in June near Birmingham, Ala., that killed a pilot and two flight nurses (*AMN*, June 13, 1986). "It's a miracle that more of the accidents this year didn't result in fatalities," said John B. Galipault, president of the aviation institute. Last year, 10 people were killed in hospital helicopter accidents.

Einhorn said that "the one threat to the survivability of aeromedical EMS in this country is the issue of safety." He cited several factors that have contributed to the string of accidents. They are:

- **Stress and fatigue.** Don Wright, president of the helicopter pilots' association, said that too many hospitals are trying to run their aeromedical program with only two pilots. This means that each pilot must work at least 12 hours a day, seven days a week, to provide around-the-clock coverage. Wright said that pilots had confessed to him that they had fallen asleep at the controls due to fatigue.

Einhorn noted that flying a helicopter requires far more pilot concentration than does flying a regular airplane. Hospital helicopter pilots also must be on the lookout for wires and obstructions, navigate with street maps, and at the same time, communicate with air traffic controllers and emergency service dispatchers, he said.

- **Training.** Most EMS pilots have military and commercial backgrounds that do not prepare them for the challenges of aeromedical flying, where they must frequently land by expressways, in the middle of subdivisions, or in populated areas that aren't prepared for helicopter landings. Problems are compounded when the pilot flies at night or in bad weather. A large number of crashes resulted after the helicopter struck an unseen electric or telephone wire. Presently, there are no national training standards for aeromedical pilots, and as a result, the quality of training given to pilots varies widely from program to program.
- **Equipment.** In order to economize, many aeromedical EMS programs operate with helicopters that have only one engine, as opposed to the preferable two, and that don't have all the instruments and equipment needed for some flights.
- **Operating standards.** There are no nationally accepted operating standards for aeromedical programs that would govern when conditions are suitable and unsuitable for flight. Presently, Einhorn says that all too often, a heroic "save the patient" attitude exists, causing flights to be made in conditions that are unsafe.

In addition to questions of safety, questions regarding the very need for hospital helicopters were raised. Wright said that too often a hospital starts a program for financial, and not medical reasons. "The administrators may have seen the studies that show that patients brought in by helicopter are overall better insured and tend to stay in the hospital three times longer than average patients."

In addition, Wright said that administrators may be swayed by the 150-mile radius of coverage a helicopter will give a hospital, and the vast amount of free publicity it provides. "TV news shows love shots of helicopters whisking injured patients away from accident scenes," he said, adding, "Too often a hospital in a city will start an aeromedical program, and that in turn will spark other hospitals in the area to start their own. This happens in cities that can't even support the first one."

Dr. Stewart said that data is "sparse" to support air over ground transport of patients to hospitals. "We are not certain that air transport improves patients' outcomes; preliminary data suggests that it may be detrimental."

Dr. Stewart cited a study that showed that cardiovascular patients, who make up a high percentage of those transported by helicopters, had a greater incidence of problems when transported by air instead of by ambulance. Kenneth W. Kizer, MD, the director of the California Dept. of Health Services concurred with the studies saying, "It's not surprising that a heart patient who finds himself loaded aboard a cramped machine with whirling rotors would have problems."

> In Los Angeles, before the 31 hospital helicopters began coordinating which would respond to a patient, 'They stopped just short of air-to-air missiles in competing for patients.'
>
> —Kenneth W. Kizer, MD, director of the California Dept. of Health Services

Those who spoke at the conference stressed the need for studies of the need for aeromedical programs, and the results of those operating so far. They also stressed the need for coordination in communities that already have competing programs. Dr. Kizer explained the situation he had found in the Los Angeles area. "Any or all of 31 helicopters could respond to a patient. Before they started trying to cooperate, they stopped just short of air-to-air missiles in competing for patients."

Wright and Einhorn said the pilot's association was calling immediately for a minimum standard of four pilots per aeromedical helicopter to alleviate the problems of fatigue. They also are working to develop operating procedures and standards, and minimum weather requirements for flight. —Ryan Ver Berkmoes

PUBLIC HEARING

COH'S Proposed Helipad

Children's Hospital has released its Draft Environmental Impact Statement on their proposed helipad.

Come to a public hearing to learn about or comment on the helipad proposal:

Laurelhurst Elementary School Auditorium
Tuesday, September 23, at 6:00 P.M.

- It is important to show the city and the hospital that we are concerned.
- Issues to be discussed include: helicopter safety, proposed flight paths, noise and vibration, alternative locations for the helipad, and more. Each person may speak for 3 minutes at this meeting.

IN ADDITION to attending the hearing, your written comments on the Draft Environmental Impact Statement or on what you learn at the hearing are very important. Responses to your comments will be included in the Final Environmental Impact Statement.

Send written comments before October 2 to:

Holly Miller, Director
Department of Construction and Land Use
408 Municipal Building
Seattle, Washington 98104

You can obtain a copy of the Draft Environmental Impact Statement at the public hearing or from the Department of Construction and Land Use (same address as above or phone 625-4509). Copies are also available at the Seattle Public Library, Downtown, Northeast and University Branches or the University of Washington Library.

Copies can also be obtained from Anita Francis (524-9340) or Liz Anderson (522-2944) while the supply lasts.

This is the first of two very important public hearings. This is your opportunity to speak out and comment in writing on this issue.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Re: Proposed helipad at Children's Orthopedic Hospital & Medical Center (COH)

Dear Ms. Miller and Ms. Julie Gibbs:

In addition to the recorded testimonies heard at the draft EIS hearing held 9-23-86 in the Laurelhurst Elementary School auditorium, and in addition to previous letters from me, please read and add this letter to your permanent files on the above-named issue.

By definition, the word environment means "one's surroundings or external circumstances collectively." Be it noted in the draft EIS on the proposed helipad at COH that the phrase "no significant impact" is repeatedly used per page. "No significant impact" is not the same as "no impact," which phrase is not used. Collectively, the repeated "no significant impacts" add up to great cumulative impact on the surrounding neighborhood--the environment of individuals, families, school children.

The draft EIS document is inadequate coverage of the serious impacts on the neighborhood. It is based on faulty research and statistics. Dr. Nicola is often quoted--and he quotes himself as reference. The document shows a strong bias (COH); it is not an objective, impartial review; it does not equally present the two sides. I hereby concur with specific citings and details and examples to support the claim of deficient data as presented in testimonies at the 9-23-86 public meeting. the the draft EIS

The most serious problem is that of safety (or lack of same). Frequency rate of helicopter crashes exceeds other aircraft as well-documented nationally by news media (magazines, newspapers, radio and TV). Factors causing crashes include pilot error, pilot fatigue, obstructions (such as power lines, buildings and trees), weather conditions.

The proposed landing site is located in a high-density, residential neighborhood, including: single-family homes; an elementary school (200 children plus faculty and staff); Laurelon Terrace Condominiums (136 units); Laurel Crest Condominiums (82 units); Laurelhurst West Condominiums (54 units). The Laurelon Terrace units are contiguous to COH property and helicopter site. The 60-80 landings--estimated at 15-20 patients per month with 4 flights-landings for each patient--would be a mini-airport in our midst. It would be like a helicopter landing on Laurelon Terrace rooftops or landing in Laurelon residents' yard. These could occur any time day or night.

A helicopter crash at COH site would kill: patient, pilot, medical personnel aboard; children and personnel in COH; neighborhood residents; school children. In addition to loss of life and property damage, fire could rage as a result of a crash on this site. An oxygen tank and a natural gas main are located near site on COH property.

Weather is another factor which could cause crash. Weather is unpredictable, uncontrollable, including wind, fog, mist, rain making for poor visibility.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Noise of the helicopter is far greater than traffic--auto or ambulance (latter shuts off siren in neighborhood). Helicopter noise decibels are above health and acceptability levels for individual residents, school classes, hospital patients' welfare.

Another real concern is the lack of standards for decision-making processes involved in helicopter usage and flights. Lack of designated/named responsible persons to make decisions is a serious flaw in the proposed plan(s). I am also concerned about the lack of reference related to insurance. For example: Who carries policy/policies? Who pays the premiums? What is the amount of coverage? Who and what is covered?

The extreme expense related to initiation and maintenance of helicopters and their services is another concern. The millions spent on this marketing tool to be competitive with other hospitals could and should better be spent on patient care, programs, personnel, research. Duplication of these expenses across city and state as hospitals compete for business is wasteful and wrong.

The helipad proposed at COH is just one more example of institutional encroachment in a residential neighborhood. The helipad would be a veritable mini-airport wantonly endangering the lives of hundreds of residents each time a flight was made (often circling several times--losing precious time--over homes, condos, school before landing at a rate of approximately 1,500 feet per minute endangering the life of baby patient aboard).

In the face of mounting evidence of: (a) the unsafe record of factors involved in medical helicopter crashes; (b) the uncertain benefit derived from usage of helicopters for critical patients--documented by the medical profession; (c) the lack of standards for decision-making; (d) the excessive expense of helicopters; and (e) strong and widespread community objection, this proposal must be rethought and cancelled permanently.

I thus recommend:

1. <u>Absolutely NO helicopter landings at COH</u>.

2. COH and University Hospital-UW Medical School cooperatively construct and use a helipad on UW soccer field or adjaccent UW land <u>only</u> if a need can be proved for this unsafe and expensive service. (The jostling and rapid descent by helicopter is far more injurious to patient than ambulance transport -- Seattle ambulance service second to none in the nation.)

   The University Hospital and UW Medical School currently are doing and plan to expand research on COH campus. COH could share a helipad with University Hospital on UW property where the approach is wide open. It is ridiculous that there be two helipads within one mile of each other.

We all -- citizens, neighbors, COH--have a moral responsibility to <u>STOP TRAGEDY BEFORE IT HAPPENS</u>. A helipad at COH must not be further considered a viable option and never constructed. Helicopter landings in parking lot and/or any part of COH grounds must not be permitted, must be stopped.

Thank you.

Sincerely,
Maryann E. Spangler

September 1, 1986

Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98014

Dear Director:

I have a unique perspective on the issue of the helistop at CHMC. I, my wife and two children are neighbors of the hospital, living about two blocks from the site of the proposed helistop. In addition to this I am a physician employed at the hospital, who also works as a flight physician with Airlift Northwest.

Children's Hospital and Medical Center offers unique services to patients throughout Washington and the Northwest. Children who are critically ill often can not be treated appropriately anywhere else in Western Washington. These critically ill children should not be put at added risk by having them endure multiple transfers in and out of ambulances, let alone the added time needed to reach the hospital, necessitated by landing elsewhere.

I am glad that as a Laurelhurst resident my two girls are so very close to one of the nation's outstanding children's hospitals. In my experience as a flight physician I know that residents throughout Western Washington are also very grateful that it is possible to get their child to Children's Hospital rapidly and safely through the use of air transport. This helistop is for them and their children.

The risk of having a helistop in the Laurelhurst neighborhood and the inconvenience of the sound of a helicopter landing are trivial in comparison to the good it provides children throughout this state and beyond. It should be built well, to provide the maximum safety and minimal disturbance to the neighborhood, but it must be built and put into service as soon as possible.

Thank you for your consideration.

Sincerely,

Thomas P. Strandjord

To Whom It May Concern:

Please incorporate the following comments into your EIS on the proposed Children's Hospital Helipad.

For starters, let it be known we are NOT opposed to the development of health care services generally at Children's Hospital. We applaud the expertise and care of this institution to children of the Northwest.

What we DO object to though is the unreasonable expansion of the hospital into the community under the guise of improved health care. It has NOT been clearly demonstrated yet that there exists substantial benefits to patients in helicopter transit directly to the hospital versus landing at Graves Field and being ushered into the care of an awaiting team of physicians, etc via an ambulance.

Secondly, are we to believe the hospital personnel that the helipad will be used for only extreme cases once the proposed service begins? Will the expense of this service be paid for by using the helipad route for non-emergent cases simply because its there and it's an "advanced " way to handle a case? Physicians in my neighborhood have serious doubts that either of the above two concerns are satisfactorily met with the proposed helipad. In our opinion it is high tech above reasonable judgement.

Next,we are angered with the arrogant attitude of COH displayed towards the community in resisting the proper channels of documenting their needs for the proposed helipad. Why have the administrators objected to complying with a standard documentation of need for this helipad? Are they concerned that we will become educated and protest this action en masse? Let's play by the rules of a free and open democracy and discuss the issue honestly and openly.

Lastly, we look to you to fairly portray our concerns and not be unduly affected by the deserved admiration of the entire community towards COH. Yes...they are a valuable part of the Northwest, but this stature must not obscure their responsibility to all our citizens to develop in a fair, honest way, accountable to all. We urge you to deny COH the helipad permit.

Sincerely,

Mark Plunkett Janette Plunkett

P.S. Please send a copy of the final EIS.

Re: Children's Orthopedic Hospital
Helipad

To Director Holly Miller:

I am the owner of an apartment in the Laurelon Terrace Condominium complex, which is next door to the proposed Children's Orthopedic Hospital helipad.

I was present at the meeting of September 23, held at Laurelhurst Elementary School, at which this plan was discussed. According to COH there should be about ten emergency cases brought in by helicopter a month - a total of twenty trips. I believe there will be many more than that once the helipad is in place. Doctors will order helicopter service for their patients more often than they now anticipate as a defense against the possibility of any legal action against them by the child's parents in the event the child does not survive.

There is great concern by the residents of this condominium about having these helicopters coming down for a landing next door to us. Many have shown their concern by moving. I have lived in many neighborhoods in my life but never before have I seen so many "For Sale" signs appear in one neighborhood as there have been here since we all became aware of the proposed helipad two years ago. The Port of Seattle has been in the practice of buying up houses of people living in the flight pattern of SeaTac when they have been unable to sell them to anyone else. Now the City of Seattle is finding itself obligated to buy houses of people living near the Midway landfill. Will Seattle also come to the rescue and buy up the apartments of Laurelon Terrace residents when the frequency of helicopter flights overhead becomes unbearable and we are unable to find buyers? Had I known three-and-a-half years ago when I bought my apartment that there would be helicopters landing next door, I wouldn't have even made the trip over here to see the place.

Yours very truly,

Marjorie D. Kresge

To whom it my concern:

We hope a careful study will be made of the excellent testimony given at the hearing Sept. 23, 1986 at Laurelhurst school regarding CO & Helipad, by several people who are experts in the use of helicopters - This has been a major concern to us - The weather and winds make it impossible to predict which way an aircraft approaches a landing site -

One point we did not hear addressed at the hearing was the close proximity of the large Oxygen storage tank to the Helipad site - This could be hazardous -

Our city and its residential areas are already impacted by too many private planes flying at uncontrolled altitudes - Should another be added when the need for the helicopter has not been proven.

Again we say who will pay for the service?

Sincerely

Mr and Mrs Fred M Wright

DRAFT ENVIRONMENTAL IMPACT STATEMENT - PUBLIC HEARING

Seattle's Department of Construction and Land Use has issued a Draft Environmental Impact Statement (EIS) for the proposed:

Project Description

4800 SAND POINT WY NE ZONE 1-4/1-2/SF 5 PROJ #8405870/KROLL 16W TO CONSTRUCT AN EMERGENCY HELISTOP FACILITY ACCESSORY TO AN EXISTING HOSPITAL/ MEDICAL CENTER (CHILDREN'S HOSPITAL & Medical Center).

The following Master Use Permit components are part of this application
SEPA ENVIRONMENTAL DETERMINATION
COUNCIL CONDITIONAL USE
TO ALLOW A HELISTOP WITHIN A MAJOR INSTITUTION ZONE.

Further Information Available:
A copy of the Draft EIS is available for public review at the downtown Seattle Public Library, 1000 Fourth Avenue the Governmental Research Assistance Library, Seattle Municipal Building, and the branch library in the neighborhood in which the project is located.

Additional information and a limited number of copies of the draft EIS are available through the Master Use Information and Notification Center, Room 408, Seattle Municipal Building (625-5200).

Opportunity For Public Involvement

A public hearing to gather comments on the environmental impacts of the proposal will be held on
SEPTEMBER 23, 1986 at LAURELHURST ELEM SCHOOL 06:00PM.
4530 46th Ave. N.E.
In addition, written comments may be submitted through OCTOBER 02, 1986

Comments should be addressed to: Director, Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.
If you wish to receive notice of the decision(s) on this project or to receive notice of the availability of the Final EIS (which responds to comments made at the public hearing or on the Draft EIS), please return the completed form below to: Seattle Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.

Ms. Holly Miller, Director
City of Seattle, Department of Construction and Land Use
Room 400 Municipal Building
Seattle WA 98104

Dear Ms. Miller:

This letter is a response to the Draft Environmental Impact Statement for the Children's Hospital and Medical Center Helistop (September 1986). My direct interest in the outcome of the licensing of the helistop is that I live along the Montlake Cut which lies along one of the major proposed helicopter approach and takeoff paths. More generally I am very concerned about the high levels of noise throughout the city which may yet force us to move from Seattle into the suburbs. I have only a few brief points and a suggestion or two to make.

I strongly support the concept of rapid access to hospitals for patients who require it. My goal here is to assure reasonable access consistent with the health of city residents. A reasonable heliport site and approach path will be proposed that will permit COH (and University Hospital) patients to have necessary timely medical care without placing an unfair burden on permanent residents along the helicopter flight paths. First I wish to draw your attention to serious deficiencies in the draft EIS regarding the impact of helicopter traffic on neighborhoods in the vicinity of COH, including mine.

I refer primarily here to the chapter entitled "Noise and Vibration" in the EIS. Here are the data upon which the EIS draws its conclusions regarding helicopter noise in the neighborhood:

- Monthly number of takeoffs and landings: 80 (p.83)
- Typical maximum outdoor sound levels: 75-85 dBA (p.85)
  (75 dBA is comparable to siren at 500 feet - 1 block;
  85 dBA is comparable to accelerating truck, lawn mower, p. 75)
- Outdoor-to-indoor noise reduction level: -25 dBA

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Based on these data and adopting standards of noise impact from of undiscussed acceptance, the EIS manages to conclude:

- Increases in neighborhood noise levels will be 0 to 3 dBA monthly (p.85)
- The impact of such noise increases ranges from "Barely Perceptible" to "Noticeable" at worst (p.74)
- The very worst case is an increased noise level of 5 dBA (p.83) which is considered "noticeable".
- In the worst case 40% of neighbors will be awakened if their windows are open and 20% if their windows are shut.

Anyone over the age of 3 years living anywhere in the University District or Montlake knows that the noise generated by a helicopter on approach to COH is very loud. "Barely perceptible" is not a description of helicopter noise that any sane person would ever dream of using. "Noticeable" seems much too modest. The conclusions regarding noise impact fly right in the face of experience. How can the experts be wrong?

This is easy to understand if the data are converted into measures that most of us understand, and if the procedure for processing the data are made clear. The second question first. Believe it or not, the EIS allows itself to convert the noise made by helicopters from a "peak" value -- the value heard by people nearby when the helicopter passes overhead -- to a monthly average value! (See bottom of p.74 and top of p. 76.) Since helicopters are overhead no more than 10 minutes per day, and since there are 43,200 minutes per month, the monthly average noise made by a helicopter trip is about 1% percent of its peak value. **In other words the writers of the EIS divide the noise of a helicopter by a factor of approx. 100 before they assess their noise impact!** How's that for taking the benefit of the doubt! I am dazzled. If this is standard "industry" practice then Lord help us.

My second point regards the assumtion that going indoors is a perfectly good way to escape from helicopter noise since noise levels inside a house are 25 dBA (about six times) less inside than outside. The 25 DBA result is based on high frequency noise (such as sirens), and it assumes that the windows are closed. The assumption seems very reasonable for sirens during the half of the year that windows are shut. I submit that these standards are completely irrelevant for low frequency noise all year long.

Consider expensive loudspeaker cabinets. The best ones are invariably the largest. Why? Because even the best loudspeakers have difficulty producing low frequencies (helicopters are great at it, however). The loudspeaker

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

But that doesn't mean that they are right. Consider first the "generalized flight paths", or general approach routings, shown on p. 44. All approaches over the city follow either the I-5 or Fremont-Montlake canals. These are already among the noisiest parts of the city. Perhaps the helicopter pilots foes that these routes are safe (I wouldn't know) or that since these routes are already noisy, a little more noise won't hurt. I consider these routes to be highly inconsiderate of noise impacts for the many residents of these areas.

I urge you to require that large-scale approaches be overwater wherever possible. Flights from the west should come over Elliot Bay, along the Mercer Street corridor, over Lake Union across U.W. (see Figure "A" below), to the playfield. The approach from the east shown on p.44 is fine. Flights from the north and south should be required to fly over Lake Washington to a point a mile south of Webster Point and then approach the playfield as shown on p.51. None of these approaches will add more than 30 seconds to flights headed for COH.

Generalized Flight Paths

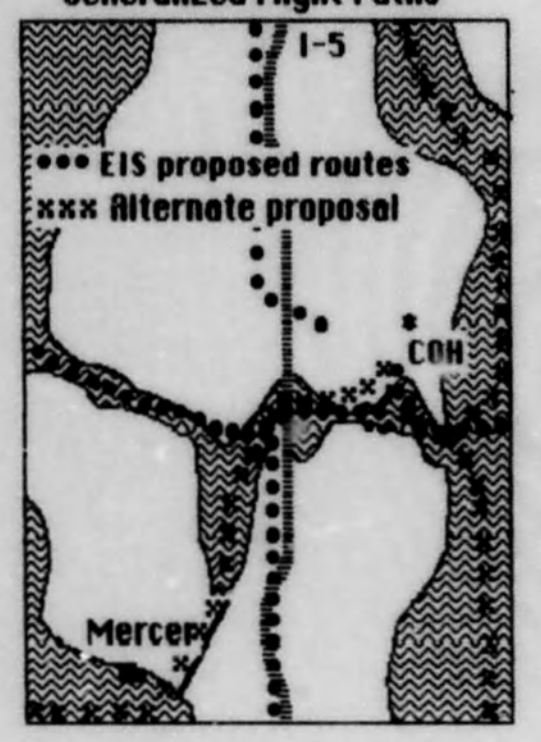

Figure "A"

Approach Paths to Playfied Helistop

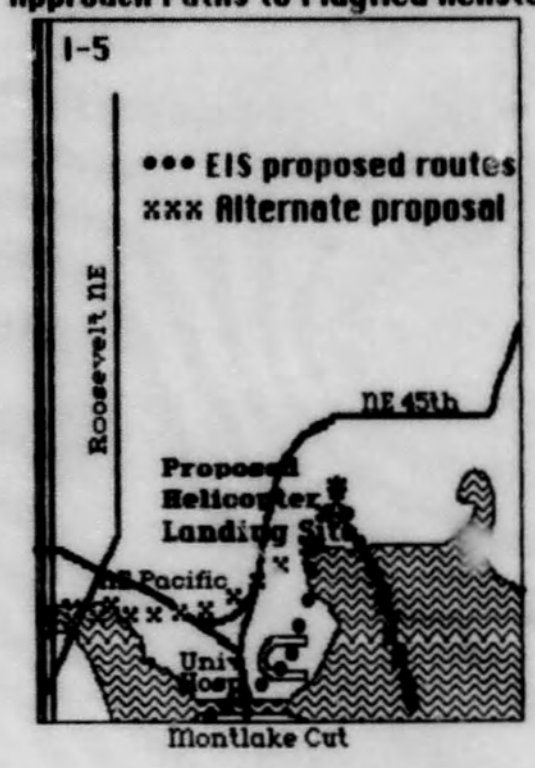

Figure "B"

Now examine the figure on p.51 which shows the proposed final approach paths to the playfield landing site. The approach from the southeast is fine as

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

cabinet resonates and helps to strengthen the lower frequencies. The larger the cabinet the more effectively it boosts lower and lower frequencies.

A very expensive loudspeaker cabinet is your house. It resonates very effectively at the very low frequencies -- the sounds that helicopters produce abundantly. These frequencies are so low that the ear does not hear them. **Instead the house (and all of the people inside of it) vibrate.** As noted in the EIS (p.81) **"short-term sound pressure of these [helicopter-generated] levels can cause rattling and movement of dishes and other lightweight objects"**. How would you like to live in a house whose dishes vibrate eighty times per month, or almost one-thousand times per year?

I have described the worst case, according to the EIS. Maybe, but I doubt it. My house is more than a mile from the landing site. I have never counted the occurrence of dish-rattling helicopter overpasses, but I assure you that they are not just occasional. I can also assure you that the writers of the EIS don't live near me, or that they have decided to take more doubtful benefits! Finally it is well known that low frequency noise is far more objectionable than high frequency noise to humans. I cannot supply a reference for this conclusion, but it is cited frequently in FAA documents on the subject of jet noise.

In other words, I urge you to not let yourself get lost in the overabundant words and jargon in the EIS chapter on noise impact. The data, or the interpretation of the data, or both, completely conflict with reality. Challenge their conclusions, especially the rationale for interpreting the data in the way that they have.

In spite of my cynicism regarding the noise impact of helicopters, I believe that it should be possible to land helicopters near COH with only minor noise impact, and that the people at COH and their consultants have not tried very hard to find a prudent procedure for accomplishing this.

My proposed landing procedure is based on the first alternative listed in the EIS; namely, the U.W. playfield site. I accept the conclusions that landings at this site will not be highly objectionable. My concern is with the proposed flight paths to this site which were recommended by the helicopter pilots. Since helicopter pilots are inside the helicopter and cannot escape its vibration and noise, the pilots cannot be expected to be very concerned with the noise impacts of helicopters along the approach paths. Rather, they want to fly the most direct routes and over low-lying parts of the city. I can't blame them.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

shown. That from the southwest is abominable. The Montlake Cut region is already jammed with small planes and news helicopters, especially in the summer months. Emergency helicopters will create a safety hazard in this zone, and will add appreciably to the noise in the residential area to the south where I live. In addition, the route passes over University Hospital which it will vibrate. The University Hospital hopes to add a helipad on their roof, and the conflict of airspace will become even more hazardous if their rooftop landing site is approved.

In the interest of health and safety I urge you to require an approach path from the southwest as follows: cross the I-5 overpass over the canal and University Bridge. From there follow a line to the intersection of NE Boat Street and Brooklyn NE, and along the Burke-Gilliman Trail to the I.M. Buildings immediately north of the Hec Ed Pavillion, and then directly to the landing site. (See figure "B" above). This flight path is far from residences and avoids classroom buildings on campus. The noise will impact transients (motorists) rather than residents. Conflict with low flying planes and helicopters is avoided. It is also faster than the routes shown on p.51.

Sincerely yours,

Bruce Balick

Re: Comments on Draft Environmental Impact Statement
for Childrens Hospital Helistop

Dear Director Miller:

This letter is submitted on behalf of the Laurelhurst Community Club, a Washington non-profit corporation whose membership is comprised of Laurelhurst community residents, to comment upon the Draft Environmental Impact Statement (DEIS) in the above matter. These comments should be considered as supplemental to comments submitted by other members of the Community Club.

In general, the DEIS presents only a superficial view of the issues raised by the proposal. Specific inadequacies are noted below:

Land Use, Page 28: The DEIS assumes that consistency of the proposal with specific land use criteria is not a topic appropriate for discussion in the DEIS, at least to the extent of reviewing the criterion of medical need. This is incorrect. Such a criterion is part of the City's Land Use Code. The DEIS should consider consistency with the Land Use Code, including this criterion as part of the EIS process.

Further, the DEIS discussion of land use impact is wholly insufficient in its focus solely upon the policies applicable to the major institution zone. The City's conditional use criteria require review of impacts upon surrounding residential property. In reviewing such impacts, the DEIS should also examine policies applicable to the surrounding residential zones to determine whether the proposed use is consistent with those policies in its impacts, which clearly spill over beyond the campus where the helistop will be located.

Alternatives, Page 49: The discussion of alternatives appears to accept the judgment that the proponent's objectives are synonomous with "the purpose of the Helistop" as that term is used in Seattle Municipal Code, Section 23.48.05. Thus, the discussion of alternatives does not analyze their consistency with the conditional

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

use criteria, but merely dismisses them as inconsistent with "the proponent's objectives." While it may be relevant to discuss whether or not the alternatives fit into the proponent's tailor-made objectives, the DEIS should <u>also</u> discuss whether or not the alternatives are consistent with the standard established by the City for the conditional use permit.

Weather, p. 67: Although weather is considered in the context of safety, the DEIS does not contain a similarly detailed discussion of weather as a factor in preventing airlift operations in the context of the proposal and its alternatives. Clearly, weather conditions may affect the viability of the proposal and its various alternatives and the extent to which they accomplish their announced purposes.

Noise Impacts, Page 80: The suggestion that "there is little valid scientific basis for claiming direct health impacts from aviation noise " is unsupported in the DEIS and is suspect. While it may be true that noise cannot be correlated with direct impacts (e.g. tumors), there is a substantial body of evidence that noise may be associated with, for example, pyschological and physiological changes relating to health. This should be addressed in the DEIS.

Page 90, Cumulative Impacts: The discussion of cumulative impacts is singularly one-sided and perfunctory. It ignores the very justifications used by the proponent for its application, dismissing the possibility that other institutions will use the same justifications, regardless of whether they are currently considered tertiary care referral centers. Further, although the possibility of further helistops is discounted in the discussion of cumulative impact, based on the alleged restraints by various governmental reviews necessary for their establishment, no mitigating measures are explored which would turn this speculative restraint into a reality or which would affect the COH permit in any substantial way (e.g. through automatic revocation) if other helistop approvals by other institutions were sought.

Because of the deficiencies in the EIS, a new DEIS should be prepared and recirculated for comment prior to issuance of a Final Environmental Impact Statement to ensure that the public has an opportunity to comment on missing information and analysis which must be included if the EIS is ultimately to be found adequate.

Thank you for this opportunity to comment on the DEIS.

Sincerely,

Peter J. Eglick

Dear Ms. Gibb:

It is time to resolve the question of making it possible for critically sick children to be lifted by helicopter to Children's Orthopedic Hospital and Medical Center. Any critically sick child residing in the vicinity of Puget Sound or areas depending on bridge access risk not reaching the Hospital in time to save a life, with the expertise offered there by its physicians, surgeons, and equipment.

It only requires the imagination of a parent or grandparent to find the answer which resides in the use of a tool like the helicopter to save a life.

Re: CHMC Helipad

Even though I can understand the residents' feelings, fears and concerns about the noise and possible devaluation of their property in that exclusive area, I feel that perhaps they have over reacted, as my understanding is that the helicopter would be used only for emergency purposes, so it would not be a constant thing and should not affect them that much. CHMC should have the latest and best facilities for saving lives and I would, therefore, like to add my support for building the helipad outside the emergency room of CHMC.

Please convey my support to the City Council.

Dear Sir/Madam,

With reference to the application for construction of a Helistop Facility accessory to Chidrens' Hospital and Medical Center,I want to protest such a construction in the strongest terms ,both as individual resident within a few hundred feet of the hospital and as Vice-president of the Laurel Crest Condominiums Home Owners Association.

While pretending that the use of helicopters to ferry patients to the hospital is resorted to only in emergencies,the C.O.H. administration has demonstrated the untruthfulness of that claim by arranging for almost daily helicopter landings on its grounds during the month of August, including one at around midnight during a recent weekend. To the best of my knowledge ,C.O.H. has no permit for such landings and is constantly violating ordinances of the City of Seattle .Why do you and our elected officials remain silent in the face of such overt lawbreaking by a politically powerful organization ? The recent spate of crashes by helicopters used for ferrying patients and the disastrous effects of such a crash on the lives of people residing in a densely populated part of the city,should be enough reason to outlaw even a single landing of a helicopter on the grounds of C.O.H. .In addition to which the noise of the helicopter is deafening and certainly wakes up anyone trying to sleep at night.

The original reason for C.O.H. to locate in the Laurelhurst area was to get the benefit of a quiet neighborhood.If,some decades later, the goals of C.O.H. have changed and helicopter service for patients has become an indispensible marketing tool in the competition for patients ,then Childrens' Hospital must move to where such services will not interfere with the lives and the tranquillity of people living in a quiet neighborhood.The fact that Childrens'Hospital is out there aggressively campaigning for more patients is clear to all of us who watch its advertisements on Television and its fullpage advertisement in magazines such as Newsweek

Dear Ms. Gibb.

This is to express my concern about the possible banning of helicopter landing at Childrens Hospital. My husband is a S.C.Atl. surveyor and, while this is not necessarily his opinion in this case, we have been made aware many times of the great need for this service at many facilities in times of emergency. I believe the positive factors far outweigh neighborhood objections. Please convey my thought on this matter to the city Council. Thank you.

Sincerely,
Jeanne C. Gosney

Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I just became a parent last month to a healthy baby boy. If something where to happen, such as an emergency situation, I would really appreciate knowing that he could be rushed over to COHMC via helicopter to receive emergency treatment. This service is especially needed in places like Port Townsend, which is where we live, because we do not have the emergency facilities that COHMC has. And if we where to have to drive over to Seattle in an emergency situation it might just be too late.

I understand the concerns of those who are objecting, but I truly believe that having this helistop service could save many lives, maybe even the life of my own son!

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Lisa Talley

Dear Mr. Justen:

RE: Proposed helipad at Children's Orthopedic Hospital

As a neighbor of COH, I am concerned about the proposed helipad, and believe that COH should be required to prepare an environmental impact study regarding this project.

Many of us in the nearby neighborhood have questioned the projected number of helicopter landings per month at COH, and wonder if only the truly "life saving" cases will be flown in, or rather if the helicopter landings will become frequent in order to make the service financially viable. Several medical authorities have wondered aloud if eventually broken legs and hang nails might be treated using the helicopter service.

This possibility raises the issue of environmental impact. What about the noise level on a regular on-going basis? What about the possibility of an accident or crash involving the helicopter? What about the air pollution from helicopter engine emissions?

I ask that DCLU require COH to conduct an enviromental impact study to address these and other issues.

Sincerely,

Jane Johnson

Helicopter landing area at Children's Hospital and Medical Center undergoes alterations

By ANDRA MARJERISKA

Children's Hospital and Medical Center has cleared a group of trees and replaced four street lamps with lower ones near its temporary helicopter landing area.

The changes were made last month for safety reasons, according to Nancy Greenawalt, director of government affairs for the hospital.

"While the landing area was not unsafe without the alterations, the pilots with Airlift Northwest had made the request and our attorneys felt it was best to comply," Greenawalt said.

Air ambulances have been landing on a grassy area just outside the hospital's emergency room since August 1985.

Children's has been seeking approval from the city to build a helipad in that area since that time.

Greenawalt said besides safety, the "unanticipated length" of the permit process also factored into Children's decision to improve the temporary landing area. "We had expected to have been at this stage two years ago," said the hospital's governmental affairs director.

She stressed, however, that "in removing the three trees and replacing the street lamps with surface-level fixtures, we are not assuming the outcome of the land use process. We remain committed to following the process as outlined by the city."

Greenawalt said a letter regarding the improvements made to the temporary landing site was sent out to community residents. "I talked with some neighbors the night before the changes were made, and it didn't faze most of them," she said. "Of course, there were a couple of people that were upset, but they don't want to see any helicopters landing there at all."

Children's has been battling with the surrounding community on the helipad issue ever since it requested a conditional land use permit for the helipad.

The Laurelhurst Community Council, in particular, has voiced loud objections to the plan, noting that the medical need for a helipad has not yet been demonstrated. The state Legislature had considered a bill this session which would have required all hospitals to produce a certificate of need when seeking helipad permits. However, the bill, which was drafted in response to the controversy surrounding the Children's proposal, never even got a committee hearing.

Another sticking point with Laurelhurst residents is the issue of safety. The community council points to statistics in the American Medical News showing the high rate of aeromedical accidents.

Some of those concerns — expressed at a September public hearing — are in the process of being incorporated into a final Environmental Impact Statement (EIS).

The final EIS, which will also include recommendations from the city's Department of Construction and Land Use, is expected to be completed in the next two months.

The EIS will then go before the Hearing Examiner, who will review Children's application for the helipad. The Hearing Examiner will be specifically addressing whether the helipad is necessary to save lives; how it will impact the surrounding residential property; and if its use will be restricted to life-threatening emergencies.

The Hearing Examiner's recommendation will be forwarded to the Seattle City Council, which will decide on the helipad proposal. The council will have the option of holding a public hearing on the conditional-use permit application before voting.

Meanwhile, Dr. Bud Nicola, King County Health Director, has submitted his updated opinion concerning the necessity of Children's having a helipad. Nicola analyzed some 100 cases over the last year and one-half.

That report was submitted to DCLU's executive director two weeks ago. DCLU had requested the report.

In his two and one-half page report, Nicola stated that, in his opinion, a helipad for transporting critically ill patients directly to Children's campus was necessary.

In addition, he said no more than six patients a month would need to land at the hospital.

Currently, the majority of Children's patients who are transported by air ambulance land on Harborview Medical Center's helipad. They are then transported to Children's by ambulance.

While nearly 200 children have been airlifted to the hospital since its application for a helipad was made, 44 were actually flown right to Children's grounds — about two a month.

Some of Children's patients have also landed by helicopters at the University of Washington's Intramural Activities Field. The UW is currently seeking a permit to build a helipad on the field, which could be shared with Children's. It is also still in the process of getting permission to use a helipad already built on the top of the sixth floor of its new east wing.

Senior Activities

RAVENNA-BRYANT SENIOR CENTER
6559 Ravenna Ave. N.E.
527-0718

THURSDAY: 9 a.m tai chi; noon lunch by reservation; 12:30 p.m. speaker, home safety; 1-4 p.m. bowling at University Village Lanes.

FRIDAY: 9 a.m. tai chi; 10 a.m. bridge groups; 1 p.m. slide show on Carribean Cruise by Carol Blakely and 2 p.m. on Around the U.S.A. by Bob Boye; 2 p.m. bridge instruction, last day.

MONDAY: 8:30 a.m. tai chi; 10:00 a.m. writing your life story; 1 p.m. writing creatively; 1-4 p.m. bowling at University Village Lanes.

TUESDAY: 9:30 a.m. exercise; noon lunch by reservation; hands-on craft group; 1:30 p.m senior wellness clinic.

WEDNESDAY: 9 a.m. tai chi; 10 a.m. hula class; 2-4 p.m. Puget Consumers' Co-op cooking class.

Special Events:

The center's annual Mother's Day Brunch will be on May 8, by reservation only.

Members wanted: starting at 12:45 p.m., after lunch on May 14 the annual Board of Director Elections will be held at the center. Get acquainted with the nominees and with the center.

painting, set up for Rummage Sale.

FRIDAY: Hamilton House closed for Rummage Sale set-up.

SATURDAY: Rummage Sale, 9 a.m. to 3 p.m.

MONDAY: 9 a.m. dance exercise class; 9:30 a.m. watercolor, stitchery, coffee hour, Hamiltone Sirs; 10 a.m. dolls and toys, Just Friends;10:30 a.m. Hamiltones; 12:30 "Sights and Sounds of China, Part 2" by Hamilton House member, Maybeth Pressley.

TUESDAY: 9 a.m. bridge, women's pool;10 a.m. creative writing; 12:30 p.m. progressive bridge.

WEDNESDAY: 9:30 a.m. pinochle, weaving, coffee hour; 10 a.m. dancing with live music; 12:30 p.m. afternoon pinochle; 1 p.m. nurse practitioner (by appointment).

Election Results:

At the Tallmadge Hamilton House Board's Annual Meeting on April 20 the following officers were elected: Donald Spickard, President; Richard Garrity, First Vice President; Brewster Gere, Second Vice President; Betty Smith, Secretary; and Jacob Ehli, Treasurer.

Robert Birkner, Brian Dempsey, Jaacob Ehli, Particia Emory, Ludwig Lobe, Marty Richards and Donald Spickard have been elected to the Board of Diorectors for a three year term. James Mizell has been elected for a two year term.

DEPT. OF CONST. & LAND USE

Holly Miller, Director
Department of Construction and Land Use
408 Municipal Building
Seattle, Washington 98104

Dear Ms. Miller:

It is becoming quite apparent that the Childrens Orthopedic Hospital is making every effort to proceed with a Heliport on the C.O.H. grounds without due regard to the risk to the surrounding neighborhood.

First of all, the Laurelhurst Elementary School, containing approximately 250 children, is located less than two blocks from the proposed Heliport.

The physical risk to these children cannot be ignored. Also let us not overlook the noise and vibration factor that would surely disrupt school activities during landings and takeoffs. In addition to this, there is no approach route to this proposed landing site that would not jeopardize residences and business in the surrounding area.

The fact that many structural obstructions, as well as trees, in the area certainly do not enhance the safety of this proposed landing site.

One accident would certainly negate any value claimed by the use of this proposal.

For years the C.O.H. has been using the University of Washington East Campus Intramural Field for emergency helicopter landing sites. This area is totally unobstructed and approaches over water would certainly be safer with no risks to any ground personnel or structures. Transportation by ambulance from the Intramural Field to the hospital has been timed at two and a half minutes. This includes during rush hour traffic. Two and a half additional minutes to a forty-five minute or so helicopter trip is quite inconsequential particularly when we consider the overall risk. The jostling of the patient in the transfer is certainly no greater than the jostling suffered during the helicopter ride.

There can be no apparent advantage to transferring a patient from the Harborview Trauma Center to C.O.H. by helicopter--in these cases the time element is not a factor.

We must also consider a proposed heliport for the University of Washington Hospital. A centrally located heliport on the University of Washington Intramural Field would serve both institutions very well.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If these proposals for individual heliports are not controlled, it is not inconceivable that many hospitals in this area (Seattle) will claim the necessity of such a convenience and the precedent will have been established.

Finally, it has come to our attention that the C.O.H. has filed Application #8602396 to build a four story medical office. Should not this application be included in the same Environmental Impact Statement as the one for the Heliport?

Let us please consider objectively the overall risk to the many as opposed to any claimed advantages to a few.

Thank you.

Sincerely,

Harold Kurt

Re: Your letter on Children's Hospital Helistop Application

Mr. and Mrs. Harold Kurtz
5043 Sand Point Place NE
Seattle, WA 98105

Dear Mr. and Mrs. Kurtz:

Thank you for your very thoughtful letter outlining your concerns about this proposed helistop. You pointed out a number of questions we have asked the hospital to research and present in the Environmental Impact Statement.

Safety is certainly a potentially significant impact to the area surrounding Children's Hospital. The Draft Eis (DEIS) reviews and analyzes potential safety impacts. During the present comment period on the DEIS we are receiving many comments and questions regarding safety. These comments will be responded to in the Final EIS.

Noise and vibration are also identified as environmental impacts and are discussed in detail in the DEIS. In addition to safety and noise impacts, we have asked for a thorough review of the siting of the helistop to insure that a proposed site has as little disruptive effect as possible to adjacent residents and land uses. In particular, the DEIS reviews alternative sites at the UW Intramural field and at the University Hospital.

The cumulative effects of siting helistops at hospitals, as you note, is also an area of concern which we are addressing in the EIS.

The medical office building proposed by Children's is subject to environmental review. A decision has not yet been reached regarding the environmental impacts of this project. Its planned construction is identified in the helistop EIS. The hospital does not feel that its location would change their preferred helistop site.

Finally, as you suggest, it is our responsibility to consider objectively the benefits of the proposed action and weigh them against the identified adverse impacts which cannot be

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

reasonably mitigated, and to recommend to the City Council an action based upon that analysis. That is our job, and we do take it seriously.

Thank you for taking the time to write to me about this proposal. Please call Julia Gibb at 625-4509 if you have questions about the status of the application.

Sincerely,

Holly Miller

Seattle City Council
Mr. Sam Smith, President
600 Fourth Avenue, Seattle 98104

Dear Mr. Smith and City Council Members:

Please allow me to add my voice to many others you must be hearing, in favor of allowing a permanent heliport at Childrens Hospital & Medical Center.

We all already owe you tremendous thanks for permitting helicopters to land at the Hospital during the past year. The privilege was not used more often than absolutely negessary to save a life; and the infrequent landings were neither heard nor noticed by the neighborhood above the usual high-decibel background of daytime city sounds.

Our darling grand-daughter became crucially ill last summer, and was rushed by ferry (which waited!) and by car out to the Hospital in time for her life to be saved. If this emergency had occurred very late when the ferries are several hours apart, we would surely have hired a helicopter, and have been forever grateful that it could take her right out to the Hospital.

We are lucky: our little one is now fine. But we do think about other frantic parents (and grand-parents).

PLEASE DO ALLOW THE PERMANENT HELIPORT.

Very sincerely yours,

Prudence L. Trudgian

Re: Children's Orthopedic Hospital and Medical Center
Helistop/Draft Environmental Impact Statement
File No. 8405870

Dear Ms. Miller:

We represent the Laurelhurst Condominium Association. That association is composed of the owners of 55 condominiums located at 4545 Sand Point Way N.E., approximately 1/4 mile from Children's Orthopedic Hospital. Substantively, the Association opposes absolutely the construction of the helistop. However, we realize that your department seeks input on the adequacy of the Statement. Gauging from the level of public interest shown at the recent hearing at the Laurelhurst Elementary School last month, your department will have received a great many comments. We wish to add, briefly, our input.

We direct your attention to page 92 of the draft Environmental Impact Statement. The section is entitled, "Significant Impacts that Cannot be Mitigated." The risk of helicopter accidents is stated to be "a potentially significant impact that cannot be entirely mitigated." A helicopter flying in and out of the hospital will be traveling a corridor up Sandpoint Way and 45th N.E. (This is the primary approach, p. 45 of the draft Environmental Impact Statement). We are less sanguine about that conclusion than the proponents of the statement. This area is densely occupied and heavily traveled during certain hours of the day. The draft Environmental Impact Statement contains little information regarding EMS helicopter flights. Certainly, the NTSB does not compile such statistics (p. 61, draft Environmental Impact Statement). The comparisons with St. Anthony's Hospital in Denver is demonstrateably unsound. ("... actual figures on

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the total number of air ambulance flight hours have not been kept.") Also, is "accident" defined by the Denver study (p. 61, draft Environmental Impact Statement), in the same fashion as the National Transportation Safety Board? (p. 65, draft Environmental Impact Statement). Are the physical conditions of arrival and departure comparable between the two hospitals? Under what conditions did the accident occur? What was the distance of the accident from the hospital? At p. 64, the draft Environmental Impact Statement recites 57 EMS helicopter accidents occurring in 1985. The hearsay statements of Nina Merrill of ASHBEAMS and Tim Einhorn of NEMPSA should be supported by a writing from those parties regarding the distance of those accident occurrences from the hospital. The observations in the helicopter safety section at p. 68 of the draft Environmental Impact Statement is replete with hearsay quotations from Gene Hill, Frank Benedict and Thomas Poulton. What questions were put to these individuals? Are the responses complete and in context? There would be a total of sixty to eighty overflights per month. These overflights will pass directly over our client's eight story condominium at a height of 1,000 feet. Our client is not satisfied that complete and accurate information is set forth in the draft Environmental Impact Statement. Frankly, the risk of accident does not appear to be "a potentially significant impact," but rather, a significant impact that cannot be mitigated." (p. 92, draft Environmental Impact Statement).

In the next paragraph, at p. 92, the proponent states that noise and vibration is not a significant impact based on regulatory criteria; however, it is recognized that helicopter noise could and probably would be disruptive of some adjacent residents' lives. SMC 23.48.05(A)(1)(b) sets forth the following criterion that "the helistop is located as to minimize impacts upon surrounding residential property." Helicopter noise is an "impact" that a number of the residents of the Laurelhurst Condominium have brought to our attention. The residents have not previously been concerned about noise from helicopter landings at the Graves Field. However, the Condominium Association informs us that a serious noise problem exists when helicopters fly to Children's. We note that the proponents of the draft Environmental Impact Statement are willing to quote conclusory hearsay statements from "experts" on helicopter safety. While there is a significant effort devoted to the noise issues, no resident of the area has had a chance to give his or her impressions on the subject of noise. "Regulatory criteria" aside. There is a dearth of evidence regarding the nature of the disruption of the adjacent residents' lives. As stated at page 28 of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the draft Environmental Impact Statement, the purpose of Seattle's Major Institutions Policy, SMC 23.16.10, "is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods adjacent to institutions." It does not appear that the proponent of the draft Environmental Impact Statement put all that much thought into the statement set forth at page 92 of that document. We suggest that additional information be obtained and included in this final chapter and that an additional effort me made to verify the reliability of the comparison with St. Anthony's Hospital in Denver and the self-serving quotations which are sprinkled through the draft Environmental Impact Statement.

Very truly yours,

c/o Children's Orthopedic Hospital
P.O. Box C-5371
Seattle, WA 98105

Dear Sir:

On behalf of the children and parents of our City and Fire District, we would like to express our utmost support of the proposed conditional use of Children's Orthopedic Hospital and Medical Center as a heliport site for emergency transport of the critically injured or ill children and infants.

Often it is easy to focus our views and needs on a more local latitude and somehow forget the vast, rural areas with their infants and children--which do desperately need the critical care provided by such facilities at COHMC. More often than not, our children have greater potential for, or illness, requiring the type of treatment available only by COHMC where time is THE MOST CRITICAL FACTOR. With the availability of air ambulance service to our area, we can actually bring specialists to the scene and turn around and transport them back to their facility in less than 40 minutes. This is truly a matter of life or death in some situations. Therefore, we are asking that you rule favorably to allow this use of COHMC facilities.

For many, many parent's sake in Western Washington, this is a cry for the children...

Sincerely,

Robert Merritt

OCT 14 1986
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Dear Ms Miller:

Just a note in opposition to the proposed helistop at Children's Hospital and Medical Center. As a physician I feel this helistop is not needed. It will not handle the larger helicopters most likely needed in real emergencies. The transfer time from the already used site at Graves Field is minimal and little more than at Harborview.

The proposed helistop offers more danger to the surrounding community than it does advantages for improved emergency care. The enthusiasm of the arguments proposed by Children's exceeds the real medical needs by far.

The helistop offers little if any advantage in critical care over the current program and real disadvantages and danger to the community. Sincerely yours

R O Bullfield M.D.

DEAR Ms. MILLER

RE. CHILDREN'S HOSPITAL, DEIS.

I WOULD LIKE to QUESTION CHILDREN'S OBJECTIVE AS STATED IN THE EIS INTRODUCTION (PAGE 1 PAR. 2) " TO CREATE A LANDING PAD FOR HELICOPTERS TRANSPORTING CRITICALLY ILL OR INJURED CHILDREN " OR " THE SPECIFIC OBJECTIVE OF THIS PROPOSED ACTION IS to MINIMIZE BOTH THE PATIENT TRANSFER TIME AND THE NUMBER OF POTENTIALLY DESTABILIZING PATIENT TRANSFERS---." CHILDREN'S POSITION IN THIS EIS IS THAT THEY ARE TRANSPORTING PATIENTS IN CRITICAL CONDITION (PAGE 13 BOTTOM). THE COUNTY EMS GUIDLINES DEFINES THE CONDITIONS FOR HELICOPTER USE PAGE 12 #1 THE PATIENT "MUST BE AN EXTREMELY ILL PATIENT SUCH THAT THE ARRIVAL AT A HOSPITAL CAPABLE OF PROVIDING SPECIALIZED CARE WILL IMMEDIATELY SAVE THEIR LIFE OR REVERSE THEIR MEDICAL DETERIORATION."

IN REFERANCE to TABLE II, PAGES 14, 15, & 16, TITLED

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"KEY CHARACTERISTICS OF CRITICALLY ILL PATIENT TRANSFERED BY ALNW DIRECTLY TO CHILDREN'S AUG 1,1985, TO JUNE 10,1986", I LOOKED FOR REFERENCES TO TABLE II IN THE TEXT AND WHERE THE PATIENTS WERE TRANSPORTED FROM. I FOUND THE FOLLOWING REFERENCES:

PAGE 17 PAR 1. "TABLE II PRESENTS DATA ON THE MEDICAL CONDITION OF PATIENTS WHO WHERE TRANSPORTED DIRECTLY TO COH BY HELICOPTER".

PAGE 24 PAR. 4. "TABLE II DESCRIBES ALNW HELICOPTER TRANSPORTS TO COH THROUGH MID JUNE 1986" FROM THIS TABLE DATA, COH STATES THAT ~63% OF THE TRANSPORTS TO COH WERE NEWBORNS. THE DATA AGREED, 13 OF THE 21 LISTED TRANSPORTS WERE NEWBORNS.

PAI. PAR. 1 "BASED ON DATA FROM EXISTING FLIGHTS (TABLE II) IT IS ESTIMATED THAT 20% OF THE FLIGHTS WOULD OCCURE AT NIGHT TIME HRS. (10PM-7AM)." THE DATA DOES NOT AGREE.

TABLE II IS USED TO EXTRACT DATA FOR USE IN OTHER SECTIONS OF THE EIS, THEREFORE THIS TABLE MUST BE ACCURATE.

NOW'S THE TIME TO ASK TWO QUESTIONS: IS THE TABLE ACCURATE? AND. WERE ALL THE PATIENTS TRANSFERED TO THE NEAREST CAPABLE HOSPITAL? I'VE SUBSQUENTLY FOUND THE ANSWER TO BOTH QUESTIONS TO BE NO.

THE ALNW PILOTS LOG SHOWS 64 NOT 21 FLIGHTS

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3/5

FROM AUG 1, 1985, TO MAY 30, 1986. COH ACKNOWLEDGES ONLY 21 IN TABLE TWO. CALENDARS MARKED BY LOCAL RESIDENCES PRODUCE A NUMBER OF FLIGHTS IN THE THIRTY'S. COH'S NUMBERS ARE INCORRECT, ILL USE NUMBERS FROM ALNW PILOTS LOG (64).

OUT OF THE 64 FLIGHTS 17 OR 25% EITHER OVERFLEW TACOMA GENERAL - MARY BRIDGE (A CAPABLE FACILITY) OR THE FLIGHT DISTANCE WAS CLOSER TO TACOMA THAN COH. THERE MAY HAVE BEEN MORE FLIGHTS AS IT IS DIFFICULT TO DETERMINE FROM THE FLIGHT LOGS FLIGHTS THAT ORIGINATED VIA FIXED-WING AND THE LOG DATA DOES NOT INCLUDE JUNE 1986.

THE EIS STATES THAT "ALNW ALSO WILL TRANSPORT PATIENTS TO NON-CONSORTIUM HOSPITALS" (PAGE 22 TOP) WHICH ACCORDING TO THIS DATA ISNOT BEING DONE. COH CLAIMS ITS OBJECTIVE IS TO SAVE LIFES BY SAVING TRANSPORT TIME. DR NEFF, COH'S MEDICAL DIRECTOR, SAID "FOR CRITICAL PATIENTS EVERY MOMENT LOST INCREASES MORTALITY" (PAGE 17 PAR 3). THE EIS CONTAINS SEVERAL STATEMENTS LIKE "THIS TIME SAVINGS CAN REDUCE SUFFERING, DECREASE HOSPITAL STAY TIME AND IN THE MOST SEVERE CASES CAN MEAN THE DIFFERENCE BETWEEN LIFE AND DEATH (PAGE 46 PS)

IF 25% OF THE PATIENTS TRANSPORTED BY CHOPPER

Seattle, WA 98104

Dear Ms. Miller:

I am writing about the proposed helipad at Children's Hospital. I am a pediatrician and on the staff of Children's Hospital, so I am not unsympathetic to the need for efficient and effective transportation of sick children. However, I believe that the current plan proposed by the hospital is insufficient and does not contain adequate safeguards for either the patients or the community.

Regarding the patients, while it may seem intuitively obvious that faster transport will enhance survival, this is not necessarily the case and should be documented with good scientific studies. Judging by Dr. Nicola's recent excellent review of the literature on this issue, there are none. A possibly analagous example of the misuse of technology is the situation with monitoring of near-term fetuses, where the use of electronic monitors increases the rate of Cesarean sections but does not necessarily enhance rates of survival of infants. Ground transportation has advantages over air transportation. The only way to resolve situations in which such uncertainty exists is to perform proper comparisons of the available methods on appropriate subjects. Until such a study is performed, one might be able to draw some tenuous conclusions from a review of data from transports performed during last year's snow. During that time, what was the survival rate of patients in comparison to similar patients transported during better weather? I think that Children's Hospital should be required to provide such data to justify the use of an expensive technology, for which the neighbors, the patients, and society at large must pay. It should be analyzed by a third party.

Regarding the community, are they being protected from the strictly entrepreneurial interests of Airlift Northwest and Children's Hospital? What mechanism is there to prevent the abusive use of helicopter transport for all sorts of medically unnecessary purposes? I have heard stories of Airlift Northwest transporting corpses of children. Why should the community suffer this? Will the city allow the proverbial fox to guard the henhouse? What disinterested party is going to monitor the use of a heliport once it is constructed? Who has verified the hospital's data on noise and other environmental concerns? Rather than belabor the issue with a long litany of possible abuses of the community by entrepreneurs, I will simply urge that this issue be considered in light of the recent history of Children's Hospitals relations with its neighbors.

Sincerely,

Thomas A. Bell, M.D.

DEPT. OF CONSTRUCTION AND LAND USE

October 13, 1986

Holly Miller
Director, Dept. of Construction and Land Use
408 Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

I am concerned about the proposal to allow construction of a helipad in the Laurelhurst community on the Children's Hospital grounds. Making this decision involves balancing the resulting disruption and safety risk to the transported patients and to the neighborhood against the benefit that patients might receive from transport that would be more rapid than that by ground. The decision has greater than simply local implications, in that many other hospitals in the state are clearly interested in transporting patients to their institutions by helicopter as well. Others will look to this decision for guidance. It will become a precedent, whether justified of not.

My overriding concern about this situation is that the EIS is not the proper forum in which to consider this decision. Unfortunately, it appears that it is the only approval that Children's will be required to obtain. Assessment of the environmental impact cannot adequately address issues of medical need and medical decision-making, which are the real issues in this case. However, since medical justification of this undertaking is addressed in the text and in Dr. Nicola's appended letter, I wish to take issue with some of the conclusions reached, and request some revisions.

I have reviewed the literature cited in the EIS and Dr. Nicola's letter regarding medical justification, and disagree strongly with the conclusions reached. The EIS clearly states (p. 8) that Children's Hospital is not a trauma center, and that emergent trauma and burn cases in children go to Harborview. Therefore, the patients for whom Children's is requesting their helipad are critically ill children and neonates outside of the trauma or burn setting. The literature cited in the EIS and Nicola's letter, however, examines primarily helicopter transport of <u>trauma</u> victims. The only studies allowing conclusions to be drawn about whether helicopter transport of patients is better for them than ground transport deal soley with trauma cases. The only study cited outside of the trauma setting is mentioned in passing in Dr. Nicola's letter, but not commented upon. (p. 3: Resp Ther 15(2): 47-50, 1985). This is published in a journal that is not considered of

sufficient quality to be carried by the Health Sciences Library at the UW (approximately 3300 journals carried), or the respiratory therapy departments of the University of Washington, Harborview Hospital, or the VA Medical Center. It is viewed as more of a magazine than a scholarly journal.

The justification offered for construction of the helipad, therefore, is no justification at all. I ask that the DCLU alter their sections of the EIS on pages 19 and 20 to state clearly that, although some trauma cases appear to benefit from helicopter transport, there is no published evidence that such transport of non-traumatized children or neonates improves, or in fact is not detrimental, to their health. In addition, it would be appropriate to ask Dr. Nicola to re-examine the literature and direct his conclusions to the type of patient that Children's proposes to transfer, rather than to helicopter transport in general.

The latter possibility, that helicopter transport could be detrimental to some patients, is quite real. (Am Med News, p. 33; Sept 5, 1986). This evidence has appeared since Dr. Nicola's letter, and I cannot fault its omission, but I think it should now be included and addressed.

Lastly, table 2 in the EIS (pp. 14-16) is extremely misleading, and should be corrected or clarified. Attatchment "A" suggests that about 20% of patients transported in 1985 (once return flights have been eliminated) were admitted to floors and not to an ICU. However, all of the cases in table 2 are listed as either expiring in the ER, or admitted an ICU. This suggests that the cases have been selected for severity of illness, and are not in fact representative of all patients transported directly to Children's Hospital. If this is the case, the table should read that the cases are selected, and state what characteristics they have been selected for, or be altered to show consecutive unselected cases transported. If I am in error, then the table should state that these are in fact unselected, consecutive cases.

I wish to emphasize that I have the utmost respect for our emergency medical service and its supervisors, and I recognize the contribution that Children's makes to the care of sick children in our state. However, in order to make a major change in the manner in which patients are cared for, it should be necessary to show that patients will benefit from the change, and that it can be done without undue risk to others. Children's has refused to do the former, and has not done a good job of doing the latter. If it is not within the scope of the DCLU to address these specific deficiencies, then it should be taken up by a more appropriate section of city or state government prior to approval. If helicopter transport of non-traumatized children and neonates turns out not to be in

Julia Gibb
City of Seattle Department
of Construction and Land Use
Room 408
Municipal Building
Seattle, Wa

Dear Ms. Gibb:

For six years I was a Search and Rescue pilot for the U. S. Coast Cuard. I also served for three more years as the Senior Controller in the Coast Guard's Rescue Coordination Center located atop the Federal Office Building downtown. I was responsible for information processing, planning, and launching helicopters from Astoria, North Bend, and Port Angeles, and fixed-wing aircraft from Sacramento and Kodiak. I have worked extensively with MAST, the National Guard, Navy helicopters from Whidbey Island, and the Air Force in conjunction with the National SAR Plan. I am a graduate of the National Search and Rescue School in New York. I have personally been involved in hundreds of search and rescue operations and medical evacuations on both coasts, the Caribbean, Mexico, Alaska, and the South Pacific. I am currently a Captain for Alaska Airlines. I am the 737 Safety Representative for the Airline Pilots Association, and recently completed the Association's Accident Investigation School in San Diego, California.

It is my professional opinion that the Children's Hospital and Medical Center Helistop Proposal is neither necessary nor safe.

It takes 2½ minutes, in rush hour traffic, to drive from the University of Washington Intramural Field to the door of the Emergency Room at Children's Orthopedic Hospital. On Table 2 (p. 14) of the DEIS, from August, 1985 thru June, 1986, the average one-way flight time (from pick-up of the patient to arrival at COH) was one hour and four minutes (1+04). If two of the longer flights are excluded, the average flight time is 46 minutes. The total mission time, including flight time from Boeing Field to COH to pick up the Medical Team, flight time to arrive at the accident scene or the referring hospital, and return to COH, is at least twice the amount of time reported in the DEIS. This does not take into account the initial medical evaluation time, the decision making process, notification, flight planning, and the preflight checks of the aircraft. The time frame we are discussing is obviously not minutes and seconds. In nine years of hands-on operations, I never, ever saw the outcome of a single mission determined by 2½ minutes.

The DEIS would have you believe that the jostling sustained in the transfer from helicopter to ambulance might be dangerous to a critically ill child. Turbulance is primarily caused by low

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

level winds. Even light winds, when associated with buildings, hills, or trees can cause moderate to severe turbulance from the surface up to 2000 or 3000 feet in altitude. This, of course, is exactly the operating regime of most helicopters.

I can personally guarantee that the smoothest part of a child's ride will be when it is carefully lifted by the paramedics from the helicopter and placed in the ambulance. To assert that a professional medical team will jostle a small child more than a 46 minute helicopter ride is nonsense.

While the necessity of the proposal seems contrived at best, the safety issues are very real.

The current helicopter landing sight at the University of Washington Intramural Field allows a wide-open, normal, controlled approach profile from all quadrants with no obstructions. The proposed helicopter landing sight at COH is surrounded by hills, tall trees, power lines, tall buildings, an elementary school and a densely populated residential area.

The approach profile proposed by Airlift Northwest calls for a 1500 ft/min rate of descent. A normal approach by a commercial jet aircraft is based on a 500-700 ft/min rate of descent. Remember how that feels on your ears and sinuses and thentry to appreciate the damage possible to a small child with a descent rate three times as great.

The proposed flight path also calls for excessive maneuvering in downwind landing situations. This is always a critical maneuver, but is made more so by the lack of escape routes from the proposed landing sight. A helicopter simply does not enter or sustain hover as well downwind, and a downwind departure with full fuel tanks, medical personnel, and at maximum gross weight, could be particularly demanding.

Emergency Medical Operations are conducted under the rules of Part 135 of the Federal Aviation Regulations. When operating under the Visual Flight Rules of this Part, helicopters must maintain 300 ft altitude over congested areas except in the landing environment. They must not operate under Visual Flight Rules when the in-flight visibility, as observed by the pilot, is less that one-half mile. Contrary to the testimony of the Airlift Northwest pilot in the DEIS, there is no FAA minimum ceiling specified for helicopters.

There are no FAA weather minimums, other than visibility and icing that are restrictions on Part 135 helicopter operations and inflight visibility is determined by the pilot and if the pilot, based on his observation of the weather, believes there might not be icing conditions, regardless of forecasts, then this restriction does not apply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FAR Part 135.213(a) states that for operation under VFR, the pilot in command may, if a National Weather Service weather report is not available,"use weather information based on the pilots own observations...."

Under Part 135, and EMS pilot is limited to eight hours flight time in a twenty-four hour period, except in the event of bad weather when there is no restriction.

It is reasonable to assume that a helicopter pilot will do everything in his power to transport a critically ill child, even into a marginal landing environment.

Given a single piloted aircraft, such as the Agusta, in marginal weather conditions, the pilot must not only maintain aircraft speed, altitude, and attitude, monitor critical engine operating parameters, and maintain navigational guidance by reference to his instruments, but he must also maintain visual reference with the surface, all the while talking on the radios and maneuvering his aircraft to avoid obstacles such as hills, trees, power lines, tall buildings, and elementary schools.

There is no question that helicopters play a vital role in the transport of critically ill patients.

I would only ask that you consider the following. First, the need for a helicopter landing site 2½ minutes closer to Children's Orthopedic Hospital is negligible.
Second, the shift from a wide open, inherently safe landing site, to a congested, difficult, and demanding landing site invites incident ranging from the merely injurious, to the catastrophic.

If for some profit motive or marketing consideration this proposal is considered favorably and is brought to fruition, and if one small child dies or is seriously injured as a result of this senseless plan, this community and the city of Seattle should be morally outraged.

Sincerely,

Bart E. Baxter

Reference: Application CU84-022 Helipad at Children's Orthopedic Hospital and Medical Center

Dear People:

Please register my opposition to the proposed helipad. Having heard the approach and departure of the helicopter arrival March 4 or 5 evening, and then discussing the matter including the question of medical need with someone living near the edge of COHMC's property, I'm convinced approval of regular use of the helipad would be a mistake for the community and for Seattle.

Very truly yours,

Thomas E. Savage

LAURELHURST COMMUNITY CLUB

NOVEMBER | DECEMBER 1986

ALL-COMMUNITY MEETING

BOARD ELECTION TIME AGAIN!

An all-community general meeting will be held to elect members of the Board of Trustees of Laurelhurst Community Club and to discuss ongoing community issues.

TIME: December 11, Thursday, at 7:30 p.m.
PLACE: Laurelhurst Elementary School Auditorium

Except for Kate Hemer and Charlie Saunders, the current Board plus the following people will comprise the slate of nominees: Jack Beck, Adam Bruckner, David Hennings, Lucy Krause, John Kehoe, Jane Johnson, Sara Jane Johnson, and Yori Milo. We will miss Kate and Charlie, but hope that they will continue to attend meetings and help with community issues.

The current issues the Board is dealing with include: Children's Hospital proposed helipad and professional office building, Washington Retirement Park development at Villa Academy, the Beach Club property, other shoreline property, and the Springbrook Professional Building.

Galle and Williams Help LCC

Seattle City Councilmembers Virginia Galle and Jeanette Williams responded quickly to help the Community Club get a review of problems inherent in the plans for the Washington Retirement Park project. Taking time from a busy schedule, Galle and Williams met with representatives of the Department of Construction and Land Use and the Community Club, and followed up by contacting the Mayor.

The Mayor has agreed to consideration of inconsistencies of the plan as approved by the Council with those filed by WRP. Areas of concern include elimination of the cluster concept for independent living units, the project road within the buffer, lack of an effective covenant limiting future development, multiple access roads, and the proposed location of the main road at Nicklas Place N.E.

Kate Hemer

EAA PROPOSES MORE FLIGHTS OVER CENTRAL SEATTLE!

The Federal Aviation Administration is proposing to reroute jet traffic to Sea-Tac airport. Aircraft that now descend over Puget Sound and Elliott Bay would be rerouted to fly over north Seattle on a path that begins at a point 17 miles north of Seattle. When the departure direction from Sea-Tac is south, all arriving jets would be directed to fly directly over Lake City, Ravenna-Bryant, the University District, Capitol Hill, the Central Area, First Hill and Beacon Hill. These aircraft would be allowed to fly as low as 3000 feet.

Since Sea-Tac recently recorded 1000 flights/day (a new record), one could see and hear about 500 flights a day (roughly,30 or more per hour) passing inbound over North and Central Seattle.

CURRENTLY, the approach pattern used depends on flying conditions. The Instrument Landing System is used only when visibility is poor, strong winds are present or it is dark. Visual approaches are used when the cloud ceiling exceeds 3000 ft. and there is 4 miles of visibility at Boeing Field and Sea-Tac. When making a visual approach, aircraft must stay above 8000 ft. until over Puget Sound. They then descend over the Sound, flying over Elliott Bay to the outer marker at Boeing Field. They then make their landing following the Instrument Landing System signal.

THE PROPOSED PLAN would probably result in easier work for air traffic controllers and easier, faster landings for pilots. But, noise now dissipated over water will be moved directly over homes and neighborhoods. Noise levels experienced the worst of days in affected areas with the current plan would endure year around under the proposed plan.

This information was sent to us by the Ravenna-Bryant Community Association. Laurelhurst Board members have received complaints from residents about the noise of aircraft activity in this area, but it would be helpful to have an assessment of whether many people share this concern, especially in view of the proposed increase in air traffic which will impact this area. To express your views, please call or send a note to: Anita Francis, 5003 45th N.E. Seattle 98105, 524-9340. Your comments will be forwarded to the noise abatement office at Sea-Tac and will also help LCC determine whether to take a position on this issue.

Charles Royer, Mayor

November 20, 1986

Revised letter

Marcia Graber
2294 Old Day Creek Road
Sedro Wooley, Washington 98284

Dear Ms. Graber:

Thank you for sending me your thoughts about the proposed helipad at Children's Hospital and Medical Center (CHMC).

The Department of Construction and Land Use (DCLU) is the City agency responsible for evaluating individual applications with the ultimate decision being made by the City Council. They have asked CHMC to prepare an Environmental Impact Statement addressing factors including noise, safety and cumulative impacts which could result from the helipad.

If you have further questions about the decision process on the helipad, please call Julia Gibb at 625-4509; she will be glad to help you.

I am confident the City's decision on the helipad will acknowledge both the medical needs of children and the concerns of residents in the neighborhood surrounding CHMC.

Sincerely,

Charles Royer

Hospitals' helicopter insurance is sky-high

Associated Press

SPOKANE — Spokane hospital officials say liability-insurance costs for helicopter ambulances are increasing because accidents nationwide are on the upswing.

Spokane's two helicopters have not been involved in accidents, but rates could jump 30 percent to 100 percent because of increased accident rates nationwide.

Nationally, helicopter ambulances have one of the highest accident rates in aviation, said Tom Einhorn, a co-founder of the National Emergency Medical Service Pilots' Association in Houston.

"When you compare it to commercial airlines, we're anywhere from 80 to 110 times worse," Einhorn said.

Those accidents, many involving fatalities, result in tremendous losses for insurance carriers and huge premium increases for helicopter operators.

Mike Ward, a vice president of Spokane's Sacred Heart Medical Center, said the cost of insurance for its helicopter may double in 1987.

Heartflite, Sacred Heart's helicopter, is leased from Eagle Helicopter and has been operating since June 1985.

Coverage for Deaconess Medical Center's helicopter, Lifebird, will increase about 30 percent, said Thomas J. Miller, director of operations at Felts Field Aviation Inc., which provides the helicopter and pilots to Deaconess. Lifebird has been operating for more than five years.

Ward and Miller declined to say exactly how much their insurance costs. But insurance officials and helicopter operators said the price can range from about $70,000 to $150,000 a year.

Deaconess officials said the higher insurance costs will not immediately increase their charges to patients for helicopter transport.

Ward said he was not sure how an increase might affect Sacred Heart's patient bills.

Einhorn said his pilots' association has recorded an accident rate of about 20 accidents per 100,000 hours of flying, about 100 times higher than the commercial airline industry accident rate.

Insurance officials said a single helicopter crash can cost millions.

LAURELHURST LETTER

LAURELHURST COMMUNITY CLUB FEBRUARY, 1987

Review Pending for Washington Retirement Parks Project

The City's recent determination that the plans for the Washington Retirement Parks Project comply with the Council's conditioned approval has been appealed. The Community Club Board and the Villa Neighbors organization filed separate appeals seeking a review by the City's Hearing Examiner.

Issues in the appeal include: (1) failure to adequately guarantee permanent retention of the required open space; (2) landscaping of the buffers; (3) adequate buffers; (4) limited access; (5) location of the access; (6) the lack of specificity necessary to assure conformance with the City Council's approval; and (7) the failure to include features important to the City in its approval of the preliminary plans, such as clustering the residential units and orienting all buildings facing the lake rather than the existing neighborhood.

The Hearing Examiner will hold a hearing on the appeals. The Examiner may: approve the City department's determination that the plans substantially comply with the Council approval of preliminary plans; may direct specific changes to the final plans; or may find that the plans do not substantially comply with the Council authorization, in which case the application would be remanded for processing as a new application.

A considerable effort was made in November to get the City to ask for revisions to the plans to address community concerns. Councilmember Virginia Galle spoke with Mayor Royer who (she understood) agreed to arrange a forum for possibly resolving some of the issues. However, this did not occur. The Department of Construction and Land Use (DCLU) issued its decision setting an appeal deadline of Christmas Day. To correct a clerical error, DCLU is reissuing the notice of its decision providing additional time for filing appeals. The first notice did not provide the correct time period for filing.

We have now determined that DCLU issued a preliminary approval well over a year ago, long before the community knew of the existence of revised plans. Unfortunately, there was no opportunity in the DCLU approval process for comment to the City prior to this commitment.

Kate Hemer

LCC Board

At an all-community meeting on December 11, 21 trustees were elected to the Board: Bettie Amick, Liz Anderson, Dick Barnum, Jack Beck, Adam Bruckner, Mike Bush, Margaret Campbell, Anita Francis, David Hennings, Al Hovland, Jane Johnson, Sara Jane Johnson, John Kehoe, Bob Klug, Lucy Krause, Ed Lapic, Rich Morse, Jane Piehl, Myron Sayles, Maryann Spangler, and Annie Warsinske. In addition, Kate Hemer and Jerry Schneider, experts on land use issues, continue to provide vital support to the Board.

At the JANUARY Board meeting, officers were elected: Bob Klug, President; Liz Anderson, Vice President; Ed Lapic, Treasurer, and Al Hovland, Secretary.

At the NOVEMBER Board meeting: Board members talked with Jim Street, Chair of the Seattle City Council Land Use Committee. We discussed problems with the multi-family and major institutions codes, primarily.

Property at 4000A 55th Ave NE: Dixie Porter reported a great ending for the issue involving that property. The neighbors bought the lot at a foreclosure auction. A covenant will be placed on the property, turning it into a non-buildable lot. Community support really helped. The lot is prone to landslide.

NW Juvenile Court Conference Committee: Annie Warsinske serves on this committee, which has the power of the Court to reach disposition of cases to help keep youthful offenders out of the court system.

The DECEMBER Board meeting was the annual Christmas dinner for the Board at Bettie Amick's. It was a very pleasant evening, and many thanks go to Bettie for hosting it.

The JANUARY Board meeting centered on a review of the many issues facing Laurelhurst, including the Villa Retirement Center, Helipad and Medical Office Building at Children's Hospital, Billboard, vandalism at the Community Center, downzone of some multi-family and single family areas, the Neighborhood Planning Study, 45th Street Condominium, and Sea-Tac Overflights. Proposed change in the Board's committees was discussed at length and tabled until the next meeting.

Al Hovland and Anita Francis

Children's Hospital Heliport Update

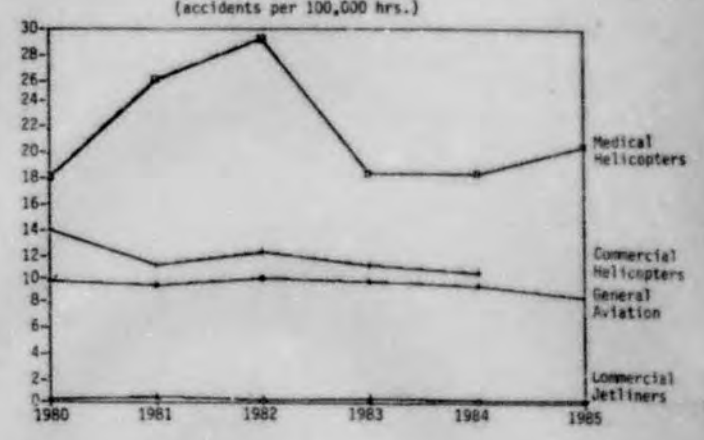
Children's Hospital has offered a new proposal to limit the number of helicopter flights using the helipad they want to build on the hospital grounds. Although the Hospital's draft environmental impact statement says that all helicopters transporting children to the hospital would land on the hospital helipad, the hospital now says the helicopters would land at the hospital only when transporting children whose lives are in immediate danger. Nancy Greenawalt, hospital spokesperson, has said that out of 200 children airlifted to the hospital since the flights began, only 44, or about 2 a month, actually were flown directly to the hospital. The others landed at Harborview Medical Center and were then brought to Children's by ground ambulance.

A final impact statement, due for publication very soon will incorporate the new standard as the hospital's preferred alternative, Greenawalt said.

Area residents who have been concerned about the hospital heliport location still need to worry about the new proposal for a number of reasons:

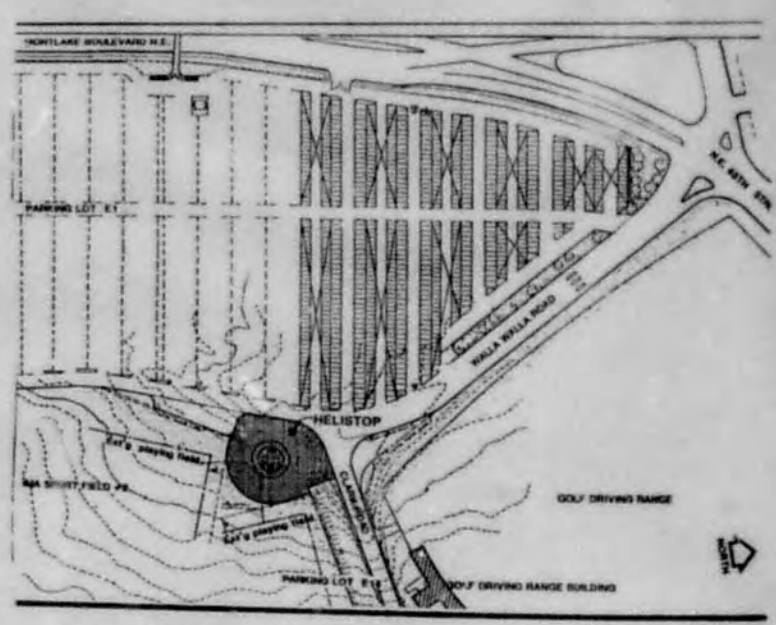
1. Once a camel gets his nose in a tent, the rest of the camel usually ends up there too. Similarly, once a few flights to Children's heliport are allowed, it is difficult to envision any successful ways of limiting the number of flights. The City has not been able to stop unauthorized landings which have been taking place, so how can they stop overuse of the facility if permission is given to use if for "only a few flights"?

2. A recent study by the Aviation Safety Institute of Columbus, Ohio, shows that the current safety record of aeromedical helicopters is the worst in modern aviation history. 1986 was the worst year yet, with 31 accidents resulting in 21 deaths. A comparison of the accident rates for various aircraft is shown below.



Neighbors are concerned that the safety risk to the community does not justify flying in helicopters to the cramped Children's Hospital site, especially since an alternative is nearby. The University of Washington soccer field is only 3 minutes away, has been approved by the University as a paved helipad, and is a wide open site, far away from hills or residences. Why choose an unsafe site when a safe one is so near ?

3. In spite of the fact that government officials health planners, members of this community, and others have called for a regional plan for the coordination of air services for over two years, no planning study has even been started. Children's with their influence and political savvy, could have taken a lead in promoting such a plan. Without a plan, serious problems will result, as pointed out by Dr.Bud Nicola, King County Health Director. These problems could include a proliferation of unneeded air ambulance services, inappropriate uses of the services to make them cost-effective, and a failure to address safety concerns.



4. There is no enforcement, supervision, standards, or planning associated with air ambulance services, as no agency is responsible for monitoring them. Unfortunately, however, there are many changes which will occur at all landing sites and in the helicopter operations over time. Most of these will have a direct impact on the safety of helicopter operations. Yet, there is minimal or no supervision, no agency looking at these factors as a whole. These include changes in flight paths, changes in the hospital size and proximity to the helipad, and helicopter personnel such as pilots and mechanics.

Let's keep the camel out of the cent, the helicopter out of residential neighborhoods, and the helipad at the safest site than can be found say Citizens Concerned About Helicopter Transport.

Uproar Over Jets

Complaints are soaring because of the increasing noise from jet airliners. Laurelhurst is heavily impacted from noise of (1) aircraft departing to the north and turning east, as well as (2) aircraft arriving from the north on the instrument arrival route at an altitude of only 2500-3000 feet (above mean sea level).

An informal survey conducted in the most recent Laurelhurst Letter indicated that many Laurelhurst residents are upset by the aircraft noise. Forty-one people responded to the poll, and for every one who responded, there are probably several others who did not voice their annoyance. Unfortunately, without action on the part of local residents, it is likely that aircraft noise will continue to increase here.

More noise likely: Due to complaints by Eastside residents, the Federal Aviation Administration is considering a change in the East Turn as an experiment. This "scatter plan" would spread out East Turn departures so that they would scatter more widely (mostly northerly) over Lake Washington than they currently do. This means that the neighborhoods north of the Evergreen Point Bridge will experience more overflights.The experiment is tentatively scheduled to run four months--April to July.

The Port plans to monitor community acceptance of this East Turn scatter plan by the number of phone calls received by the Port's Noise Hotline. As shown on the map on the back of this page, more complaints are already made by residents of Laurelhurst and nearby areas (zone 12) than by Eastside residents (zone 13). Unless Port Hotline receives even more calls from us, the Port will assume that the experiment is a success and make the change permanent.

This scatter plan has significant problems. First, it does not take into accour the fact that Laurelhurst and other nearby communities are already heavily impacted by aircraft arriving from the north on the instrument arrival route, at a low altitude, as well as seaplane traffic and other small planes. No ground level noise monitoring has been done to determine which North Seattle areas are most heavily impacted already and what effect this East Turn scatter plan would have.

Second, the scatter plan is an abandonment of the noise abatement procedures now in effect. These noise abatement procedures should not be lifted without careful study of the effects.

Third, the monitoring of the impact of the scatter plan, by use of the Noise Hotline, is most likely to be biased. Some have noted that the Eastside residents who are complaining about East Turn noise are few in number but very vocal and well-organized.

Actions can be taken that will help. The Central Seattle Community Federation has adopted a resolution stating its concern about the current aircraft noise level and opposing any changes that would increase jet flights over residential areas. The resolution lists positive steps: 1) Route aircraft over water and industrial areas so as to impact and put at risk the fewest people, (2) maintain the highest possible elevation for aircraft using the gradient slope descent for landing at Sea-Tac, (3) encourage airlines to use the quietest aircraft, (4) use curfews, (5) resist expansion of the airport if it means an increased number of flights over populated areas, and (6) conduct aircraft noise monitoring studies.

Helpful actions at this time include writing to Jim Wright, President of the Port Commission, Sea-Tac International Airport, P.O.Box 68727, Seattle 98168. Frequent calls to the Port's Noise Hotline are also important: 433-5393. They won't know planes bother us unless we tell them!

BREAK-IN NEAR LAURELHURST ELEMENTARY SCHOOL

At about 11 a.m. on Tuesday, January 20, a Laurelhurst resident returned to her home near the Elementary School and saw a man walking down the street with two of her suitcases. She entered her house and, seeing that it had been ransacked and burglarized, called the police. She was able to describe the vehicle the man had gotten into. Later, the police apprehended him, but there were no stolen goods in the car, so they had to let him go. The car has been seen since then, with two men in it, driving slowly along Laurelhurst streets.

Unclassifieds

FOR SALE:

3 stereo speakers (AR-25) $100; Porsche bra cover (new) $35; Portable SCM typewriter $35; Bike panier rack with panniers $40; 1 set panniers (new) $40. Call eves or week-ends 527-1350.

Great looking, coordinated boy's ski outfit. Red & navy. Roffe stretch pants, size 16, CB Sports hooded jacket, man's small, and matching sweater size 16. Call J. Sayles 527-4878.

Cowichan Lake Indian sweater. Hand knit in 1935. Call 525-6363.

9-drawer, 78 in. long, pecan buffet. Handsome piece with brass pulls. $180. 522-8903.

WANTED:

Need R.N. to give IV push injections in patient's home or in your home if you are in Laurelhurst. Call 527-8824.

Desperately seeking nice condo unit at Crystal Mt. for President's Weekend. Responsible family, non-smokers, will pay top $ now. 525-6662.

Want garage to rent. I am willing to assist in the cleanup and repair of your garage to make it usable as a rental space for my boat & trailer. It would still be possible for you to use the garage for misc. garden tools, etc. Jack McGary, 522-3727.

Need infant crib, Gerry Baby Backpack Carrier; "twin" stroller. 526-1320.

Need childcare for 2 yr.old & 3 mos. old in our Laurelhurst home starting in April. MON & TUES ONLY. Call 526-1320.

Babysitter wanted on as-needed basis for infant in my Wallingford home. 632-7650.

SERVICES:

Day Care/babysitting by loving mother. My home. reasonable rates, flexible hours. I live across from grade school. 527-9662.

Classified ads, except repeatedly placed ads for commercial services, are free to Laurelhurst residents. The deadline for the March newsletter is February 16. Mail to Anita Francis, 5003 45th NE Seattle 98105

45th STREET CONDOMINIUM APARTMENT BUILDING

Since our last update, several things have happened behind the scenes. In late summer, 1986, two of the investors in Laurelhurst Associates, the partnership that now owns the two lots, had another architect, developer, and potential investor, Roger Newell take a look at the project. Bob Klug and I met with him and reviewed some initial ideas and sketches he had done on a redesign of the project. Although the total number of units had been reduced to 12 from the original 15, and the exterior was more esthetically pleasing than the original design, the height, bulk, and scale of the original design remained basically intact. This was unacceptable to the NE 45th Street Concerned Neighbors, but we thought it was a step in the right direction and asked to continue the discussions.

Shortly thereafter, Bob Klug and Attorney Jim Leach made a presentation to one of the partners for the Laurelhurst Associates to sell the two lots with substantial tax benefits and to minimize their out-of-pocket losses. The lots, if they were willing to sell, would be bought by a group of people within the community, or by a fund-raising effort of the recently established Laurelhurst Park and Open Space Foundation. The investors decided, however, not to sell and to proceed with the original plan of the 3 story, 15-unit structure.

In August 1986, our attorney, Peter Eglick, filed an appeal of the permit to the Land Use Committee of the City Council. Their attorney requested and was granted a one month delay in filing his comments on our appeal; the deadline was September 5, 1986. Through mid-January 1987, their attorney had still not filed their comments and response regarding our appeal to the Land Use Committee.

As soon as the hearing date is set, we will notify you and will ask that you attend the public hearing to let the City Council know that the community does not want this proposed project.

Additionally, we are still in need of money so that our attorney and architect can make a full and complete presentation of the facts in this case to the City Council. It is crucial that we get the Council to deny the building permits for the proposed project in favor of a structure or structures more like the surrounding development (single family and two-story townhouse condos). We have appreciated your contributions and support in the past and ask that you send your contributions to the NE 45th Street Concerned Neighbors, 4027 NE 45th Street, Seattle 98105. That you for your help and continued support. Myron Sayles

Increase in helicopter crashes raises concerns

By LAWRENCE KILMAN

NEW YORK (AP) — When a helicopter ambulance plowed into an Oregon wheat field the same day one crashed in Tennessee, it brought instant national attention to a problem that has concerned Don Wright and Tom Einhorn for more than two years.

"It is an industry in distress. We are experiencing the worst accident rate in modern aviation history right now," said Einhorn, who with Wright founded the National EMS Pilots Association in 1984.

Helicopters as ambulances are among the newest, fastest-growing medical care services. Four such services existed in 1978; today almost 150 are in business.

In emergencies, helicopters are faster than ambulances, especially in rural areas or traffic-jammed cities. They routinely transfer patients to hospitals where specialized treatment is available. About 75,000 patients will be flown this year, up from 62,400 last year, said Howard Collett, editor and publisher of Hospital Aviation magazine. Industry estimates say about 20 percent of patients served by helicopters would have died without quick attention.

But at the same time, accidents have been mounting.

A pilot, a nurse and a paramedic were killed in the Oregon crash near Pendleton Dec. 3; a patient, a pilot and two nurses died in Tennessee hours later. The two accidents were the 30th and 31st medical helicopter accidents reported in 1986 to the National EMS Pilots Association, which offers the most complete such statistics. Twenty-one people were killed in accidents in 1986.

In 1985, 13 people died in 14 medical helicopter accidents.

Based on hours of flying time, medical helicopters are twice as likely to crash as other types of helicopters, and 2.5 times as likely to crash as small planes and other noncommercial aircraft, according to the pilots' association.

Helicopter rescues are more dangerous than other types of flights because pilots may have to land on highway median strips or in fields, facing ground hazards unknown at conventional landing pads. And such pilots accept risky missions more readily, knowing patients' lives are literally in the balance.

Most of the minor accidents in 1986 were caused by mechanical problems — power losses, doors falling off in flight, fuel linkage problems. The more serious accidents occurred when the helicopters struck power lines or were flown into the ground, accidents where pilot error and weather conditions often were contributing factors.

"I guess you can understand that flying to an accident in the middle of the night where you have two or three people pinned in a car can be a stressful situation," said Einhorn.

"We don't have the luxury other pilots have. We don't know where we're going days in advance. We have about five minutes' alert. You have to get into the air, know where you're going, in an area you've never been to before at 3 o'clock in the morning in marginal weather."

The pilots' association contends fatigue is the most serious problem and wants helicopter services to add more pilots. It also says better training and navigation equipment for hazardous weather flying are necessary.

"This industry is growing so rapidly, anyone can come in and put a medical helicopter in a hospital," Einhorn said. "You can put a Bell 47, like you see on 'M*A*S*H,' and put one pilot in there and call yourself an EMS (emergency medical service) operation."

"With any growth comes problems, and this is a problem we need to deal with," said Nina Merrill, executive director of the American Society of Hospital-Based Emergency Air Medical Services, an industry group of 145 members that started in 1980 with 25.

Most emergency medical service helicopters are rented to hospitals by private companies, and Merrill's group has been providing safety guidelines.

So has the National EMS Pilots Association, consisting of about 300 doctors, nurses, paramedics and mechanics as well as pilots. The two groups sometimes disagree.

Merrill said a new list of improved minimum safety standards has been drafted and will be submitted to members for approval.

Separate guidelines drafted by the pilots' group call for a minimum of four pilots to work different shifts for each aircraft. Einhorn said such staffing is needed to avoid fatigue problems.

"I'm not sure you can write one standard across the board, based on the geographical diversity of our members," Merrill said. "If you have one aircraft doing 90 flights a month, I don't think any two people can keep up with that. But if you're doing 30 flights, that's a different story."

Scott Tish, the lone pilot for Lifeguard, a Pendleton-based organization that lost three employees in an October crash, said he is not a member of the pilots' association, but he plans to join the group.

"For a long time I think the pilots were considered to be little more than truck drivers," Tish said. "I think this association takes into consideration the pilots' needs and concerns.

"They have set up what they consider to be a model system, and I think it's all great, but it costs a lot of money," Tish said, adding that Lifeguard plans to hire two more pilots. "But what they are aiming at is good."

David Long, director of Life Flight, based at Emanuel Hospital & Medical Center in Portland, said his pilots are members of the pilots' association.

"The group will have credibility as long as it doesn't become strictly a union group," Long said. "I support anything that increases safety. We plan to hire a fourth pilot by April and that will make us one of only six programs in the nation to have four pilots."

Einhorn said the industry should set new safety standards quickly, or the government is likely to step in with its own regulations — a move neither the pilots' group nor the industry group wants.

"If something isn't done in a hurry, nobody is going to have to worry about regulations because this industry will cease to exist," Einhorn said.

The accidents already have raised governmental concern.

The National Transportation Safety Board intends to study the safety of EMS aircraft next year, said Ted Lopatkiewicz, a spokesman for the agency.

The board does not generally study "public use" helicopters such as emergency response aircraft, but the new study is needed "because we just noticed, reading the papers, that there are more of these accidents," Lopatkiewicz said.

Mike Burke, chief pilot for a helicopter company involved in a fatal crash in Michigan in foggy weather, said pilots had requested new equipment for flying in bad weather before the crash occurred.

"From the hospital's point of view, they really didn't understand what we were talking about," he said. "But an accident makes it very dramatic. We now have the kind of aircraft we were talking about."

Helicopter accidents

Thirty-one emergency medical helicopters were involved in accidents in 1986, with the loss of 21 lives, as reported by various sources to the National EMS Pilots Association. Locations are where the helicopter was based, not necessarily where the accident occurred.

	Date	Place	How accident occurred	Casualties, if any
1.	Jan. 19	Baltimore	Crashed into trees	Two killed
2.	Jan. 26	Santa Ana, Calif.	Struck wires on takeoff	Minor injuries to four
3.	Jan. 27	Missoula, Mont.	Struck building on takeoff	No injuries
4.	April 5	Pittsburgh	Power loss on takeoff	No injuries

Re: Comments on DEIS Children's Hospital Heli-Stop

Dear Ms. Gibb:

I have reviewed all MAST Flights for the past ten years as a part of my regular duties with the MAST Coordinating Committee.

On only one occasion, in the winter of 1986, was it necessary to deliver an infant directly to the hospital's door, rather than landing at Graves' Field.

My data shows no other bad patient outcome resulting from landing at the Grave Field site.

Last winter I asked the Seattle Fire Department, Chief Jerry Burt and Shepard Ambulance, Mr. Ken Ruef, if they knew of any bad outcomes occuring during the transport of pediatric patients from a MAST helicopter at Graves' Field to Children's Hospital.

Neither activity knew of any of any bad result at that time.

Warm regards,

Jay M. Kranz, MD., Chairman
MAST Coordinating Committee

Subject: DEIS on Helistop Proposed by Children's Hospital

Dear Director Miller:

The DEIS is seriously inadequate.

The environmental disclosure should be accompanied by a master plan to enable the community and the City Council to evaluate the proposed helistop in light of the proponent's long range planned use of the site. The major institutions policy states that a master plan shall be required when development is planned which, when taken into account with other recent development within the boundaries, creates a significant cumulative impact on the surrounding area. Recent development within the COH boundaries includes an increase in the Hospital's short stay facilities, doubling of its oxygen storage capactiy, development of an employee center and a proposed mixed use development to cover more than 132,000 sq.ft. and have more than 600 occupants and an undisclosed number of visitors. A program change to staff a trauma center is also underway.

The environmental effects of the proposed helistop operation must be analyzed in conjunction with the application for a helistop by the University of Washington Hospital and the proposal for a master plan by Harborview Hospital. SEPA requires that proposals that are related to each other closely enough to be in effect, a single course of action shall be evaluated in the same environmental document. SEPA also provides that agencies may analyze similar actions in a single environmental document.

The helistops proposed by all three hospitals are specifically intended to serve Airlift Northwest. Only through a consolidated review of the need, projected use, and environmental consequences can alternatives be evaluated which supercede the corporate turf and financial interests of the individual hospitals. One such alternative which should be evaluated to determine if it would provide superior medical care while minimizing adverse effects on residential communities is the proposal to centralize emergency medical care requiring helicopter transport at Harborview, the region's trauma center.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The DEIS does not address the City's residential land use policies or other pertinent policies such as Goals of Seattle 2000. A more complete discussion of the proposal in relation to the major institution policies is needed including a review of implementation guideline seven which calls for decentralization of facilities.

The proposal is based upon an unsubstantiated assumption of need making the projections for use and environmental impact determinations problematic. An analysis of the need must be accomplished.

If credibility is to be given Dr. Nicola's determination of need, it must be documented. What questions were asked? Of whom? What control of bias was maintained? How do Nicola's findings compare with other researchers investigating the relative benefits of interhospital transport of patients by helicopter compared with ground transport?

In light of testimony in September's AMA News by Dr. Ronald Stewart, (President of the National Association of EMS Physicians), the Nicola recommendation is highly questionnable. Stewart states that data is sparce and that "we are not certain that air transport improves patients outcomes; [in fact] preliminary data suggests that it may be detrimental."

Because it is natural to assume there is a need for helicopters when health and safety issues are involved, I will remind you of some local history. In the early 1970s, the Seattle Police Department operated two helicopters. As I recall, the hard questions on need came only after an accident during a "joyride" to view skinny-dipping off the Arboreteum freeway ramp. An analysis of need (the Clayton Report) established that for the police work, the helicopter was one-half as effective and twice as costly as the patrol car. It's been more than a decade since we've "needed" police helicopters.

Not only is the need unsubstantiated but the projections for use and therefore the expected environmental impacts are purely speculative. Children's Hospital, which advertizes widely on TV and in both Time and Newsweek, has proposed no limitations on the use of the proposed helistop.

How does the proponent intend to restrict occurrences to life threatening emergencies? What are the triage guidelines which will be used in the operation of helicopters coming into the helistop? What is the protocol which will govern the dispatch of service? What review of the use is proposed?

Do the projections exclude transfers of patients who could be safely transferred by ground or to a closer qualified

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

hospital? Do the projections exclude trauma and burn patients who should be sent to Harborview?

What marketing activities will COH pursue which will affect the level of helistop activity.? Has this proposal been integrated into state, and regional and local EMS programs to assure that the projections of COH's share of the market are reliable?

What charges will be imposed on patients using the service? And what ramifications will the charges have on the patient or physician either in selecting the helicopter as a means of transportation or in determining that COH is the appropriate hospital?

The hospital should define the patients for whom the service is intended, detail the triage practices it will impose, develop use projections which are tied to population data and regional service areas and provide for a strong internal audit function before a meaningful analysis of the environemntal impact can be made.

Just as with the projections of use, the projections of impacts based on the proposed flight paths are speculative. No one but the pilot has control over landing and departure. The impacts projected based on the type of helicopter use is also conjecture as COH has no control over the type of helicopter landing at the site.

Because of the impacts which cannot be mitigated, the proposal should be revised to strictly define the need, establish enforceable means of restricting occurences and give weight to alternatives which limit the number of sites and locate the site(s) so as to minimize impacts on residential communities. Such a revision is needed if the proposal is to be described in terms of the objective rather than the proponent's preferred solution.

Sincerely,

Kate W. Hemer

Seattle, WA 98105

Dear Miss Greenwalt,

As we discussed, I'm enclosing for you a copy of the Draft materials on Air Ambulance Criteria. This is beginning to be drafted in proposed WAC form. Some of the areas that are still open to negotiation deal with the interaction between air transport units and the County medical program director in which a patient is to be picked up. This is of particular concern in areas outside of King County in the prehospital helicopter mode. In King County, the only area of concern that I have been able to aduce so far is that realative to use of helicopters to transfer patients either prehospital or interhospital to Children's Orthopedics. Since the medical director of the helicopter service must receive letters of designation from the County medical program director, (in this case Dr. Nicola) and there will be some sort of requirement by the County medical program director for run review, how Children's Orthopedic finally comes out in this local hassle will depend upon negotiations with Dr. Nicola.

While I am somewhat heartened by your recent conversation suggesting that the apparent public posture demonstrated by Children's Orthopedic medical director program directors a year or so ago is in a changing state, I am afraid the public controversy surrounding Children's Hospital and the use of helicopters will make necessary some form of run review involving adequate medical considerations besides those of the Children's Orthopedic positions and Dr. Mike Copas. Such a review may do nothing to quiet the continued furor of the Laurelhurst community, but certainly should go far to answer concerns that exist in the legitimate medical community.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As you can see, this is a working document which will ultimately be designed to have affect across the State, so such doesn't significantly hinder Children's Orthopedic hospital nor help the Laurelhurst community as in all matters that deal with these types of controversies, the Washington State Medical Association committees try to deal with issues related to quality of patient care and patient care safety. Local issues must perforce be acted out on the local stage beyond the sphere of the Washington State Medical Association. I hope this information is helpful to you. I would happy to discuss this further if I can be of any assistance to COH or the Laurelhurst community in resolving their problems.

Sincerely yours,

L.H. Pinkers, M.D. FACS

AIR AMBULANCE POLICIES
EMERGENCY MEDICAL SERVICES
STATE OF WASHINGTON

DRAFT

PURPOSE

The purpose of this document is to set forth air ambulance policies adopted by the State of Washington Department of Social and Health Services to promote and protect the health and safety of the people of this state. Field use of an air ambulance shall only occur when there is reasonable cause to believe that the patient's death or increased morbidity will result if any means other than air ambulance is utilized.

DEFINITIONS

A. Department

The State of Washington Department of Social and Health Services

B. Committee

The Emergency Medical Services Advisory Committee appointed by the Governor, pursuant to RCW 18.73.040.

C. Air Ambulance

Any privately or publicly owned air vehicle specifically designed, constructed or modified which is intended to be used for and is equipped with the intent to be used for the transportation of individuals who are sick, injured, or otherwise incapacitated or helpless.

D. Local Medical Program Director

A licensed physician authorized by the department to perform duties specified in RCW 18.71 and 18.73.

E. Basic Life Support

Pre-hospital and inter-hospital emergency care or medical direction which includes some or all of the techniques and procedures taught in a state approved emergency medical technician basic training course.

F. Advanced Life Support

An advanced level of pre-hospital and inter-hospital emergency care that includes basic life support functions plus some or all of the following techniques or procedures:

1. Cardiac monitoring
2. Cardiac defibrillation
3. Telemetered electrocardiography

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Administration of specific medications, drugs, and solutions
5. Use of adjunctive medical devices
6. Trauma care
7. Other techniques and procedures authorized by a physician

G. Air Ambulance Support Personnel

1. Air Ambulance Medical Director

A physician licensed and certified by the State of Washington pursuant to RCW 18.71. A physician knowledgeable of potential medical complications which may arise because of aeromedical evacuations, who is contracted by the air ambulance service and is responsible for overseeing and assuring that the appropriate aircraft, medical personnel and equipment are provided for patients transported by the air ambulance service. The local medical program director may designate a licensed physician to perform his/her duties. The air ambulance medical director functions through delegation of responsibility of the local Medical Program Director.

2. Registered Nurse

A person licensed and certified by the State of Washington to perform nursing functions pursuant to RCW 18.88.

3. Paramedic

An emergency medical technician who has completed an advanced life support training program approved by the department, who is certified by the department as qualified to render services enumerated in RCW 18.71.

4. Emergency Medical Technician

An individual who has completed a basic life support training program approved by the department, and who is certified by the department pursuant to RCW 18.73.

5. Pilot

An individual certified by the Federal Aeronautics Administration and licensed with the State of Washington Department of Transportation pursuant to RCW 47.68. This individual must meet certain criteria set forth by the department.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

H. Patient

An individual who, as the result of illness or injury, needs immediate medical attention, whose physical or mental condition is such that he is in imminent danger of loss of life or significant health impairment, or who may be otherwise incapacitated or helpless as a result of a physical or mental condition.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The department is authorized to issue licenses to services conforming to these regulatory standards.

A. Requirements for licensure

1. The department is authorized to issue licenses to services conforming to these regulatory standards.
2. No agency or person either as owner agent or otherwise shall furnish, operate, conduct, maintain, advertise, engage in or profess to engage in air ambulance services in this state unless the agency or person holds a currently valid license to do so.
3. An application for an original or renewal license shall be made to the department and shall contain as a minimum, but is not limited to, the following:
   a. Financial statement of ambulance service operating revenues and expenses for the previous fiscal year. Services operating for a profit shall also provide a balance sheet.
   b. Articles of incorporation and current business license. Federal Aviation 135 certification is required by all agencies.
   c. The name and address of the owner of the air ambulance service or proposed ambulance service.
   d. The name under which the applicant is doing business or proposes to do business.
   e. The training and experience of the applicant in the transporation and care of patients.
   f. A description and general location of each aircraft to be used as an air ambulance, including the make, model, year of manufacture, insignia, name or monogram, or other distinguishing characteristics. Upon approval by the committee for licensure, a detailed description including FAA number or other distinguishing characteristics shall be provided to the department.
   g. The geographical service area, location and description of the place or places from which the ambulance service is intended to operate.
   h. Name of the training officer who will assume responsibility for the ambulance personnel continuing education program.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

i. The air ambulance medical director for a geographic area who shall review treatment protocols, assess field performance and critique air ambulance runs with the local Medical Program Director. The air ambulance medical director shall be delegated in writing by the local Medical Program Director.

j. Agreement to abide by the review process designated by the department and/or the local Medical Program Director.

k. A proposed roster of medical personnel which includes level of certification or licensure.

l. Agreement to provide reports to the department for each trip made, on forms or a data format specified by the department.

m. They shall provide letters of support from local medical program directors and the local EMS council in areas of operation.

4. The department shall review each application for licensure based upon type of service to be offered, equipment, trained personnel, and whether the public convenience and necessity requires the proposed service. Before issuing a license to a new service, the department shall inspect the vehicle, the ambulance equipment and the personnel roster.

5. An ambulance license will be issued for a period of three years from the date of issue and will remain valid for the period unless revoked or suspended by the department. Annual inspections may be conducted to assure compliance. The vehicle license will be for a period of one year and updated annually.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. Denial, Suspension or Revocation of License

Grounds for denial, suspension or revocation of air ambulance license shall include, but are not limited to proof that the applicant and/or service:

1. Has been guilty of misrepresentation in obtaining the license.
2. Has engaged or attempted to engage in service that is not authorized by the license.
3. Has demonstrated incompetence or has otherwise been unable to provide adequate service.
4. Has violated or aided and abetted in the violation of any provisions contained in RCW chapters 18.73 and 18.71.
5. Has demonstrated unprofessional conduct in the course of providing services.
6. Has failed to meet the requirements as specified in code, policies and procedures.
7. Has failed to meet requirements in associated statute and rule.

C. Selection and Utilization of Pre-hospital Air Ambulance Services

The selection and utilization of an air ambulance service shall be determined by the medical program director, air ambulance medical director or the referring physician prior to response based upon the following:

1. The level of medical care the patient's illness or injury requires during the transport.
2. The urgency of transport (immediate or not immediate). In special circumstances, because of the urgency of transport, an action of providing less than minimal air ambulance transport care may occur.
3. The dispatch protocols adopted by the Medical Program Director in the county of origin.
4. Any agency (requesting agency and transporting service) that dispatches a service that does not meet the minimum requirements is required to prepare and submit a written justification to the local medical program director and the state Emergency Medical Services Training and Licensing Section within 14 days of the action.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

D. Air Ambulance Personnel Requirements

1. Air Ambulance Medical Director

a. Each air ambulance service must have an air ambulance medical director (or his/her delegate) who is a licensed physician knowledgeable of the air medical requirements of patients. It is the responsibility of the air ambulance service applicant to provide in writing to the department the name of the medical director and approved designee. If the medical director is replaced or removed, the department must be notified within thirty days after the action. The air ambulance service must contract for a replacement of the air ambulance medical director within thirty days after the action in order to retain licensure as an air ambulance service.

b. The medical director (and delegate) must have training in altitude physiology and be familiar with the emergency medical services communications system.

c. The medical director (or delegate) will:

(1) Be knowledgeable of the capabilities and limitations of the aircraft used by his service.

(2) Be knowledgeable of each of the medical attendants' capabilities relative to meeting the patient's medical needs.

(3) Be knowledgeable of potential medical complications which may arise because of aeromedical evacuation of patients being transported by the air ambulance.

(4) Match during interfacility transports appropriate aircraft, medical personnel and medical equipment necessary in the care of patients' medical needs or any anticipated inflight complications.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(5) Be knowledgeable in the application, use, maintenance, removal and hazards of any routine or special medical equipment used in the transport of patients by the air ambulance service.

(6) Assure current certification, training requirements, and education requirements are met by all medical attendants providing services for the air ambulance service.

(7) Ensure that all medical attendants are adequately trained to perform inflight duties prior to functioning in an inflight capacity.

(8) Ensure that each medical attendant meets the requirements necessary to provide given levels of medical care.

designated by

d. The medical director is responsible to coordinate with local medical program director(s).

2. Air Ambulance Medical Attendant

a. At least one medical attendant shall be provided who:

(1) Has current Washington State certification or licensure as a Paramedic, Registered Nurse, or Physician.

(2) Must have training and be familiar with altitude physiology, aircraft safety and Washington emergency medical systems communications, as determined by the department.

(3) Must be knowledgeable in the application, operation, care, and removal of all medical equipment used in the care of the patient. The medical attendant(s) must have a knowledge of potential inflight complications and their treatment which may arise from the use of such devices.

(4) When ordering or giving medications to a patient who is to be or is being transported, must be licensed or certified to give such medications.

(5) Will be required to know and follow all policies and procedures of the air ambulance service's medical director.

(6) Will be responsible for assuring that aircraft used is an approved basic medical care air ambulance and that all equipment required for a basic medical transport is on the aircraft and is in working order at the start of a patient transport.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(7) Must have available during transport a current copy of all written protocols authorized for use by the medical director. Patient care shall be governed by these authorized written protocols.

b. The air ambulance medical director shall designate attendants with specialized skills to meet the specific needs of the patient.

3. Pilot

In addition to being licensed with the State of Washington Department of Transportation pursuant to RCW 47.68, the pilot must:

a. Possess commercial rotorcraft certification and a minimum of 2,000 rotorcraft flight hours as pilot in command.

b. Be factory trained or equally prepared and have at least five (5) hours in the specific type of aircraft, before flying as pilot in command on patient missions.

c. Meet FAA requirements for medical certification, licensing and type of ratings for the flight(s).

d. Have training and be familiar with altitude physiology and EMS communications.

e. File a flight plan in accordance with FAA standards.

f. Obtain recurrency training annually on factory review of the aircraft and its systems and refresher course and competency training in emergency procedures. The operator shall maintain the aircraft according to FAA requirements.

g. The final decision to fly or not to fly will be made by the pilot.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

E. Records

1. A record shall be made for each trip on forms or data format specified by the department. Copies shall be transmitted in accordance with instructions provided by the department. Storage of forms and use of information contained therein will be in accordance with state law to assure patient confidentiality. Copies of the above trip records shall be maintained and stored by each ambulance service for a minimum of ten years. The method of storage shall lend itself to ready retrieval of specified records.
2. Personnel Records - A personnel file shall be maintained for ambulance personnel which shall include their qualifications and training.
3. Records required herein shall be available for inspection by representatives of the department.

F. Communications

1. All air ambulances shall be equipped with two-way communications equipment or telephone capable of ambulance to hospital communication.
2. All air ambulance aircraft will carry required FAA radio communication equipment.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CRITERIA FOR USE OF "PREHOSPITAL" AIR AMBULANCE

I. To provide rapid delivery of a critical patient(s)* to an appropriate definitive care facility when ground transport times would be protracted (more than 15 - 20 minutes).

For example: Long distances
Terrain problems
Traffic congestion
Long field extraction times
Hazardous road conditions or other road obstruction

* CRITICAL CASES - EXAMPLES

A. TRAUMA

1. Physiologic Criteria

   a. Trauma score 12 or less

   b. Glascow Coma Scale 10 or less

2. Mechanism of Injury Criteria

   a. Motor vehicle accident with:

      Extrication time more than 20 minutes
      Structural intrusion into victim's space by more than 1 foot
      Victim ejected from the vehicle
      Associated death in the same vehicle
      Pedestrian struck and thrown 15 feet or more
      Child under 12 years struck by vehicle

   b. Falls of 15 or more feet

   c. Evidence of rapid deceleration

3. Anatomic Criteria

   a. Penetrating injury anywhere from the head through the groin

   b. Amputation above the ankle or the wrist with potential reimplantation

   c. Critical burns or burns by inhalation injury, electrical burns, or other accompanying trauma

   d. High voltage electrical injuries (more than 1,000 volts)

   e. Spinal cord injuries

   f. Toxic inhalation injuries

   g. Three or more long bone fractures

   h. Injuries of two or more body systems

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Comorbid Factors

   a. Age - 12 or less/60 or older

   b. Underlying medical conditions, for example

5. Criticality Criteria

   a. Deteriorating conditions which may include Loss of consciousness, onset of shock and/or respiratory distress within 30 minutes of injury (define vs. remove)

B. Medical - requiring emergent (within 15 minutes) definitive care center intervention, for example

   Rupturing aortic aneurysm

   Severe hypo or hyperthermia

   Acute subarachnoid hemorrhage

C. Obstetric or neonatal - requiring emergent (within 15 minutes) definitive care center intervention

II. To provide rapid delivery of special critical care medical personnel to the scene otherwise staffed by non-critical care personnel, for example, paramedics/RNs/physicians assistants/EMTs - experts to assist in disaster or hazardous material incidents

III. To provide extrication from otherwise ground inaccessible sites and/or assist in search and rescue operations (mountains/islands)

IV. To provide integrated support in multiple patient incidents, e.g., most seriously injured patients - to deliver skilled personnel or needed supplies/equipment

CRITERIA FOR NON-UTILIZATION OF A HELICOPTER

I. Obviously fatal injury

II. Cardiac arrest of any etiology

III. If the ground ambulance is capable of arriving at the hospital with the patient before the air ambulance can arrive at the scene of the accident or illness.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CRITERIA FOR INTERHOSPITAL AIR AMBULANCE UTILIZATION

GENERAL

1. Requirement for critical care enroute, not otherwise available
2. Time critical injury or illness
3. Need to minimize time out of hospital
4. Alternate travel means unavailable or undesirable

SPECIAL CONDITIONS

1. Cardiac
   a. Acute coronary occlusion
   b. Cardiogenic shock
   c. Dysrhythmias, life threatening
   d. Pericardial tamponade
   e. CHF with decompensation
2. Respiratory
   a. Respiratory failure
   b. ARDS
   c. Ventilator dependency
   d. Severe asthma
   e. Epiglottitis
   f. Aspiration
3. Other Medical
   a. Renal failure (acute fluid overload or electrolyte imbalance) requiring dialysis
   b. CNS bleeds requiring airway and/or ventilator management
   c. Shock (hemorrhagic, DKA, septic, anaphylaxis)
   d. Coma requiring airway and/or ventilator management
   e. Overdose requiring airway and/or ventilator management or accompanied by shock, dysrhythmias
4. Trauma
   a. Multisystem trauma (Champion-Sacco Criteria)
   b. Trauma score $\leq$12
   c. Glasgow Coma Score $\leq$8
   d. Severe extremity injury (amputation, crush injury, unstable long bone fracture)
5. Other Surgical
   a. Acute vascular catastrophe
   b. Acute abdomen
6. OB
   a. Premature labor
   b. Pregnancy induced hypertension
   c. Poorly controlled D.M.
   d. Premature rupture of membranes
   e. Prolapsed cord
   f. Vaginal bleeding (including abruptio placenta, placenta previa)
   g. Fetal distress

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7. Neonatal
   a. Respiratory distress syndrome
   b. Prematurity
   c. Sepsis
   d. Congenital anomalies
   e. CHF
8. Pediatrics
   a. Respiratory distress
   b. Decreased level of consciousness
   c. Poisoning
   d. Severe infections (epiglottitis, meningitis, severe pneumonia)
   e. CHF

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

RE: Comments on Draft EIS Statement for Children's Hospital Helistop

Dear Ms Miller,

I have read the material in the environmental impact statement and additional material submitted to me by one Jerry B. Schneider who is a member of the Laurelhurts Citizens Group discussing this issue. The additional material that Mr. Schneider submits is a letter from Kenneth L. Mattox, M.D., professor of surgery, Baylor College of Medicine, and a photocopy of an article in the Journal of Emergency Medicine date May 30, 1986 by Dr. Mattox.

First of all, let me say that issue is quite complex, it is heavily clouded by emotion, both on the part of the Children's Orthopedic Hospital, Airlift Northwest, and the Laurelhurst citizens. In doing an extensive literature search on the use of Helicopters for prehospital transportation and interhospital transportation, the bibliography of which has been used in part by Dr. Nicola has shown clearly that there are not adequate criteria for the use of helicopters as a mode of transport. Most of the articles are self serving written to demonstrate how good that particular service is. The Washington State Medical Association, since it is a State wide organization which looks at the needs of the entire State cannot specifically deal with local issues. However, I believe that I can as a well educated observer, make comment on the Children's Orthopedic program. These comments stem from opposite areas. In the first place, helicopters are expensive to own and operate. This tends to ask for over utilization in order to offset costs. There is an inherent danger in their operation, particularly with pilots that have inadequate training and hours of flight time. On the opposite side of the coin, these instruments are exceedingly useful when properly employed both in prehospital and interhospital care. It is this very latter question which is so difficult to really assess. The comments made by Dr. Mattox and by Dr. Nicola summarize the problem quite well.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's Orthopedic as a tertiary care center needs to have the ability to deliver critically ill or injured children to its door. For a small number in any years time, there needs to be direct transportation without an intervening additional ambulance ride. Children's Orthopedic Hospital has been placed in a residential area long years ago and, shy of moving it out of that area completely, the primary mission of the hospital has to be recognized. That time of discussion has long since passed. I am quite skeptical about the commentary made by the Children's Orthopedic administration. They tend to overinflate their importance and try to bulldoze the community into submission by waving the flag of suffering children. Dr. Nicola, I think, has a better handle on this and utilization figures that he discussed seem reasonable to me. The Laurelhurst Community, on the other hand, is equally over emotional in its opposition to helicopter flights and their attempt to simplfy the transportation of critically ill children or adults to mere safety factors. I personally believe that there is a combination of points which are really the more satisfactory. One, I think Dr. Nicola's suggestion for limited access is quite good. On the other hand, I think the Children's Orthopedic Hospital needs to construct an adequately safe and permanent landing ground outside of its emergency entrance so that those limited permitted flights can arrive directly and safely without intervening ground transportation.

Lastly, I will send to you under separate cover what is only a working copy of WSMA committee dealing with helicopter standards. These are really not for publication yet, because they will be couched in terms of Washington Administrative Code in the relatively near future. Significant points however, are as follows:

1. Helicopter transportation or air transportation services should be integrated completely with the EMS program in the county of origin.

2. The dispatch should be under medical control and follows the same guide lines and criteria (and be integrated with) the dispatch guidelines existing in the County for land units.

3. The run reviews specifically should be reviewed by the County Medical Program Director or his designé . In a politically sensitive area like King County and the City of Seattle, I would advise that Dr. Nicola not only to do this himself, but make sure that a non involved [redacted] joins him in , the review of these run records for appropriateness and quality of care. It would be totally inappropriate if the the review was only by Children's Orthopedic Hospital and the medical director for Airlift Northwest.

4. There is great concern in the Washington State Medical Association EMS Standards Committee for the safety of flights on emergency runs. We are currently looking at a recommendation of three thousand to four thousand pilot hours of additional training for EMS helicopter pilots. It

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

is felt that this additional training may well reduce the hazards.

5. It will be a point of the administrative code that the decision to lift off, will be that of the pilot's alone, protecting that pilot from the overzealous orders of the air transport unit medical director.

It is my impression that allowing the Children's Orthopedic hospital to construct an adequate heliport for safety is necessary. It is also necessary in their conditional use permit to insist upon adequate run review, dispatch standards, preplanned interplay between the proposed helicopter unit and existing EMS systems to minimize "overutilization" and focus public attention on the appropriateness of air transport when it is properly used.

I would be happy to discuss any of these concepts with you or the draft material which I will submit to you as additional resource material.

Sincerely yours,

L.H. Pinkers, M.D. FACS

The Smith Tower, Suite 1812
506 Second Avenue
Seattle, Washington 98104

Dear Mr. Sachs:

I appreciated the opportunity to review portions of your environmental impact statement for the proposed helistop at the Children's Hospital and Medical Center of Seattle. In general, I think you have done a credible job of reviewing the objective data available. My present opinion remains that most hospital-based helicopter programs are in fact quite safely operated. That notwithstanding, the statistics cannot be ignored: the incidence of fatal helicopter accidents associated with medical operations is outrageously high. In the final analysis, the safety of an operation depends upon the presence of at least one strong figure within the program (medical director, program administrator, chief pilot, or chief flight nurse) who is firmly committed to having a safe operation. Placing safety as the first concern of the program is essential. Making that the first priority means that public relations must be compromised, medical care must be compromised, commitment to the patient must be compromised, and every team member's ego must be subordinated to that single top priority: safety.

In any medical care delivery operation, the traditional first priority is total commitment to the patient and a good outcome for the patient. In EMS helicopter operations, that cannot be the first goal. The first goal is the safety of the helicopter crew. As long as the team members are willing to put their own safety first, I believe it is possible to have transport programs with safety at least as good as that experienced by ground transport programs.

I hope these comments are of value to you.

Sincerely yours,

Thomas J. Poulton, M.D., F.A.A.P., F.C.C.P.
Associate Professor and Vice-Chairman, Department of Anesthesiology
Medical Director, Life Flight Helicopter Operations

Dear Katy,

I have received your letter of October 10 regarding Children's Hospital Helistop Draft Environmental Impact statement. The Hospital Council, as a matter of policy, does not get involved in individual institution's Certificate of Need applications or zoning applications with the City of Seattle. The current competitive environment in which hospitals operate, prohibits such involvement by the Hospital Council. The Council is involved in emergency medical services matters, particularly in terms of involvement with the King County Emergency Medical Services Division, but we would only review general matters of policy and procedure, not specific matters related to only one institution. We appreciate your invitation to submit comment, and hopefully this letter will clarify our position. Should you have any questions, please let me know.

Sincerely,

James L. Nell

TESTIMONY:
LIZ ANDERSON
4746 45th NE
SEATTLE .WA.
PRESENTED Sept. 23 1986
PUBLIC HEARING DEIS/COH
HELIPAD

It is very difficult to reduce testimony on this Draft to 10 minutes, so my remarks tonight will address only the safety aspects of this proposal. I'd like to submit, as part of the record of tonight's testimony, a segment of a CBS broadcast which was aired August 29, 1986. This tape makes some important points that are not represented in the DEIS.

OCT 17 1986
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

I would like to see included in the Draft, in the discussion of the EMS helicopter safety record, the statement that current statistics reveal that its record is the worst in aviation history. I would like to see a change in the concluding remarks on p. 92 which state that " the risk of helicopter accidents is a potentially significant impact that cannot be entirely mitigated". I request that the word "potentially" be removed from that sentence; the risk of helicopter accidents is a significant impact that cannot be mitigated. The use of the word potentially minimizes the conclusion.

refer to DEIS for map

This slide shows the primary and seconday approach-departure paths that ALN'W proposes to use to transport patients to COH. The primary path on the left of the map is plotted over supposedly the least populated areas of the community and will be used when the weather is good. Please define in the next Draft specifically what weather conditions will permit the use of this path. The secondary approach-departure path is plotted almost directly over the Villa Academy Elementary School, St Bridget's Church, what will be the Washington Retirement Park, and the Laurelhurst Elementary School. This flight path, according to the Draft, will be used during the winter months when the wind is out of the Northwest and is 17 knots or better. I do not find it particularly consoling that ALNW won't fly

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in winds of 40 knots. I would like to see included in the draft a detailed discussion of what the weather policies of the FAA and ALNW are and how they compare to the standards proposed by the National Emergency Medical Services Pilots Association (NEMPSA). Also included should be a statement of policy about whether ALNW plans to comply with these standards. This issue will be discussed later, with particular attention to marginal weather conditions and pilot discretion.

These flight paths will be approved based on information supplied on FAA form 7480. I would like to submit the following slide to be included in tonight's record. This is the most recent FAA form 7480 that has been submitted by COH ,describing these flight paths. As you can see, there is not much information supplied. The flight path is described in the section "magnetic direction of compass" and the information supplied by COH reads "In-West; Out-West". Under the section "Obstructions", only a fifty foot cypress tree and lamp post are listed. There is no mention of telephone wires or poles, existing buildings or proposed buildings. Please have included in the next Draft or Final EIS a copy of the updated FAA application form 7480.

According to the DEIS, the FAA has guidelines, but not standards, for helistop construction and for regulations that pertain to certifying pilots and personnel. Please include a comprehensive discussion of how exactly the helistop site is determined safe and by whom? In addition, standards for pilot training and experience, site construction, and site safety are being defined by NEMPSA. These standards represent a significant step forward to improving safety in this industry. The EIS needs to include these standards and specify the proposal's compliance with them. The omission of standards for training, staffing, and pilot experience is particularly striking

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

as EMS helicopter transport has been described as a more demanding field of aviation than any other, short of actual warfare. Please also include in these discussions who will be held accountable for the actions of pilots transporting patients to COH, being sure to include other helicopter services as well as ALNW.

Another problem arises over safety procedures, particularly those called into play under "marginal weather conditions". Please include a discussion of how weather conditions at COH will be determined by incoming pilots, flying for other helicopter services as well as for ALNW. Both the draft (p.62) and NEMPSA agree that flying in marginal weather presents major safety risks, yet ALNW policy, as stated in the draft, is to allow pilot discretion to be used in questionable weather conditions. How will pilots decide when it is safe to fly in these kinds of conditions? Is leaving the decision to pilot discretion advisable, particulary given cautions both cited in the draft and by NEMPSA that EMS "pilots show a willingess to fly in adverse weather when other commerical helipcter pilots would not fly". These concerns need to be addressed in the EIS. (The pressures which can be brought to bear on pilots are very real and may make a decision to not fly, while a safe decision, a difficult one to make.)

Another concern with the material presented in the Draft focuses on the process COH has used in determining acccident probablity. We will submit tonight a calculation based on what we feel is more representative of the worst case scenario, as required by the DEIS. Our figures , which have been verified by a statistician from the University of Washington, show one accident every 6.59 years while the Draft projects one accident every 22.7 years. Please reconcile this discrepency in the next EIS.

see testimony of Anita Francis for calculation

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We would also like to see a comparison of safety advantages and disadvantages of alternative sites. This comparison is lacking in the Draft and represents a serious oversight in a consideration of safety issues. To illustrate, an ALNW pilot is cited as saying that an improved site is preferable to an unimproved site. This, however, does not clarify whether an improved site at the East Campus of the University of Washington would not be safer than an improved site at COH. To complete the consideration of alternative sites, as required by Seattle's Land Use Code, safety advantages and disadvantages of all opitons need to be assessed.

A comprehensive discussion should be contained in the Draft dealing with the issue of liability. The following questions should be answered. What are the limits of coverage currently held in regards to personal and property damage? Who arethe carriers for ALNW, SJC, and HAT? What are the projected costs of this coverage for the future? How have the risks been calculated to determine the premiums for the currently held coverage?

Lastly, the information which is provided on safety in the DEIS is undermined by its biased, non-objective nature. Many of the sources used are of questional credibility, because of a conflict of interest. For example, Mr. Hill's authority on such issues as site safety and pilot qualifications must be viewed with some skepticism; he is a pilot for ALNW, the agency intimately involved in this project. His opinions should be backed with other objective sources. Further, a supporting statement from the Agusta marketing representative on the safety of her helicopters strikes us as less reliable than we would hope to find in a document of this importance. Even in cases when the sources are reliable and verifiable, such as the table on p. 64, COH has interpreted the data in a unique fashion. Alternate interpretations (Airnet) should also have been provided.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As a final note, throughout the draft and in all areas, not just those concerned with safety, the use of personal communication leaves the reader without the capability of verifying the validity of information cited. In fact, in checking on a source, we found that he was unaware that his name was being used in the document. To our knowledge, it is generally considered policy to make sure that approval to use personal communications are obtained before publications are issued. Access to both personal communications and bibliographic entries should be a required part of the EIS.

In summation, we feel that this DEIS is unacceptable in its present form to the extent that the city should require that another Draft be written, rather than amending this document. A final EIS would disallow the community from commenting on it beofre it reached the hands of the Hearing Examiner. This DEIS, produced by CDH, is a sales pitch not an analysis.

THE CHILDREN'S ORTHOPEDIC HOSPITAL AND MEDICAL CENTER

February 3, 1986

Beatrice Farrar Ryan
Director
Department of Construction
and Land Use
Room 400, Municipal Building
Seattle, WA 98104

Dear Ms. Ryan:

In your Notice of Decision dated January 13, 1986 regarding Children's Orthopedic Hospital and Medical Center's (COHMC) application for a conditional land use permit to build a helistop, you requested public comment on the scope of the Environmental Impact Statement (EIS).

COHMC examined the issue of alternative sites quite thoroughly prior to applying for a permit to locate a helistop outside the Emergency Room. The most important considerations were whether a proposed site met our objectives, which are: to minimize the number of patient transfers from one vehicle to another, to decrease transport time from the referring hospital to the Emergency Room entrance at COHMC, and to reduce the impact of helicopter landings on the Hospital and the neighborhood with regard to noise and safety. Other considerations on possible on-campus sites included topography, existing roadways, and distance from the Emergency Room.

Two sites continue to surface in discussions as possible alternatives to the ER landing site. They are the Hospital roof and the Hospital's parking garage. We believe the scope of the EIS should exclude these two sites as possible alternatives for the following reasons:

1. Noise - without conducting a formal noise study, a visual examination of both sites suggests that the noise level when landing a helicopter on either site would significantly exceed those noise levels at the ER site primarily because there would be no building or land buffer to protect the surrounding neighborhood.

2. Safety - both sites significantly increase the potential risk to public safety because the helistop would be located on occupied buildings. In the unlikely event of an accident, it would be potentially more damaging to land on a building than on the ground because of possible damage to property and human injury

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Patient care - medical objective - again, both sites involve considerable more patient handlings and transfers over longer distances than the site next to the ER. A helistop located atop the parking garage would require that the child be transferred from the helicopter to an ambulance, then from the ambulance to the Hospital ER, in effect resulting in the same situation present when landing a helicopter at Graves Field.

4. Cost - the issue of a rooftop helistop has measurable structural implications. As you are aware, the Hospital was constructed at two different times. The roof of the newer part of the Hospital was designed to hold a 25 lb. live load per square foot. In addition, there is no unobstructed roof space large enough on the newer roof to accommodate a helistop. The old Hospital was designed to hold a 20 lb. live load per square foot. There is an unobstructed open space large enough to accommodate a helistop, but it is located above the eighth floor (a considerable distance from the emergency and intensive care rooms). The approximate weight of the Augusta helicopter is 5400 lbs. (Maximum gross weight of the Augusta is 5730 lbs. Average empty weight is 3892 lbs.) The FAA recommends that a helistop landing pad be able to hold 2 to 2½ times the helicopter weight for safety reasons. The conclusion of the Hospital's architectural consultants from NBBJ is that the existing building cannot support a helicopter landing pad without significant structural modifications. At a minimum, contractors would have to go back into the building and construct an additional landing pad that must span to major columns that support the building. This could easily cost in excess of $150,000 beyond that already necessary to build the helistop. The additional cost would have to be passed on to patients.

To summarize, not only do these two sites (Hospital roof and parking garage roof) not meet the Hospital's objectives and the community's objectives, but they also would be significantly more expensive to implement than the originally proposed site. COHMC recognizes that an application for a conditional use permit requires that we examine additional on-campus sites. However, in the process of examining possible sites, COHMC concluded that none of the alternative on-campus sites met our objectives. Therefore, COHMC requests that the scope of an EIS be limited to significant issues surrounding a helistop located outside the Emergency Room as compared to locating a helistop at Graves Field.

Sincerely,

Treuman Katz
Chief Executive Officer

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I have been an employee of the hospital for the past ten years and am a member of the management team of the hospital.

I feel that the helistop is critically important to the care of the children we treat at our hospital. The difference between saving a child's life and the neighborhood's concern about noise can not be measured. Certainly the sooner a child can reach our hospital and be treated by our specialized physicians and nurses, the better chance they will have to survive. I strongly support the use of helicopters to bring those children who require immediate treatment to our hospital. I would want that opportunity to be available for those children I know and love.

Thank you for this opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Julia

RECEIVED
JUN 6 - 1986
DEPT. OF CONST. & LAND USE

Ms. Holly Miller, Director
Department of Construction
and Land Use
Room 400 Municipal Building
Seattle, Washington 98104

The following resolution concerning the siting of heliports for emergency medical care is endorsed by the Board of Directors of Laurel Crest Residential Park Condominium Association.

The Board of Trustees of the Laurelhurst Community Club supports the development of a regional plan for the siting of heliports for emergency medical care. This plan should be based on an analysis of the medical need, the potential adverse impacts on communities, and the costs of helicopter services.

The designation of sites should be limited to the minimum necessary to meet the needs of the region. Where there is choice, the location of the heliports should be limited to sites where overflights and landings will have the least impact on residential communities.

Criteria for use must be established in the regional plan so that helicopter service is limited to emergencies. These criteria should define conditions, such as difficulty of access, time constraints, and life-threatening situations, which make helicopter transport the only reasonable choice.

The Hospital's projections for helicopter use and its contract for services with Airlift Northwest indicate the proposal is for a commercial transportation service which is costly, may not be limited to medical emergencies, and includes financial incentives for overuse.

Quality emergency care has been satisfactoraly provided by helicopter transport to the University's intramural field and Harborview's trauma center. At this time, the Board of Trustees of the Laurelhurst Community Club opposes the approval of a helistop at Children's Orthopedic Hospital until a medical need for the helistop on campus is substantiated.

May 2, 1986

Larry A. Thompson
Executive Director
Puget Sound Health Systems Agency
601 Valley Street
Seattle, WA 98109

Dear Mr. Thompson:

In response to a proposal for a helistop at the Children's Orthopedic Hospital, members of the Laurelhurst community have asked what controls would govern such a development. We have found there are no controls proposed, and there is no integration of the current or proposed hospital helicopter service with the existing emergency medical service program in King County, the Puget Sound Region or the State. Additionally , there has been intentional circumvention of the State's certificate of need review and public hearing process by providers of air ambulance services.

It is urgent that a plan with defensible treatment and transfer protocols, patient triage and hospital classification guidelines be in place. The lack of a plan leads to misuse and overuse of helicopters, excessive costs and unnecessary safety hazards, air and noise pollution.

We have recently reviewed a copy of your draft proposal for development of a regional plan. We hope the timeframe projected can be shortened appreciably. Certainly, Phase III and Phase IV could be undertaken immediately. We consider ourselves affected parties and hope to be represented as such if not represented on the steering committee.

The goal of the plan should be to assure the highest qualty of medical care with the least adverse effects on costs and the safety and welfare of the general public. A reasonable balance is required.

Objectives of the plan should include:

- State certification which assures costs relative to need;
- Regional service areas which maximize time benefits;
- Designation of appropriate receiving hospitals tc limit adverse impacts of overflights and landings;
- Dispatch guidelines which assure use only for emergencies and only when the helicopter is the superior choice; and
- Periodic review of the use to provide a check on the administration of the program.

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am an employee of Children's Orthopedic Hospital. Having raised four children myself, I can readily identify with a parent whose child's life might actually be saved by use of this service.

As far as the concerns about noise, it has been my personal experience that there is very little noise involved in a landing. My office is in the wing adjacent to the landing site and in clear view of the helicopter. I have been more distracted by the sound of local fire-engines than by the noise of the helicopter.

It is my opinion that the concern about noise and safety should be minimal. The possibility of saving even one child's life by this rapid transport is of far greater concern. The greatest deciding factor that repeatedly comes to mind is "What if it were my child in need?".

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council

RE: Proposed Helistop at Children's Orthopedic Hospital

Dear Ms. Newman:

Thank you for your letter of August 4, 1986 regarding the use of helicopters to transport patients to Children's Orthopedic Hospital. I am not familiar with the incident of July 7th when KIRO's helicopter was used to transport a patient to Children's. I am aware that KIRO has graciously offered to transport critically ill or injured patients when no regular air ambulance service is available. Transports of this sort are very infrequent, and must be authorized by the State of Washington.

Your letter raised a number of other issues regarding the effectiveness and environmental impact of helicopters to transport patients to Children's Orthopedic Hospital. Later this month, the City of Seattle Department of Construction and Land Use will release a Draft Environmental Impact Statement (EIS) regarding the proposed helistop at Children's. The EIS addresses the questions raised in your letter. I would recommend you contact the Department of Construction and Land Use at 625-4509, and request a copy of the Environmental Impact Statement for review and comment.

Thank you for writing.

Sincerely,

Bud Nicola

August 4, 1986

Dr. R. M. Nicola
Seattle-King County Health Dept.
400 Yesler Bldg.
Seattle, WA. 98104

Dear Dr. Nicola:

On July 7, 1986 at 7:40 P.M., the Channel 7 news helicopter delivered to Children's Orthopedic Hospital a drowning victim. A few days later I read in the newspaper that the patient had died. Has a news helicopter the permission to transport a gravely ill patient to COH? If yes, how can the COH distinguish and control the bringing in of patients, gravely ill or not?

In flying a helicopter tremendous vibration and noise would produce stress to the gravely ill patient and questions of help in the survival are raised.

I would like to know the data on how many children have succumbed or how many have survived due to helicopter transport? This is one of the most important questions to which nobody seems to know the answer.

AirLift Northwest charges $2,000 per trip. One helicopter costs one and a half million. With the danger to 200 children in one block from the landing at Laurelhurst Elementary School, and the residents of the 136 units in the Laurelon Terrace Condominiums next to it, plus an oxygen tank right next to the landing site, is it worth it to endanger that many people?

Please answer these crucial questions by return mail before the hearing which may occur the end of this month.

Thank you.

Sincerely yours,

Helen Newman

Dear Dr. Nicola:

Thank you for your letter of August 13, 1986 in promptly to my letter of August 4, 1986, but you did not answer any of my questions.

How many children have been helped by helicopter transport, and how many have died? What medical problems have there been with the landings at the nearby soccer field?

Sincerely yours,

Helen Newman

Holly Miller
Director, DCLU
5th Floor, Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

Enclosed is a copy of a letter to Frank Chestnut of the Department of Social and Health Services in Olympia. It requests that DSHS require (for the third time) the Childrens Orthopedic Hospital to submit a Certificate of Need application and go through that process.

DSHS was forced to reverse its two previous decisions to require a Certificate of Need because of deficiencies in its rules and legal action by COH. The rules have recently been changed so it is possible that DSHS can now succeed in making COH go through the Certificate of Need process. The University Hospital situation may be different as they have already built their rooftop helipad and simply need a permit to use it.

St. Luke's Hospital in Bellingham was required recently to submit a Certificate of Need application to DSHS. It was reviewed by the Washington State Hospital Commission and it failed all of their criteria. They have asked for and received a 2-month extension so that they can revise their application before the hearing, now scheduled for May 22.

If COH is required to justify its air ambulance/ helipad proposal via the Certificate of Need process, much information that is currently unavailable (and is not likely to be contained in the EIS now being prepared) will become available for public review. This information would also be helpful to DCLU in preparing its recommendations as well as to the City Council and others who will be involved in the permit review pro .

We urge you to monitor closely Frank Chestnut's efforts to deal with this problem and to express any of your concerns directly to him. There has not been much coordination between DCLU and DSHS on this issue to date and we hope that you will improve the level of interagency coordination as this issue reaches the final stages of the process. Both agencies have important roles to play in dealing with this issue.

Sincerely,

Liz Anderson

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Frank Chestnut, Director
Certificate of Need Program ET-33
Department of Social and Health Services
Olympia, Washington 98504

Dear Mr. Chestnut:

We applaud the changes that have been made recently to the rules that govern the applicability of the Certificate of Need legislation (WAC 248-19-230). We request that you use these new rules to require that Children's Hospital prepare a Certificate of Need application for their proposed helipad and associated air ambulance service.

The City of Seattle's Department of Construction and Land Use has determined that this project might have a significant impact on the environment and has required COH to prepare an environmental impact statement. The draft environmental impact statement is expected to be available in May or June. After it is distributed, there will be a hearing and a comment period of 30-45 days, then it goes to the City Council for a final decision. It is likely that Council action will take place in August or September. As far as we know, University Hospital has not yet applied for a permit from the City to use their helipad.

The Puget Sound HSA has developed a proposal for a regional planning study that is now under review in King County and the City. A 12-month study limited to King County with a budget of $37,000 has been proposed. It is hoped that the geographic scope and budget will be expanded. This study is not likely to begin before July.

Dr.Lothar Pinkers is working with a medical society committee to develop some medical criteria and guidelines that will help define the appropriate role of air ambulance services in the region. This work is expected to be completed in June or July.

We have examined the Hospital Commission's review of the air ambulance Certificate of Need prepared by St. Luke's Hospital and feel that it shows how important the process is. The same process is very much needed in relation to the pending proposals of COH and University Hospital.

Since August, 1985, there have been about 19 helicopter landings on the grassy knoll adjacent to the COH emergency room. There have also been several helicopter landings of COH-bound patients at Harborview with a subsequent transfer to COH by ground ambulance. There has been one landing of a MAST helicopter at COH but MAST has used the intra-mural field at the University of Washington for the rest of their land-ings for UW and COH-bound patients. The City has cited COH twice for violating the City's land use code. The first violation was dismissed because it was prepared improperly by DCLU. The second was continued with a compliance hearing date of September 9, 1986.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopter transportation should be developed in accordance with a regional plan using criteria developed by physicians in the area. This is a logical and reasonable way to proceed, given the large public investment that has already been made in Extended 911 and Fire Aid services in the Central Puget Sound Region, the extensive existing private ground ambulance system, and the availability of MAST services.

To date, we have seen no solid projections of the level of need for helicopter transportation (demand side) that are population-based and that take the existing EMS system into account (supply side). We feel that both COH and University Hospital should prepare Certificate of Need applications that define the air ambulance role clearly. University Hospital has expressed a willingness to do so if COH is also required to do one. This seems only fair. We hope you will quickly determine that both hospitals should be required to justify their proposals by going through the Certificate of Need process. Such applications would provide information that would greatly ease the job of preparing a regional plan and lend further support to the medical society committee and its efforts toward development and implementation of criteria or guidelines for emergency helicopter transport.

We are hopeful that it will not become necessary to involve a lawyer in the resolution of this reviewability matter. We believe it is the responsibility of state and local governments to work together in this situation toward a common goal of a well-planned and well-coordinated emergency transport system to ensure the continued support of the public.

Please give us a written response to this request as soon as possible.

Sincerely,

Citizens Concerned About Helicopter Transport
Steering Committee

HELISTOP (Continued)

The need must be justified and standards set.
Given this picture of competition among hospitals and the specter of helicopters as flying billboards, it is particularly important for the need for a helistop to be documented. COH has been asked by the State Department of Social and Health Services to go through the Certificate of Need process three times. Children's first requested a reconsideration of the requirement. DSHS reconsidered and then again required a Certificate of Need. COH responded by filing suit against the State. The State Attorney General's office, which also represents Harborview's administration of Airlift Northwest, succeeded in getting the Certificate of Need requirement dropped. Recently, a change of law prompted the State to again inquire into a CofN for Children's. We have yet to hear the outcome of that request.

Hospital helicopters are overused by a factor of 90%, according to studies noted in a recent report of the Washington State Hospital Cost Commission.

We are unwilling to assume that a service to COH is justified and, if justified, would not be overused.

We have asked COH to spell out its proposed conditions of use and to justify the need. Because hospitals are regulated by the State, it is necessary that need relative to cost be ascertained through the State's Certificate of Need process. Because helicopters operate most effectively in a regional area, it is necessary for planning to occur on a regional basis. The medical indicators for helicopter transport must be decided by the medical community.

Our community has been requesting these actions for over a year, with some success. A regional planning effort has been initiated by the Puget Sound Health Systems Agency and the Washington Medical Association is developing medical guidelines. However, COH may continue to refuse to pursue a Certificate of Need or define limitations on use of the proposed helistop.

On the enclosed Opinion Poll, we have listed key conditions which assure, in other regions, that helicopter service is focused on quality health care at the least cost to the patient and the communities. These conditions assure that hospital helicopters will be used only for emergencies in which the helicopter is the superior choice of transportation and that the service is directed to the hospital best able to care for the emergency. We'd like to know if you agree that these are reasonable and responsible requests.

Kate Hemer

LCC Board Meeting

Highlights of June 9, 1986 meeting:

Laurelhurst Park security: Neighbors near the Park presented their concerns about our park being turned into a party location for young people from all over the northend and eastside. There has been vandalism, speeding cars, and drinking. Possible solutions were discussed. It was decided to present the problem to the general meeting to be held on June 11. (Ed's note: The all-community meeting on June 11 was a big success. Over 150 people were there, and the Police Captain, Mr. Farrar, was impressed with the level of concern about the Park and will take steps to correct the situation, he said.)
Park and Open Space Foundation: A series of discussions have been held with the Parks Dept. on the forthcoming renovation of the Fieldhouse. A resolution was passed giving $300 from the Athletic Fund as seed money for this organization.
Annual Salmon Bake - Laurelhurst Playfield- will be held August 7, 1986 at 5:30 p.m.
Large Billboard, near U. Village: Residents' letters have been coming in to the Department of Construction and Land Use protesting this bit sign. These are very important in letting them know that this is an issue that matters to us.
Villa Retirement Center: The developer has submitted final drawings of the project to DCLU. The committee is reviewing these plans to see if they conform to the intent of the City Council.
Major Institutions Code: A letter was sent to the City Council asking for a moratorium on the provisions of this code. Citizens and major institutions are equally unhappy with the code.

JULY

CAMPAIGN AGAINST BILLBOARD HEATS UP

Ackerley Communications and Northwest General Contractors of Bellevue want to put up a large, 14 ft. by 48 ft., billboard on a single pole, about 46 ft. above ground level, near the N.E. 45th St. entrance to the University Village Shopping Center. The billboard would be between the building still under construction and the entrance to the shopping center. The readable side would point toward the Burgermaster; the blank side toward the N.E. 45th St. Viaduct.

Northwest General Contractors also want to build the 3 story, 15 unit apartment condominium on the two vacant lots on N.E. 45th St., or the so-called balckberry patch.

Also, Northwest General Contractors is in a major battle with the University Village over the use of parking space in the shopping center. The building hard upon the entrance and the billboard are the tactics of the developer in this struggle. As many of us remember, Ackerley Communications tried to put up a billboard at Almvig's several years ago without a valid permit. After extensive negotiations, that billboard was relegated to Baskins and Robbins at N.E. 45th and Union Bay Place.

The billboard near the University Village would be the same size and type; a very large, ugly structure. In discussions with the Department of Construction and Land Use (DCLU), it is apparent that the City can regulate the billboard, specifically its size, height, and location such that a billboard at this site would be less advantageous to the developer.

It is important that DCLU understand that this billboard creates serious problems. (1) It is completely out of scale with adjacent structures and would seriously disrupt the city scape along N.E. 45th St. (2) The billboard through its size, direction, and location, would obstruct the entrance sign of the University Village; the shopping center has the right to identify itself without undue obstruction (3) Sec 24.44.010 of the Municipal Code states that there shall be a minimum distance of 100 ft. between signs; the distance between the Shopping Center sign and this billboard would be only 50 ft. (4) The obstruction of the Shopping Center entrance sign plus the building near the entrance with no setback means that early recognition of the entrance and exit will not occur; as a result, it will increase traffic congestion and the accident rate will increase. (5) The property owner, Northwest General Contractors, wants access and use of the parking space in the Shopping Center; the billboard is the latest tactic in connection with that strategy.

View Ridge Community Council is helping to gather signatures on the statement aginst the billboard, writing letters to DCLU; the University Village will use its legal counsel, and Laurelhurst Community Club Club is gathering signatures and sending letters to DCLY. Copies of the statement against the billboard were placed in various shops in University Village, Windermere Realty, and Laurelhurst Community Center.

The comment period ended on July 3. We will keep you informed as to how this issue is resolved. The community response has been strong and should be effective.

Bob Klug, President
Laurelhurst Community Club
527-4892 or 447-4054

LAURELHURST OPINION POLL

Your opinion on the Children's Orthopedic Hospital helistop proposal is needed now! A hearing on the helistop will be held by the City in August or September. Your Community Club Board has been representing you on the helistop issue and we would like some reassurance that most of you still agree with the Board's position. If not, we will modify it to be more representative of your opinions. We would also want to submit your responses to the City as part of our testimony to the City Council.

To help you understand the Board's current position, excerpts from a recent presentation are provided in the newsletter on page 2, "Proposed Helistop Lacks Limits." After reading this article, please complete the questionnaire, and return it to us at the address on the reverse side of the questionnaire.

Thanks for your participation. It is very important to us.

Anita Francis, Newsletter Editor
Laurelhurst Community Club Board

* * LAURELHURST OPINION POLL * *

June, 1986

Dear Neighbor,

In response to a proposal for a helistop at Children's Orthopedic Hospital, members of the Laurelhurst community have asked what controls would govern such a development. We have found there are no controls proposed, and there is no integration of the current or proposed hospital helicopter service with the existing emergency medical service program in King County, the Puget Sound region or the State. Additionally, there has been intentional circumvention of the State's certificate of need review and public hearing process by providers of air ambulance services.

It is urgent that a plan be in place before siting and use decisions are made. The lack of planning leads to misuse and overuse of helicopters, excessive costs and unnecessary safety hazards, air and noise pollution.

The goal of the plan should be to assure the highest quality of emergency medical care with the least adverse effects on costs and the safety and welfare of the general public. It follows that the designation of sites should be limited to the minimum necessary to meet the needs of the region. Where there is a choice, the location of heliports should be limited to sites where overflights and landings will have the least impact on residential communities.

Conditions imposed in states which plan for helicopter service are included in the position statement below. We hope you'll take the time to respond to this statement with your comments.

Sincerely,

Liz Anderson and Kate Hemer, Co-Chairs, Land Use Committee

----------Fold, seal, and return by mail to address on reverse side----------

LAURELHURST HELISTOP QUESTIONNAIRE

The Laurelhurst Community supports the position that a helistop should NOT be sited on the COH campus until the following conditions are met:

* Need should be established through the State's certificate of need process
* Geographical service areas must be established to ensure that patients are transported quickly to the nearest qualified hospital
* For transfer of patients, hospitals must be classified according to their emergency care capability
* Patient conditions requiring helicopter transport must be defined by the State Medical Association
* Enforceable rules must assure that the helicopter is used only for emergencies and only when no better choice is available
* An evaluation of flights, conducted periodically by an objective and credible review panel to ensure against overuse and misuse, must be implemented

Circle your choice. Add comments on top of reverse side (your name and address are optional):

Re: Illegal Helicopter Landings at Childrens Orthopedic Hospital

Dear Ms. Miller:

This is an addendum to my earlier letter regarding my concern over illegal helicopter landings at Childrens Orthopedic Hospital. Due to recent developments, I feel compelled to supplement that letter with the following information.

Due to the dramatically increasing number of helicopter flights into Childrens Orthopedic Hospital (there was another one at 11:00 p.m. last night), I called tne hospital and spoke to Nancy Greenwalt, Community Relations Representative at Childrens Orthopedic Hospital.

According to Ms. Greenwalt. the Hospital has conducted some kind of noise monitoring to determine the effect of the helicopter flights on the community and has determined that the noise was the same as a large diesel truck going by. Although I respect Ms. Greenwalt as a dedicated person in a difficult position, I strongly disagree with this statement. The vibrations of the helicopter are much more severe than a diesel truck going by. For example, a diesel truck has never vibrated the plates off my walls whereas this did happen to me on Sunday, July 13 when a helicopter came over at 5:00 p.m.

Ms. Greenwalt also stated that one of the noise monitors had been placed ~~had been placed~~ in a condominium at Laurelon Terrace where I live. Laurelon Terrace consists mainly of two-story buildings. Although Ms. Greenwalt did not say where the noise monitor was located, I expect that the monitor was probably placed in a sheltered ground floor location rather than an exposed second floor location. I don't think anyone who lives on a second floor condominium would agree that the noise level equates to a diesel truck going by. If you are interested I would be happy to have a noise monitor installed in my second floor condominium.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Finally, more than noise is at issue here. A substantial part of the disruption caused by the helicopter relates to vibrations which wouldn't be present unless a large diesel truck drove right past my front door. Moreover, I am concerned about helicopters coming low for their final approach to Childrens Orthopedic Hospital and the danger to which I am exposed in the advent of adverse weather conditions or mechanical problem in the helicopter. Additionally, we are not talking about replacing truck noise with helicopter noise but instead adding the noise, vibrations and overhead menace of the helicopters to the already existing truck noise.

I again request that the City maintain its present regulations regarding helicopter landings at Childrens Orthopedic Hospital and proceed with even stronger enforcement of those regulations until this apparent violation is stopped.

Sincerely,

Pat Lundquist

Dear Ms. Gibb,

I am writing in support of Children's Orthopedic Hospital and Medical Centers request for a conditional land use permit to build a helistop outside their emergency room.

I am a resident of Port Townsend, and have grandchildren visiting here regularly. If any of these children would require the services of COHMC in a hurry, I want to know that the helicopter can land directly at the hospital.

It is not possible for me to understand the concerns of those who would object to this life saving service for children. Please convey my opinions to the Seattle City Council.

Sincerely,

Dear Ms. Gibb;

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am a Nursing Home Administrator and realize the value of time in critical or life threatning situations. It is not difficult to understand the objections of those living in the area of the hospital but I think they are more fearful than realistic. Those of us who live significant distances from Seattle have a definite need of speedy and safe access to Children's Orthopedic Hospital in times of extreme emergency. It doesn't make much sense to get from somewhere on the Olympic Peninsula only to have a potential problem from landing on the U of W soccer field and transporting to the hospital.

In a matter as vital and important as this it is time to put aside selfish fears and concerns and support this very humane and life promising service.

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

George Avis
Administrator

RE: Children's Hospital Request for Heliport

Dear Ms. Gibb:

I write this letter in support of the request of Children's Hospital for a conditional land use permit to build a heliport outside their emergency room.

Two years ago, when my son was ten years old, he suffered what was feared to be a very serious head injury. He was transported by helicopter from Jefferson General Hospital in Port Townsend to Seattle for emergency treatment. Fortunately my son's injury was less severe than first diagnosed and he quickly recovered; however, that experience has brought home to me the importance of air transport for emergency medical services.

In the case of my son, it was necessary to remove him from the helicopter and place him in an ambulance for transport to the hospital emergency room. At the time I was concerned about that procedure. It was obvious that it would have been much more advantageous if he could have been removed from the helicopter and taken directly to the emergency room.

Children's Hospital is requesting authorization to build a helicopter landing site immediately outside their emergency room. That location certainly makes good sense.

I understand that some members of the Laurelhurst community object to the proposal because of noise and safety factors. In light of the limited number of flights required those concerns simply do not reflect the greater interests of the community.

It is my request that you convey my concerns to the Seattle City Council when this matter comes before them for consideration.

Very truly yours,

William E. Howard

Dear Ms. Gibb

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am a parent that has had to make use of air transportation for my son who was desperately ill at birth. The hospital did a wonderful job with what was available and I am very thankful to them. I know that the helistop will make situations like ours much better. While I was at the hospital with my son, I had the opportunity to hear the helicopter and do not believe that concerns about noise and safety outweigh the good that will be realized.

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Dear Ms. Gibb,

We received a communication in the mail yesterday about the proposed Helipad near the Children's Hospital which is near our home, although we live West of it instead of on the hill.

We were gone during the winter and thought the whole thing had been resolved when we saw helicopters landing there this summer, but find that it is not.

I am appalled at those stupid, selfish people in Laurelhurst opposing something which is as good as being able to bring ill children into the hospital as fast as possible.

We have lived here for 52 years and there are many noises much worse than the helicopters make. Sandpoint Way has sirens screeching picking up speeders, etc., and the ambulances which bring children to the hospital along with the air traffic which we have all hours of the day.

I am sorry that more people who think that a helipad is not a bad idea do not speak out.

Sincerely,

Margaret R. Cline

Dear Ms. Gibb,

I am writing this letter in support of Children's Hospital & Medical Center's request for a conditional land use permit to build a heli-stop outside their emergency room.

I am a sergeant with the Port Townsend City Police Department and reside 2 blocks from a heli-port adjacent to Jefferson General Hospital in Port Townsend. I understand the concerns to those who are objecting, but I also understand the lives that are being saved by helicopters landing at the hospital in emergency cases. I deal with emergency situations on a daily basis and understand that time is a critical factor.

Our home is in the flight path of the helicopter's landing at Jefferson General Hospital. When I hear them above our house I don't think of them as an annoyance, I think of them as a life-saving measure used in the field of medicine today.

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Dear Sirs:

We, the Clara E. Walker Orthopedic Guild, wanted to write and let you know that we would very much like to see you vote in favor of the helicopter pad at the Children's Orthopedic Hospital. We feel that if the administration of COH can improve the quality of care that so many of our children need with this pad, then they should have it. None of us know when COH may have to save the life of one of our dear little ones and how sad and mad we would be if one could not get the care needed because some people didn't think it was necessary. Looking forward to your favorable vote.

Sincerely,

Dear Mr. Street:

I wish to express my support for the continued operation of emergency helicopter landings at Childrens Orthopedic Hospital.

As you are aware, this issue is of more than local importance, because Childrens Orthopedic Hospital provides critical medical services to children and their families in a wide geographical area.

In some cases, Childrens Orthopedic Hospital is the only medical center capable of providing the emergency care that is needed to save a child's life. In such circumstances it would seem unforgivable to deny the child the speediest possible access to medical care.

As the Council considers this issue, please urge each of them to imagine, for a moment, how they would feel if their own child's life were at stake.

Thank you.

Very truly yours,

Nancy J Johnson

Sir:

As Vicepresident of the Laurelcrest Condominium Owners Association I speak for eighty (80)families in identifying significant issues involved in the planned construction of a helistop facility on the grounds of Childrens Orthopedic Hospital and Medical Center.I was also present at the public hearing conducted by Dr. Nicola,City Health Officer,on October 24. 1985.

1. At no time during 1½ hours of testimony did spokesmen for Childrens Orthopedic Hospital present evidence that one single life was endangered, let alone lost,by landing a helicopter at the nearby University of Washington field and transferring the patient by ambulance to the hospital less than 2 miles away.Arguments about landing difficulties at night,or in inclement weather,totally ignored the existence of a heliport at the nearby Sandpoint Naval Base,available for such emergencies.

2. The numerous occasions during the past three months when helicopters landed on the hospital grounds,in violation of city ordinances,at all hours demonstrated just how bad the noise level is.The fact that within the same time period two helicopters carrying patients to hospitals crashed, killing patients and crew,demonstrates that such disasters are not so farfetched and are most likely to occur during inclement weather.

3. The public declaration by an administrative officerof Childrens Orthopedic Hospital that the hospital must fulfil its mission as regional resource, which is more important than any significant environmental impact on the residents of the surrounding area,makes any promise to use the planned helistop for emergencies only quite suspect.Misrepresentation of the costs of the helicopter service by Childrens Orthopedic Hospital,to avoid having to apply for a Certificate of Need ,is another proof of its bad faith.

The Board of the Laurelcrest Condominium Owners Association strongly opposes any permission by the Department of Construction and Land Use to construct an emergency helistop facility accessory to Childrens Orthopedic Hospital and Medical Center.

Sincerely yours
Albert A Feldmann

RE: The Environmental Impact Statement for the Emergency Helistop Facility at Children's Orthopedic Hospital, 4800 Sand Point Way, Seattle, Washington

The members of the Board of Directors of The Laurelon Terrace Condominium Homeowner's Association are the elected representatives of the owners of 136 family dwelling units located on the West boundary of The Children's Orthopedic Hospital.

Recently, there have been several (5-10) unauthorized helicopter landings at the hospital. The flight paths for most of the landings were low angle approaches over several of the Laurelon Terrace Condominium residences. The extreme noise and reverberations generated during these flights, has been stressful to elderly residents and the night flights have been especially so, due to the anxiety of waiting for the helicopter to depart.

We respectfully request your thorough investigation of the following:

1. MEDICAL NEED:

Is there truly a medical need for a helicopter landing site at Children's Orthopedic Hospital? Would the site be used only for bona fide critical cases and not for "marketing" purposes?

2. SAFETY:

Can there be assurances that the flight path for all landings would be a route that would minimize danger and noise for the surrounding community of homes, schools and businesses?

3. FREQUENCY OF FLIGHTS:

At least some of the recent flights were actually two trips (four over-flights) for one patient. One flight to pick up a medical team and another to deliver the patient to the hospital. There are many conflicting accounts of the anticipated number of flights per month and the costs associated therewith.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Director, Dept. of Construction and Land Use January 30, 1986

4. ALTERNATE SITES:

The present landing site at the nearby soccer field has served well for many years. Is it actually no longer a suitable landing site? If not, why not? Is there a medically acceptable alternate landing site? The approach to a landing site at The Sand Point Naval Station could be mostly over water. There is presently a landing site at Harbor View Hospital and may soon be a landing site at University Hospital which is even closer than the Sandpoint Naval Station or Harbor View. Perhaps Seattle's Medic I, with the best response record in the nation, could be utilized.

5. COST:

We do not wish to imply that a dollar value be placed on a human life. Common sense, however, requires that initial and recurring costs be considered as a vital part of your investigation. Duplication of services would not be cost effective and should be avoided.

6. QUALITY OF LIFE:

The residents of Laurelon Terrace have always supported the Children's Hospital and will continue to support this outstanding institution with both money and voluntary service. The surrounding community is entitled to health, safety and tranquillity, rights which should not be ignored, but have been abridged by the hospital in their endeavor to institute emergency helicopter service.

Thank you for the opportunity to express our concern in this matter. Please notify us of the time, date and place of any public hearing regarding this project.

Dear Mr. Street,

This letter is to express the grave concern of the entire neighborhood regarding the extreme danger of helicopter landings at Childrens' Orthopedic Hospital (COH).

It has been determined after exhaustive study by experts that a helipad at COH is entirely unnecessary, that it would duplicate services already being provided. Our apprehension is for the safety of people living in the proximity of the hospital whose homes, limbs and very lives are at risk every time a helicopter attempts to land or take off .This area is zoned First Class Residential and there are children playing nearby. Laurelhurst Elementary School is just 2 blocks from COH.

There have been several extremely noisy helicopter landings in the past few months, hazardously close to houses and trees. The helicopters have not followed a previously prescribed landing approach. Their landings have been haphazard, unpredictable, sometimes 50 feet above a house. Thus far they have not been impacted by wind. However, sudden downdrafts caused by a south wind over COH could have disastrous consequences as the helicopted approaches the pad. Let's not create "an accident waiting to happen"!

Please take immediate action to permanently deny a permit for a helipad at COH.

Urgently,

Helen and David Belvin

Dear Mr. and Ms. Belvin:

Thank you for your recent letter regarding the Children's Orthopedic Hospital heliport application.

The application is for a Council Conditional Use permit and at present is being reviewed by the Director of the Department of Construction and Land Use (DCLU). Her recommendation will be reviewed by the Hearing Examiner who will conduct a public hearing and prepare a recommendation for the City Council. A record is now being formed, and I am forwarding your correspondence to DCLU so that it may be included in that record. The Council will take it into consideration when we come to review this application.

I appreciate your interest. Thank you for taking the time to write.

There have been several extremely noisy helicopter landings in the past few months, hazardously close to houses and trees. The helicopters have not followed a previously prescribed landing approach. Their landings have been haphazard, unpredictable, sometimes 50 feet above a house. Thus far they have not been impacted by wind. However, sudden downdrafts caused by a south wind over COH could have disastrous consequences as the helicopted approaches the pad. Let's not create "an accident waiting to happen"!

Please take immediate action to permanently deny a permit for a helipad at COH.

Urgently,

Helen and David Belvin

To Whom It May Concern:

I strongly recommend that you allow the Children's Orthopedic Hospital to construct an emergency helistop facility accessory to the hospital. When patients need helicopter transportation time is of the essence. An ambulance ride from Harborview to 4800 Sandpoint Way may well mean death, rather than life, for the child. I would much rather hear the helicopter now and then rather than delay treatment for a sick patient.

I wonder if the people who are trying to prevent the construction of the helistop facility lived where they now live when the Naval Air Station was active and Friday nights & Saturday Nights for years lines of planes practiced landing and immediate takeoff on the north end of Lake Washington-weekend after weekend. No one asked us whether we approved. I worked full time 5 days a week and part-time Saturdays and Sundays. Many weekends I was

Dear Sir:

I've written before. Please consider what you are doing in the matter of the helipad at the Children's Hospital.

The Children Hospital chose to settle in Sandalwood rather than near arboriums or along Lake Union. Now they are working diligently and single-mindedly to pursue their aims regardless of the effect on the community.

During the observation trip by the city at the hosp. all the helicopter trips came in high & then swooped down all three trips approach low & right over the roofs of the low condo group between 42nd & 45th St. the noise is horrendous & frightening.

Everyone knows landings & take-offs are the most dangerous

To Whom it May Concern;

I certainly do believe that Children's Orthopedic Hospital should have a helipad for transporting children in critical or acute condition. I cannot imagine anyone objecting if it were their child or grandchild, where minutes count.

Fire engines, ambulances and Medic One are noisy too, but they do save lives. It is a very poor trade-off when the noise consideration comes first!

Dear Director:

As an across-the-street neighbor of the Childrens Orthopedic Hospital I wish to record my strong opposition to the construction of a helipad and the introduction of regular helicopter service by the COH. I have had no part in the actions of the Laurelhurst Community Club; hence my opinion is not a repetition, but an independent and additional expression of opposition.

If the helipad is constructed, it is perfectly obvious what will happen: (1) after that expenditure, there will never be a subsequent vote of disapproval; and (2) the expenditure will have to be justified by maximizing the use of helicopters. Whatever the Hospital people may say now, and may honestly believe, all the psychological forces will be toward increased use of helicopters for all kinds of purposes. There will be no way of monitoring these flights. There will inevitably be a very bad effect on a residential neighborhood already suffereing from the constantly increasing density of traffic generated by hospital business.

Please note this: some time ago a hospital employee was heard to remark that she hoped the helicopter flights would soon be in so that she could use them for commuter service to Sea-Tac airport. That is precisely the kind of thing that there will be no way of stopping if helicopters are ever permitted.

There has been a great deal of doomsday talk about "saving a life." Even the hospital, however, though it is given to translating things into life-and-death terms, has not claimed that a life has ever been lost under the present system. The present system has obviously worked very well indeed. The desire for helicopter landings here clearly reflects, though the motive may be unconscious, not a dire need but a desire for, and a fascination by, new techniques, mechanical aids, sheer convenience, etc.

"Saving a life" is simply not relevant. But talk about it obscures another value which gets lost in the excitement--namely, the quality of life for hundreds, and probably thousands, of people in a residential neighborhood which should be saved from further inroads of a business-and-industry way of life.

I hope that your division will rule against the construction of the helipad.

Sincerely yours,

Robert B. Heilman

JAS
Jan. 25/86

Dear Mr. Portman -

I wish to state my objections to the use of helicopters at COH.

They have been using Graves field which is not directly within a residential area. They have not had any deaths related to the 3 to 5 min. drive to COH from this site, which I believe is much safer.

I live within 300 ft. of the main parking lot. I've seen the helicopters land and take off. The take off usually takes place over the filled parking lot. I believe the safety of this is questionable.

Also the noise! One would gladly put up with it in a life or death situation but I do not believe this is the case. This will be made use of to the extent that it is financially rewarding, and I resent the use of Childrens lives to promote its approval

Dear Sirs:

This is to protest the permit for a Heliotop at the Orthopedic Hospital at 4800 Sand Point Hwy N.E. Zone 1-4-1-2/SF 5-Dvaj +8405870/K Roll-16-N

We are concerned not only about the noise, but also about the fact that they sometimes crash. Just last week a helicopter crashed at the Meat Packing Plant in Austin, Minn.

They have been flying very low here right over our apartment.

I sincerely hope you will consider the plight of all the people who live here as it is a high density population area.

Very Truly Yours
Ariel G. Nelson

1 February 1986

Beatrice Ryan, Interim Director
Department of Construction and Land Use
Room 400 Municipal Building
Seattle, Washington 98104

RECEIVED
JAN 30 1986
DEPT. OF CONST. & LAND USE

Dear Ms. Ryan,

The purpose of this letter is suggest a scope and content for the Environmental Impact Statement that DCLU has asked Children's Hospital to prepare in connection with its application to construct a helistop on its campus. These suggestions have been developed by several members of Citizens Concerned about Helicopter Transportation and represent the views of those living in the impacted neighborhoods. We believe that the EIS should cover five areas: noise, vibration, safety, air quality and alternatives. Further, we believe that the term alternatives should not to be limited only to landing sites but that alternative service alternatives should be considered as well. We urge DCLU to include the following requirements in their definition of the scope and content of this EIS:

1. The noise measurements should be made at several different landing sites and should include several landings at each site. One needs several landings in order to get enought data to derive statistically significant results. All types of helicopters that might be using the landing sites should have their noise measured. This is especially true for the Huey and Blackhawk helicopters that are now being (or are likely to be) operated by MAST. The background noise measurements at each site should be made at homesites in the neighborhoods directly adjacent to the proposed landing sites, not by busy adjacent arterials. Several noise measurement instruments should be used to record the noise instead of using just one and extrapolating its results to other locations. The number of people living within various contour levels of noise should be determined for each alternative landing site. The demographic characteristics of these people should be determined. The flight path and landing profile to be used by the helicopters during the noise testing should be carefully worked out and strictly adhered to. A noise expert from the Seattle-King County Health Department should be present as an observer during all noise tests and should approve the procedures to be used before they are implemented. The residents of the impacted neighborhoods should be given at least two days advance notice as to when the noise tests are to be conducted and should be invited to observe them as well. The helicopters should be loaded in the same way that they will be loaded when flying actual missions. Fuel levels, a full medical team and special equipment should be on board during the noise tests.

2. All vibration measurements should be conducted at the same time as the noise tests are made. Suitable instruments should be placed in several homes in adjacent impacted neighborhoods and vibration levels recorded during multiple landings at each of the proposed sites. Background vibration measurements should also be made at each of the residential sites to provide baseline data.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. The safety analysis should be customized to each proposed landing site as each will have special characteristics that need to be taken into account. Safety levels are closely associated with the frequency of flights and the types of helicopters and pilots used. Estimates of the number of flights to be made should be based on a careful analysis of the population that can be served better by helicopters than by ground transport or fixed-wing transport. To do this, one must first estimate the number of people that live in areas that can be served better and faster with ground transport. Then one needs to add those that are beyond the flying range of each of the helicopters that are likely to be used. The remainder is the population that could benefit from helicopter transport and appropriate incidence ratios can be applied to them to derive estimates of flight frequencies. Once these are known for 5 and 10 years in the future, some risk factors can be derived that can define the safety levels associated with each alternative site. Other factors that should be investigated include pilot capabilities and training, the availability of specialized equipment for dealing with adverse weather conditions, appropriate communications equipment, suitable levels of liability insurance and definitions of the parties that are responsible for any accidents that may occur.

4. One can expect that there will be significant amounts of jet engine exhaust gases blown into the surrounding neighborhoods while the helicopter is landing, running on the ground and taking off. We know from observing landings at the intramural field and at COH that these gases smell very bad and presume that they can be expected to have some adverse health effects. What is the content of the exhaust gases from twin jet engines like those on the Agusta and MAST helicopters? What are the likely health effects of these exhaust gases on the residents of the neighborhood? These estimates should be based on the projections of use and detailed analyses of jet engine exhaust gases from the machines most likely to be used at the various alternative sites. A model of dispersion should be used to estimate how the gases can be expected to move from the landing site into the neighborhoods.

5. There are several alternatives that should be investigated as follows:

a. The do-nothing alternative. A clear and detailed description of the way that MAST helicopter service has been provided to COH during the past five years should be presented to provide baseline data to use in the evaluation of the do-something alternatives. The benefits, costs and impacts of continuing past practices for another 10 years should be presented in this section.

b. Landing MAST and Airlift Northwest helicopters at the UW intramural field. There are several suboptions under this general heading. They involve locating a site suitable for all-weather operations that have good access to ground transportation vehicles. Careful noise and vibration measurements need to be made at all alternative landing site locations in this area. The University of Washington should be an active participant in these investigations because of the UW's responsibility for the safety of the people that are often involved in sports activities at their intramural fields. This section should describe the benefits, costs and environmental impacts of using

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

feasible intramural field sites for landing helicopters.

c. Landing MAST and Airlift Northwest helicopters at Children's Hospital. There are two suboptions under this general heading. One would be to land on the roof of the hospital and the other would be to land on a specially constructed helipad located near the entrance to the emergency room on the north side of the COH complex. Extensive noise and vibration studies should be conducted at both sites. Since a helicopter cannot presently land on the roof of the hospital, such landings should be simulated as closely as possible in order to get adequate noise, vibration and safety data.

d. Landing MAST and Airlift Northwest helicopters at a site at the Sandpoint Naval Support Facility There are several landing site options that should be investigated by the applicant at the Sandpoint NSF. Extensive noise and vibration studies should be conducted at all sites found to be feasible at the NSF.

e. Concentrating all initial care for critically ill neonates and children at Harborview Hospital. This alternative would assume that all children arriving by helicopter be seen first at Harborview and then be transferred to COH or other locations by ground ambulance if appropriate. Such an arrangement would concentrate all helicopter landing activity at Harborview and eliminate the problem at COH and University Hospitals. A careful investigation of this alternative is needed to determine its benefits, costs and environmental impacts to both providers and consumers of emergency medical services.

It is recognized that the University Hospital intends to operate a helicopter service with a landing site on the roof of its new East Wing in the near future. We believe that it would be beneficial for all concerned to have both of these proposals revieved concurrently. If this is not possible, the COH EIS should contain as complete a description of the proposed UW helicopter service and its relationships to the service proposed by COH. If any way can be found for the two hospitals to share a helistop, such an alternative should be given careful study.

Yours sincerely,

Jerry Schneider Anita Francis

RE: Scope of the EIS of Proposed Helistop at 4800 Sand Point Way

Dear Ms. Ryan:

We understand from discussion with Department staff that the EIS for the proposed helistop will cover a minimum of four areas: noise, vibration, safety and alternatives. Further, we understand that the term alternatives is not to be limited to alternative landing sites but that service alternatives will be considered as well. We appreciate the opportunity to comment on the proposed scope.

We ask that two additional areas be addressed: the cumulative impact which can be expected if a permit for the proposed helistop is granted and the effect on air quality.

Establishing a helistop at COH would set a precedent of City approval for onsite landings for interhospital transfers. The precedent can be expected to apply to all hospitals. As you know, the University Hospital is actively preparing a request for approval of a helistop. To compete, other hospitals will have to provide this service also. The areawide implications of an initial approval of onsite helicopter landings are significant.

Helicopters require several times the quantity of air polluting fuel as the alternative ground transportation vehicles. The Council should be aware of the effects of jet exhaust gases on the neighborhoods in making its decision on the helistop proposal.

The validity of the projections of environmental impacts will depend upon the accuracy of the proponent's projections for use. We look to the environmental impact statement for a definition and projection of the proposed use. The project's objective and criteria for use should include a list of limitations which would be imposed and a plan for the monitoring and enforcement of those limitations.

Reasonable limitations might include that the helistop would not be used: for transfer of patients who could be safely transferred by ground; or for transfer flights originating within seventy or outside one hundred and fifty miles of the hospital; or for flights where the origin is closer to another hospital qualified to treat the patient; or for trauma or burn patients which will go to Harborview; or for neonatal cases unless University Hospital beds are not available; or for any purpose other than transport of patients to the hospital; or for landing heavy or inadequately maintained equipment.

The limitations on use must be clarified. The effects on the community of one landing a year are quite different from those of one thousand landings. With the use defined, the number of expected occurrences can be derived from pertinent data on the population and area which would be served. We expect to see that data and the proponent's criteria for use discussed as it relates to the area's land use and environmental policies and to City goals.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In addition, the validity of the projections of environmental impact is also dependent on the hospital's future growth and program development. For the Council to adequately assess the effect of the proposed helistop, the hospital's five, ten and twenty year plans for development should be included. The environmental consequences would be quite different if projected from a COH plan to return to its original objective of providing for chronically ill children than they would be if the plan is to evolve as a trauma center.

We expect your experienced staff to fully anticipate the needed scope and content requirements. We do have one special request. We would like the analysis to include the potential impacts on the children and staff in the hospital. The quasi-public nature of the hospital's work make this consideration both reasonable and responsible.

We know that you are committed to preparing a professional analysis and unbiased document. If it is appropriate and allowable, we would like a representative from our community present at the scoping meeting. Otherwise, we would like to review minutes of the meeting when they are available.

Sincerely,

Robert Klug, President
Laurelhurst Community Club

Seattle, Washington 98104

RECEIVED
FEB - 3 1986

Dear Ms Ryan:

Thank you very much for being as watchful as you are over the proceedings Children's Orthopedic Hospital is using to get permission to construct a helipad. A private helicopter service in any residential neighborhood should always be looked at very carefully before permission is granted. We urge you to include in the environmental impact statement considerations regarding noise, safety of the area residents, and the increased fire hazard that a low flying aircraft would surely bring with it. I am not against helicopter service for sick children. I have lived in this neighborhood for five years and have been awakened by the MAST helicopter many times as it brings sick children to the emergency room. To the best of my knowledge, this service has worked admirably over the last ten years and I believe that no child's life has ever been lost in the three minute transfer between the playing field at UW and the emergency room at COH. I am convinced that no other means of emergency transport is needed and I hope your department will scrutinize this issue very carefully.

Sincerely yours,

Carolyn Margon

SEATTLE CITY COUNCIL LEGISLATIVE
JAN 23 1986

391[illegible] 48th Place N.E.
Seattle, Washington 98105
January 17, 1986

Mr. Jim Street
600 - 4th Avenue
11th Floor, Municipal Building
Seattle, Washington 98104

Dear Mr. Street:

As a Laurelhurst property owner, I wish to express my views on the land-use issue to be considered soon by the City Council concerning the construction of a helipad by Children's Orthopedic Hospital and Medical Center.

I urge the council to approve the hospital's request for a conditional land use permit. The concerns which I have heard and read on the part of some Laurelhurst residents seem to focus primarily on noise and safety. It seems to me that a few minutes of helicopter noise occasionally is a minor matter when the life of a child may depend upon the utmost speed. As for safety, I'm sure we face far more danger daily from automobiles, pollution, and criminals than from the possibility of a crash by Airlift Northwest's helicopter.

It is proper and natural for residents of any community to be actively concerned about any proposal which alters zoning and land use. However, this request does not seem out of line. When one buys property near a hospital, one should expect the noise of ambulances, increased traffic and parking problems, and possibly the transport of emergency cases by airplane. I believe that those opposing this request represent a highly vocal minority.

Sincerely,

Carolyn S.R.B. Scott

Re: Helistop- Children's Orthopedic Hospital

Dear DIRECTOR:

Thank you for your notice of decision, dated 1-13-86 and opportunity to address the issue of environmental impact of the proposed helistop at COH.

My first letter related to the helicopter site at COH was written 11-15-84 to the president of the Boa.d of Trustees at COH. Subsequently I have written dozens of letters and copies which have been sent to city, county, state officials and departments and which should be on file in the various offices. I have copies of these letters. I have attended many, many meetings.

I am a member of the Board of Trustees of Laurelhurst Community Club and the Laurelon Terrace Homeowners Board of Trustees; but I speak as a concerned, individual citizen here. (I have lived in Laurelhurst since 1953.)

My concerns, which I suggest ought to be included in the environmental impact statement, are as follows:

1. Safety - Let's stop tragedy from occurring before it happens. We read about helicopters and other small planes crashing within city neighborhoods across our nation. The COH helipad site is within a high density residential neighborhood. Approximately 150 feet from Laurelon Terrace condominium complex, consisting of 136 units, the flight pattern will cut a diagonal path across these condos. It is within 1½ blocks of an elementary school as well as a block from many single family residences. Site allows no margin of error--engine failure, malfunction, poor weather conditions (visibility), etc. These residents are not expendable

2. Vibration and noise factors - Low-flying and landing helicopters cause very real disturbance and pose unhealthy conditions as noise decibels are well above acceptable level for healthful endurance. Vibrations are felt and are disturbing especially to all within the flight pattern across Laurelon Terrace but also to all nearby residents. Flights will be anytime during day or night disrupting not only peace of mind but sleep, too.

3. MAST helicopters - The proposed site is not large enough to accommodate these large planes. On 12-6-85 at 10:17 a.m., a low-flying (approximately 200 feet) MAST helicopter circled several times over the Laurelhurst area, the Laurelon Terrace Condominium area, and the Laurelhurst Elementary School. School was in session. Hundreds of children's lives were endangered as well as hundreds of residents' lives. The MAST helicopter could not land on site repeatedly used by other helicopters at COH because of inadequate space; therefore, it landed in the parking area after circling several times. Time was lost and extra transfer of patient required.

4. Alternate sites - Several other sites are available and adequate. There are no problems on record, no loss of life has been documented for landings (past and present) at UW soccer field with transfer by ambulance within two minutes from COH. Another site is Sand Point Naval Station which is just five minutes from COH. In addition, a helipad is to be soon in place at University Hospital a short distance from COH, also.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The quality of life, the health and safety of residents whose homes are contiguous to COH and those within a block or two ought to be considered as high priority. For many residents the helicopter landing at COH would be like it landing on their roof top or in their front yard. Is COH, is the City of Seattle prepared to take responsibility and pay for loss of life and property in case of crash? The rights of these residents are being abridged and/or ignored.

Within the past five to six months, repeated helicopter landings have occurred and have been documented by residents. These landings have occurred without permit; these landings are illegal. The impact has been felt.

Please consider the above-mentioned factors carefully. This institutional encroachment in a densely populated residential neighborhood is a clear endangerment of life, property, and environment. Of course, it likewise is a horrendous duplication and excessive expenditure -- these impacts are economic and must be considered by another department as rise in medical costs escalates.

Thank you.

Sincerely,

Maryann E. Spangler

Re: Illegal Helicopter Landings at
Childrens Orthopedic Hospital

Dear Ms. Miller:

On Sunday, July 13, 1986 at 5:01 a helicopter came in for another illegal landing. The noise and vibrations were extremely loud and jarring. In fact, the vibrations were so strong and l[illegible] that I heard a crash in my kitchen and went in to find one (of a matching pair) of my favorite English antique "Blue Willow" plates had been vibrated out of the plate hanger and crashed and broken all over the floor. I later saw one of the elderly ladies (91 years old) going over to check on her neighbor (also elderly) to see if she had survived the onslaught of another illegal helicopter landing.

The value of my property has been severely impacted by this intrusion into our community. I realize there is another side to the story (one that the hospital uses to influence people to accept this incredibly disruptive plan of theirs which I feel is motivated more by economics for the hospital if the bottom line were known).

I live in direct line of approach to the hospital and would never have bought in the area if I had known what I know now. The parking garage was added after I bought my condo (4-5 years ago) and from an esthetic standpoint, it is nothing but ugly and spoiled the hillside on which it sits, further deteriorating the surroundings.

This letter may sound strong but it is a reaction to the invasion of undesirable forces which we who live in the shadow of Childrens Orthopedic cannot get away from. We are trapped and must suffer whatever comes over our heads. It's too late to get away once you have heard the approaching of those helicopters, its like being in a combat zone and somehow you feel sympathy for people who have been in a war zone.

Either the Orthopedic should buy out the approaches or cease and desist their illegal practice.

Sincerely,
Pat Lundquist

Marie Davis and John L. Prinzin
4810 134th Place Northeast
Marysville, Washington 98270

Dear Marie Davis and John L. Prinzin:

Thank you for sending me your thoughts about the proposed helistop at Children's Hospital.

The proposal presently before the City is to construct a helistop. The Department of Construction and Land Use (DCLU), is the City agency responsible for evaluating individual applications with the ultimate decision being made by the City Council. They have asked COH to prepare an Environmental Impact Statement addressing factors including noise, safety and cumulative impacts which could result from the helistop.

I sent a copy of your letter to Julia Gibb, the DCLU Land Use Specialist reviewing the application. She will notify you when the Draft Environmental Impact Statement is available for review and comment and about any public hearings that may be scheduled.

If you have further questions about the decision process on the helistop, please call Julia Gibb at 625-4509; she will be glad to help you.

I am confident the City's decision on the helistop will acknowledge both the medical needs of children and the concerns of residents in the neighborhood surrounding Children's Hospital.

Sincerely,

Charles Royer

Dear Mayor Royer;

I am a citizen concerned about the proposal before the Seattle City Council to ban the helicopter landing site at Childrens Orthopedic Hospital, because of noise pollution.

In the event of an emergency, espically when a child is involved, there should be no barriers. A child is our most important resource and everything should be done to sustain his or her life.

Perhaps noise levels could be more closely monitored at rock concerts and sporting events instead of at our hospitals, where lives are being saved not endangered.

We as concerned citizens should all work to put down such a proposal.

Thank You,
Sincerely Yours;

Marie Davis

Dear Mayor Royer,

Enclosed is a copy of a letter, written to Mr. Glenn Wright.. of KIRO Television.

We think you should have a copy...as, perhaps..you might want to do sometning, about this proposed 'nuisance problem.'

Maybe you do not care, either..and..cannot..or do not want to anything to help us in the matter of noise pollution. We have voted for you..but, we are quite dismayed at how you've let our, once beautiful city, 'slip and slide' into pestilence/pollution of all kinds. Just name it!! We REALLY THOUGHT you were going to 'work for the people!' Ha!..the joke is on us!! Politics again! 'you rub my back..and..I'll rub yours!!' At least, that's what it seems to be.

You have our comments..for whatever they're worth to you.. probably nothing!!

Sincerely,
Mr. & Mrs. Robert H. Means

Mr. Glenn Wright, Vice President, General Manager
KIRO Broadcasting
2807 - 3rd Avenue
Seattle, Washington

Dear Mr. Wright,

Your editorial, last night, on a proposed 'heli-port'..or..a 'heli-pad' at Children's Orthopedic Hospital, has us just infuriated!! And...that's putting it mildly!!

If a heli-pad is shoved down our throats..the way Seattle's becoming a so-called 'sanctuary city' was, also...then, our neighborhood will become a 'living hell' of even more noise pollution. It already has been the latter, since 1970. Even worse, when all of the jets started flying over, this area, in 1982. It's just NOISE..EVERY DAY!!

Both of us were born and raised in Seattle..and..have lived in this house all of our married lives..29 years. Never did we think we would live to see Seattle become just EXACTLY LIKE the dirty, polluted and unfriendly cities..in the east part, of our country.

We have thought about moving..but, we cannot afford anything better..than, what we have...so..we're stuck here. We just cannot understand such total ignorance, on your part, Mr. Wright, about what constant noise pollution and stress, from said pollution, does to people. It makes them sick!! Once a heli-pad is established, then helicopters won't just be coming here..'once and awhile'..as you said, last night. People will be hiring helicopters to fly in here... ALL OF THE TIME..morning, noon and night!!

You must think we're just a bunch of 'dumb-bunnies' and selfish people, out here. Not so!! We have had all of this noise pollution 'up to here!'...we ARE FED UP!! Yes, a baby's life was saved..and.. that is good!! But, what about ALL of the many other souls/lives, who live here..and..what continual noise will do to all of us??? Do we not count for anything?? One life, against MANY...is minimal.

You do not even live, here, Mr. Wright...so, what do you know?? It's easy for you and others, who do not live here..to 'preach' for a noisy heli-pad..and..the hell with all of us, in this neighborhood.

Lastly...keep your nose out of things that do not pertain to yourself. What with all of the 'info' on noise pollution on TV, magazines, newspapers, etc.....now can you still be so very blind and completely thoughtless on this situation?? Anyway, we have had

Dear Ms. Gibb,

I am writing in support of Children's Hospital and Medical Center's request for a conditional land use permit to build a helistop outside thier emergency room.

On March 14, 1986, I became the father of a 26 week premature infant who weighed 1010 grams. I consider myself extremely fortunate to live in the north end of the city (Lake City) where we have immediate access to medical centers like Children's and the University Hospital. Our child is alive, but only because of the availability of the NICU's expert medical attention on a timely basis.

I feel that our elected officals and those appointed to safeguard the publics welfare should consider my child's chances had we been living on Whidbey Island, Squim or Bellingham.

Please convey my opinions to the Seattle City Council.

Sincerely,

Gerard C. Kirchner

Gentlemen + Ladies:

I am writing to protest a Helipad at Orthopedic Hospital.

With or without approval this service has been going on for many months.

As for the regulation on building costs and limits it is a known fact that the hospital had already constructed the helicopter pad before applying for permit, thereby eliminating cost factor.

It is a scary situation having these machines flying so low over our homes - shaking not all sound and shaking our homes so badly that pictures fall off the walls and breaking figurines.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There is no hospital in the area who has better access to emergency care than C.O.H. Consider the Sand Point facility and the U.W. Wash. landing spaces (2). (Three minutes to hospitals)

One C.O.H. doctor wrote a letter to the morning paper saying that it would take ten minutes from Union Bay landing to transport a child to the hospital. Well, I am an elderly citizen and I could push a stretcher from Union Bay to the hospital in less than ten minutes — let alone an ambulance. It is not hard to see that this helicopter service will be used constantly for convenience of V.I.P.'s and seldom for the rare emergency case.

C.O.H. has brought our once quiet neighborhood many problems and ever increasing building and traffic + parking. We do not need a Helipad - nor do they

Dear Ms. Gibb:

I am writing to give my support to Children's Hospital and Medical Center's request for a conditional land use permit to build a landing port for a helicopter outside their emergency room.

As a mother of children that would use Children's Hospital and as a guild member of a guild in Woodinville, I feel that the use of a helicopter by the Hospital is of upmost importance. To be able to transport a critically ill child to the Hospital as quickly and a safely as possible is a vital requirement of a high technological Medical Center. I would hope that such as service would be available to all children that would need it.

I understand the concerns and worries of those who oppose such a service. However, I feel that the Hospital has recognized these concerns and has addressed them with options that would provide workable alternatives, that would alleviate some of the noise and safety questions. The benefit of having the helicopter land at the Hospital far outweights the dangers in my opinion.

Thank you very much for letting me state my opinions and would you please convey them to the rest of the Council.

Dear Ms. Gibb:

This a letter of support for Childrens Hospital, Seattle for a conditional land use permit to build a helistop outside their emergency room.

I am a member of Amelia Humerford Orthopedic Guild on Bainbridge Island, and have known 2 cases recently of close personal friends' experiences where helicopters have been the saving grace in the life-death situation involved.

I am "draped" daily also by the Sea-Tac air traffic over my home and find it an objectionable, as I am sure those who oppose the Medical Center's request find the helicopters.

I hope there is a compromise possible, but I believe saving lives by helicopter emergency service will say more positive things

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

I am a nursing administration employee at Children's. I understand the concerns of the neighbors who are objecting however, feel strongly that this issue is a broad city-wide issue:

* The cost of supporting severely neurologically damaged children for a lifetime affects Seattle directly as the highest population dense area who pay state taxes. The most common outcome I have seen in 15 years of nursing following a resuscitation that is not supported in a sophisticated facility ASAP is brain damage. Can we afford $1,000+ a day in medical care costs in order to spare a small neighborhood the noise of a periodic helicopter landing.

* Seattle is considered the best place in the country to have a heart attack. The capability to land at Harborview via helicopter is part of the reason we can taut this honor. Are the children of Seattle second class citizens? They can't vote but their parents can!!!

* I would want to be in the hands of skilled practitioners immediately following a life threatening "ass ult" to my body. Parents and children are not any different.

* I spent one week in February recuperating from surgery at my mother's home which is one block from the hospital. There were 2 helicopter landings during that week and I vaguely heard one of them because I was attuned to listen for the sound. I hope the City Council will come 'hear' for themselves. I would be happy to have them sit in my mother's living room for a demonstration landing then vote on this issue.

Department of Construction and Land Use
400 Municipal Building
Seattle, Washington 98104

Dear Ms. Gibb:

I am writing to give my support to Children's Hospital and Medical Center's request for a conditional land use permit to build a landing port for a helicopter outside their emergency room.

I am a mother of small children and a member of a guild in Woodinville. It would ease my mind to know that my child, as well as any child, could be transported safely as well as quickly to Children's Hospital if such an emergency should arise.

I understand the concerns of those people who are objecting but feel that those concerns about noise and safety are far outweighted by the good that will be realized if the helicopter is used.

Thank you for the opportunity to state my opinion. Please let the rest of the Seattle City Council know of my concern.

Sincerely,

Debbie Adair

DEAR MS. GIBB:

WE'VE read and heard a great deal about the controversy over the heliport at Children's Orthopedic Hospital. As parents and Seattle area residents we strongly support a permit for this heliport. It should be obvious that emergency care for children outweighs occaisional noise pollution of the neighborhood.

Please let the city council know of our opinion at the appropriate time.

SINCERELY,

Office Of The Mayor
City of Seattle

Charles Royer, Mayor

June 9, 1986

Martin C. Hansen
3843 120th Southeast
Bellevue, Washington 98006

Dear Mr. Hansen:

Thank you for your thoughtful letter about Children's Orthopedic Hospital's helistop proposal. We have received many letters expressing strong feelings about this application.

I wish it were easier to decide whether to allow this helistop, but the law requires us to make sure the helistop proposal conforms to the criteria set down in the Land Use Code. These include examination of alternative locations including sites outside the hospital boundaries.

You are right; we can all be proud of Seattle. We all have the opportunity to voice our opinions and cooperate in keeping our city, its institutions and neighborhoods as sources of pride. Striking a working balance among our community's numerous and various goals is an important responsibility of city government, and I am confident the decision made on this permit application will be one which acknowledges both the medical needs of our children and the concerns of residents.

You can keep track of the decision process on the helistop by calling Julia Gibb, Land Use Specialist, Department of Construction and Land Use, at 625-4509.

Sincerely,

Charles Royer

DCLU MAYOR'S RESPONSE DUE 5/21 LOG P3853

3843 - 120th S.E.
Bellevue, WA 98006
April 23, 1986

RECEIVED
MAY - 7 1986
MAYOR'S OFFICE

Mayor Charles Royer
Seattle City Hall
600 - 4th Avenue
Seattle, WA

Dear Mayor Royer:

I read an article in the Seattle Times entitled, "No legitimate objection to sound of saving lives," which infuriated me. Judy Horner pointed out in her letter to the editor that concerned citizens located in the vicinity of Children's Orthopedic Hospital are opposed to the issuance of a permit for a helipad at the hospital. I join Ms. Horner in stating that I am appalled at the selfishness of these people. Supposedly, the helipad, if built, would be restricted to life and death cases. Now, I ask, how often would these heartless people be disturbed?

Seattle is a city that we can all be proud of. You, as Mayor, have worked very hard to help make it that way. However, have we become so caught up in cleaning up Puget Sound, saving the salmon, cleaning up oil slicks, clean air, and keeping the Mariners in the Kingdome, that we are willing to overlook the life of an innocent child to appease a few very vocal, self-centered people? I am hoping the answer is no! It is my hope that you can use some influence in order to insure that this permit is issued to Children's Orthopedic Hospital.

My guess is that these "concerned citizens" willingly attend noisey football games, baseball games, basketball games, and dance to loud music, but think nothing of that--because it is something that pleases them. But, when it comes to putting themselves out a bit for the life of a child--well, that is another thing! These people need to answer the following question: "Would the noise be less disturbing if the life of your own child was dependent upon the use of the helipad?" Please use your influence to help save the lives of dying children.

Sincerely,

Martin C. Hansen

6/4/86

Dear Ms Gibb,

I am writing to let you know I support the helistop at COHMC. As a patient, I feel valuable time is lost in the present transport method. It only makes sense to move the child once. These children are usually in a life or death situation, therefore, I don't feel the intermediate transportation aids the immediate attention these children need — and deserve. I would like to feel assured that if my children ever needed the Helicopters Services, that they would get the needed care in the shortest time.

The concern about noise should not prioritize the life of a child. After all, it hasn't been all that many years that Sandpoint was used. The Hospital is part of the community & I think the needs of a "chosen few" do not out weight the needs of the entire community.

Please convey my opinions to the Seattle City Council.

Sincerely,

Diane Magruder

Dear Mr Gibb

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside their emergency room.

The concerns of those objecting are understandable; however, as a neighbor myself I feel that the advantages of such a service to the community outweigh the potential risk and noise involved. Being on intensive care nurse for a few years and more importantly - being a mother of a very adventuresome & curious 2 year old boy prompts me to say a quick prayer for those being affected whenever a siren is heard. I place myself in their situation and give thanks for the advanced technology & care now available and also give thanks that it is not my family. It is though with deep assurance that

Dear Ms. Gibb:

I am writing to you to support the request by Children's Hospital and Medical Center for a conditional land use permit to build a helistop outside the emergency room.

I'm obviously not a Seattle resident, and, therefore, some would feel I have no right to comment. I did grow up in Seattle, and my mother still is a taxpayer there. What is more important, however, is that Children's is the only regional facility that specializes in treatment of children. If my

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children need specialized emergency treatment they will need to go to Childrens, and I think it is reasonable to allow helicopters to land directly at the hospital.

As ~~such~~ we all know, minutes and seconds count in an emergency. My first child died as an infant in another hospital, but had she lived, she would have been transferred to Children's. I want to know that my two surviving children, ages 6 and 3, would be assured of expert medical care in the most timely way possible. I also would not want other parents to experience the death of their children because a helicopter could not land at Children's.

I can understand that no neighborhood wants its peace upset. I can identify with the helicopter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

noise concerns of the Laurelhurst neighborhood. We live in a quiet neighborhood. After we had been here about four years, the army started flying overhead to and from Paine Field. We have had to accept that noise as a price of aiding search and rescue operations (Lest you think otherwise, the copters do fly low — barely above the tops of our trees because we're on the crest of a tall hill.) The flights also come over for routine practice flights, something that would not happen in Laurelhurst.

Use of helicopters should be monitored to assure that the use is not excessive — that should be monitored by medical workers as well as others in the community. And "community" should mean the greater Seattle community, or at least the whole city of Seattle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As much as any area of a community might want to be isolated from the less pleasant aspects of the community as a whole, we all need to share in what makes our community desirable, and good medical care for our children certainly qualifies in that respect. I'm sure Laurelhurst residents do not object to the helicopters that take adults in extreme medical need to Harborview which is in a low-income area of the city. We want children to be treated as well as adults are.

I am able to write today because I was treated at CCH as a two-year old at the Queen Anne Hill facility when I had pneumonia. Children today are being saved from far more serious afflictions. I want time to be on their side. I worry

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

about ambulances having to rush too fast (and, maybe, to no avail) if the helistop is not approved; my uncle was severely injured in an ambulance that was rushing him to a hospital.

Thank you for reading this letter. I would appreciate your sharing my comments with the Seattle City Council and any relevant committees, or with Liana Gale, Executive Director of Seattle City Council.

Sincerely,

Carolyn B. Edwards

Commodore girl dies

The halls of Commodore Middle School are quiet this week as students and staff mourn the death of 13-year-old Danielle Yates. Danielle died Monday after a five-day struggle for her life at Children's Orthopedic Hospital in Seattle. Danielle was the daughter of Dan and Linda Yates.

The Commodore Middle School eighth grader collapsed during a physical education class last Wednesday. Commodore teacher and volunteer firefighter Jim Dow immediately was called to the scene where he administered cardio-pulmonary resuscitation.

Danielle had a history of heart problems, according to firefighter Tim Dahl who appeared at the school after the emergency call came. The cardiac arrest may have been caused by a ring that doctors discovered in her mouth, Dahl said.

Also responding to the scene were two doctors from the Winslow Clinic, Dr. Tom Hagger and Dr. Bruce Nitschs. Firefighter/EMT Ron La France managed to resuscitate Danielle with use of a defibrillator. Once stabilized, she was transported to Children's Orthopedic by Airlift Northwest. Dahl said Danielle was at the hospital within an hour from the time the fire department was called.

Services for her will be held Friday. A complete obituary is on page A-10.

Dear Ms. Gibb:

I have a thought which is supplemental to my letter of April 28. Since I office in the Columbia Center I regularly see helicopters fly into, and leave from, Harborview Hospital. You may see them too. No one, certainly, would dare question this access by helicopter. Access to this important emergency medical facility by helicopter is simply not questioned. Why should the result be any different simply because COH happens to be out of the downtown urban area? The important, and indeed determining, aspect should be available and speedy access to the crucial medical center which, in the cases we are talking about, happens to be COH. As I said in my earlier letter, simply because COH is located in Laurelhurst should not result in denying medical care to those families desperately in need of that care.

Yours very truly,

Meade Emory

Dear Ms. Gibb:

It is my understanding that you are the individual to whom one should express opinions with regard to Children's Orthopedic Hospital and Medical Centers request for a conditional land use permit to build a helistop. I live in the Wedgwood Community about five minutes from Children's Orthopedic Hospital and I am a parent of two small children. I have considered myself fortunate in not having to use emergency service for my children and even more fortunate to live just a few minutes away from such an excellent facility as Children's Orthopedic Hospital and Medical Center.

While I recognize that there is some level of inconvenience to our community when a helicopter needs to land at Children's Orthopedic Hospital I fully support this additional resource to our community. Each time I hear the helicopter come in it occurs to me that one more child has received a chance he or she did not otherwise have. I believe the children in the Northwest Region who don't live as close to Children's Orthopedic Hospital as I do also deserve every chance possible given an emergency for survival and a future healthy life.

Sincerely,

Ruth M. Benfield

Dear Ms. Gibb:

I understand that Children's Orthopedic Hospital and Medical Center has requested a conditional land use permit to build a helistop outside their emergency room. As a parent of a one and a half year old, I support the request. If I lived in an area of Puget Sound not accessible by ground transportation or regular plane, I would want to know that direct helicopter service is available if I ever needed it for my children.

I live in the Laurelhurst area and am, therefore, a neighbor of Children's. While I know that many in the area are concerned about the noise, I do not view the slight increase in neighborhood noise as a significant problem.

I would appreciate it if you also let the City Council know my views.

Sincerely,

Claudia Sanders

Dear Ms. Gibb:

I am writing to support the request of COHMC for a permit to build a Helistop.
I am a former patient and soon to be parent that feels anything to better the already terrific services of COHMC should be supported. I am aware of the concerns of those opposing the project, but feel the life of a child is very precious at any cost. The noise and intermittant disturbances that local residents would experience is little compared to the grief and loss a parent would feel if they lost their child. Being a mother-to-be, I would like the satisfaction of knowing that is something happens to my child, it could reach COHMC in the fastest possible manner.
Please convey my opinions to the Seattle City Council.

Thank you,

Dear Ms. Gibb

I am an employee of COHMC and I really believe we need helicopter transport available for certain situations. I am also a part time employee of Harborview and I know the helicopter transport lands there frequently. The types of cases arriving at the two hospitals, in a way, aren't that much different.
Arguments could be made about the comparative urgency of saving an adult versus a frail newborn; that would make as little sense as the Not In My Backyard attitude of some people. Personally I would be happy to hear a helicopter cruise over my house if I knew a critical baby was on its way to intensive care.
Thanks.

Dear Ms. Gibb:

I am writing in support of the Children's Hospital helistop outside the emergency room.

I am a Seattle resident and the father of two young children.

We must be able to respond as quickly and effectively as possible to medical emergencies. We are fortunate to have a hospital like Children's. We cannot deny its expertise to those not lucky enough to live in the immediate neighborhood.

I know that a few neighbors are upset, but I believe that the health of a child in desperate need of the most sophisticated health care available far outweighs their objections.

Sincerely,

Jeremy Mattox

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a helistop outside its emergency room.

As a resident of Seattle and a mother-to-be, I believe a regional pediatric medical center needs to be able to land a helicopter as close as possible to its emergency and intensive care facilities. The lives of these critically ill children transported via helicopter depend upon how quickly they can be transported to Children's and immediate care administered.

I am fortunate to have a Children's Hospital in my community, but I would hope that a mother who lives farther away would be able to depend upon the fastest transportation to Children's for her child in need.

Please convey my opinions to the Seattle City Council.

Thank you.

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Dear Ms. Miller,

Thank you for meeting with us October 7 and giving us the opportunity to present some of our concerns. We hope you will give serious consideration to our requiest that the University Hospital Environmental Impact Statement be integrated with the Children's Hospital EIS insofar as the DCLU process is concerned and that the regional planning study be completed before any helipad citing decisions are made by the city.

In relation to medical need, enclosed is a copy of a letter and editorial from Dr. Kenneth Mattox, Chief of Emergency Surgical Services at Ben Taub Hospital in Houston, Texas, and Professor at Baylor College, who states that the "use of helicopter transport for neonates is almost certainly a guarantee of intracerebral hemorrhage."

We hope that you will be successful in getting the University Hospital and Children's together to plan for a joint use helipad on the East Campus and hope you will require that this alternative is investigated in much more detail in the final EIS than it has been to date. In particular, we hope that you will require that the alternatives in the final EIS will be compared in a rigorous fashion and that the preferred alternative be derived from such a comparison and the reasons why it has been selected clearly explicated.

As Bart Baxter, the commercial airline pilot who spoke at our meeting with you pointed out, "The East Campus site is a safe, open landing area contrasted with the congested Children's Hospital site. The extra time required for the transfer must be weighed against the safety and other needs of the community. The site has been satisfactory for the past 11 years."

Thanks again for meeting with us.

Sincerely,

Anita Francis

Mr. Jerry B. Schneider
Ms. Liz Anderson
5003 45th N.E.
Seattle, Washington 98105

Dear Mr. Schneider and Ms. Anderson:

Thank you for your letter of August 28, 1986, concerning helicopter air ambulance services. As you requested, I have enclosed the editorial published EMERGENCY MEDICINE. I have also enclosed a copy of an article published in the AMA News, September 5, 1986.

While I feel that air ambulance operations are being massively overused and that by my own count perhaps 80% of the patients presently transported by air ambulance could have been conveyed just as expeditiously by ground ambulance, I do not wish these contentions to be interpreted that I am totally opposed to this form of transportation. My thesis is that is should be used only for those appropriate medical cases and should not be used merely as an expensive marketing ploy for a hospital.

In these days of cost containment when we are being asked to provide equal or better medical services at decreased costs, (i.e., an equally effective but less expensive antibiotic,) hospital administrators and regional planners should apply this same logic to prehospital transport.

As the American Medical News article points out, hospital based aeromedical helicopters have the worst accident rate in modern aviation history. The reasons for this are numerous. The double tragedy occurs when an unnecessary death secondary to the crash occurs and close analysis reveals that the mission was not required or the patient's conditions was such that air ambulance transport was either unnecessary or contraindicated.

Sincerely,

Kenneth L. Mattox, M.D.
Professor of Surgery

Viewpoint

Kenneth L. Mattox, M.D.

Standards for EMS Helicopter Transport

Currently, over 100 hospital-based air ambulance services are in use in the United States and they represent a multimillion dollar industry. The cost of purchasing a helicopter ranges from $700,000 to $1.5 million and the annual operating budget is in excess of $1 million per helicopter. The cost of an air ambulance ride ranges from $200 to $1800, with the national average close to $1000; an ambulance ride on the ground averages $100 to $120.

Responsible spending of the health care dollar is now mandated by DRG regulations. The same logic that decrees the in-hospital use of less expensive but equally effective antibiotics should be applied to prehospital transport. One must question the percentage of helicopter-transported patients who have medical conditions that, on close scrutiny, do not even require the use of a basic life support ground ambulance. Urban time-distance studies have shown that a ground ambulance 35 miles from a hospital can deliver a patient just as fast as an air ambulance with comparable advanced life support personnel on board—and perhaps achieve greater patient stability. Therefore, from 50 to 80% of patients transported by air ambulance could be transported just as efficiently and at considerably less expense by ground ambulance.

Air ambulance flights may actually be detrimental to some patients. The tight cabin space prevents effective interventions during flight. According to some neonatologists, a helicopter flight for a premature infant almost guarantees an intracerebral hemorrhage.

In some cities, air wars just short of blazing guns are waged between helicopters from competing hospitals and the helicopter crew that wins will transport the patient to their hospital even if a quality medical center lies closer to the emergency center or site of accident. Investigation of some recent helicopter accidents revealed that in more than one incident, the patients being transported did not have conditions that warranted air ambulance transport, nor was the distance great enough to require such an expensive and risky vehicle.

The helicopter can be a valuable transport modality when used appropriately. To reduce the possibility of misuse, national standards for air ambulance transport are long overdue. I would like to propose four basic standards:

1. Air ambulances should be limited to patient care activities; they should not be regional multipurpose helicopters used for weather, traffic control, police, and other activities as well.
2. Air ambulances should be used only for patients who require advanced life support.
3. The use and dispatch of an air ambulance service, whether public or private, should be under the direction of the regional EMS director who supervises regional ground ambulance activities.
4. An advisory panel composed of individuals who have no financial interest in the hospital or hospitals that own a helicopter should regularly review the necessity, effectiveness, and regional economic impact of air ambulance operation.

Through implementation of such standards, the true value of air ambulance operations will be preserved and misuse for marketing or strictly competitive purposes will be eliminated.

A member of EM's Editorial Advisory Board, Dr. Mattox is professor of surgery at Baylor College of Medicine and director of emergency surgical services at Ben Taub General Hospital in Houston.

i. Air quality and odor - were not reviewed because proposal would not have significant effect. Each time there has been a landing I have been aware of a terrible odor associated with the emissions of the helicopter. This will most likely affect those residents closest to the proposed site. Please include a discussion of what is causing the odor, how toxic this emission; is, what, if any, will be the long term and cumulative effect on adjacent residents, with particular attention to pregnant women.

iii. Climate - should have been included and not determined non-significant. While the construction of the helipad does not affect the climate, the climate will affect the operation of a helicopter service in this area. There is not an adequate discussion of weather in this document. Please include a <u>specific</u> discussion of what conditions allow Airlift Northwest to fly or <u>not</u> fly, how frequently (in days, not percentages) will there be winds from specific direction (i.e., out of northwest quadrant requiring the use of secondary flight path.)

1. How often can predict rain, fog, sun
2. How often is visibility less than 500 ft.
3. What will visibility have to be in order to fly?
4. How will pilot be appraised of area condition at COH?
5. How does climate at COH differ from Boeing field?

C. Water iv. page xi. No discussion is included. Thes people living adjacent to Laurelon Terrace are very aware of the underground springs that run through the hillside that includes COH Campus. With each phase of building on the campus comes disruption to the springs and consequent flooding in the Laurelon Terrace condominiums. Please address this issue in the next document by answering these questions:

1. What is the potential for flooding in Laurelon Terrace as a direct result of the disruption and paving over of the hillside?

2. Who will be responsible and liable party in the event of flooding or continued flooding and inevitable damage?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. What conditions might DCLU impose on permit to build helistop that may mitigate this potential impact on nearby residences?

2. Built Environment pg.xii.
iii Release of toxic or hazardous materials. This is not revieved and is deemed non-significant. There is a liquid oxygen tank (5000 gal. drum) located on COH campus. Please discuss the potential effects on residents in the event of a helicopter crash that ignites this highly combustible material.

b. Land and Shoreline Use.
iv. Aesthetics -- not reviewed, non-significant. This proposal will greatly change the aesthetics of the surrounding neighborhood. What is a quiet residential neighborhood is transformed to a "war zone" each time one of those helicopters land. Many people who have witnessed landings by Airlift Northwest and MAST (Military Assistance to Safety and Traffic) have remarked that they felt as if they were in the middle of Viet Nam. The sound of the incoming helicopter frequently "blankets" the entire neighborhood from some distance away as it is approaching the hospital. Please discuss the potential psychological effects on neighboring residents who must experience the anxiety and fear each time a landing occurs, and the anxiety of "anticipation" that is associated with this proposal. Please include in your discussion the potential effects on the patient population at COH--with specific attention; to the fact that this population is <u>obviously</u> physically debilitated to start with.

pg.iii. Light and Glare--not reviewed, not significant. How will the lighting on the helipad effect the nearby residences? Will there be lights only when the hospital is notified of incoming flights or will there be lights on 24 hours a day? How will light projected from the helipad effect the sleep patterns of neighboring residents?

pg.xii.ii.Vehicular Traffic. Not reviewed--not significant. Will an ambulance have to meet each patient transported directly to the ER door of COH as is done at Harborview currently? If not, please discuss why not. On Page 2, para. 1, DEIS it is stated that "upon arriving at the helistop, the engine would be shut down, <u>a ground crew</u> would assist the on-board medical team for transporting the patient to the emergency room." Please define what is meant by a "ground crew".

pg. xiii. d. Public Services --Fire. Please include in the next document, a detailed discussion of what would be done in

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the event of a crash and/or fire on or near the Campus of COH. What unit would respond to the site? What special training if any would be required of the personnel involved? How much time would it take to respond to the COH Campus? What emergency procedures would be followed in the event of a crash on the elementary school playground or the nearby park? What special program if any could the fire dept. conduct at the schools (Villa Academy as well as Laurelhurst Elementary School) so as to educate the population on how to respond in the event of an emergency landing or a crash.

Please include in this discussion the identification of any special fire fighting equipment that will be stored at the helipad and how CO personnel will be trained to respond.

iii. Schools - because there was no increase in population, a discussion of the impacts on the two elementary schools in the Laurelhurst neighborhood was deemed non-significant. I find this hard to believe in light of the fact that one of the major safety points that has been repeatedly raised as a result of this proposal was the close proximity of the proposed helipad to the school and the fear of a crash there. Include in the next document a complete discussion of the potential impacts on both elementary schools. Key points addressed should be:

1. Noise impact on classroom instruction
   A. How often will classes be disrupted?
   B. What will be the noise level experienced by the school?
   C. How can impacts be mitigated?

2. How often can the school expect direct overflights?

pg. xiii. Parks and Recreation

1. Please discuss how often the Laurelhurst Park will be overflown.

2. Who will respond in the event of a crash?

3. What will noise impact be on people using the park? How will that effect the u0se of the park?

pg. xv. Distribution List

Why were the community clubs surrounding COH not sent a DEIS? Not even the Laurelhurst Community Club was sent one. Please see to it that the next document is sent to the following community organizations:

Laurelhurst C.C. Bob Klug Pres.
View Ridge C.C. Bob Di Julio
Hawthorne Hills C.C. May Kemp

Central Seattle Community Council Federation Beth Means

Page 1, para 2. There is an inadequate discussion of what the objective of the COH proposal are. Please include a discussion of what role "marketing" plays in this proposal, as it is well documented that marketing plays as much of a role in the instigation of these services throughout the nation as does the delivery of medical care. It is not sufficient to say that the COH insignia is not painted on the side of the aircraft. What steps has COH taken or anticipates taking to market such a service? Brochures? Physician contact? Advertising in newspapers, magazines, T.V.? And in what states will they advertise?

Page 1, para 4. It is stated that 3 trees will be removed from the site. On FAA form 7480-1, COH submits that one 50 ft. cypress is an obstruction to the flight path. Please rectify this descrepancy. Please submit as part of the final document, a copy of the current FAA Form 7480-1 that COH has submitted.

Please explain why the original prediction of 3-4 landings per month has now jumped to 10 per month;. What is the basis from which either of these predictions are made? Airlift Northwest is described as "a Seattle vendor based at Boeing Field." Yet, on the aircraft operated by Airlift Northwest is clearly stated "operated by Hospital Air Transport, Inc.." Who is Hospital Air Transport, Inc.? What role do they play in this proposal? Do they have guidelines or standards to which pilots must adhere? Do they carry liability insurance? If so, how much? How has the liability insurance figure in the Airlift Northwest contract been determined and who is the provider/vendor? Who is their contract with Seattle Jet or the four hospitals involved in the proposal?

Dr. Nicola's report predicts that over time COH could expect 15-20 flights per mention. (Mentioned on Page 1, DEIS.) Yet, Airlift Northwest records will show that for the month of August, 1986, COH recieved 17 patients via Airlift Northwest. Three or four came directly to the door of the E.R. at COH and the remainder were delivered to Harborview, transferred to an ambulance and then transported to COH by ground ambulance. Why were these patients delivered to Harborview at all? Was the helicopter ride necessary? Where did the patients come from? What was their presenting condition? If this helipad is permitted will these patients who are obviously stabilized come directly to COH via Airlift Northwest in the future? If 15-20 flights per month was Dr.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Nicola's predicted use for future then those figures need to be reassessed. If COH had 17 ANW transports in Aug '86 then 15-20 per month is a future prediction that is grossly underestimated. Please address this in FEIS.

Pg. 1. DEIS. "The majority of these flights would be performed by Airlift Northwest (ALNW), a Seattle vendor based at Boeing Field; although flights could occur by other ambulance services, U.S. Army MAST helicopters, or private helicopters." It is not sufficient to merely predict that landings will occur other than ALNW. The impacts on the neighborhood of these potential landings must be weighed just as those of ALNW. What other ambulance services in the area exist that might use this helipad? What types of aircraft do they fly? Will the helipad physically be capable of servicing these aircraft? What types of liability insurance do they carry? What will be the predicted frequency of MAST landings at COH as well as others providing this service?

Page 2 - sixth paragraph. "Impacts on patient outcome are expected to be more favorable under the proposed action....." This is an entirely subjective statement by the proponent. There is no scientific basis for this claim. All evidence to date supports the fact that in the eleven years of landings at the soccer field there were never any problems with patient transfer other than one occasion on which the ambulance became stuck in the mud. This is a problem which is easily remedied by improving the landing site or building the proper facilities at some point on the east campus of UW. The proponents further claim that anything "other than the proposed action could result in suffering, the need for prolonged treatment, or even death." Again there is no scientific basis for this claim, please remove from DEIS. Any of these could result from the patient manipulation that will be involved in landing on COH campus and pushing the patient 120 ft. on a gurney to the ER. There will be less patient manipulation involved and less exposure to the elements if the current landing situation (Graves field) remains status quo.

Page 3. 2nd para. It is stated that 3/4 of patient transports are expected to occur during daytime hourws. How was this prediction determined? This entire paragraph should be omitted from DEIS as it is based on an inadequate noise study. See remarks from noise consultant.

Page 3 (2nd para cont.)The concluding remarks of paragraph two are ridiculous. The ambulances that approach COH turn off their sirens and lights as traffic permits, but once they turn onto the COH Campus the sirens are always turned off (Shephard Ambulance, Oct.,1986) It is not sufficient to say that sirens are approximately as loud as a helicopter. Please provide specific comparisons.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Page 3. The expected statistical frequency of a helicopter accident one in every 5,459 flights or 1 every 23 years is an estimate that is based on inappropriate figures. To determine the accident probability; the proponent should have used worst case scenario which Dr. Nicola predicts to be 40 cases per month. The accuracy of this prediction is supported by the fact that COH had seventeen patients transported by ANW Aug. '86. Further the average length of flight of 48 minutes which is used in this calculation is not representative of what is reported in the ALNW actual flight logs, according to the logs.

Page 4. 1st para. If the grassy area outside of ER door does pose public risks because the site is not secured etc. why is COH currently landing there? Since the City has not ordered them to cease and desist landing will the city of Seattle share in the liability in the event of an accident? Please discuss in final EIS what current landing proceedure on campus is--what are problems associated with this proceedure. Why this proceedure will not be adequate in future as well.

Page 4 paragraph 2.
In the event of a crash and fire on COH campus in vicinity: of natural gas meter, could there be an explosion? I find it hard to believe that the natural gas would <u>simply</u> flare until shut off. Please have remarks verified by local gas authority as well as fire department.

Page 4 para.2 --
It is mentioned that there is possibility of traffic accidents associated with ground ambulance. There is also the potential for traffic accidents caused by the helicopter flying overhead along Sand Point Way. Further, when people get in their cars and drive there is an associated risk that drivers accept. It is entirely different though to sit in your own home and have the risk of a helicopter crashing on your roof because the helipad is located too close to residences. One situation involves a voluntary participation in action that could result in an accident and the other situation involves a risk that is totally involuntary! These kinds ofl remarks should be eliminated from this draft, because argum ents such as these can be presented to the point of absurdity.

Page 4 Paragraph 2
I object to the three point rationale used in maintaining that there will be no proliferation of helicopter services in Seattle.

1. The point is made that the land-use criteria used by DCLU to evaluate helistop applications limit the use of helistops to those facilities that can demonstrate that it is needed to save lives. The argument is that COH is a tertiary care facility offering specialized services to the region, and thus demonstrates the need and offers unique medical

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

capabilities that no other hospital offers in; this region. There are two problems with this logic. First the land use criteria states only that the hospital must need a helipad in order to save lives. Every hospital in the state of Washington faces life threatening emergencies probably every day. COH is not unique from that standpoint. There is no mention in the land use criteria about those hospitals having to be tertiary care facilities or having to offer unique medical services. They must only show that the helipad is needed to save lives. Secondly, Mary Bsridge Hospital in Tacoma offers the same medical services that COH does with the exception of cardiac surgery. Yet in many instances already ALNW has flown right over the roof of Mary Bridge in order to supposedly save someone's life at COH. If those people involved in transporting these patients feel that the pt. can afford the time involved to be selective about what hospital they are sent to then why is landing site at Graves Field or the East Campus not an adequate site for a helipad? Further, COH has no permit and no pad and is landing anyway, directly violating the land use code, why wouldn't other hospitals do the same?

The 2nd argument is that the PSHSA has written two proposals to develop guidelines for the siting of helistops and policies having to do with the integration of such services with the statewide EMS system. The claim is made in the DEIS that these guidelines along with those being written by the Wa. State Medical Association will deter proliferation & the improper use of such services.

The problem with this argument is again twofold: 1. Currently, there is nothing be done to promote the development of regional plan. So far many people have given lip service to the idea but there has been no financial backing of such a proposal. Accordin gto my conversations with Dr. Lothar Pinkers, there is not even consensus on what criteria should be evaluated in a regional plan. The last information that I received on this issue was that the "meat" of the plan had abeen gutted and as it stood now the plan called only for an inventory statewide to be taken of such services. By DCLU's own admission (a conversation with Katy Chaney) a regional plan would take years to develop.

According to a recent conversation with Dr. Lothar Pinkers the guidelines being developed will be thought of as "suggested buidelines." The Wa. State Medical Association does not have the authority to force compliance with such guidelines, and by COH's own admission in this document, they will also view these recommendations as suggestions, not standards with which to comply.

Why would these guidelines carry any more weight with any other hospital than COH?

Finally, COH cites the CON as being another protection against proliferation. One only has to review the history of events resulting in COH's exemption from this process to realize how ridiculous this statement is. DSHS asked COH 3

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

different times to go through this process and their responses included filing a lawsuit against the State. Currently, the UW is in the process of preparing a DEIS on a similar proposal and they have not obtained a Certificate of Need either. St. Luke's Hospital in Bellingham recently (this spring) went through the C.O.N. process. The CON committee voten unanimously to deny the application but the ultimate action taken by DSHS was quite contrary. They recommended that St. Luke's make a few changes in their proposal and the Certificate would be granted. What kind of protection does a process like this offer the public? DCLU has only to contact legislator Ken Jacobsen orl any other for that matter to verify that there is a big push; by lobbyists in Olympia to get rid of the C.O.N. process altogether. Which leaves absolutely no protection for the public from the proliferation of helipads and helicopter services.

Please eliminate these arguments from the final EIS and state that there is no effective way to guard against proliferation and improper use of such services, and that DCLU wil,l be forced to deal with these permits on an application by application bsis, which does not allow for the development of a regional plan for such services that is so desperately needed.

Please include in final document a detailed description of what the actual problem is that generated this proposal for a helipad at COH Campus. Please document all statements regarding problems that have been experienced under the past landing situation (MAST, Graves Field.)

Page 7 para 3 --Please include in next document--a discussion ofwho has classified COH as a tertiary care facility? Was this through a self designation process?
They may be the largest pediatric facility; in the area but they are not the only pediatric facility. Because Blue Cross designated 64% of a summary of cases '84-85 as unique cases, does not mean that COH was the only hospital that could administer this care. Please include a detailed very specific discussion in next document of COH's particular medical capabilities that no other hospital has. Pleas include a comparison of the capabilities and services available at COH and Mary Bridge Hospital in Tacoma. What other children's facilities or pediatric services are available in Idaho, Alaska, & Montana?

On page 8 para 4. Statement is made that "Childrens is not a trauma center, as it does not meet all criteria necessary to be so designated." Yet all supportive data in Dr. Nicola's report examines the transport of trauma victims. If there is no data avilable that suggests that neonates or other nontrauma patients benefit from helicopter transport this document should state that clearly. Please include in next publication. I request that the medical need matter be remanded to Dr. Nicola for further scrutiny. Dr. Nicola's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

next report should focus solely on the type of patients that COH transports.

Please discuss whether COH has plans to upgrade their capabilities so as to self designate themselves a regional pediatric trauma facility? Does COH plan to administer care in the future to pediatric trauma or burn viction? Does COH have a written or verbal agreement with Harborview as to who receives this type of patient now or who will in the future? Please include in next document. What sort of agreement has been signed between the involved hospitals (UW, COH, Harborview and Providence) as to the division of patients transported by ALNW?

What would COH have to do to become classified (self or otherwise) a trauma center?

Is there any provision in ALNW proceedure for their medical team to stabilize patient at <u>community</u> hospital and then transport patient by ground? If so, how do they handle billing? Will patients always be transported to another hospital? And always by ALNW? Is there any provision for team to administer care at community or outlying hospital resulting in stabilization of patient and the option of leaving patient at referring hospital? Please discuss in next document. If answers are "no" please include explanation. Please refer to Dr. Nicola's report (Pg. 3) "Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to baby's heart and lungs and check the stability of its condition."

Page 10--5th para.
There is a minimal description of the training required by paramedics. Please include in next document a complete discussion of training required for paramedics--This is pertinent to this proposal and important to include because it will be the paramedics that will be calling for ALNW in many instances. What training do they have that will enable them to decide when to call ANW? How will they be able to distinguish what patients can be transported by ground and which require air transport? How is dispatch handled--how is site determined for ALNW to land--at what risk to surrounding community?

Please expand this discussion to include the background, training and experience of flight physicians associated with ALNW. Some specifics to address:
1. Are they residents?
2. Are they intensivists?
3. Are they board certified?
4. What has been their experience in pediatric medicine?
5. Are they neonatologists?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Dr. Nicola's report suggests (Pg. 3) that "One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse to the community hospitals to stabilize a deteriorating baby."

Page 10. para 3. There is a reference to the guidelines being proposed by the Wa. State Medical Association. The proponent suggests that "It is the opinion of the Seattle King County Dept. of Public Health that any recommendations be used as guidelines and not standards." This is quite contrary to what is mentioned in Dr. Nicola's report; "I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with <u>specific criteria for use.</u>"(Pg. 4)

Please resolve this discrepancy, and include a discussion of how any guidelines proposed will be implemented by this program (ALNW). Who will monitor adherence to these guidelines? Please include in next document a copy of the patient Distribution Guide (pg.11--2nd para) that is used by hospital medical staff in determinin, appropriate medical center for treating patients. When was the last time this was updated?

It is mentioned that COH & UW only offer neonatal services (pg. 11. para 6) and that critically ill or injured pts. are generally referred to COH but HARBORVIEW is the only hospital with an operating room staffed twenty four hours a day. How long does it take for COH to become "operating room ready"? How is the ER staffed at COH? How is the ICU or NICU staffed at COH?

Page 12--1st para -- According to DEIS in 1985 there were 2 helicopter transports to COH out of 141 patients that were served by the County's EMS systems. How does this figure compare with the number of total transports thus far in 1986? How do you account for the difference?

Page 12 --2nd para. Discussion of guidelines that paramedics use for determining mode of transport. Under item #1.examples are listed of presenting medical problems that would MOST likely require helicopter transport. <u>What</u> specific areas of <u>South</u> King County would transport these patients by helicopter rather than ground?

Page 12--last para. "Under no circumstances shoul d there be a delay at the scene waiting for a ride from the helicopter." Please examine flight record of near drowning patient transported from Auburn. Did the paramedics in fact wait for ALNW to arrive at a Park and Ride lot that they had transported the patient to in order to be picked up? What was the reason for this action. What was the delay in time? What effect did this have on patient's condition?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Page 13 --item #4 "Permission to use any helicopter by a paramedic must be obtained from the medic unit's base hospital physician." Please include a discussion which details the dispatch system of ALNW. What has been used to date, and what might be contracted in the future. Please verify that the paramedic must call into the unit's base hospital physician, who then must in turn call the dispatch person for ALNW who must in turn contact dispatch doctor on call, who must then return call to unit's base hospital physician, who must then return call to paramedic unit giving o.k. How much time on the average does this dispatch system require?

Page 13 --item #6--Please explain the rationale used in determining that paramedics should not call to get estimated arrival times for MAST and ALNW.

Page 13 - last para. COH describes "critically ill or injured patients as those patients who might die or become seriously damaged unless appropriate treatment is received immediately."(Neff,1986). Please explain in next document why some patients have been flown over the roofs of hospitals that could have provided the same treatment sooner that COH administered.

Page 14, 15 & 16. Please explain how these patients were selected for this list. Does this list represent all patients transported to COH for this time frame or have these patients been selected over others to be represented in this document. If so how have these patients been selected? Are these consecutive cases that were transported to COH? What is the relationship between this list and Attachment "A"?

Page 13 last para. Dr. Neff suggests that critically ill patients who have been brought to COH include (1) near drowning --shouldn't these go to nearest hospital?
(2)premature children --may go to UW as well
(3)severe injuries --is categorized as trauma and would go to Harborview
(4)overwhelming infection--COH or closest hospital?
(5)ingestion of toxic substance--Shouldn't this go to nearest hospital?
Please include more specific discussion of what type of patient will be transported to COH and provide explanation of how and why decision would be made? The explanation that is provided in this paragraph does not make sense. If patients (trauma) are transported to Harborview then that is where the surgery would be done.

Page 17 para 5. Dr. Neff suggests that if the patient is jostled in transfer there is a risk that a child will become hypothermic due to the opening of the isolette. Is it not true that the isolette would not be opened until it was placed in the ambulance?--which would consequently have little effect on the patient?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Page 18 --Table 3.
This table should be eliminated from the draft. No one is suggesting that critical patients be transported by ambulance from Enumclaw -- only that the helicopter transporting them land at the soccer field, in which case the difference in travel time would be ten minutes or less. In addition, almost all patients from Enumclaw could be served at Mary Bridge Hospital Tacoma which is a lot closer to Enumclaw than COH/Seattle.

Please include a table that shows the difference in transport time when comparing the transport of a patient from Enumclaw to Mary Bridge and Enumclaw to COH!

Page 19 para 2 -- Please include a list of physicians that Dr. Nicola spoke with both in and out of the region in gathering information for his recommendation.

Page 19. Dr. Nicola's analysis and report are seriously flawed and should be re-examined. The data he uses to support his findings have to do with studies dealing with trauma patients. COH does not receive trauma patients. There is current data that has been released that relates to helicopter transports that should be included in an analysis, as some are now saying it may be detrimental to certain patient populations. From what bases does Dr. Nicola determine that COH may require three patient transports per month?

Pg. 20 para 2
Dr. Nicola suggests that some patients may be adversely affected by 3-5 min. delay in receiving treatment. Please have Dr. Nicola address in next medical need analysis, the issue of whether or not some of these patients are being adversely affected by the delay in treatment which is a direct result of patients not being sent to the nearest medical facility that can provide the appropriate care.

Page 20 para 5-- Please clarify and expand the statement about the phase-in of Blackhawks by MAST being altered. The reference is listed as Greenawalt, 1986. Please include in next document a detailed description which includes the physical characteristics of the Blackhawks (i.e. weight, dimensions, etc.) This is important information and pertinent to this proposal as these helicopters will land at COH once the helipad is built according to Nancy Greenawalt.

Page 21 para 4 --Proponents mention that from 1983 to date MAST transported 29 patients to COH.
--Please compare the use of MAST for transporting patients with the current use of ALNW (May '85 --present). Please explain why there has been dramatic change in number of transports.
--Please have MAST document whether or not there were ever any problems with transfer at soccer field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

--Please explain in next document how MAST will continue to operate in region with ALNW when they are restricted from competing with private transport services.
--Please include a copy of any agreement which exists betweer MAST and ALNW for the division and transport of patients.

Page 22 para 2 --Please include in next document a copy of current contract or proposed contract under which ALNW is or will operate in future. This information is critical in terms of analyzing this proposal as it (contract) "characterizes the airlift program and organizational structure, the roles of support, distrribution of revenues, indemnification, record-keeping, services extended to non-participating hospitals, and provisions for amendment and termination of contract." It is well documented that in many locations across the nation, the improper use and abuse of such helicopter services have been the direct result of the contract signed for such services.
Further, since this consortium was formed in 1984, there have been at l east two different contracts, possibly three. I have been given conflicting information about who it is that contracts with Seattle Jet, what function or role Hospital Air T ransport, Inc. serves and who carries liability insurance related to a helicopter accident. The contract which defines this structure should be made public information.

PLage 22 --There is no mention of what type of helicopter is used for back-up in ALNW service. There are times when Agusta will be serviced or inspected by FAA which will preclude the aircraft from being used for transport. What type of aircraft will be flown in this situation? What are specific features of this aircraft (i.e., dimensions, weight, engines, fuel, range, speed, seating)? How is it maintained? How does it compare to Agusta in terms of noise gnerated and what is the standard medical equipment on board? Is this aircraft capable of carrying a 160 lb. isolette unit with ventilator?
What is 147 gallons equivalent to in terms of measured weight? This is important information to include in next document as the helicopter that was used in noise test did not carry an isolette (weighing 160 lbs.) nor did it carry a full crew (only a flight nurse and pilot). It is my understanding that the heavier the aircraft the more noise it generates. At the time of the test the pilot told me that the full tank of fuel made up for the weight that would be added with the isolette and full crew. Please verify in next document. If this is not accurate information then noise studies are not valid.

Page 24 para 4 --Table two describes ALNW helicopter transports through mid June 1986, yet ALNW began services in May '85--Please include total number of transports to COH May, June and July '85. If there were none during this time please specify. Does Table 2 repreeent consecutive transports

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

to COH--were these all the transports to COH via ALNW during the time. What other patients did COH receive via other helicopter services during this time and what were the specifics of each case as listed in Table 2. If this is not a complete list of consecutive flights how were these selected?

Page 25--Table 5
Item #4 --What is basis for forecasted figures in Table 5? Please include in next document method used for these projections. The prediction is that COH's transports will grow steadily over ten year period but as a per cent of the total ALNW rotar transports, there is a steady decline. Please explain basis for this prediction in next document.
It should be noted that this table also does not reflect any "return flights" as represented in Attachment "A."
Please include in next document a table that does include numbers that are reflective of all flight segments involved in the transport of patients as proposed by COH in this DEIS. This would include the pickup of medical team at COH, the pickup and delivery of patient, and the return of the helicopter to the base. Please include predictions that allow for "return flights" as well since this is also being done and involves 2 flight segments over the community.

Accurate numbers and method for projecting these figures are critical to any analysis of this proposal, as the risk to the community must be properly assessed and weighed in relation to the benefit that patients might receive from this transport and the location of the landing site. A final EIS lacking this information would be inadequate.

Page 26 para 1. Please include an explanation in next document of why dimensions of helipad are less than what is suggested by NEMSPA. And please describe how dimensions of COH's proposed pad compares with those suggested in FAA guidelines for construction of helipad.

Page 26 para 2.
What is meant by "generally helicopters are given more latitude in their operations than fixed wing?" Please explain.

Page 26 para 3 --Please include in next document a copy of current FAA Form 7480-1 filed with FA in regard to COH's proposal for helipad.

Please note that because there is little or no monitoring of this type of flight activity once approved by FAA --the burden of dealing with pilot negligence and deviation from approved flight path rests with the citizen as FAA states quite clearly that unless complaintant can prove negligence or operation of aircraft in unsafe manner, the FAA will generally not take any action on complaints. Is the City ready to share in the responsibility of monitoring these

NOTICE: IF ... DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

flight paths? What role might the City play in enforcing adherence to these flight paths? What authority will City have over aeromedical pilots if this permit is granted?

Regulation:

While the Wa. State Medical Association is developing "user guidelines" that may be applicable to these services as proposed in the DEIS, the proponent makes it quite clear that these will be viewed as guidelines, not standards. If there are no specific criteria to which the operators of such services must adjere, only guidelines, from what basis will a peer review committee operate? The use of guidelines rather than standards diminishes the possibility of any group or agency having any authority over such services. WHat would characterize inappropriate use of such services if there are no standards with which to comply, and what legal support would exist for the revocation of a permit in the event of inappropriate usage? Who will assess the appropriateness of patient transfers, how often and who will empover this committee? How would this committee be selected? How can the community be assured that such a group would report inappropriate usage? How would this committee deal with the patient's right to privacy and how would committee view transports that were inappropriate but initiated by patient request? Dr. Copass has stated clearly that he is in the business of providing a service and will not deny this service to anyone. Will ALNW be held accountable for such flights if this permit is granted and conditioned with peer review? Who will be accountable COH, ALNW, Seattle Jet, Hospital Air T ransport, Harborview, the referring physician? WHat will be the consequences of violations of the permits issued?

Will there be any formal or informal public review of the guidelines proposed by Wa. St. Med. Assoc. subcommittee before they are adopted? What can the City do to insure some citizen input to the process?

Please disclose in next document whether ALNW, Sea. Jet or Hospital Air Transport, Inc. are members of ASHBEAMS. If not, please explain why. If they have enrolled please include in final EIS the criteria to which they have agreed to comply. Does the City have the authority to enforce compliance with such guidelines?
Are ALNW pilots members of the NEMSPA?

Please include in next publication of this document an interpretation of WAC 248.18.285 as proposed by the City Of Seattle legal department. Please state whether or not the City is in agreement with proponent's interpretation of ordinance. If the City is not in agreement with proponent in this regard how might the use of this helipad be regulated by COH and how would City persuade COH to do so. What consequences would COH face if they did not comply?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If DCLU issued permit to COH for construction of helipad on their campus, what possible conditions could be placed on the permit? How would these conditions be enforced and such service monitored over time? Who would be responsible for determining such conditions? Please provide a detailed discussion of possible conditions and potential for enforcement. Please suggest who would be charged with responsibility of reporting violations other than the appropriateness of transport (i.e., noncompliance with noise abatement proceedures?) A complete discussion of this topic must be included so as to determine whether or not the adverse impacts of such a proposal on surrounding neighborhoods might be mitigated in the event of a permit being issued.

The conclusion that should be drawn and stated in next publication with regard to regulation of such services is that this proposed service as well as any other of like nature are and will be totally unregulated once flight paths are approved by FAA and that no agency, whether federal, state, or city has the authority to modify, revoke, or even condition such services. Please state so.
It would be irrational, irresponsible, and certainly worthy of challenge in a court of law for the city to grant a permit for this proposal cognizant of these facts.

Pg. 29 para. 5
Please include in next document a discussion of the role the Wa. State Dept. of Transportation might be encouraged to play in this issue. In other states (i.e., Louisiana) it was this department that orchestrated and carried out formal studies of aeromedical helicopters for such transport within their states and produced an overall plan. Does this Dept. have the capability of conducting such a statewide study and plan in this state?

Has this (Dept. of Transportation) been considered in a discussion of regional planning? Since the Div. of Aeronautics "deals specifically with air transportation by participating in statewide transportation planning, assisting in enforcement of FAA regulations, investigation of aircraft accidents, providing search and rescue support for aircraft, and providing funding for public aviation facilities--it seems a natural! Please research and report results in next publication.

Page 28 para 3
With regard to section on conditional uses permitted in Major Institutions zoning.

The proponent must show that

1a. The helistop is needed to save lives. This has not been shown by information provided in this document or any other forum. OF transported patients 50% died anyway. It is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

not clear or even addressed whether the other remaining patients lives were saved due to the helistop being located at COH. --Please discuss how COH plans to document that they are in compliance with this first criteria. Does the City believe that COH has provided adequate information from which they will be able to determine whether or not this proposal meets this criteria? Please discuss how City views report issued by Dr. Nicola as well.

b. The helistop is located so as to minimize impacts upon surrounding residential property. ---Have City personnel who will be responsible for making this decision visited the COH campus and witnessed a helicopter landing? Without doing so I don't believe that one can adequately assess whether proposed site location mitigates the impacts upon surrounding residences. The City should conduct an independent survey of residences within a 3 block area all directions from COH of helipad location to determine what their experiences have been to date with the helicopter landings. With particular attnetion to how it has changed their lives (i.e. some residents feel they must sell property and move, and our exp. loss in prop. value, some have experienced personal damage due to vibration, some have experienced physical changes and psychological changes (elevanted blood pressure, sleeplessness, anxiwty, fear, stress.) A final EIS lacking this information which is available and easily obtained due to the fact that COH has been landing only feet from the proposed site since May '85--would not provide sufficient information from which to determine whether or not item b. of COnditional Use--Helistops had been met. Please conduct survey and include results in final EIS.

(NB: What type of homeowners insurance will be required of residents closest to helipad and how will premiums be effected?)

Item c. Use of the helistop will be restricted to occurences involving life-threatening emergencies. --Since this service has been operating illegally at proposed site since May '85 it seems appropriate to review <u>all</u> flight records to determine whether or not COH has been using helistop for only life threatening emergencies. Please form a "<u>credible</u>" review panel that includes objective people, lay people as well as physician and community members to determine whether flights to date have been justified. Please include

(Continue with next page here)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(18.)

Criteria for evaluation and results in final EIS. Please see Attachment "A" as this reflects that use of helistop is not being used for life threatening cases, i.e., return flights etc.

2. "The directors report shall examine alternative locations for the helistop, including sites outside the institutions boundaries which would accomplish the purpose of the helistop with a lesser impact upon residential areas."

The purpose of the helistop according to COH is two fold; critical time saved and decrease in patient manipulation. Locating the helipad at an alternate site located on the UW east campus saves the same amount of time in transport, less a few minutes. These few minutes that might elapse because of an additional transfer can be made up on some other leg of the transfer with minimal modifications. I'm sure ALNW can do something which would allow them to take off sooner. The COH pediatric team might respond quicker for pick up - a possible change in the flight path might make arrival at the destination sooner. Better preparations at referring hospitals may expedite the transfer. Improvement in the overall dispatching systems which Robb Child, administrator of ALNW describes as "archaic" could easily make up for the minutes lost doing a field transfer. Most peole involved in search and rescue and emergency transport will agree that it is a very small percentage of cases in which minutes are critical anyway (Dr. Nicola). In most cases transport of patients take <u>hours</u> (flight time, stabilization time, transfer time) In view of this, an alternate site at the UW campus would meet COH's first objective.

The second objective is to decrease patient manipulation. In talking to people involved in doing emergency transport, I have discovered that some people think one is really "splitting hairs" in discussing whether or not there is more patient manipulation due to an additional transfer at the east campus. The reason being is that if a site is permitted at the COH campus in the Kitchen Graden area the helicopter will land, unload a patient on to a gurney (same procedure as field) or stretcher and they will be pushed, <u>120 ft</u> (all the while exposed to the elements) into the Emergency room at COH. All the while exposed to the risk of tubes and I.V. becoming tangled, jostled, disconnected. At the field, the ambulance pulls up to the aircraft the patient is moved into the ambulance (is not exposed to elements anywhere near as long as in case of proposed action) and then is transported to emergency room directly and unloaded. He is not subjected to the jostling associated with a 120 ft ride on a gurney. The point is that neither procedure is perfect, they both have their disadvantages and one is <u>not inherently</u> better than the other.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The alternate site offers better safeguards against hypothermia than the proposed COH site. When one weighs these facts with the ever present risks to community associated with landing at COH, the prudent site selection is an alternative at UW east campus, and this alternative meets COH's criteria for decrease in patient manipulation. (Windchill factor from blades ? and 120 ft trip)

Please keep in mind that the purpose of the Major Institution Policy is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods.

Locating the helipad at the UW east campus area is not an idyllic situation. At best it is a compromise that the Laurelhurst and Montlake Communities are willing to live with. Much of our Communities will still suffer adverse imparts from the use of this alternative site. The noise will still be of concern although to a lesser degree. The flight paths may be modified but I doubt seriously altered and the number of flights COH receives via ALNW may even escalate as a result of the use of the east campus area. The burden of reporting violations will still be on the surrounding communities. What sort of compormise has COH offered to live with? They have dismissed the possibility of an alternate site saying that it does not meet their objectives. Please include in final EIS a serious consideration of alternate sites which included a realistic assessment of the proposed transfer at COH landing site.

(Please refer to testimony of Dr. Jerry Schneider from public hearing held September 23, with regard to Draft EIS.)

Page 33. para 2

1. The sponsors objectives are suspect due to the fact that ALNW is not attempting to deliver medical expertise available to critically ill patients in the least amount of time.

A. Please explain why many transported cases have flown over hospitals that could have administered medical treatment more quickly than COH?

B. What steps might be initiated by proponent and ALNW to insure that doesn't happen in future? How might geographic area be divided so as to delineate what patients are taken to what hospital?

2. They are not minimizing transport time from the place of patient pickup to ER at COH. Please describe in detail the system which dispatches ALNW. What are existing problems with ths system? How might it be changed in future to expedite transfers? How does total dispatch time compare to the time involved in transfer at soccer field?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The proposal may not minimize or reduce additional transfer.
Please define what is meant by "ground crew" that will assist in transfer of patient to ER at COH site. Will an ambulance be used to transfer patient from COH helipad to ER door, as is the case of Harborview. If not, please explain why. The proponent has not discussed what potential problems exist for the patient landed at COH and then transfered 120 ft to the ER. Please include in final EIS. Consider in discussion jostling and movement of patient, exposure to elements (i.e., rain, cold temperature, snow, hail, wind) consider also the wind chill factor produced by aircraft, the risk involved in disconnection of life support lines etc, the potential problems associated with moving patient on gurney over slick surface. Please examine what potential effects these problems may have on patient stabilization as these must be weighed against the potential problems of a transfer at the soccer field.

The 4th objective,- to construct a helistop that minimizes potential environmental impacts in a manner that would not sacrifice proper patient medical treatment. The alternative locations in this section have not been adequately reviewed and discussed in order to determine that the proposed action is the action that most effectively meets this objective. Please include in next document a comprehensive discussion of alternative sites both on and off the campus of COH. Merely stating that an alternative has been judged unacceptable is not a sufficient discussion of alternatives. Who has determined that these sites are unacceptable? If discussion does not include how transfer of patient would be made and all the other information that is provided for in the proposed action section (i.e., flight path, transfer time, transfer methods, associated transfer problems), how might the reader of this document determine whether or not an alternative is even remotely feasible? One cannot, one has to rely solely on the biased opinion of the proponent in this situation. Please redo this entire section giving it as much consideration in your document as is done for the proposed action and is required by SEPA.

In addition, please address specifically

1. Why would a route through the medical center be less desirable? The patient would not be exposed to the elements which results in proposed action.

2. Changing floors is mentioned as being a disadvantage. Does the UW share this opinion? Their rooftop location will require a descent by elevator 5 floors to the emergency door. Please address.

3. Surrounding tall trees are not seen as a disadvantage in proposed action. They have been earmarked for removal. Would this not likewise be a solution to this problem with alternative location of pad?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Please explain why flight path would change in administrative wing and surface parking lot alternative. How could landing site be any closer to residences than what it is for Laurelon Terrace? Please compare distance and report

5. Pg 39 para 2- "The significance of the safety distincitons are believed by the pilots to be negligible". The pilots referred to are ALNW pilots whose livelihood depends on the continuation of this service. Please provide an unbiased safety report that relates to the proposed action as well as the alternatives on and off campus.

Pg 39. Had all concerned parties been involved in the scoping process, there would have been an opportunity to discuss as an alternate site the possibility of sharing a helipad on the NOAA or Navy property (Sand Pt Way)

This site is already paved, lite,secured and marked with a big red H. It has adjacent parking as well. It is easily accessed from the lake without having to fly over the homes of surrounding residents. There is a paved road that leads from the site out onto Sand Point Way (short distance) and the distance to COH is minimal. (3 minutes by car). Please explore this situation as a possible alternative to a site at COH and discuss in final EIS. Since the pad is already built and would eliminate a major expense, and have minimal adverse impact on surronding heighborhoods, it should be considered.

Pg 40- Please address why the proposed helipad specifications are less than those proposed by NEMSPA for medium size helicopters. How do these dimensions compare with those suggested by the FAA?

Who would be responsible for turning on lights at helipad in event of emergency? Isn't this an additional risk to safety of community. Failure to turn on lights may result in a catastrophic accident. Please state that an added advantage to an off site pad is the option of leaving lights on 24 hours a day, and not being subject to human error.

Pg 40- Please state in next document that "future" in relation to this proposal equates to ten years, lest someone underestimate potential for growth of this proposed service. Please provide estimates for twenty year growth so that the cummulative impact over time might be properly assessed and weighed now when decision is being made.

Pg 40- Why haven't signs been posted warning people of current helicopter activity on campus as a safety precaution?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pg 41- The projection for expected flights in year 1990 is not any where near accurate. COH received in Aug '86, 17 flights via ALNW alone. 3 or 4 came to emergency room, the remainder were transferred at Harborview to ground ambulance and transported. The future (10 year) projection is representative of the number of flights COH is currently receiving. Please adjust figures and present more realistic predictions for future growth. Dr. Nicola estimates that the average number of flights that COH will receive once helipad is located on campus is 30-40. Since the proponents refer to Dr Nicola's report for support of their proposal many places throughout the draft, why are his figures ignored? Please provide realistic figures in terms of anticipated utilization, both current and projected. If COH does not agree with Dr. Nicola's figures then state so and provide argument for this position.

Pg 41 3rd para- How has proponent arrived at conclusion that COH shares 17% of ALNW total flights? Please include calculation in next document. In order to determine whether or not one can realistically predict that COH's transports will remain constant, one must have some conception of what changes in capabilities might occur. While I recognize that it is difficult to determine what physicians may leave COH in future, certainly COH has an institutional plan for growth which would reveal what additional services would be made available at COH in near future that would affect the total number of transports expected. What programs and /or specialists does COH plan to add to present staff that may affect this proposal.

It is stated that ALNW has capability of performing 80-90 flights per month. How does ALNW plan to meet demand for additional flights if requested? Would there be additional helicopters leased that might land at COH? How might an expansion of ALNW affect COH in terms of present flight #'s and expected flights?#'s What happens to flight #'s if a hospital drops out of consortium?

Page 42 para 1- Please include in next document any agreement reached with MAST in terms of landing and communication. If agreement has not been reached, please include a discussion of what is being considered by involved parties. What efforts will COH make to meet with other aeromedical transport companies in the region that may have reason to transport to COH?

Please define and describe a pre-arranged transport by ALNW.

How much time elapses on the average from the time the first call comes in to dispatch system until the time the helicopter lifts off?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pg 43 In reviewing history of ALNW helicopter service to date, in how many instances has the helicopter landed in front of ER door of referring hospital? In how many instances has there been an ambulance ride involved in the transfer at referral hospital?

How long must helicpter run after landing at COH before engine may be shut down? How long must engine run before actual lift off?

How does the number of flights transported by fixed wing to Boeing field that are met by ALNW compare with those initiated by a referring physician requiring pick up of medical team at COH? Please provide figures that are representative of service since acquisition of helicopter by ALNW.(Please review statement on pg. 43 in which proponent maintains that there would usually not be a need for pick up of medical crew at COH.)

Page 45 What patient condition might require deviation from flight path?

Please define "adverse" weather conditions during which ALNW would not fly.

Please provide comparison of FAA standards, NEMSPA and ALNW policies and/or standards for weather conditon.

How does the noise generated by the ALNW helicopter relate to the turn South over the parking garage in attempting to land at COH? What are specific dangers associated with this restricted turn.

Pg 45 para 4 - Please discuss the proximity of the helicopter to residences in relationship to the unusal winds which require deviation from normal flight path.

Please state clearly in final EIS that when winds are out of northwest quadrant and 17 knots or better, the secondary flight path will be used which puts the helicopter over the Villa Academy School, Laurelhurst Elementary, St. Bridget's Church. Many people do not look at maps and this information needs to be clear for those assessing this proposal.

Please check estimates for length of time elapsed from moment of touchdown until patient enters the emergency room. There will have to be time allowed to push patient on gurney 120 ft to the emergency room doors. This movement alone may require more than three minutes. Please adjust figures for final document to reflect this leg of the transfer.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

How long can one expect it to take for the pilot to retreive the isolette and take off. For people trying to sleep at night in neighboring residences and for patients being cared for at COH this time is critical as it is disruptive to normal sleep patterns. Please include in final document.

Conclusions drawn on page 46 (last two paragraphs) need to be supported by providing comparative figures for transporting patients by ALNW and Medic One or other responding gound transport systems. Please review all patients that have been transported via ALNW since May'85 and determine transport time for each and provide estimate for similar transport by ground. Please include origination of patient and specific time initial call came into ALNW. Also include how many actual transfers each patient experience before final delivery into ER at COH.

How might the risk of the patient destabilizing been decreased by transporting the patient to the nearest qualified hospital to administer the approppriate level of care, rather than flying to COH? Please review pateint transports May '85 to present and provide this information in final EIS. Please provide data to support claim that "time savings can reduce suffering, decrease hospital stay time and in the most severe cases, can mean the difference between life and death". If no data is available that pertains to specific nature of patients transported to COH (not trauma or burn data) please remove this statement from document. Unsubstantiated claims of this nature are inappropriate in this document.

What role will medical malpractice play in the decision to transfer patient via ALNW and/or the decision of where to land? Please include discussion relating to this topic in final EIS. Please use unbiased sources (those having no affiliations with proposed service (ALNW) or any affiliation with participating hospitals.)

Figure 7
What safety risks are associated with the noise abatement approach in figure 7.

Page 49- Please discuss "fire prevention system" that helistop will incorporate. Where has the oxygen tank been moved to? Please describe location in terms of distance from the proposed helipad site.

Please explain comment. "Childrens and Airlift have actively participated in the development of communications guidelines to ensure communication from air-to-ground is facilitated."

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please include ALNW specific quidelines on acceptable weather conditions in next document as mentioned on pg. 49- paragraph 4. In addition provide ALNW pilot qualifications. Please document that ALNW requirements exceed those guidelines developed by NEMSPA and ASHBEAMS.

What provision might ALNW make for pilots to report safety concerns without fear of losing employment? How are pilots checked out before lifting off? What sort of aircraft maintenance program does ALNW employ? What safety checks are made on craft before lift-off? Where are windshield wipers for ALNW aircraft? How often does FAA inspect aircraft- what does inspection consist of? Please provide in next document the safety record for the Agusta A109 Mark II.

What is minimum distance allowed by FAA between helicopter landing site and surrounding buildings? How close to a building does the FAA allow a helicopter to land?

Is there a weather advisor that will be stationed at COH to report to ALNW? and incoming flights- please discuss.

How does COH see a review panel functioning? Please discuss possible participants, frequency of review, violation and enforcement, credibility.

Please include in next document copies of correspondence between Tullman Trask and Trueman Katz as mentioned on page 50 in the DEIS. Also include letter to Bob Klug, Laurelhurst Community Club President with regard to same topic (Trueman Katz was sent a copy.) As your comments on pg 49 and 50 are misleading and need to be clarified.

Page 52- The 15 minute transfer may not be accurate as described. I have been told that in most cases the ambulance pulls up very close to the helicopter. Consequently the eight to nine minute estimate of moving patient from chopper to ambulance is an exaggeration. Please verify that in most instances the patient is not moved across the field to the waiting ambulance. Also please clarify for readers that proposed helipad alternative area would be paved and have adjacent parking lot and allow for ambulance to back up to aircraft.

Please provide data to support Dr. Neff's statement (1986) on pgs 52 and 53. If no data is available please remove from this document.

Page 53- Please explain what specific liability reasons would preclude COH from using proposed UW rooftop helipad. Please include any documentation of this communication in final EIS (Goertzen, 1986; Shawcroft, 1986)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Argument about traffic delaying the transfer of patient from UW to COH is ridiculous. There is a back road from stadium through east campus area that would eliminate any problems caused by congested traffic (See Public Hearing transcript, Dr. Jerry Schneider testimony) Please address this point in final EIS.

Page 56- In the limited landings section. Please address in the final EIS that the possiblity does exist for COH to remove tall trees so as to avoid deviation from proposed flight path in final approach to COH.

Page 57- In final EIS please clarify that potential mud problem may be eliminated by considering a landing site already paved as mentioned in Dr. Jerry Schneider's testimony, public hearing DEIS Sept 23, 1986.

Page 57 Para 5 - Please include in final EIS a copy of section 7.70.040 of the Revised Code of Washington and a discussion which reveals whether the city is in agreement with the interpretation made by the Hospital.

Pg 58 Please include in final EIS a report from Medic One which clearly reveals their policies on running their sirens. Also include a discussion of agreement COH has made with Laurelhurst Community and City of Seattle with regard to ambulance sirens approaching their hospital -- Please review past permits issued COH by City of Seattle.

Pg 58 Please remove statement about approval of proposed Action or Alternative not having an impact on the number of Emergency helistops constructed in this region. This is an opinion expressed by the proponent that is quite contrary to the trend across the United States that has been well-documented.

Pg 58 An added benefit as a result of reserving implementation of the proposed action for the future is that the area school populations (which have been sadly overlooked in this DEIS) will not be subjected to noise and vibration and resulting disruptions to classroom activity. In addition they will not be subjected to overflights in bad weather and possibility of crash on school play ground that most likely would involved <u>death</u> and destruction. Please address in final EIS.

<u>Helicopter Safety</u>

Pg 59 Please identify recognized authorities mentioned pg. 59 paragraph 3. For final EIS please use <u>un</u>biased sources rather than opinions of ALNW pilots. Please recognize that they may be experiencing a conflict of interest.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

This discusssion of "trends" in helicopter safety is not germaine to the issue. How many EMS programs were even in operation during the time frame 1975- 1981? How has that figure changed during the years '80-'85. Please focus on safety as it relates to the EMS helicopter industry from 1980 - '85. And include conclusion-recognized by authorities- that it has the worst aviation record in hsitory (Einhorn, AMA News, Sept 5, 1986). Please secure NTSB statistics for general aviation for the years 1982-85 and provide that information for final EIS.

On pg 60 the proponent maintains that the increase in helicopter safety is due to the increased use of turbine powered engines. But on pg. 65 Table II shows that in 1981 the single leading cause of accidents among turbine powered helicopters was engine failure or malfunction.

On pg. 65 proponent makes the argument that pilots are crashing due to striking wires or obstacles (single greatest cause of EMS accients 1977-1985) is because the pilots are unfamiliar with the landing area. I would like to submit that this has more to do with the inability to see wires and obstacles as a result of flying in restricted areas and flying at night. (See 67, 1st para). The second greatest cause of EMS accidents is power loss or mechanical failure (25%)- Thirty six percent of these accidents resulted in injury or death.

Helicopter Safety

Pg 67 It is stated that in December of 1985 ALNW refused to answer twenty calls over a two week period due to bad weather. Please investigate what happened to these patients and report findings in final EIS. Please indicate condition of patient at time of call to ALNW- subsequent treatment administered-- what hospital were patients transfered to-- geographic origin of call -- mode of transfer- time of transfer and patient outcome.

FAA standards for flying are written for and applicable to all aircraft. There is a big difference between what conditons are acceptable for commercial jets to fly in and what would be acceptable for helicopters-- Please indicate this in final EIS. Please specify what FAA standards are as well as ALNW. Who establishes the ALNW criteria for flying and how do they compare with the NEMSPA. Please include NEMSPA standards in final Document so that there is a means of comparison for the reader.

Pg 68 para 1- What is good visibility? Why doesn't ALNW fly with two pilots? (instead of 1)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

para 2- How many Agusta 109's are in operation around the country. How many are involved in EMS programs?

pg 68- Gene Hill's comments on the reliability of turbine powered aircraft is not supported by information provided in Table 11-- 42.3 % of all helicopter accidents (turbine powered) were due to engine failure or malfunction. Please ask G. Hill to comment on this and provide for final document. Engine malfunction is not the only factor that contributes to helicopter safety. Please have Gene Hill or preferably an unbiased pilot comment on potential outcome in the event of transmission failure or rotar problems.

Frank Benedict is not viewed as a reliable source in the discussion of EMS helicopter safety. In a conversation with Mr. Benedict on Sept 23, 1986, he told me that he was completely unaware of the current safety record held by the EMS helicopter industry. Please include in final EIS comments on the fact that in 1985, one out of 10 aeromedical helicopters suffered a reportable accident (Aviation Week and Space Tech., March 24, 1986). Please include this article as part of final EIS.

Pg. 68 +69- The comments made by Dr. Thomas Poulton in regard to improved EMS flight safety are not substantiated by the data represented in this document. What is meant by "early operators"? How does Dr. Poulton feel about accident rate of EMS helicopters in 1985?

If restrictive budgets play a role in EMS helicopter safety, please define. What is a restrictive budget? How does this compare with that of the ALNW budget. Please provide this budget information in final EIS. Please include all cost related information to the operation of ALNW (i.e., salaries of personnel, expenses, equipment etc.) Please explain how participating hospitals share in expenses, both fixed and variable. Please provide information on cost to patient of such services. Billing procedures, history of date of recovery of these charges. What has been experience (since inception of service) with regard to third party payors?

How does the budget of ALNW affect the judgements made in regard to which flights to take and which not?

Pg 69 para 2- Please provide specific information and data on safety record of "major vendors". It is not sufficient to say that it is someone's opinion that they have a better record. Please provide the data to support this point in final document.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pg 69 para 3- What are "insurance companies' standards"? How do they compare with FAA regulations? It is not sufficient to say they are more stringent. Please provide information . Please provide ALNW standards for pilots so that reader may make comparison. Please provide individual pilot accident record to date for pilots flying for ALNW in final document. Please specify definition of "small airport".

Pg 70 para 2- Dr. Nicola suggests COH will have 30-40 flights per month not 15-20. This document is supposed to represent worst case scenario. COH had 17 transports Aug '85-- your figures are not realistic. Please adjust for final EIS.

Pg 70, para 3- According to our review of flight logs, the average flight was not 48 minutes but 77. Please address in final EIS.

Please provide accident probabilities based on worst case (40 flights per month). Please project this probability over twenty year period allowing for growth of service. Include in final EIS.

Pg 72, para 5- Please include in final EIS Mr. Benedict's comments on which landing site would offer least safety risks to community in comparing proposed action with alternative sites reviewed in EIS and include Navy Site,Sand Point. In my conversation with Mr. Benedict (Sept 23, 1986), he was unaware that MAST had previously landed at UW soccer field and that this alternative was being considered in proposal. Has Mr. Benedict physically visited the COH campus and viewed proposed site or alternatives reviewed in this document? Please include in EIS. Comment in EIS suggest that Mr. Benedict compared the COH site only to landing areas in downtown Seattle.

Pg 72- There is no discussion of proposed medical office Bldg and its effect on landings at COH. Please include discussion in final EIS, include unbiased credible sources when determing effect. Please also include what other bldgs COH has planned to erect on its property (not just vicinity of proposed site). This development and proposed development should be considered in siting a helipad on campus.

Pg 72- Please address in final EIS- possibility of natural gas meter leaking undetected as a result of accident on site and possibility of subsequent explosion. Who is responsible for shut off of main valve across SandPoint Way? In the event of emergency-- how long does this procedure take?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pg 73- Please refer to Table 12 - Helicopter Accidents by Cause 1972-1985. 31.5% struck wires and obstacles. 22.2% flew into the ground. 16.7% loss of control. The flight path to landing site at COH includes more wires and obstacles, trees, light standards, buildings etc., than open area of alternative sites. The flight path is over homes and schools, the landing site is 240 feet from multi family housing. The landing site is located in a very restricted area -- loss of control could have devastating results. How can you possible conclude that the alternative sites would not be more safe from a helicopter accident frequency ? Please consider varying wind currents, the influence that buildings have on wind, etc.

The fact that you cannot produce any statistics on ambulance accidents involving a transfer of patient such as would be required in alternative action suggests that if a risk exists it must be very minimal-- please compare this risk to that which is experienced by locating helipad at COH.

Please have pilots comment on whether open, paved lite secured area of alternative (build helipad on East Campus) is preferred to restricted site at COH. Please have ALNW pilots comment as well as unbiased authority.

Pg 76- Please explain why exempt sound sources can not be considered a public nuisance, and what authority puts forth this information.

Pg 80- The discussion on health effects of Noise is inadequate. Please attempt to give serious consideration to this issue. As one source of infomation please refer to EPA pamphlet entitled "Noise: A Health Problem"(Enclosed). Please refer to letter sent to Hermia Ipp, DCLU, by Liz Anderson in reference to noise tests conducted at COH. Date: See file DCLU.

There is no discussion of impacts of Helicopter noise on elementary schools located in vicinity of landing site. Secondary approach departure path is over both elementaries. Please give serious consideration to this issue and present in FEIS. It is not sufficient to say that they are noise-sensitive.

Please verify that noise measurements were actually taken at only one spot designated to be measured. Other information was extrapolated from these findings.

Pg 81 There is not an adequate discussion of impacts of two bladed helicopters that will land at COH-- please address.

With what degree of accuracy can measurements taken at Harborview with regard to Helicopter noise be applied to COH site and vicinity? Different terrain, Bldgs, etc. Please respond FEIS.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

31.

Pg 81 para 6 Please verify that gross vehicular weight has negligible effect on helicopter noise. Gene Hill is not a noise expert. Provide comments by credible authority in final EIS.

Specific noise measurements should be taken at both elementary schools doing separate tests for primary and secondary flight paths. Include results in FEIS.

Pg 83- Noise information conclusions are invalid as presented in this document as the report assumed twenty patients transport or 40 round trip flights. Impacts of 40 transports per month or 160 round trip flights should be used as is supported by findings of Dr. Nicola, 1986. Please use <u>accurate worst case</u> predicions in FEIS.

Pg. 84 para 2 - The flight path that incorporates a sharp turn south over parking garage is still being used. Consequently there would <u>not</u> be a lowering of 7-9 dBA. Delete from test for FEIS.

There have been no measurements taken for backup aircraft used by ALNW which has landed several times at COH already. Please provide noise information for this aircraft in FEIS-- Please provide noise information on BlackHawk heliocpter, as military plans to replace the Huey. Provide for final EIS.

Please provide information on how hospital rooms at COH were determined noise-sensitive. If noise studies were done accurately, it would be shown that more than 30% of hospital would be awakened. Please discuss effects on patients when windows are open during summer, fall, spring of year.

How did proponent determine there were <u>no</u> known health effects associated with the predicted helicopter sound levels for the neighborhood surrouding COH? Please discuss FEIS.

The current helicopter noise awakens more than 15-20% of closest residents. Please poll the closest line of sight residences to determine.

Please address the potential impacts on residences of consecutive night flights that prevent residents from sleeping at all. This has already been experienced at least once since landings have been taking place at COH.

Why is it that in addressing noise impacts of intramural field helistop, the proponent mentions the potential disruption to class lectures at the UW--

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

but does not even acknowledge this same impact with regard to the elementary schools located in vicinity of COH. This disruption occurs even when the school is not overflown.

Pg 89- The proposed flight path does not keep helicopters at "high" altitude over Sand Point Way. What does proponent consider high altitude?

The disturbance to residences as experienced in noise abatement approach is not minimal.

Residents to the south of hospital experience disruption to lives as a result of helicopter landing at COH. Many have complained about sleep interference.

Pg 90- When did the UW receive CON approval for their helistop? Helen Shawcroft (UW) was unaware that the institution had gone through process. See testimony Joanne Brekke hearing, September, 1985.

What do long range plans of Seattle area project in terms of helicopter service acquisition?

Please note: Six months prior to COH announcing its plans to acquire helicopter service and building pad, hospital representatives maintained in a public community meeting that they in fact had no plans to acquire such services nor did they intend to build a helistop on their campus-- so much for your survey of Seattle area hospitals. Why would these hospitals divulge their plans to COH anyway? COH certainly does not share its institutional plans with other hospitals. Please delete your survey of hospitals, it has no validity with regards to the precedent setting nature of the issuing of this permit.

Ludwell Lake, EMS helicopter program consultant, has remarked in the St. Luke CON hearing (helicopter proposal Spring '86) that a consortium is the worst way to set up an EMS helicopter program. Please address in final EIS and research his "Public Utility model".

How can ALNW do an adequate job of providing appropriate medical services to public if it is not integrated to total EMS system and part of regional plan?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

See references to CON process and helicopter service acquisition by hospitals.

Your conclusions on pg. 91 are contrary to realistic results expected and experienced to date, of CON, PSHSA study, Washington State Medical Association guidelines, the city's land use process -- see earlier discussion.

Pg 91- What Dr. Nicola suggested as referenced in para 6 is illegal.

Pg 92- Please refer to comments on 1st para in public hearing speech, Liz Andreson 9/23/86. Please reconsider concluding paragraph on noise and vibration when accurate noise study is complete.

Dear Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a heli-stop outside their emergency room.

I am an employee of Seattle Central Community College and understand the concerns of parents who have children who need emergency care at the Children's Orthopedic Hospital.

I sympathize with those who are objecting to this permit due to the noise, but I feel that the good that will be realized outweights any objection that the residents may have.

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Verbalee Dance

Re: Helistop Proposal (cc 84-022)

Dorothy Teeter
Children's Orthopedic Hospital
Post Office Box C-5371
Seattle, Washington 98105

Dear Ms. Teeter:

We have outlined the permit processes for the helistop proposal for Children's Orthopedic Hospital (see attached). Under Process I, the Department of Construction and Land Use (DCLU) would complete the environmental review (SEPA) before moving to the Council Conditional Use (CCU) process. This option requires separate hearings conducted by the Hearing Examiner, and may take about 215 days. Under Process II, DCLU would issue a SEPA decision and CCU recommendation at the same time. The hearing examiner would conduct a consolidated hearing. This option would take about 113 days. It is obvious that the latter is more expeditious. We plan, therefore, to proceed with Process II.

Assuming Dr. Nicola's report on medical needs is completed by November, 1985, and assuming the environmental checklist information and noise study which we received last week is adequate, it is feasible that the Department would issue a threshold determination and recommendation on the conditional use in December, 1985. The hearing examiner may then conduct his hearing in late January, 1986.

If you have further questions, please do not hesitate to call me at 625-2781.

Re: Scoping of Environmental Impact Statement
MUP 8405870

Nancy Greenawalt
Children's Orthopedic Hospital
P. O. Box C5371
4800 Sand Point Way N.E.
Seattle, Washington 98105

Dear Ms. Greenawalt:

Based upon the Department's analysis and upon letters received during the scoping comment period, our scoping determination for the Environmental Impact Statement for your application for a helistop permit is as follows:

AREAS OF IMPACT

Noise
Vibrations
Safety
Cumulative land use impacts of emergency medical transport by helicopter in the Seattle-King County region
Alternatives
- alternative sites off-campus, including UW Graves Field (soccer field)
- shared usage of sites
- no action alternative

MITIGATION MEASURES

Possible mitigation measures discussed in the EIS shall include the following:
- flight paths
- number of flights
- usage and location of U. S. Army (M.A.S.T.) or other agency helicopter landings
- off-campus pick-up of medical teams
- liability insurance
- criteria for use of helicopters
- plan for monitoring use

Comment letters should be carefully reviewed by the consultants preparing the EIS. The letters contain concerns regarding background data, impacts, study methodology and possible mitigation measures, within the scope of the EIS just outlined.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If you have questions on this scoping determination, please call me at 625-4509.

Sincerely,

NOTICE OF PUBLIC HEARING

Notice is hereby given of a meeting of the King County Board of Health to be held December 2, 1986 at 2:00 p.m. in the King County Council Chambers, 402 King County Courthouse, Seattle, Washington.

Agenda items will include:

1) Discussion and public comment on air ambulances in King County

2) Consideration of proposed administrative rules and procedures to license and review annually four state-certified methadone treatment programs per RCW 69.54.030 and King County Ordinance 7738.

Interested persons wishing to attend or testify at this hearing are invited to do so. Written testimony will be accepted provided it is received prior to the meeting and should be addressed to: Board of Health, C/O Rita Hensley, Seattle-King County Department of Public Health, 7th Floor, 400 Yesler Building, Seattle, WA 98104. Copies of proposed regulations and licensing procedures for methadone treatment programs are available from the Division of Alcoholism and Substance Abuse Services Division, Room 1008 Smith Tower, Seattle, Washington.

TESTIMONY:
MARV GRISMAN
(Presented Sept 23, 1985
Public HEARING DEIS/
COH HELIPAD

1985

In reviewing [redacted] ncerning federal, state,
local, and private agencies with jurisdiction over helipad construction and
air ambulance servies, it has become clear that the hospital's statement
that " there is no single agency with jurisdiction" is painfully true. While
a number of agencies advise and give suggestions concerning helipad
proposals, there is no agency that is responsible for enforcement,
regulation and supervision of air ambulance services. To illustrate, the
FAA, which many assume police and assure the safety of the skies, offers
only quidelines, not specifications for helistop construction. Further, as
quoted from the Draft, the FAA will investigate complaints but will
"generally not take action" on them (p.26). At the state level, the CON
office with the DSHS has been empowered to review helistop construction,
but was unable to enforce this regulation on COH. Another state agency,
the Emergency Medical Services, has no authority for COH's helistop, nor
does the Washington State Department of Transportation. In short, this
striking lack of jurisdiction was outlined in the Draft; it was not
identifed as a problem area nor one requiring resolution. We in the
community, however, feel that enforcement and regulatory provisions
should be a necessary part of this draft and therefore ask that these
concerns of regulation, enforcement and jursidiction be addressed in the
next DEIS.

OCT 17 1986
LAW OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Some of the enforcement questions which should be answered are:

1. Who ensures that pilots abide by FAA standards?
2. Who will monitor flight paths, for compliance with noise
abatement procedures as outlined in the DEIS?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Who will ensure that ALNW functions to benefit the region, not just its sponsoring hospitals?

4. How will the appropriateness of patient transfers be assessed, with a consideration of retrospective review?

5.How will the military and civilian services be coordinated?

6. What will be the consequences of violations of the permits issued?

7. Who will monitor the safety of the flights?

While these are only a few of the questions which have occurred to us, they show our concerns with enforcement, regulation, and jurisdiction which need to be addressed in the DEIS.

We would also like to note that our concerns over regulation are neither idle nor naive; rather, they reflect a number of unfortunate experiences with COH which have impressed upon us the need to guarantee that safeguards are in place before the cat is out of the bag, the toothpaste is out of the tube. To illustrate, in 1979 and 1980, COH began a policy of charging for parking in their parking lots. This policy violated the City's Land Use Code but COH did not comply with the code until they received a number of citations(October, 1979; March, 1980). Further, the City's Land Use Code requires a permit for a helicopter to land; as far as we know, the Hospital still does not have a permit but continues to land anyway. Lastly, enforcement at the state level has been equally difficult. The State CON office did ask, on three separate occasions, that COH submit a CON application. COH refused and the State did not enforce their regulations. The failure of COH to complete a CON is of particular importance, as this regulation is one that is cited in the Draft as a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

safequard against helicopter proliferation and resulting escalating health care costs. If COH can avoid doing a CON, there is little hope that other hospitals will not do the same and the promise of a source of regulation is further undermined. (It should also be noted that there is currently a concerted lobbying effort designed to abolish CON requirements totally.)

In sum, we would like to see our concerns about regulation, enforcement, and jursidiction addressed in the EIS. The "who, what, and how" of enforcement should be an integral part of this proposal, not only so that COH can be encouraged to fulfill its obligations and agreements, but also so that the EMS system in this region can continue to be viable and effective. It is not enough to say the an agency does not exist that can oversee this proposal. What is needed is a plan for an agency, a proposal for regulation and supervision, which will ensure proper and fair compliance with provisions and standards.

Signed,
Mara Chrisman

December 4, 1985

Beatrice Ryan, Interim Director
Department of Construction and Land Use
400 Municipal Bldg.
Seattle, WA 98104

Dear Ms. Ryan:

This letter is in response to your request of August 30, 1985 for an opinion about the medical need for the Children's Orthopedic Hospital (COH) to establish a helipad on hospital grounds.

In order to review the complete facts of this issue, I have spoken with numerous physicians, administrators, community residents, and former patients. I have reviewed the medical literature on emergency medical services delivered by helicopter, viewed a simulated transport/helicopter landing at Graves Field and near the COH proposed helipad site, examined helicopter and transport equipment, held a public hearing October 24, 1985 in the City Council chambers from 6:00 to 9:00 p.m., (written testimony attached), toured the COH facility, reviewed Airlift Northwest logs and individual patient charts.

Existing Pediatric Emergency Medical Services System in Seattle

Pediatric and neonatal emergencies within Seattle which are hospitalized are generally admitted at one of the 19 neonatal intensive care (NICU) beds or 17 pediatric intensive care beds (PICU) at Children's Orthopedic Hospital or one of the 19 neonatal intensive care unit beds at the University of Washington Medical School Hospital. The only other NICU beds in the region are the 12 beds at Mary Bridge Children's Hospital in Tacoma; the only other pediatric or neonatal intensive care beds in the State are located in Spokane. All pediatric surgery in the region is currently done at Children's. Pediatricians and neonatologists from within the State and from surrounding states (Alaska, Montana, Idaho) generally use COH and the UW as referral centers for the most seriously ill children or neonates requiring tertiary specialty care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Personal health care can, in general, be subdivided into three functional levels: a primary level, where the health care system is entered and basic services received and where all health services are mobilized and coordinated; a secondary level, represented by ambulatory services of a specialist nature and inpatient services provided in a community hospital-type facility; and the tertiary level, which includes the highly complex and sophisticated services available only at a "medical center" (Alberta Parker, "The Dimensions of Primary Care" in Primary Care: Where Medicine Fails, 1974, New York, John Wiley and Sons).

The University of Washington has a program which admits high-risk mothers so that low birth weight babies do not have to be transported between hospitals. This method of delivering high-risk mothers has been found to substantially reduce the morbidity and mortality associated with the delivery of low birth weight babies (Hickok, D. et al., "Decreased Mortality of Very Low Birthweight Infants After Maternal Transport," Department of Obstetrics and Gynecology, University of Washington School of Medicine, unpublished paper.)

But even with an excellent maternal transport program, there will still be individual patients who deliver small birthweight babies at small community hospitals throughout the State, where the infant needs to be stabilized and transported to a tertiary care hospital. Even though the UW is the hospital generally designated for the care of premature low-birthweight infants, its beds are frequently full and patients are referred to COH. The same pediatric medical staff, including interns and residents, deliver services at both COH and UW. In addition to small birthweight babies who have undeveloped lungs and intestines and require intensive support for survival and growth, there are transfers from hospitals around the State to COH for pediatric surgery or acute infection. Trauma patients generally go first to the region's trauma center, Harborview Medical Center, but may be transferred to COH for follow-up after surgery and stabilization.

This referral pattern exists regardless of transportation mode.

Helicopter Transport

There are existing guidelines and standards for patient care while being transported (Guidelines for Perinatal Care, "Interhospital Care of the Perinatal Patient," American Academic of Pediatrics and American College of Obstetricians and Gynecologists, 1985) but there are no standard published guidelines for which mode of transportation to use on a given patient or, for example, which criteria a patient should have to be transported by helicopter versus ambulance. The State Medical Society's EMS Committee is working on the delineation of medical necessity or medical reasonableness for medical transport and under Dr. Lothar Pinker's direction are hoping to have guidelines published in six months (see attached letter). There are some generalities that all the experts agree on.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Over 150 miles it is most timely, stable and economic to use fixed-wing aircraft, so most interstate transports occur in fixed wing. Between 100 and 150 miles, rotary-wing aircraft or helicopters appear most appropriate, so regional out-of-County transfers appear to be the general rule. Less than 70 miles, depending on geography, ground transport is the generally agreed preference.

The key to any transportation of sick people is the stabilization of the patient, making sure that vital signs are stable and that the general physical condition is not deteriorating. One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse to the community hospital to stabilize a deteriorating baby. Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to a baby's heart and lungs, and check the stability of its condition. There appears to be a balance between amount of transport time required and possibility of deterioration.

There are several studies in the literature that assess the severity of illness and injury in pediatric air transport. In one study, Mayer and Wallie prospectively evaluated 636 patients transported over 79 months of service to a regional children's center. Of these patients, 57.5% were transported by helicopter. Eighty-one percent of patients were taken to surgery or admitted to the intensive care unit immediately on arrival at the regional children's hospital. Overall mortality was 9%; a trauma score was used to classify patients (Ann. Emerg. Med. 1984 Feb.; 13(2):108-11). At Johns Hopkins, Dr. Columbani et al reviewed 267 children over a one-year period; 46% of patients arriving directly from the injury scene were delivered by helicopter. Fourteen of seventeen deaths resulted from head injury; a more aggressive approach to the management of brain trauma was advocated (J. Pediatric Surg. 1985 Feb.; 20(1):8-13). Other areas reviewed include a Hawaiian MAST system (Hawaii Med. J. 1984 Jun.; 43(6):200,202,204); a Kansas perinatal system (Respir. Ther., Mar.-Apr. 1985, 15(2):47-50, ISSN 0048-7392.

Another study evaluating air transport in a rural EMS system looked at 569 patients with multisystemic injuries. The emergency helicopter service was rated, utilizing strict specific guidelines as either essential, helpful, or not a factor in the preservation of life. The helicopter was essential to 16.5% and helpful to 10.9% of patients. In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Baxt et al. looked at a group of 1,273 blunt trauma patients who were treated and transported from the site by seven different hospital-based rotorcraft aeromedical emergency care services and saw a 21% reduction in expected mortality ($p<.05$) in five of the seven services. There is some debate about methodologic errors in the study. An editorial in the same journal issue (Annals Em. Med. 1985 Sept.; 14:9; 859-61) states that

> The effectiveness of aeromedical evacuation of battlefield casualties is well established; the transfer of this technology to the civilian setting is a logical event. Its effectiveness for civilian trauma care should be based on the following three principles: 1) early field resuscitation; 2) rapid transport; and 3) delivery to the hospital best suited to admit and treat the patient definitely and without delay. As Baxt and colleagues point out, helicopter emergency medical service (HEMS) patients may benefit from a highly integrated team effort at the receiving trauma center that is the direct or indirect result of a program but for which the helicopter (unless distance is a factor) is the least important component. This is a strong argument for the concept of regional trauma care that concentrates multiply injured patients in trauma centers organized to best care for them. The potential role of HEMS in making regional trauma care a reality should be explored by EMS systems.

My conclusions from the literature review are that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on your question at issue, the current Graves field site versus the hospital site 3-5 minutes away.

Current Data

COH admits approximately 1,000 patients per month in 200 regular beds and 36 intensive care beds (previously described) In August of 1985 82 patient admissions were ambulance transports to the emergency room, 34 were prearranged newborn ground transports, 30 were prearranged fixed-wing transports, and 6 were prearranged rotary transports. On an annual basis, there are 400-450 ground neonatal transports through the neonatal team; 80-85% of these transports go to COH, the rest to UW. During fiscal 1985 (a one-year period ending June 31) 279 patients were transported by air: 148 into intensive care units (see Attachment 1). Thirty-nine percent of these patients were under one month of age; 16% were greater than five years of age (see Attachment 2). Seventy-one percent (197) had peripheral intravenous lines, 27% (76) were intubated, and 2% (6) were undergoing CPR (see Attachment 2).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I also reviewed the detailed flight logs of Airlift Northwest for August, 1985. There were 52 fixed-wing flights with 859 average miles per flight; 18 (54%) flights were out of State; all flights were out of County; 30 flights were to (or from) COH. There were 34 rotary-wing flights from Airlift Northwest averaging 110 miles: no flights were out of state; all but one of the flights were out of County (a motor vehicle accident to Harborview from South King County); 6 flights to COH.

Recommendations

It is my professional opinion that there are hospital transfers to COH where 3 to 5 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small. The criteria for helicopter transport in these cases would include the previous comments on distance, stable clinical condition during transport, severe injury or illness requiring tertiary center treatment (rather than secondary or community hospital level), and a strong possibility of decompensation (severe clinical deterioration) during transport. The most important part of the transport, in most cases, will be in getting a specially trained team out to community hospitals around the State.

In most cases, one single site near Graves Field would be adequate for both the University of Washington and COH; however, there will be a small number of cases at each hospital where the ability to land at the hospital may be life-saving. From the transport physicians I have talked to, about 5-10% of all transported children might fall into that category.

The number of children transported by air into COH for any given month may be 30 to 40 and based on the above criteria and clinical estimates, 3 to 4 of these patients may have a medical need for helicopter transport to the doors of the hospital.

The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any number would have to include an additional number of patients whose condition at time of referral was appropriate for air transport but who over time were determined not to have need of helicopter transport as essential. There also needs to be some flexibility for seasonal variation in disease.

Taking into account these factors, I would estimate ten expected helicopter transports for critically ill pediatric patients per month as an upward bound for COH.

I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use, rather than a hospital-by-hospital provided service. A consortium of hospitals providing helicopter services such as the one in Airlift Northwest is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

certainly a most sensible approach and will make it easier to establish a systematic approach to provision of these services. We are, however, just beginning to integrate helicopter transport into our EMS system. Once a technology is made available to the medical community, it quickly becomes a standard of care for medico-legal reasons.

Until there is a defined systematic integration of these services on a County-wide (or regional or State-wide) basis, I would recommend that the permit granted be a conditional use permit pending a defined relationship to our existing State EMS system and final development of criteria by the Washington State Medical Association's EMS Committee, and that helistop use be reviewed for appropriate medical need in six months. Appropriate use could be monitored by review of individual patient records by an outside panel which includes recognized EMS/pediatric experts as well, perhaps, as out-of-County reviewers. The Health Department would offer our consultation services for that purpose, and I believe it might also be useful to ask the Department of Social and Health Services, Division of Health's Emergency Medical Services Program, and the Washington State Medical Society's EMS Committee for consultation assistance. If a helistop were being used for purposes outside those expressly permitted, I believe it would be appropriate to revoke the permit at the end of the six months.

I hope that these observations and recommendations will assist you in your permit procedure deliberations; please let me know if any comments need further clarification. My thanks to your staff, to a wide variety of health professionals involved in delivery care, to the staff and administration at COH, to the community residents of Laurelhurst, and to a number of other interested individuals who helped me to reach a better understanding of the emergency medical services delivered to infants and children in our community and the many factors which affect those services.

Sincerely,

Bud Nicola MD

WAC 248-19-200 PURPOSE OF CHAPTER 248-19 WAC. The following rules and regulations are adopted pursuant to chapter 70.38 RCW for the purpose of establishing a certificate of need program which is consistent with the provisions of Title XV of the Public Health Service Act as amended by the health planning and resources development amendments of 1979 (Public Law 96-79). [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-200, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-200, filed 11/30/79.]

WAC 248-19-210 PURPOSE OF CERTIFICATE OF NEED PROGRAM. The purpose of the certificate of need program is to ensure the obligation of capital expenditures, the development and offering of institutional health services, and the acquisition of major medical equipment are consistent with the public policy of the state of Washington, set forth in RCW 70.38.015.

"(1) That planning for promoting, maintaining, and assuring a high level of health for all citizens of the state, and for the provision of health services, health manpower, health facilities, and other resources is essential to the health, safety, and welfare of the people of the state. Such planning is necessary on both a state-wide and regional basis and must maintain responsiveness to changing health and social needs and conditions. The marshaling of all health resources to assure the quality and availability of health services to every person must be the goal of such planning, which must likewise assure optimum efficiency, effectiveness, equity, coordination, and economy in development and implementation to reach that goal _____;

(2) That the development and offering of new institutional health services should be accomplished in a manner which is orderly, timely, economical, and consistent with the effective development of necessary

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and adequate means of providing quality health care for persons to be served by such facilities without unnecessary duplication or fragmentation of such facilities;

(3) That the development of health resources, including the construction, modernization, and conversion of health facilities, should be accomplished in a planned, orderly fashion, consistent with identified priorities;

(4) That the development and maintenance of adequate health care information and statistics essential to effective health planning and resources development be accomplished; and

(5) That the strengthening of competitive forces in the health services industry, wherever competition and consumer choice can constructively serve to advance the purposes of quality assurance, cost effectiveness, and access, should be implemented." [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-210, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-210, filed 11/30/79.]

WAC 248-19-220 DEFINITIONS. For the purposes of chapter 248-19 WAC, the following words and phrases shall have the following meanings unless the context clearly indicates otherwise.

(1) "Acute care facilities" means hospitals and ambulatory surgical facilities.

(2) "Affected persons" means the applicant, the health systems agency for the health service area where the proposed project is to be located, health systems agencies serving contiguous health service areas, health care facilities and health maintenance organizations located in the health service area where the project is proposed to be located providing services similar to the services under review, health care facilities and health maintenance organizations, which, prior to receipt by the department of the proposal being reviewed, have formally indicated an intention to provide similar services in the future, third-party payers reimbursing health care facilities for services in the health service area where the project is proposed to be located, any agency establishing rates for health care facilities or health maintenance organizations located in the health service area where the project is proposed to be located, any person residing within the geographic area served or to be served by the applicant, and any person regularly using health care facilities within that geographic area.

(3) "Ambulatory care facility" means any place, building, institution, or distinct part thereof not a health care facility as defined in this section and operated for the purpose of providing health services to individuals without providing such services with board and room on a continuous twenty-four hour basis. The term "ambulatory care facility" includes the offices of private physicians, whether for individual or group practice.

(4) "Ambulatory surgical facility" means a facility, not a part of a hospital, providing surgical treatment to patients not requiring inpatient care in a hospital. This term does not include a facility in the offices of private physicians or dentists, whether for individual or group practice, if the privilege of using such facility is not extended to physicians or dentists outside the individual or group practice.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(5) "Applicant," except as used in WAC 248-19-390, means any person proposing to engage in any undertaking subject to review under the provisions of chapter 70.38 RCW and Title XV of the Public Health Service Act as amended by P.L. 96-79.

"Applicant," as used in WAC 248-19-390, means any person or individual with a ten percent or greater financial interest in a partnership or corporation or other comparable legal entity engaging in any undertaking subject to review under the provisions of chapter 70.38 RCW and Title XV of the Public Health Service Act as amended by P.L. 96-79.

(6) "Annual implementation plan" means a description of objectives which will achieve goals of the health systems plan and specific priorities among the objectives. The annual implementation plan is for a one-year period and must be reviewed and amended as necessary on an annual basis.

(7) "Board" means the Washington state board of health.

(8) "Capital expenditure" means an expenditure, including a force account expenditure (i.e., an expenditure for a construction project undertaken by a facility as its own contractor), which, under generally accepted accounting principles, is not properly chargeable as an expense of operation or maintenance. Where a person makes an acquisition under lease or comparable arrangement, or through donation, which would have required certificate of need review if the acquisition had been made by purchase, such acquisition shall be deemed a capital expenditure. Capital expenditures include donations of equipment or facilities to a health care facility, which if acquired directly by such facility, would be subject to review under the provisions of this chapter and transfer of equipment or facilities for less than fair market value if a transfer of the equipment or facilities at fair market value would be subject to such review.

(9) "Certificate of need" means a written authorization by the secretary for a person to implement a proposal for one or more undertakings.

(10) "Certificate of need unit" means that organizational unit of the department responsible for the management of the certificate of need program.

(11) "Commencement of construction" means whichever of the following occurs first: Giving notice to proceed with construction to a contractor for a construction project; beginning site preparation or development; excavating or starting the foundation for a construction project; or beginning alterations, modification, improvement, extension, or expansion of an existing building.

(12) "Construction" means the erection, building, alteration, remodeling, modernization, improvement, extension, or expansion of a physical plant of a health care facility, or the conversion of a building or portion thereof to a health care facility.

(13) "Council" means the state health coordinating council established under the provisions of chapter 70.38 RCW and Title XV of the Public Health Service Act as amended by P.L. 96-79.

(14) "Days," except when called "working days," means calendar days counted by beginning with the day after the date of the act, event, or occurrence from which the designated period of time begins to run. If the last day of the period so counted should fall on a Saturday, Sunday, or legal holiday observed by the state of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Washington, a designated period shall run until the end of the first working day following the Saturday, Sunday, or legal holiday.

"Working days" exclude all Saturdays and Sundays, January 1, February 12, the third Monday in February, the last Monday of May, July 4, the first Monday in September, November 11, the fourth Thursday in November, the day immediately following Thanksgiving day, and December 25. Working days are counted by beginning with the first working day after the date of the act, event, or occurrence from which a designated period of time begins to run.

(15) "Department" means the Washington state department of social and health services.

(16) "Expenditure minimum" means one hundred fifty thousand dollars for the twelve-month period beginning with October 1979, and for each twelve-month period thereafter the figure in effect for the preceding twelve-month period adjusted to reflect the change in the preceding twelve-month period, in an index established by rules and regulations by the department for the purpose of making such adjustment.

(17) "Health care facility" means hospitals, psychiatric hospitals, tuberculosis hospitals, nursing homes, both skilled nursing facilities and intermediate care facilities, kidney disease treatment centers including freestanding hemodialysis units, ambulatory surgical facilities, rehabilitation facilities, hospices and home health agencies, and includes such facilities when owned and operated by the state or a political subdivision or instrumentality of the state and such other facilities as required by Title XV of the Public Health Service Act as amended by P.L. 93-641 and implementing regulations, but does not include Christian Science sanatoriums operated or listed and certified by the First Church of Christ Scientist, Boston, Massachusetts.

(18) "Health maintenance organization" means a public or private organization, organized under the laws of the state, which:

(a) Is a qualified health maintenance organization under Title XIII, Section 1310(d) of the Public Health Service Act; or

(b)(i) Provides or otherwise makes available to enrolled participants health care services, including at least the following basic health care services: Usual physician services hospitalization, laboratory, x-ray, emergency and preventive services, and out-of-area coverage;

(ii) Is compensated (except for copayments) for the provision of the basic health care services listed in subsection (18)(b)(i) of this section to enrolled participants by a payment which is paid on a periodic basis without regard to the date the health care services are provided and which is fixed without regard to the frequency, extent, or kind of health service actually provided; and

(iii) Provides physicians' services primarily:

(A) Directly through physicians who are either employees or partners of such organization, or

(B) Through arrangements with individual physicians or one or more groups of physicians (organized on a group practice or individual practice basis).

(19) "Health services" means clinically related (i.e., preventive, diagnostic, curative, rehabilitative, or palliative) services and includes alcoholism, drug abuse, and mental health services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(20) "Health systems agency" means a public regional planning body or a private nonprofit corporation organized and operated in a manner consistent with the laws of the state of Washington and P.L. 93-641 and capable of performing each of the functions described in RCW 70.38.085, and is capable as determined by the secretary of the United States Department of Health and Human Services, upon recommendation of the governor or the council, of performing each of the functions described in the federal law, Title XV of the Public Health Service Act as amended by P.L. 96-79.

"Appropriate health systems agency" means the health systems agency for the health service area where a particular project is to be located.

(21) "Health systems plan" means a plan established by a health systems agency which is a detailed statement of goals and resources required to reach those goals as described in the federal law, Title XV of the Public Health Service Act as amended by P.L. 96-79.

(22) "Home health agency" means any entity which is or is to be certified as a provider of home health services in the Medicaid or Medicare program.

(23) "Hospice" means any public or private entity, center, institution, or distinct part or parts thereof certified or to be certified as a hospice provider in the Medicare program or licensed or certified by the state of Washington to provide hospice services or providing a coordinated program of home and inpatient services for the terminally ill. Services provided by a hospice are primarily palliative and supportive rather than curative in nature, including bereavement care to the family after the patient's death, and provided by an interdisciplinary team. The services are designed to meet the physiological, psychological, social, and spiritual needs of the patient and his or her family.

(24) "Hospital" means any institution, place, building or agency or distinct part thereof which qualifies or is required to qualify for a license under chapter 70.41 RCW, or any state-owned and operated institution primarily engaged in providing to inpatients, by or under the supervision of physicians, diagnostic services and therapeutic services for medical diagnosis, treatment and care of injured, disabled, or sick persons, or rehabilitation services of injured, disabled, or sick persons. Such term includes tuberculosis hospitals but does not include psychiatric hospitals.

(25) "Hospital commission" means the Washington state hospital commission established pursuant to chapter 70.39 RCW.

(26) "Inpatient" means a person receiving health care services with board and room in a health care facility on a continuous twenty-four-hour-a-day basis.

(27) "Institutional health services" means health services provided in or through health care facilities and entailing annual direct operating costs of at least seventy-five thousand dollars for the twelve-month period beginning with October 1979, and for each twelve-month period thereafter the figure in effect for the preceding twelve-month period adjusted to reflect the change in the preceding twelve-month period in an index established by rules and regulations by the department.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(28) "Intermediate care facility" means any institution or distinct part thereof certified as an intermediate care facility for participation in the Medicaid (Title XIX of the Social Security Act) program.

(29) "Kidney disease treatment center" means any place, institution, building or agency or a distinct part thereof equipped and operated to provide services, including dialysis services, to persons who have end-stage renal disease.

(30) "Long-range health facility plan" means a document prepared by each hospital containing a description of the hospital's plans for substantial changes in the facilities and services for three years.

(31) "Major medical equipment" means a single unit of medical equipment or a single system of components used for the provision of medical and other health services and costing in excess of one hundred fifty thousand dollars, except that such term does not include dental equipment or medical equipment acquired by or on behalf of a clinical laboratory to provide clinical laboratory services if the clinical laboratory is independent of a physician's office and a hospital, and the clinical laboratory has been determined under Title XVIII of the Social Security Act to meet the requirements of paragraphs (10) and (11) of section 1861(s) of such act. If the equipment is acquired for less than fair market value, the term "cost" includes the fair market value.

(32) "May" means permissive or discretionary.

(33) "Nursing home" means any home, place, institution, building or agency or distinct part thereof operating or maintaining facilities providing convalescent or chronic care, or both, for a period in excess of twenty-four consecutive hours for three or more patients not related by blood or marriage to the operator, who, by reason of illness or infirmity, are unable properly to care for themselves. Convalescent and chronic care may include, but not be limited to, any or all procedures commonly employed in waiting on the sick, such as administration of medicines, preparation of special diets, giving of bedside nursing care, application of dressings and bandages, and carrying out of treatment prescribed by a duly licensed practitioner of the healing arts. The term "nursing home" includes any such entity owned and operated by the state or licensed or required to be licensed under the provisions of chapter 18.51 RCW and any other intermediate care facility or skilled nursing facility as these terms are defined in this section. The term "nursing home" does not include: General hospitals or other places providing care and treatment for the acutely ill and maintaining and operating facilities for major surgery or obstetrics or both; psychiatric hospitals as defined in this section; private establishments, other than private psychiatric hospitals, licensed or required to be licensed under the provisions of chapter 71.12 RCW; boarding homes licensed under the provisions of chapter 18.20 RCW; or any place or institution operated to provide only board, room, and laundry to persons not in need of medical or nursing treatment or supervision.

(34) "Obligation," when used in relation to a capital expenditure, means the following has been incurred by or on behalf of a health care facility:

(a) An enforceable contract has been entered into by a health care facility or by a person proposing such capital expenditure on behalf

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of the health care facility for the construction, acquisition, lease, or financing of a capital asset; or

(b) A formal internal commitment of funds by a health care facility for a force account expenditure constituting a capital expenditure; or

(c) In the case of donated property, the date on which the gift is completed in accordance with state law.

(35) "Offer," when used in connection with health services, means the health facility provides or holds itself out as capable of providing or as having the means for the provision of one or more specific health services.

(36) "Person" means an individual, a trust or estate, a partnership, a corporation (including associations, joint stock companies, and insurance companies), the state, or a political subdivision or instrumentality of the state, including a municipal corporation or a hospital district.

(37) "Predevelopment expenditures" means capital expenditures, the total of which exceeds the expenditure minimum, made for architectural designs, plans, drawings or specifications in preparation for the acquisition or construction of physical plant facilities. "Predevelopment expenditures" exclude any obligation of a capital expenditure for the acquisition or construction of physical plant facilities and any activity which may be considered the "commencement of construction" as this term is defined in this section.

(38) "Project" means any and all undertakings which may be or are proposed in a single certificate of need application or for which a single certificate of need is issued.

(39) "Psychiatric hospital" means any institution or distinct part thereof primarily engaged in providing to inpatients, by or under the supervision of a physician, psychiatric services for the diagnosis and treatment of mentally ill persons and licensed or required to be licensed under the provisions of chapter 71.12 RCW, or is owned and operated by the state or by a political subdivision or instrumentality of the state.

(40) "Rehabilitation facility" means an inpatient facility operated for the primary purpose of assisting in the rehabilitation of disabled persons through an integrated program of medical and other health services provided under competent professional supervision.

(41) "Secretary" means the secretary of the Washington state department of social and health services or his or her designee.

(42) "Shall" means compliance is mandatory.

(43) "Skilled nursing facility" means any institution or distinct part thereof certified as a skilled nursing facility for participation in the Medicare (Title XVIII) or Medicaid (Title XIX) program.

(44) "State health plan" means a document, described in Title XV of the Public Health Service Act, developed by the department and the council in accordance with RCW 70.38.065.

(45) "State Health Planning and Resources Development Act" means chapter 70.38 RCW.

(46) "Undertaking" means any action which, according to the provisions of chapter 248-19 WAC, is subject to the requirements for a certificate of need or an exemption from the requirements for a certificate of need. [Statutory Authority: RCW 70.38.135. 84-07-014 (Order 2082), § 248-19-220, filed 3/14/84; 81-09-012 (Order 210), § 248-19-220, filed 4/9/81, effective 5/20/81. Statutory Authority:

Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-220, filed 11/30/79.]

WAC 248-19-230 APPLICABILITY OF CHAPTER 248-19 WAC. (1) The following undertakings shall be subject to the provisions of chapter 248-19 WAC, with the exceptions provided for in this section.#

(a) The construction, development, or other establishment of a new health care facility.

(b) Any capital expenditure by or on behalf of a health care facility substantially changing the health services of the facility. Substantial changes in services shall be limited to the following:

(i) The establishment of health services not offered on a regular basis within the twelve-month period prior to the time such services are offered or the termination of such services;

(ii) The introduction of a new technology for diagnosis or treatment;

(iii) A change in the level of service; or

(iv) The offering of any of the following health services at a new location not formerly part of the health care facility's campus. Specific substantial changes in services are as follows:

Alcoholism/substance abuse
Burn unit
Cardiac catheterization
Chronic renal dialysis
Kidney lithotripty
CT-computed tomography
NMR-nuclear magnetic resonance
PET-positron emission tomography
Emergency services including regular outpatient emergency services staffed by physicians at a health care facility, and the provision of ambulance services, including air ambulance, licensed under chapter 18.73 RCW.
Inpatient psychiatric services
Neonatal special care-level III
Obstetrics-level I
Obstetrics-level II
Obstetrics-level III
Organ transplants, including only heart, liver, kidney, bone marrow, brain, and lung transplants
Open heart surgery
Pediatrics-level I
Pediatrics-level II
Pediatrics-level III
Radiation therapy-megavoltage, orthovoltage
Rehabilitation-level I
Rehabilitation-level II
Rehabilitation-level III
Change in the number of dialysis stations in a health care facility, and
Change from mobile to fixed base CT scanning.

The department may, periodically and on an emergency basis, revise and update specific substantial changes in services.

(c) Any capital expenditure by or on behalf of a health care facility exceeding the expenditure minimum as defined by WAC 248-19-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

220(16). The costs of any studies, surveys, designs, plans, working drawings, specifications, and other activities (including staff effort and consulting and other services which under generally accepted accounting principles are not properly chargeable as an expense of operation and maintenance) essential to the acquisition, improvement, expansion, or replacement of any plant or equipment with respect to which such expenditure is made shall be included in determining the amount of the expenditure. Functional programming and general long-range planning activities, including marketing surveys and feasibility studies, are not to be included when determining whether an expenditure exceeds the expenditure minimum.

(d) A change in bed capacity of a licensed health care facility which increases the total number of licensed beds or redistributes beds among facility and service categories of acute care, skilled nursing, intermediate care, and boarding home care if the bed redistribution is to be effective for a period in excess of six months.

(e) The obligation of any capital expenditure by or on behalf of a health care facility not required to be licensed for a change in bed capacity which increases the total number of beds, or redistributes beds among various categories, by more than ten beds or more than ten percent of total bed capacity as defined by the department, whichever is less, over a two-year period.

(f) Acquisition of major medical equipment:

(i) If the equipment will be owned by or located in an inpatient health care facility; or

(ii) If the equipment is not to be owned by or located in a health care facility and the department finds, consistent with WAC 248-19-403, that:

(A) The equipment will be used to provide services for inpatients of a hospital on other than a temporary basis in the case of a natural disaster, a major accident, or equipment failure; or

(B) The person acquiring such equipment did not notify the department of the intent to acquire such equipment at least thirty days before entering into contractual arrangements# for such acquisition.

(g) The acquisition of an existing health care facility which the department has determined, in accordance with the provisions of subsection (2) of this section, is subject to review;

(h) Any new institutional health services which are offered by or on behalf of a health care facility and which were not offered on a regular basis by or on behalf of such health care facility within the twelve-month period prior to the time such services would be offered.

(i) Any expenditure by or on behalf of a health care facility in excess of the expenditure minimum made in preparation for any undertaking under this subsection and any arrangement or commitment made for financing such undertaking. Expenditures of preparation shall include expenditures for architectural designs, plans, working drawings and specifications.

(j) The obligation of any capital expenditure by or on behalf of a health care facility which decreases the total number of licensed beds or relocates beds from one physical facility or site to another by ten beds or ten percent, whichever is less, in any two-year period.

(k) Any acquisition by donation, lease, transfer, or comparable arrangement, by or on behalf of a health care facility, if the acquisition would otherwise be reviewable under chapter 248-19 WAC if made by purchase.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(2) At least thirty days before any person acquires or enters into a contract# to acquire an existing health care facility, the person shall provide written notification to the department and the appropriate health systems agency, and in the case of a hospital, the hospital commission, of the person's intent to acquire the facility.

(a) Written notification of intent, to be considered valid, shall be made in a form and manner acceptable to the secretary and shall include:

(i) The name and address of the health care facility to be acquired;

(ii) The name and address of the person intending to acquire the health care facility;

(iii) A description of the means by which the health care facility would be acquired, including the total capital expenditures associated with the acquisition, and the intended date of incurring the contractual obligation to acquire the health care facility;

(iv) The name and address of the person from whom the facility is to be acquired; and

(v) A description of any changes in institutional health services or bed capacity proposed by the person acquiring the health care facility.

(b) A certificate of need shall be required for the obligation of a capital expenditure to acquire by purchase, or under lease or comparable arrangement, an existing health care facility if:

(i) A written notification of intent to acquire an existing health care facility is not provided in accordance with WAC 248-19-230(2), or

(ii) The department finds within fifteen working days after receipt of a written notification to acquire a health care facility that the services or bed capacity of the facility will be changed in being acquire

(c) Within fifteen working days after receipt of a written notification of intent, the department shall send written notice to the person intending to acquire the health care facility, indicating:

(i) Whether the written notification constitutes a valid notification, as prescribed in subsection (2)(a) of this section and, if such notification is valid,

(ii) Whether such acquisition is subject to certificate of need review.

(d) If the department fails to make a determination within thirty days after receipt of a valid notice, the health care facility may be acquired without a certificate of need.

(3) With respect to ambulatory care facilities and inpatient health care facilities controlled (directly or indirectly) by a health maintenance organization or combination of health maintenance organizations, the provisions of chapter 248-19 WAC shall apply only to the offering of inpatient institutional health services, the acquisition of major medical equipment, and the obligation of capital expenditures for the offering of inpatient institutional health services, and then only to the extent that such offering, acquisition, or obligation is not exempt under the provisions of WAC 248-19-405.

(4) The extension, on more than an infrequent basis, of the services of a home health agency or a hospice to a population residing in a county not previously regularly included in the service area of that home health agency or hospice during the preceding twelve months constitutes extension of home health services or hospice services beyond

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a defined geographic area and shall be considered the development or establishment of a new home health agency or hospice.

(5) No person shall engage in any undertaking subject to certificate of need review under the provisions of this chapter unless a certificate of need authorizing such undertaking has been issued and remains valid or an exemption has been granted in accordance with the provisions of this chapter.

(6) No person may divide a project in order to avoid review requirements under any of the thresholds specified in this section.

(7) The department may issue certificates of need permitting predevelopment expenditures only, without authorizing any subsequent undertaking with respect to which such predevelopment expenditures are made.

(8) A certificate of need application, the review of which had begun but upon which final action had not been taken prior to January 1, 1981, shall be reviewed and final action taken based on chapter 70.38 RCW and chapter 248-19 WAC as in effect prior to January 1, 1981.

(9) Certificates of need issued prior to January 1, 1981, shall not be terminated and the periods of validity of such certificates of need shall not be modified under the provisions of chapter 248-19 WAC which become effective January 1, 1981.

(10) A project for which certificate of need review was waived under the provisions of WAC 248-19-230(8) as in effect January 1, 1980, to January 1, 1981, shall have been completed by January 1, 1981, or, in the case of a construction project, commencement of construction shall have occurred by January 1982. If this requirement is not met, the project shall become subject to the requirements for a certificate of need.

(11) A proposed change in a project associated with a capital expenditure for which a certificate of need has been issued shall be subject to certificate of need review if the change is proposed within one year after the date the activity for which the capital expenditure was approved has been undertaken.

(a) Projects subject to review under this subsection include proposed changes in projects originally subject to review according to the provisions of subsection (1)(b), (c), (d), (e), or (j) of this section.

(b) No capital expenditure need be associated with a proposed change in a project subject to review under this subsection.

(c) A proposed change in a project shall include any change in the licensed bed capacity of a facility, and the addition or termination of an institutional health service.

(12) Administrative review.

(a) The secretary shall have the authority to review and take action, on the basis of information submitted on an abbreviated application form acceptable to the secretary, the following categories of expenditures:

(i) The acquisition of land;

(ii) Capital costs associated with the refinancing of existing debt;

(iii) The obligation of any capital expenditure by or on behalf of a health care facility which decreases the total number of licensed beds or relocates licensed beds from one physical facility or site to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

another by ten beds or ten percent, whichever is less, in any two-year period; and

(iv) A proposed change in a project reviewed in accordance with WAC 248-19-230(11).

(b) Such review shall be completed within ten working days after receipt of an application.

(13) The provision of hospice services by an entity providing the services described in the definition of "hospice" in WAC 248-19-220, when such an entity was providing services as of July 24, 1983, shall not be considered the establishment of a new health facility or service and shall not be subject to certificate of need review. Persons providing hospice services as of July 24, 1983, shall submit information prescribed by the department showing they were providing hospice services as of that date and showing the services provided and the county or counties comprising the service area.

NOTE:

#Where a hospital is part of a larger institution, such as a university, the components of the larger institution (e.g., a component conducting medical research) not related to the hospital will not be considered part of the hospital, whether or not the hospital is a distinct legal entity. Similarly, when there is a legal entity, the primary activity of which is operating a hospital, but which also operates a distinct research component, the research component will not be considered part of the hospital. In these cases, the component conducting medical research that is distinct from the hospital and that neither provides inpatient services nor uses revenues derived from patient charges at the hospital to finance its operations will not be considered part of the hospital.

Further, expenditures by a component of a larger institution, such as a university, which is distinct from a separate health care facility component, such as the university's hospital, will not be viewed as being "by a health care facility." Thus, a capital expenditure by a university medical school that is a distinct component of the university will not be considered to be "by" the hospital of the university. In finding that the medical school is distinct, the department must find at least that the revenues derived from patient charges at the hospital of the university are not used for operating expenses of the medical school.

If a capital expenditure exceeds the expenditure minimum, for it to be required to be subject to review, the department must find that it is "on behalf of" a health care facility. Such an expenditure is also required to be subject to review if it is for the acquisition of major medical equipment and meets the conditions set forth in WAC 248-19-230 (1)(f). The same analysis would apply to a distinct research component of a legal entity, the primary activity of which is operating a hospital.

#A person may enter into a contractual arrangement at an earlier date, provided such contractual arrangement is contingent upon a determination by the department that a certificate of need is not needed or upon issuance of a certificate of need.

[Statutory Authority: RCW 70.38.135. 84-07-014 (Order 2082), § 248-19-230, filed 3/14/84; 81-09-012 (Order 210), § 248-19-230, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-230, filed 11/30/79.]

WAC 248-19-240 APPLICABILITY DETERMINATION. (1) Any person wanting to know whether an action the person is considering is subject to certificate of need requirements (chapter 248-19 WAC) should submit a written request to the certificate of need unit requesting a formal determination of applicability of the certificate of need requirements to the action.

(a) A copy of a written request for determination of applicability shall be sent simultaneously to the appropriate health systems agency and, in the case of a hospital project, to the hospital commission.

(b) The written request shall be in a form prescribed by the department and contain an explicit description of the action. The description shall include the nature and extent of any construction, changes in services and the estimated total costs of the action.

(2) The department may request such additional written information as is reasonably necessary to making an applicability determination on the action.

(3) The department shall respond in writing to a request for an applicability determination within thirty days of receipt of all the information needed for such determination. In the written response, the department shall state the reasons for its determination that the action is or is not subject to certificate of need requirements.

(4) Information or advice given by the department as to whether an action is subject to certificate of need requirements shall not be considered an applicability determination unless it is in written form in response to a written request submitted in accordance with provisions of this section.

(5) A written applicability determination on an action in response to a written request and based on written information shall be binding upon the department: PROVIDED, The nature, extent or cost of the action does not significantly change. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-240, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-240, filed 11/30/79.]

WAC 248-19-250 SANCTIONS FOR VIOLATIONS. The department may take or cause to be taken any action against a person who has failed to comply with certificate of need regulations which is provided for in RCW 70.38.125. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-250, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-250, filed 11/30/79.]

WAC 248-19-260 PERIODIC REPORTS ON DEVELOPMENT OF PROPOSALS. (1) During April of each year, each health care facility and any other person developing proposals subject to certificate of need review shall submit to the department a report which describes each such

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

undertaking. Such report shall be submitted in a form prescribed by the department.

(2) If the appropriate health systems agency requires submission of reports, on at least an annual basis, regarding undertakings which are under consideration, the department shall accept a copy of each such report sent to the health systems agency in lieu of the report required under subsection (1) of this section.

(3) Submission to the department of a long-range plan which includes all undertakings which are under consideration by a health care facility or other person shall be accepted as meeting the requirement of this section for a periodic report. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-260, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-260, filed 11/30/79.]

WAC 248-19-270 LETTER OF INTENT. Any person planning to develop a construction project shall submit a letter of intent to the department at the earliest possible opportunity in the course of planning such construction project.

(1) The letter of intent shall inform the department of the nature and scope of the project, clearly describing the size and extent of any new or expanded services which will be included.

(2) A copy of the letter of intent shall be sent to the health systems agency for the health service area in which the project is to be located and, in the case of a hospital project, to the hospital commission.

(3) The letter of intent submitted in accordance with the provisions of this section does not constitute "notice of intent" with respect to the acquisition of existing health care facilities, as required by WAC 248-19-230(2) or to the acquisition of major medical equipment, as required by WAC 248-19-403. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-270, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-270, filed 11/30/79.]

WAC 248-19-280 SUBMISSION AND WITHDRAWAL OF APPLICATIONS. (1) General.

(a) A person proposing an undertaking which is subject to review shall, prior to the date on which the certificate of need review of such undertaking begins, submit a complete certificate of need application in such form and manner and containing such information as the department, after consultation with health systems agencies and the hospital commission, has prescribed and published as necessary to such a certificate of need application.

(i) The information, which the department prescribes and publishes as required for a certificate of need application, shall be limited to the information which is necessary for the department to perform a certificate of need review and, shall vary in accordance with and be appropriate to the category of review or the type of proposed project: PROVIDED, HOWEVER, That the required information shall include that which is necessary to determining whether the proposed project meets applicable criteria.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(ii) Information regarding a certificate of need application which is submitted by an applicant after the department has given "notification of the beginning of review" in the manner prescribed by WAC 248-19-310 shall be submitted in writing to the department, the health systems agency, and for hospital projects, to the hospital commission.

(iii) Except as provided in WAC 248-19-325 no information regarding a certificate of need application, which is submitted by an applicant after the conclusion of a public hearing conducted under the provisions of WAC 248-19-320 or the date on which the appropriate health systems agency takes final action on the application, whichever occurs first, shall be considered by the department in reviewing and taking action on a certificate of need application. An exception to this rule shall be made when, during its final review period, the department finds an unresolved pivotal issue requires submission of further information by an applicant and the applicant agrees to an extension of the review period in order to resolve this issue as provided for in WAC 248-19-330 (2)(b), 248-19-340 (2)(c), and 248-19-350(4). The department shall furnish copies of its request to the applicant for such additional information to the appropriate health systems agency and, for a hospital project, to the hospital commission. The department shall give public notice of such request for additional information through the same newspaper in which the "notification of beginning of review" for the project was published. The notice shall identify the project, the nature of the unresolved issue and the information requested of the applicant and shall state the period of time allowed for receipt of written comments from interested persons.

(b) A person submitting a certificate of need application shall simultaneously submit copies of such application to the certificate of need unit of the department, the appropriate health systems agency and, in the case of a hospital project, to the hospital commission.

(i) The original and two copies of the application shall be submitted to the certificate of need unit of the department.

(ii) At least three and such additional copies of the application as may be required by the health systems agency shall be submitted to the appropriate health systems agency.

(iii) For a hospital project, one copy shall be submitted to the hospital commission.

(c) On or before the last day of the applicable screening period for a certificate of need application, as prescribed in subsections (2) and (3) of this section, the department shall send a written notice to the person who submitted the application stating whether or not the application has been declared complete. If an application has been found to be incomplete, the notice from the department shall specifically identify the portions of the application in which the information provided has been found to be insufficient or indefinite and request the supplemental information needed to complete the application. The notice from the department shall incorporate the findings as to insufficient or indefinite application information which have been transmitted to the department by the health systems agency and the hospital commission.

(d) The department shall not request any supplemental information of a type which has not been prescribed and published as being necessary to a certificate of need application for the type of project being proposed.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(e) A response to the department's request for information to supplement an incomplete application shall be written and submitted to the same agencies and in the same numbers as required for an application under the provisions of subsection (1)(b) of this section.

(2) Emergency, expedited and regular reviews.

(a) The department, the appropriate health systems agency, and the hospital commission for a hospital project, shall within a fifteen-day period, screen the application to determine whether the information provided in the application is complete and as explicit as is necessary for a certificate of need review. This screening period shall begin on the first day after which the department, the health systems agency and, for hospital projects, the hospital commission, have each received copies of the application.

(b) The department shall return an incomplete certificate of need application to the person who submitted the application if the department has not received a response to a request for the supplemental information sent in accordance with subsection (1)(c) of this section within forty-five days after such request was sent.

(c) A person who submits a response to the department's request for supplemental information to complete a certificate of need application within forty-five days after the request was sent by the department, in accordance with subsection (1)(c) of this section, shall have the right to exercise one of the following options:

(i) Submission of written supplemental information and a written request that such information be screened and the applicant be given opportunity to submit further supplemental information if the application is still incomplete;

(ii) Submission of written supplemental information with a written request that review of the certificate of need application begin without the department notifying the applicant as to whether the supplemental information is adequate to complete the application; or

(iii) Submission of a written request that the incomplete application be reviewed without supplemental information.

(d) After receipt of a request for review of a certificate of need application, submitted in accordance with subsection (2)(c)(ii) or (iii) of this section, the department shall give notification of the beginning of review in the manner prescribed for a complete application in WAC 248-19-310.

(e) If a person requests the screening of supplemental information in accordance with subsection (2)(c)(i) of this section, such screening shall be carried out in the same number of days and in the same manner as required for an application in accordance with the provisions of subsection (1)(c) and (2)(a) of this section. The process of submitting and screening supplemental information may be repeated until the department declares the certificate of need application complete, the applicant requests that review of the incomplete application begin, or the one hundred twentieth day after the beginning of the first screening period for the application, whichever occurs first. The department shall return an application to the applicant if it is still incomplete on the one hundred twentieth day after the beginning of the first screening period and the applicant has not requested review of such incomplete application.

(3) Amendment of certificate of need applications.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(a) Applications for emergency review. If an applicant amends an application during the screening period, the department, after consultation with the appropriate health systems agency and, in the case of a hospital project, the hospital commission shall determine whether the amended application constitutes a new application. An application which is amended during the review period shall be considered a new application.

(b) Application for expedited or regular review.

(i) If an applicant amends an application during the screening or review period, the department, after consultation with the appropriate health systems agency and, in the case of a hospital project, the hospital commission shall determine whether the amended application constitutes a new application.

(ii) To provide any affected person the opportunity for a public hearing on an amended application, the department may extend the expedited review period as necessary to conduct such public hearing and complete the review process.

(4) Submission of an amendment to an application. An amendment to an application shall be submitted to the same agencies and in the same numbers as required for an application under the provisions of subsection (1)(b) of this section.

(5) Withdrawal of applications. A certificate of need application shall be withdrawn from the certificate of need process if the department receives a written request for withdrawal of the application from the person who submitted the application at any time before final action on such application has been taken by the secretary.

(6) Resubmission of applications withdrawn or returned as incomplete. A submission of a new certificate of need application shall be required for a certificate of need review of any undertaking for which the department has returned an incomplete application in accordance with subsection (2)(b) of this section, or for which a certificate of need application has been withdrawn in accordance with subsection (5) of this section. The content of the application should be updated as necessary before resubmission. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-280, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-280, filed 11/30/79.]

WAC 248-19-290 CONCURRENT REVIEW OF SELECTED APPLICATIONS. (1) The department with the consent of a health systems agency and, for hospital projects, the hospital commission may prescribe particular time schedules for the submission and concurrent review of certificate of need applications for selected types of projects within a given health service area. Such time schedules shall be for the purpose of comparative analysis of competing or similar projects to ascertain which of such projects may best meet the needs of the service area and the defined population.

(2) The projects for which the department may prescribe particular time schedules for the submission and concurrent review of certificate of need applications include but are not limited to the following:

(a) Construction of a new hospital or a new nursing home;

(b) Alterations of or additions to a hospital or nursing home which will increase the inpatient bed capacity;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(c) New home health agencies or kidney disease treatment centers, including free standing hemodialysis units;

(d) New or expanded radiation treatment facilities; and

(e) Computerized transaxial tomographic equipment.

(3) Notwithstanding any other provisions of this section, the following new institutional health services shall not be subject to prescribed time schedules for submission and concurrent review of certificate of need applications:

(a) Projects limited to new institutional health services the type, scope and location of which have been provided for in a current health systems plan, annual implementation plan or state health plan; and

(b) Projects which have been specifically included in a long-range health facility plan developed in accordance with the provisions of Section 14 of the State Health Planning and Resources Development Act.

(4) Before prescribing time schedules for concurrent review of selected categories of projects the department shall provide health care facilities and health maintenance organizations which would be affected by such schedules the opportunity to review and offer written comment on the schedules the department proposes to prescribe.

(5) Prescribed schedules shall be published and distributed to all health care facilities and health maintenance organizations which may be affected by them. Such publication and distribution of concurrent review schedules shall be at least six months prior to implementation of the prescribed schedules.

(6) Applications reviewed concurrently shall be reviewed according to the regular review process established under WAC 248-19-330.

(7) Review schedules for concurrent review shall provide for at least a semi-annual review for a given project type within each health service area. [Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-290, filed 11/30/79.]

WAC 248-19-300 CATEGORIES OF REVIEW. (1) In the review of any certificate of need application, one of the following review processes shall be used: Regular review, emergency review or expedited review.

(2) Determination of review process.

The department, after any necessary consultation with the appropriate health systems agency and, if a hospital project, the hospital commission, shall determine which review process will be used in the review of a given certificate of need application.

(a) Emergency review.

(i) Beginning January 1, 1981, an emergency review may, with the written consent of the appropriate health systems agency, be conducted when an immediate capital expenditure is required in order for a health care facility to maintain or restore basic and essential patient services.

(ii) The department may, after consulting with the appropriate health systems agency and, for a hospital project, the hospital commission, determine that an application submitted for emergency review does not qualify for such review. Such a determination and notification to the applicant shall be made within five days after receipt of the application. When the department makes a determination that an

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

application is not subject to emergency review procedures, the application will be reviewed under another review process which is appropriate for the type of undertaking proposed. The department will notify the applicant of the other process under which the application will be reviewed.

(b) Expedited review.

(i) Beginning January 1, 1981, an expedited review shall be conducted on a certificate of need application for the following:

(A) All projects which do not involve health services or the addition, replacement, expansion or alteration of facilities for health services.

(B) Projects proposed for the correction of deficiencies as described in WAC 248-19-415.

(C) The replacement of equipment having similar functional capability and which does not result in the offering or development of any new health services.

(D) Installation, replacement, or improvement of energy conservation and mechanical and electrical systems.

(E) Demonstration or research projects related to new technology: PROVIDED, That such projects do not involve a change in bed capacity, or the provision of a new institutional health service.

(F) Acquisition of an existing health care facility.

(G) Projects which are limited to predevelopment expenditures.

(ii) An expedited review shall be conducted on a certificate of need application for a hospital's project when:

(A) The hospital has developed a long-range facility plan in accordance with the provisions of RCW 70.38.145;

(B) When an application has been found to be consistent with the applicant's long-range health facility plan and the applicable health systems plan, annual implementation plan and state health plan; and

(C) When there has not been a significant change, since the long-range health facility plan was approved, in existing health facilities of the same type or in the need for such health facilities and services.

(iii) That until January 1, 1983, or until such time as the department has developed a common form for hospital long range plans, whichever is earlier, an expedited review may, with the written consent of the appropriate health systems agency, be conducted for a project, the type, scope and location of which has been specifically described and provided for in a current health systems plan, annual implementation plan or state health plan, or when:

(A) The hospital has developed a long range plan whose form is acceptable to the appropriate health systems agency and the department.

(B) The appropriate health systems agency has reviewed the plan in conjunction with potentially competing plans and the health systems agency has approved the hospital's long range plans.

(C) The certificate of need application for the project has been found to be consistent with the hospital's health systems agency approved long range health facility plan and the applicable health systems plan, annual implementation plan and state health plan.

(D) There has not been a significant change, since the long range health facility plan was approved, in existing health facilities of the same type or in the need for such health facilities and services; and there has not been a significant change in financial feasibility.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(E) The appropriate health systems agency has given the department a written consent to an expedited review of the project.

(c) Regular review process. The regular review process shall be used for any application unless the department has determined that the emergency or expedited review process will be used in the review of such application. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-300, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-300, filed 11/30/79.]

WAC 248-19-310 NOTIFICATION OF BEGINNING OF REVIEW. (1) Notice required. The department shall provide written notification of the beginning of the review of a certificate of need application and notification of the beginning of the review of a proposed withdrawal of a certificate of need to affected persons (other than persons residing within the geographic area served or to be served by the applicant, any persons who regularly use health care facilities within that geographic area, and third-party payers who reimburse health care facilities for services in the health service area in which the project is proposed to be located) and any other person who has submitted a written request that the person's name be on the mailing list for such notice. Notification of the beginning of the review of a certificate of need application shall be provided to persons residing within the geographic area served or to be served by the applicant, to any person who regularly uses health care facilities within that geographic area, and third-party payers who reimburse health care facilities for services in the health service area in which the project is proposed to be located, through a newspaper of general circulation in the health service area of the project.

(2) Specific notice requirements.

(a) The department shall give "notification of the beginning of review" of an application after the department, the appropriate health systems agency and, for a hospital project, the hospital commission have each received a complete application or the applicant's request, submitted in accordance with WAC 248-19-280 (2)(c) that review of the application begin. Such notice shall be given according to the following requirements.

(i) Emergency review. When an application is being reviewed under the emergency review process, required notices shall be given within five working days following the receipt of a complete application or the applicant's written request that review of the application begin.

(ii) Expedited and regular review. When an application is being reviewed under the expedited or regular review process, required notices shall be given within five working days of a declaration that the application is complete or the applicant's request that review of the application begin.

(b) The department shall give notification of the beginning of the review of a proposed withdrawal of a certificate of need when it determines that there may be good cause to withdraw a certificate of need.

(c) The notices shall include:

(i) A general description of the project;

(ii) In the case of a proposed withdrawal of a certificate of need, the reasons for the proposed withdrawal;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(iii) The proposed review schedule;

(iv) The period within which one or more affected persons may request the conduct of a public hearing during the review;

(v) The name and address of the agency to which a request for a public hearing should be sent; and

(vi) The manner in which notification will be provided of the time and place of any hearing so requested.

(d) The notices to other affected persons shall be mailed on the same date the notice to the public is mailed to the newspaper for publication.

(3) Beginning of review.

(a) Review of a certificate of need application under the expedited, regular or concurrent review process shall begin on the day the department sends notification of the beginning of review to the general public and other affected persons.

(b) Review of a certificate of need application under emergency review shall begin on the first day after the date on which the department, the appropriate health systems agency and, for a hospital project, the hospital commission have determined the application is complete, or have each received a written request to begin review submitted by the applicant in accordance with WAC 248-19-280 (2)(c).

(c) Review of a proposed withdrawal of a certificate of need shall begin on the day the department sends notification of the beginning of review to the general public and to other affected persons. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-310, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-310, filed 11/30/79.]

WAC 248-19-320 PUBLIC HEARINGS. (1) "Opportunity for a public hearing," as used in this section, shall mean a public hearing will be conducted if a valid request for such a hearing has been submitted by one or more affected persons.

(2) The department shall provide opportunity to affected persons for a public hearing on:

(a) A certificate of need application which is under review, unless the application is being reviewed according to the emergency review process; and

(b) The proposed withdrawal of a certificate of need.

This requirement for a public hearing shall be deemed satisfied if the appropriate health systems agency has provided opportunity for such a public hearing to "affected persons" as this term is defined in WAC 248-19-220: PROVIDED, HOWEVER, That the department has delegated the responsibility for such hearing to the appropriate health systems agency, and such health systems agency has followed public hearing procedures required under the provisions of this section.

(3) To be valid, a request for a public hearing on a certificate of need application or on the proposed withdrawal of a certificate of need shall:

(a) Be submitted in writing;

(b) Be received by the agency identified in the "notification of beginning of review" within fifteen days after the date on which the department's "notification of beginning of review" for the particular certificate of need application or proposed withdrawal of a certificate of need was published in a newspaper of general circulation; and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(c) Include identification of the particular certificate of need application or proposed certificate of need withdrawal for which the public hearing is requested and the full name, complete address and signature of the person making the request.

(4) The department or the health systems agency to which the department delegated responsibility for public hearings shall give written notice of a public hearing conducted pursuant to this section.

(a) Written notice shall be given to affected persons and the public at least fifteen days prior to the beginning of the public hearing.

(b) The notices shall include: Identification of the certificate of need application or certificate of need on which the public hearing is to be conducted and the date, time and place of the public hearing.

(c) Notice to the general public to be served by the proposed project to which the certificate of need application or certificate of need pertains shall be through a newspaper of general circulation in the health service area of the proposed project. The notices to other affected persons shall be mailed on the same date the notice to the public is mailed to the newspaper for publication.

(5) In a public hearing on a certificate of need application or on a proposed withdrawal of a certificate of need, any person shall have the right to be represented by counsel and to present oral or written arguments and evidence relevant to the matter which is the subject of the hearing. Any person affected by the matter may conduct reasonable questioning of persons who make relevant factual allegations.

(6) The department or health systems agency, whichever conducts the hearing, shall maintain a verbatim record of a public hearing and shall not impose fees for the hearing.

(7) The department shall not be required to conduct a public hearing on a certificate of need application which is being reviewed according to the emergency review procedure. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-320, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-320, filed 11/30/79.]

WAC 248-19-325 PROHIBITION OF EX PARTE CONTACTS. (1) There shall be no "ex parte contact" respecting an application for a certificate of need after whichever of the following occurs first: The commencement of a public hearing on an application for a certificate of need or proposed withdrawal of a certificate of need, or final action of the appropriate health systems agency and hospital commission.

(a) The term "ex parte contact" shall be interpreted to mean any oral or written communication respecting an application for a certificate of need or proposed withdrawal of a certificate of need between:

(i) An applicant for or holder of a certificate of need, any person acting on behalf of such an applicant or holder, or any person opposed to the issuance of or in favor of the withdrawal of a certificate of need, and

(ii) Any person in the department who exercises any responsibility respecting the application for or withdrawal of the certificate of need.

(b) Notwithstanding the provisions of subsection (1)(a) of this section, "ex parte contact" shall not be construed to include:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(i) Communication limited to requesting and giving status reports on any matter or proceeding relating to the review of a certificate of need application or proposed withdrawal of a certificate of need application;

(ii) Information related to the application for or proposed withdrawal of a certificate of need which has been incorporated in the record of administrative proceedings prior to the beginning of a public hearing on such application or withdrawal held according to the provisions of WAC 248-19-320 or before final action on such application or proposed withdrawal has been taken by the appropriate health systems agency or hospital commission, or

(iii) Information incorporated in the record of a public hearing held in accordance with WAC 248-19-320 on such application or proposed withdrawal of a certificate of need.

(2) The department shall consider information regarding an application for or proposed withdrawal of a certificate of need, the submission of which is not consistent with subsection (1) of this section, only if the following conditions are met.

(a) The information shall be writing.

(b) The person submitting the information shall affirm that such information was not reasonably available prior to the commencement of the public hearing or final action by the health systems agency or hospital commission.

(c) Upon receipt of such information, the department shall make a determination as to whether the information is substantive and material to the department's final decision to issue, deny or withdraw the certificate of need.

(i) If such information is material to the department's decision, the department shall, within five working days of the receipt of such information, send notice to affected persons, other than persons residing within the geographic area served or to be served by the applicant, persons who regularly use health care facilities within that geographic area, and third-party payers who reimburse health care facilities for services in the health service area in which the project is proposed to be located. Notice to persons residing within the geographic area served or to be served by the applicant, persons who regularly use health care facilities within that geographic area, and third-party payers who reimburse health care facilities for services in the health service area in which the project is proposed to be located shall be through a newspaper of general circulation in the appropriate health service area. The notice shall

(A) Describe the general nature of the information received;

(B) Identify the project to which the information pertains; and

(C) Establish the date by which any request for a public hearing must be submitted to the department.

(ii) If such information is not material to the department's decision, the information shall be placed in the record of administrative proceedings; copies shall be furnished by the department to the appropriate health systems agency, the hospital commission in the case of a hospital project, and to the applicant or holder of the certificate of need if the information was submitted by a person other than the applicant or holder. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-525, filed 4/9/81, effective 5/20/81.]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-19-330 REGULAR REVIEW PROCESS. (1) The regular review process shall not exceed ninety days from the beginning of the review period and shall be conducted in accordance with the following subdivisions of this subsection unless the review period is extended in accordance with the provisions of subsection (2) of this section.

(a) Within sixty days from the first day of the review period the health systems agency and, in the case of a hospital project, the hospital commission, shall submit written findings and recommendations on a certificate of need application to the department unless the health systems agency or hospital commission has requested and received an extension of this review period from the department.

(b) The department shall complete its final review and the secretary shall make his decision on a certificate of need application within thirty days of the end of the review period or extended review period of the health systems agency and, in the case of a hospital project, the hospital commission.

(2) The review period for a regular review may be extended according to the following provisions.

(a) The review period for the health systems agency or, in the case of a hospital project, the hospital commission, may be extended for up to an additional thirty days upon the written request of either of these advisory review agencies when such additional time is needed to complete the review and submit written findings and recommendations to the department. The department may grant further extensions to this review period: PROVIDED, The person who submitted the certificate of need application gives written consent to such further extensions.

(b) If an issue, which is pivotal to the secretary's decision remains unresolved, the department may make one request for additional information from the person who submitted the application. The department may extend its final review period up to but not exceeding thirty days after receipt of the applicant's written response to the department's request for information. Such pivotal issues include but are not limited to pending action for medicare or medicaid decertification, license revocation or patient trust fund violation or termination of a provider agreement.

(c) The department may extend either the review period for the health systems agency and the hospital commission or the department's final review period upon receipt of a written request of the person who submitted the application: PROVIDED, HOWEVER, That such an extension shall not exceed sixty days. [Statutory Authority: RCW 70.38-.155. 82-19-055 (Order 244), § 248-19-330, filed 9/15/82; 81-09-012 (Order 210), § 248-19-330, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-330, filed 11/30/79.]

WAC 248-19-340 EXPEDITED REVIEW PROCESS. (1) The expedited review process shall not exceed fifty days from the beginning of the review period unless extended in accordance with the provisions of subsection (2) of this section: PROVIDED, HOWEVER, That the appropriate health systems agency consents in writing to a thirty-day review period and does not need to conduct a public hearing in accordance with WAC 248-19-320. If the health systems agency does not consent to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a thirty-day review period, the expedited review process shall not exceed eighty days from the beginning of the review period.

(a) If the review period for the health systems agency is thirty days, the health systems agency and, in the case of a hospital project, the hospital commission, shall submit written findings and recommendations to the department within thirty days of the beginning of the review period. If the review period for the health systems agency is sixty days, the health systems agency and, in the case of a hospital project, the hospital commission, shall submit written findings and recommendations to the department within sixty days of the beginning of the review period.

(b) The department shall complete its final review and the secretary shall make his decision on a certificate of need application under an expedited review within twenty days of the end of the review period or extended review period of the health systems agency and, in the case of a hospital project, the hospital commission.

(2) The review period for an expedited review may be extended according to the following provisions.

(a) If the health systems agency has consented to a thirty-day review period, the review period may be extended for up to an additional thirty days when the health systems agency conducts a public hearing in accordance with the provisions of WAC 248-19-320 or when additional time is needed by the health systems agency or, in the case of a hospital project, the hospital commission, to complete the review and submit written findings and recommendations to the department. The department may grant further extensions to this review period: PROVIDED, The person who submitted the certificate of need application gives written consent to further extension.

(b) The department may extend its final review if a public hearing is requested in accordance with the provisions of WAC 248-19-320 and the hearing is conducted by the department. Such extension may be for an additional period of up to thirty days.

(c) If an issue, which is pivotal to the secretary's decision remains unresolved, the department may make one request for additional information from the person who submitted the application. The department may extend its final expedited review period up to but not exceeding thirty days after receipt of the applicant's written response to the department's request for information. Such pivotal issues include but are not limited to pending action for medicare or medicaid decertification, license revocation or patient trust fund violation or termination of a provider agreement.

(d) The department may extend either the expedited review period for the health systems agency and the hospital commission or the department's final review period upon receipt of a written request of the person who submitted the application: PROVIDED, HOWEVER, That such an extension shall not exceed sixty days.

(3) Projects reviewed under expedited review provisions in WAC 248-19-300 (2)(b)(ii) and (iii) shall not be subject to WAC 248-19-370. The evaluation of criteria in WAC 248-19-380, 248-19-390 and 248-19-400 shall be reviewed only to the extent applicable criteria were not considered in the plan approval process and a reasonable expectation exists that consideration of these criteria could materially alter the approval of projects. [Statutory Authority: RCW 70.38.135. 82-19-055 (Order 244), § 248-19-340, filed 9/15/82; 81-09-

012 (Order 210), § 248-19-340, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-340, filed 11/30/79.]

WAC 248-19-350 EMERGENCY REVIEW PROCESS. (1) The emergency review process shall not exceed fifteen working days from the beginning of the review period.

(2) Written findings and written recommendations of the health systems agency, and in the case of hospital projects, the hospital commission, shall be submitted to the department within ten working days after the beginning of the emergency review period.

(3) The department shall complete its final review and the secretary shall make his decision on an emergency certificate of need application within fifteen working days after the beginning of the review period unless the department extends its final review period in accordance with the provisions of subsection (4) of this section.

(4) If an issue, which is pivotal to the secretary's decision remains unresolved, the department may make one request for additional information from the person who submitted the application. The department may extend its final emergency review period up to but not exceeding thirty days after receipt of the applicant's written response to the department's request for information. Such pivotal issues include but are not limited to pending action for medicare or medicaid decertification, license revocation or patient trust fund violation or termination of a provider agreement. [Statutory Authority: RCW 70.38.135. 82-19-055 (Order 246), § 248-19-350, filed 9/15/82; 81-09-012 (Order 210), § 248-19-350, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-350, filed 11/30/79.]

WAC 248-19-360 BASES FOR FINDINGS AND ACTION ON APPLICATIONS. (1) The findings of the department's review of certificate of need applications and the action of the secretary's designee on such applications shall, with the exceptions provided for in WAC 248-19-410 and 248-19-415 be based on determinations as to:

(a) Whether the proposed project is needed;

(b) Whether the proposed project will foster containment of the costs of health care;

(c) Whether the proposed project is financially feasible; and

(d) Whether the proposed project will meet the criteria for structure and process of care identified in WAC 248-19-390.

(2) The decision on a certificate of need application shall be consistent with the state health plan in effect at the time the secretary's designee made the original or reconsidered or remanded decision. A finding of inconsistency shall not be based solely on the fact a proposed project is not specifically referenced in the state health plan.

(3) Criteria contained in this section and in WAC 248-19-370, 248-19-380, 248-19-390, and 248-19-400 shall be used by the department in making the required determinations.

(a) In the use of criteria for making the required determinations, the department shall consider:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(i) The consistency of the proposed project with the applicable regional health plan (RHP) and annual implementation plan (AIP), and the state health plan (SHP);

(ii) The standards in the state health plan identified to be used for certificate of need review purposes and applicable to the type of project under review;

(iii) In the event standards in the state health plan or regional health plan do not address in sufficient detail for a required determination the services or facilities for health services proposed, the department may consider standards not in conflict with the state health plan or regional health plan in accordance with subsection (3)(b) of this section;

(iv) The findings and recommendations of the regional health council and the hospital commission (in relation to the immediate and long-range financial feasibility of a hospital project as well as the probable impact of such project on the cost of and charges for providing health services by the hospital, including recommendations to approve, conditionally approve, partially approve, or deny an application); and

(v) The relationship of the proposed project to the long-range plan (if any) of the person proposing the project.

(b) The department may consider any of the following in its use of criteria for making the required determinations:

(i) Nationally recognized standards from professional organizations;

(ii) Standards developed by professional organizations in Washington state;

(iii) Federal Medicare and Medicaid certification requirements;

(iv) State licensing regulations;

(v) The hospital commission's policies, guidelines and regulations;

(vi) Applicable standards developed by other individuals, groups, or organizations with recognized expertise related to a proposed undertaking; and

(vii) The written findings and recommendations of individuals, groups, or organizations with recognized expertise related to a proposed undertaking, with whom the department consults during the review of an application.

(c) At the request of an applicant, the department shall identify the criteria and standards it will use prior to the submission and screening of a certificate of need application: PROVIDED HOWEVER, That when a person requests identification of criteria and standards prior to the submission of an application, the person shall submit such descriptive information on a project as is determined by the department to be reasonably necessary in order to identify the applicable criteria and standards. The department shall respond to such request within fifteen working days of its receipt. In the absence of an applicant's request under this subsection, the department shall identify the criteria and standards it will use during the screening of a certificate of need application. The department shall inform the applicant about any consultation services it will use in the review of a certificate of need application prior to the use of such consultation services.

(d) Representatives of the department or consultants whose services are engaged by the department may make an on-site visit to a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

health care facility, or other place for which a certificate of need application is under review, or for which a proposal to withdraw a certificate of need is under review when the department deems such an on-site visit is necessary and appropriate to the department's review of a proposed project. [Statutory Authority: RCW 70.38.135. 85-05-032 (Order 2208), § 248-19-360, filed 2/15/85; 81-09-012 (Order 210), § 248-19-360, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-360, filed 11/30/79.]

WAC 248-19-370 DETERMINATION OF NEED. The determination of need for any project shall be based on the following criteria, except these criteria will not justify exceeding the limitation on increases of nursing home beds provided in WAC 248-19-375.

(1) The population served or to be served has need for the project and other services and facilities of the type proposed are not or will not be sufficiently available or accessible to meet that need. The assessment of the conformance of a project with this criterion shall include, but need not be limited to, consideration of the following:

(a) In the case of a reduction, relocation, or elimination of a service, the need the population presently served has for the service, the extent to which the need will be met adequately by the proposed relocation or by alternative arrangements, and the effect of the reduction, elimination, or relocation of the service on the ability of low-income persons, racial and ethnic minorities, women, handicapped persons, and other underserved groups and the elderly to obtain needed health care;

(b) In the case of health services or facilities proposed to be provided, the efficiency and appropriateness of the use of existing services and facilities similar to those proposed;

(c) In the case of an application by an osteopathic or allopathic facility for a certificate of need to construct, expand, or modernize a health care facility, acquire major medical equipment, or add services, the need for that construction, expansion, modernization, acquisition of equipment, or addition of services on the basis of the need for and the availability in the community of services and facilities for osteopathic and allopathic physicians and their patients, and the impact on existing and proposed institutional training programs for doctors of osteopathy and medicine at the student, internship, and residency training levels; and

(d) In the case of a project not involving health services, the contribution of the project toward overall management and support of such services.

(2) All residents of the service area, including low-income persons, racial and ethnic minorities, women, handicapped persons, and other underserved groups and the elderly are likely to have adequate access to the proposed health service or services. The assessment of the conformance of a project with this criterion shall include, but not be limited to, consideration as to whether the proposed services makes a contribution toward meeting the health-related needs of members of medically underserved groups which have traditionally experienced difficulties in obtaining equal access to health services, particularly those needs identified in the applicable regional health plan, annual implementation plan, and state health plan as deserving

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of priority. Such consideration shall include an assessment of the following:

(a) The extent to which medically underserved populations currently use the applicant's services in comparison to the percentage of the population in the applicant's service area which is medically underserved, and the extent to which medically underserved populations are expected to use the proposed services if approved;

(b) The past performance of the applicant in meeting obligations, if any, under any applicable federal regulations requiring provision of uncompensated care, community service, or access by minorities and handicapped persons to programs receiving federal financial assistance (including the existence of any unresolved civil rights access complaints against the applicant);

(c) The extent to which Medicare, Medicaid, and medically indigent patients are served by the applicant; and

(d) The extent to which the applicant offers a range of means by which a person will have access to its services (e.g., outpatient services, admission by house staff, admission by personal physician).

(3) The resources for the proposed project are not needed for higher priority alternative uses identified in applicable health plans.

(4) The applicant has substantiated any of the following special needs and circumstances the proposed project is to serve.

(a) The special needs and circumstances of entities such as medical and other health professions schools, multidisciplinary clinics and specialty centers providing a substantial portion of their services or resources, or both, to individuals not residing in the health service areas in which the entities are located or in adjacent health service areas.

(b) The special needs and circumstances of biomedical and behavioral research projects designed to meet a national need and for which local conditions offer special advantages.

(c) The special needs and circumstances of osteopathic hospitals and nonallopathic services.

(5) The project will not have an adverse effect on health professional schools and training programs. The assessment of the conformance of a project with this criterion shall include consideration of:

(a) The effect of the means proposed for the delivery of health services on the clinical needs of health professional training programs in the area in which the services are to be provided; and

(b) If proposed health services are to be available in a limited number of facilities, the extent to which the health professions schools serving the area will have access to the services for training purposes.

(6) The project is needed to meet the special needs and circumstances of enrolled members or reasonably anticipated new members of a health maintenance organization or proposed health maintenance organization and the services proposed are not available from nonhealth maintenance organization providers or other health maintenance organizations in a reasonable and cost-effective manner consistent with the basic method of operation of the health maintenance organization or proposed health maintenance organization. In assessing the availability of health services from these providers, the department shall consider only whether the services from these providers:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(a) Would be available under a contract of at least five years' duration;

(b) Would be available and conveniently accessible through physicians and other health professionals associated with the health maintenance organization or proposed health maintenance organization (for example - whether physicians associated with the health maintenance organization have or will have full staff privileges at a nonhealth maintenance organization hospital);

(c) Would cost no more than if the services were provided by the health maintenance organization or proposed health maintenance organization; and

(d) Would be available in a manner administratively feasible to the health maintenance organization or proposed health maintenance organization. [Statutory Authority: RCW 70.38.115. 85-05-032 (Order 2208), § 248-19-370, filed 2/15/85. 81-09-012 (Order 210), § 248-19-370, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-370, filed 11/30/79.]

WAC 248-19-373 DETERMINATION OF NURSING HOME BED NEEDS. (1) The following rules are adopted for use in making decisions on certificate of need applications involving nursing home beds submitted for review under the provisions of RCW 70.38.105.

(a) With the assistance of a work group, the state health coordinating council developed a method for determining future nursing home bed needs with the intention of incorporating that method as an amendment to the 1982 state health plan. The secretary of the department reviewed the method and submitted it to the governor for adoption as an amendment to the state health plan. The governor adopted the method as part of an amendment of the state health plan on March 27, 1984. See RCW 70.38.045 and RCW 70.38.065.

(b) The nursing home bed need projections in subsection (3)(a) of this section shall be used to interpret the certificate of need review criteria in RCW 70.38.115 (2)(b) and WAC 248-19-370.

(2) The secretary finds:

(a) That in developing the amendment to the 1982 state health plan the state health coordinating council sought and received the assistance of a work group consisting of representatives from a wide variety of groups interested in nursing home bed needs in this state.

(b) That the work group consisted of representatives from the following: State health coordinating council; Puget Sound health systems agency; Washington association of homes for the aging; Washington state health facilities association; united nursing home association; area agency on aging; nursing home ombudsman; state nursing home advisory council; senior citizens lobby; state council on aging; the department's bureau of aging and adult services, bureau of nursing home affairs, and regional offices; and the house committee on social and health services.

(c) That the following assumptions which were incorporated in the amendment regarding the bed need projection method are the appropriate policy considerations for projecting nursing home bed needs.

(i) Nursing home bed need projections should reflect variations in nursing home use by different age groups of the population.

(ii) Nursing home beds should ordinarily be located reasonably close to the people they serve.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(iii) Equity and the availability in use of nursing home beds within the state should be increased by reducing the wide variation in nursing home use rates within age groups among areas of the state.

(iv) Areas of the state that are underbedded, adequately bedded, and overbedded should be identified and treated differently in the bed need projection process.

(v) The overall supply of beds in the state should represent a reasonable and appropriate state nursing home bed to elderly population ratio.

(vi) Most current nursing home use in the state reflects an appropriate need for formal services which should be met by nursing home beds or other services in long-term care continuum.

(vii) To be responsive to unique local circumstances, the nursing home bed need projection process should include local discretion in defining nursing home planning areas and bed allocations.

(d) That the amendment to the 1982 state health plan established a 1990 target state nursing home bed to elderly population ratio (see subsection (2)(c)(v) of this section) of 53.7 beds per one thousand persons aged sixty-five or older. Taken into account in establishing this ratio were the following:

(i) The national bed ratio and the bed ratios of other states judged to have reasonable and progressive long-term care policies, and

(ii) State policy goals for the allocation of scarce resources between nursing home beds and other institutional and community-based services in the long-term care continuum, and

(iii) The effects on nursing home bed needs of new health system developments, such as hospital diagnostic related group (DRG) reimbursement, and

(iv) Progress being made in developing other long-term care services for the population at risk of nursing home placement.

(e) That nursing home bed need projections derived from the state health plan bed need methodology should not be exceeded in decisions on applications for certificates of need.

(3) The following are the 1987 projections of total nursing home beds needed in each county as derived from the state health plan nursing home bed need projection methodology. These projections will remain in effect until updated. The next update is scheduled for the last half of 1986. The projections do not reflect necessary reductions for current licensed nursing home beds (excluding nursing home beds used for IMR), beds in hospitals used for long-term care, and the number of nursing home beds approved by certificate of need, but not yet licensed. The projections less these reductions equal additional beds needed.

(b) These bed need projections include the allocation plans of the applicable regional health council, as provided for in the nursing home bed need projection method. Where there is no regional health council allocation plan, the nonallocated projection is shown.#

(c) Certificates of need issued by the department shall approve no more than the number of additional beds indicated as needed for a given county by the projection method as listed in subsection (3)(a) of this section.

NOTE:

#Step 5 of the state health plan nursing home bed need projection methodology concerns the determination of the appropriate number of nursing home beds in each county. The method states the regional health councils are responsible for the development of an allocation plan. The regional health councils may group counties into multiple county planning areas and allocate beds or reallocate beds among counties based on the planning areas. The allocation plan shall be developed separate from the review of individual certificate of need applications.

[Statutory Authority: RCW 70.38.115. 85-05-032 (Order 2208), § 248-19-373, filed 2/15/85.]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-19-380 DETERMINATION OF FINANCIAL FEASIBILITY. The determination of financial feasibility of a project shall be based on the following criteria.

(1) The immediate and long-range capital and operating costs of the project can be met.

(2) The costs of the project, including any construction costs, will probably not result in an unreasonable impact on the costs and charges for health services.

(3) The project can be appropriately financed. [Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-380, filed 11/30/79.]

WAC 248-19-390 CRITERIA FOR STRUCTURE AND PROCESS OF CARE. A determination that a project fosters an acceptable or improved quality of health care shall be based on the following criteria.

(1) A sufficient supply of qualified staff for the project, including both health manpower and management personnel, are available or can be recruited.

(2) The proposed service(s) will have an appropriate relationship, including organizational relationship, to ancillary and support services, and ancillary and support services will be sufficient to support any health services included in the proposed project.

(3) There is reasonable assurance that the project will be in conformance with applicable state licensing requirements and, if the applicant is or plans to be certified under the Medicaid or Medicare program, with the applicable conditions of participation related to those programs.

(4) The proposed project will promote continuity in the provision of health care, not result in an unwarranted fragmentation of services, and have an appropriate relationship to the service area's existing health care system.

(5) There is reasonable assurance that the services to be provided through the proposed project will be provided in a manner that ensures safe and adequate care to the public to be served and in accord with applicable federal and state laws, rules, and regulations. The assessment of the conformance of a project to this criterion shall include but not be limited to consideration as to whether:

(a) The applicant has no history, in this state or elsewhere, of a criminal conviction which is reasonably related to the applicant's competency to exercise responsibility for the ownership or operation of a health care facility, a denial or revocation of a license to operate a health care facility, a revocation of a license to practice a health profession, or a decertification as a provider of services in the Medicare or Medicaid program because of failure to comply with applicable federal conditions of participation; or

(b) If the applicant has such a history, whether the applicant has affirmatively established to the department's satisfaction by clear, cogent and convincing evidence that the applicant can and will operate the proposed project for which the certificate of need is sought in a manner that ensures safe and adequate care to the public to be served and conforms to applicable federal and state requirements. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-390, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-390, filed 11/30/79.]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-19-400 DETERMINATION OF COST CONTAINMENT. A determination that a proposed project will foster cost containment shall be based on the following criteria.

(1) Superior alternatives, in terms of cost or effectiveness, are not available or practicable.

(2) In the case of a project involving construction:

(a) The costs and methods of construction and energy provision are reasonable; and

(b) The project will probably not have an unreasonable impact on the costs and charges to the public of providing health services by other persons.

(3) The project takes into consideration the special needs and circumstances of health care facilities with respect to the need for energy conservation.

(4) The project will promote efficiency or productivity. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-400, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-400, filed 11/30/79.]

WAC 248-19-405 MAJOR MEDICAL EQUIPMENT NOT OWNED BY OR LOCATED IN A HEALTH CARE FACILITY. (1) For purposes of this section, purchases, donations and leases of major medical equipment shall be considered acquisitions of such equipment. An acquisition of major medical equipment through a transfer of such equipment for less than fair market value shall be considered an acquisition of major medical equipment if its fair market value is at least one hundred fifty thousand dollars.

(2) Before any person enters into a contractual arrangement# to acquire major medical equipment which is not to be owned by or located in a health care facility, such person shall submit a valid notice to the department and the appropriate health systems agency of the intent to acquire the equipment.

(a) The notices to the department and the appropriate health systems agency shall be submitted in writing at least thirty days before entering into contractual arrangements to acquire the equipment with respect to which the notice is given.

(b) To be valid, a notice shall include:

(i) A complete description of the major medical equipment to be acquired and the health services to be provided with such equipment;

(ii) The name, address, and general description of the facility in which the equipment is to be located;

(iii) The date on which any contractual arrangement for acquisition of the equipment was or is to be entered into;

(iv) A statement as to whether the equipment is to be used for any hospital's inpatients and, if so, whether such use will be only on a temporary basis in the case of a natural disaster, a major accident or equipment failure.

(3) The acquisition of major medical equipment which is not to be owned by or located in a health care facility shall be subject to review if the department finds that:

(a) The written notice of intent to acquire the equipment was not submitted in accordance with the provisions of subsection (2) of this section; or

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(b) The equipment will be used to provide services to a hospital's inpatients on other than a temporary basis in the case of a natural disaster, a major accident, or equipment failure.

(4) Within fifteen working days after receipt of a valid notice of intent to acquire the major medical equipment, the department shall respond to the person who submitted the notice of intent, informing such person as to whether the acquisition of the equipment is subject to certificate of need review. A copy of the response shall be sent to the appropriate health systems agency. If the department fails to make a determination within thirty days after the receipt of a valid notice, the major medical equipment may be acquired without a certificate of need.

(5) If a person has acquired major medical equipment not located in a health care facility which the department has determined was not subject to review under the provisions of subsections (2), (3) and (4) of this section and subsequently proposes to use such equipment to serve inpatients of a hospital on other than a temporary basis in the case of a natural disaster, a major accident, or equipment failure, the proposed new use of the major medical equipment shall be subject to certificate of need review.

NOTE:

#A person may enter into a contractual arrangement at an earlier date, provided such contractual arrangement is contingent upon a determination by the department that a certificate of need is not needed, or upon issuance of a certificate of need.

[Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-405, filed 4/9/81, effective 5/20/81.]

WAC 248-19-405 EXEMPTIONS FROM REQUIREMENTS FOR A CERTIFICATE OF NEED. (1) Provisions for exemptions. The secretary shall grant an exemption from the requirements for a certificate of need for the offering of an inpatient institutional health service, the acquisition of major medical equipment for the provision of an institutional health service or the obligation of a capital expenditure in excess of one hundred fifty thousand dollars for the provision of an inpatient institutional health service to any entity which meets the eligibility requirements set forth in subdivision (a) of this subsection for such an exemption and submits an application for an exemption which meets the requirements of subdivision (b) of this subsection.

(a) Eligibility requirements. To be eligible for an exemption from the requirements for a certificate of need for the offering of an inpatient institutional health service, the acquisition of major medical equipment for the provision of an inpatient institutional health service, or the obligation of a capital expenditure in excess of one hundred fifty thousand dollars for the provision of an institutional health service, an applicant entity shall be one of the following:

(i) A health maintenance organization or a combination of health maintenance organizations if:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(A) The organization or combination of organizations has, in the service area of the organization or the service areas of the organizations in the combination, an enrollment of at least fifty thousand individuals;

(B) The facility in which the service will be provided is or will be geographically located so that the service will be reasonably accessible to such enrolled individuals; and

(C) At least seventy-five percent of the patients who can reasonably be expected to receive the institutional health service will be individuals enrolled in such organization or organizations in the combination;

(ii) A health care facility if:

(A) The facility primarily provides or will provide inpatient health services;

(B) The facility is or will be controlled, directly or indirectly, by a health maintenance organization or a combination of health maintenance organizations which has, in the service area of the organization or service areas of the organizations in the combination, an enrollment of at least fifty thousand individuals;

(C) The facility is or will be geographically located so that the service will be reasonably accessible to such enrolled individuals; and

(D) At least seventy-five percent of the patients who can reasonably be expected to receive the institutional health service will be individuals enrolled with such organization or organizations in the combination; or

(iii) A health care facility (or portion thereof) if:

(A) The facility is or will be leased by a health maintenance organization or combination of health maintenance organizations which has, in the service area of the organization or the service areas of the organizations in the combination, an enrollment of at least fifty thousand individuals and, on the date the application for an exemption is submitted, at least fifteen years remain in the term of the lease;

(B) The facility is or will be geographically located so that the service will be reasonably accessible to such enrolled individuals; and

(C) At least seventy-five percent of the patients who can reasonably be expected to receive the institutional health service will be individuals enrolled with such organization;

(b) Requirements for an application for exemption. An application for an exemption from a certificate of need shall meet the following requirements.

(i) The application for an exemption shall have been submitted at least thirty days prior to the offering of the institutional health service, acquisition of major medical equipment, or obligation of the capital expenditure to which the application pertains. A copy of the application for the exemption shall be sent simultaneously to the appropriate health systems agency and, in the case of a hospital, to the hospital commission.

(ii) A complete application shall be submitted in such form and manner as has been prescribed by the department. The information which the department prescribes shall include:

(A) All of the information required to make a determination that the applicant entity qualifies in accordance with subdivision (a) of this subsection; and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(B) A complete description of the offering, acquisition, or obligation to which the application pertains.

(2) Action on an application for exemption.

(a) Within thirty days after receipt of a complete application for exemption from certificate of need requirements, the department shall send the applicant a written notice that the exemption has been granted or denied. A copy of such written notice shall be sent simultaneously to the appropriate health systems agency and, in the case of a hospital, to the hospital commission.

(b) The secretary shall deny an exemption if he finds the applicant has not met the requirements of subsections (1) (a) and (b) of this section. Written notice of the denial shall include the specific reasons for the denial.

(c) In the case of an application for a proposed health care facility (or portion thereof) which has not begun to provide institutional health services on the date the application for an exemption is submitted, the secretary shall grant the exemption if he determines the facility (or portion thereof) will meet the applicable requirements of subsection (1)(a) of this section when the facility first provides health services.

(d) If the secretary fails to grant or deny an exemption in accordance with the provisions of this section within thirty days after receipt of a complete application for such exemption, the applicant for the exemption may seek a writ of mandamus from superior court pursuant to chapter 7.16 RCW.

(3) Subsequent sale, lease or acquisition of exempt facilities or equipment. Subsequent sale, lease, or acquisition of exempt health care facilities (or portions thereof) or medical equipment for which an exemption was granted under the provisions of subsection (2) of this section, any acquisition of a controlling interest in such facility or equipment, and any use of such facility or equipment by a person other than the one to whom the exemption was granted, shall meet one of the following conditions:

(a) A certificate of need for the purchase, lease, acquisition of controlling interest in, or use of such facility or equipment, shall have been applied for and issued by the department; or

(b) The department shall have determined, after receipt of an application for an exemption, submitted in accordance with subsection (1) of this section, that the requirements of either subsection (1)(a)(i) or subsection (1)(a)(ii)(A) and (B) are met.

(4) The method of payment for services (i.e., prepaid or fee for service) shall not be considered relevant in determining whether an undertaking of a health maintenance organization qualifies for an exemption under this section. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-405, filed 4/9/81, effective 5/20/81.]

WAC 248-19-410 REVIEW AND ACTION ON HEALTH MAINTENANCE ORGANIZATION PROJECTS. (1) Undertakings requiring a certificate of need. A certificate of need shall be required for any undertaking which, in accordance with WAC 248-19-230, is subject to the provisions of chapter 248-19 WAC, unless an exemption has been granted for such undertaking under the provisions of WAC 248-19-405.

(2) Required approval. The secretary shall issue a certificate of need for a proposed project if the certificate of need applicant for

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the proposed project is a health maintenance organization or a health care facility controlled (directly or indirectly) by a health maintenance organization and the department finds the proposed project meets the criteria set forth in WAC 248-19-370(7).

(3) Limitation on denials. The secretary shall not deny a certificate of need to a health maintenance organization or a health care facility controlled (directly or indirectly) by a health maintenance organization solely because a proposed project is not discussed in the applicable health systems plan, annual implementation plan or state health plan.

(4) Sale, acquisition or lease of facilities or equipment for which a certificate of need has been issued. A health care facility (or portion thereof) or medical equipment for which a certificate of need has been issued under the provisions of this section shall not be sold or leased and a controlling interest in such facility or equipment or in a lease of the facility or equipment shall not be acquired unless an exemption or a certificate of need for such sale, lease or acquisition has been granted by the secretary. [Statutory Authority: RCW 70.38.155. 81-09-012 (Order 210), § 248-19-410, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-410, filed 11/30/79.]

WAC 248-19-415 PROJECTS PROPOSED FOR THE CORRECTION OF DEFICIENCIES. (1) For the purposes of this section, "correction of deficiencies" shall mean one or more of the following:

(a) Eliminating or preventing imminent safety hazards as defined by federal, state or local fire, building, or life safety codes or regulations; or

(b) Complying with state licensing standards; or

(c) Complying with accreditation or certification standards which must be met to receive reimbursement under Titles XVIII or XIX of the Social Security Act.

(2) An application which is submitted for a project which is limited to the correction of deficiencies, as defined in subsection (1) of this section, shall be approved unless the department finds, after consultation with the appropriate health systems agency, that:

(a) The facility or service with respect to which such capital expenditure is proposed is not needed; or

(b) The obligation of such capital expenditure is not consistent with the state health plan in effect.

(3) A determination that a facility or service is not needed shall be made only if the department finds that the facility or service has been identified in the state health plan as not being needed.

(4) An application, which is submitted for the correction of deficiencies, shall be reviewed under the expedited review process, in accordance with WAC 248-19-340, unless it qualifies for emergency review in accordance with WAC 248-19-350.

(5) An application reviewed under the provisions of this section shall be approved only to the extent that the capital expenditure is needed for the correction of the deficiency.

(6) If the department finds that any portion of the project or the project as a whole is not needed for the correction of deficiencies, such portion or entire project shall be reviewed in accordance with WAC 248-19-360, 248-19-370, 248-19-380, 248-19-390, and 248-19-400.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(7) If the department finds that a proposed capital expenditure is needed to correct deficiencies, as defined in subsection (1) of this section, the criteria in WAC 248-19-370 shall not be applied to the consideration of the project. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-415, filed 4/9/81, effective 5/20/81.]

WAC 248-19-420 WRITTEN FINDINGS AND ACTIONS ON CERTIFICATE OF NEED APPLICATION. (1) Written findings.

(a) The findings of the department's review of a certificate of need application shall be stated in writing and include the basis for the secretary's decision as to whether a certificate of need is to be issued or denied for the proposed project.

(b) In making its findings and taking action on a certificate of need application, the department shall use all criteria contained in chapter 248-19 WAC which are applicable to the proposed project.

(i) The written findings shall identify any criterion which the department has decided is not applicable to the particular project and give the reason for such decision.

(ii) The secretary may deny a certificate of need if the applicant has not provided the information which is necessary to a determination that the project meets all applicable criteria and which the department has prescribed and published as necessary to a certificate of need review of the type proposed: PROVIDED, HOWEVER, That the department has requested such information in a screening letter sent in accordance with WAC 248-19-280 (1)(c).

(c) The department shall make written findings on the extent to which the project meets the criteria set forth in WAC 248-19-370 (1) and (2) when the secretary issues a certificate of need directly related to the provision of health services, beds, or major medical equipment: PROVIDED, HOWEVER, That no such written finding shall be necessary for projects for the correction of deficiencies of the types described in WAC 248-19-415 and for projects proposed by or on behalf of a health maintenance organization or a health care facility which is controlled, directly or indirectly, by a health maintenance organization.

(d) When, as a part of concurrent review proceedings, the secretary makes a decision to approve an application or applications and to disapprove other competing applications, he shall provide a specific written statement of reasons for determining the approved application or applications to be superior.

(2) Separability of application and action. When a certificate of need application is for multiple services or multiple components or the proposed project is to be multiphased, the secretary may take individual and different action on separable portions of the proposed project.

(3) Conditional certificate of need.

(a) The secretary in making his decision on a certificate of need application may decide to issue a conditional certificate of need if the department finds that the project is justified only under specific circumstances: PROVIDED, HOWEVER, That conditions shall relate directly to the project being reviewed and to review criteria.

(b) When the department finds that a project for which a certificate of need is to be issued does not satisfy the review criteria set

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

forth in WAC 248-19-370 (1) and (2), the secretary may impose a condition or conditions that the applicant take affirmative steps so as to satisfy those review criteria. In evaluating the accessibility of the project, the current accessibility of the facility as a whole shall be taken into consideration.

(c) The conditions attached to a certificate of need may be released by the secretary upon the request of the health care facility or health maintenance organization for which the certificate of need was issued: PROVIDED, It can be substantiated that the conditions are no longer valid and the release of such conditions would be consistent with the purposes of chapter 70.38 RCW.

(4) Distribution of written findings and statement of decision.

(a) A copy of the department's written findings and statement of the secretary's decision on a certificate of need application shall be sent to:

(i) The person who submitted the certificate of need application;

(ii) The health systems agency for the health service area in which the proposed project is to be located;

(iii) The hospital commission, if the proposed project is for a hospital;

(iv) In the case of a project proposed by a health maintenance organization, the appropriate regional office of the United States department of health and human services; and

(v) When the secretary issues a certificate of need for a project which does not satisfy the review criteria set forth in WAC 248-19-370 (1) and (2), the appropriate regional office of the department of health and human services.

(b) The written findings and statement of the secretary's decision on a certificate of need application shall be available to others who request the certificate of need unit to provide access to a copy of such findings and statement.

(5) Explanation of inconsistency with the health systems agency recommendation or plan. The department shall send to the applicant and to the appropriate health systems agency a detailed, written statement as to the reasons why a decision which the secretary has made on a certificate of need application is inconsistent with any of the following:

(a) The health systems agency's recommendation as to the action to be taken on the certificate of need application;

(b) The goals of the applicable health systems plan; or

(c) The priorities of the applicable annual implementation plan. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-420, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-420, filed 11/30/79.]

WAC 248-19-430 PROVISION FOR RECONSIDERATION DECISION. (1) Any person may, for good cause shown, request a public hearing for the purpose of reconsideration of the secretary's decision on a certificate of need application or withdrawal of a certificate of need.#

(2) The department shall conduct a reconsideration hearing if it finds the request is in accord with the following requirements.

(a) The request for a reconsideration hearing shall be written, be received by the department within thirty days of the department's decision on the certificate of need application or withdrawal of the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

certificate of need, state in detail the grounds which the person requesting the hearing believes to show good cause, and be signed by the person making the request.

(b) Grounds which the department may deem to show good cause for a reconsideration hearing shall be limited to the following:

(i) Significant relevant information not previously considered by the department which, with reasonable diligence, could not have been presented before the department made its decision;

(ii) Information on significant changes in factors or circumstances relied upon by the department in making its findings and decision; or

(iii) Evidence the department materially failed to follow adopted procedures in reaching a decision.

(3) A reconsideration hearing shall commence within thirty days after receipt of the request for the hearing.

(4) Notification of a public reconsideration hearing on a certificate of need application or withdrawal of a certificate of need shall be sent prior to the date of such hearing by the department to the following:

(a) The person who requested the reconsideration hearing;

(b) The person who submitted the certificate of need application which is under reconsideration or the holder of the certificate of need;

(c) The health systems agency for the health service area in which the proposed project is to be offered or developed;

(d) The hospital commission, if the proposed project is a hospital project; and to

(e) Other persons who request the department to send them such notification.

(5) The department shall, within forty-five days after the conclusion of a reconsideration hearing, make written findings which state the basis of the decision made after such hearing.

(6) The secretary may, upon the basis of the department's findings on a reconsideration hearing, issue or reissue, amend, revoke, or withdraw a certificate of need or impose or modify conditions on a certificate of need for the project about which the reconsideration hearing was conducted.

NOTE:

#No fee will be charged for a reconsideration hearing.

[Statutory Authority: RCW 70.38.155. 81-09-012 (Order 210), § 248-19-450, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-430, filed 11/30/79.]

WAC 248-19-440 ISSUANCE, SUSPENSION, DENIAL, REVOCATION AND TRANSFER OF A CERTIFICATE OF NEED. (1) Issuance of a certificate of need.

(a) The secretary shall issue a certificate of need to the person who submitted the certificate of need application for the proposed project or a separable portion of the proposed project only if the department's findings and decision are that the project or the separable portion of the proposed project is consistent with the applicable

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

criteria contained in chapter 248-19 WAC. In issuing a certificate of need, the secretary shall specify the maximum capital expenditure which may be obligated under the certificate and prescribe the cost components to be included in determining the capital expenditure which may be obligated under such certificate.

(b) The secretary may issue a conditional certificate of need for a proposed project if it is justified only under specific circumstances. The conditions specified in a conditional certificate of need must directly relate to the project being reviewed and to criteria contained in chapter 248-19 WAC.

(2) Suspension of a certificate of need.

(a) Grounds for which the secretary may suspend a certificate of need shall include, but not be limited to, suspicion of fraud, misrepresentation, false statements, misleading statements, evasion or suppression of material fact in the application for a certificate of need or any of its supporting materials.

(b) The secretary shall issue an order for any suspension of a certificate of need to the person to whom the certificate of need had been issued.

(i) Such order shall state the reason for the suspension.

(ii) A copy of such order of suspension shall be sent to the appropriate health systems agency and, if for a hospital project, the hospital commission.

(c) A suspension of a certificate of need shall not exceed one hundred twenty calendar days.

(i) The department shall review the facts and circumstances relevant to the suspension and the secretary shall reinstate, amend or revoke a certificate of need within the one hundred twenty calendar days.

(ii) The secretary shall send written notice of its decision on a suspended certificate of need to the person to whom the certificate of need had been issued. A copy of such notice shall be sent to the appropriate health systems agency and, if a hospital project, to the hospital commission.

(3) Denial of a certificate of need.

The secretary shall send written notification of denial of a certificate of need for a proposed project or a separable portion of a proposed project to the person who submitted the certificate of need application for the proposed project for which the certificate of need is not issued.

(a) Such notification shall state the reasons for the denial of a certificate of need.

(b) Copies of such notification shall be sent to the appropriate health systems agency and, if for a hospital project, to the hospital commission.

(4) Continuing effect of a denial.

In any case in which a proposed project or separable portion of the proposed project has been denied a certificate of need, another certificate of need application for such proposed project or separable portion thereof shall not be accepted by the department or reviewed under the provisions of chapter 248-19 WAC following the denial unless the department determines:

(a) There is a substantial change in existing or proposed health facilities or services in the area to be served by the project; or

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(b) There is a substantial change in the need for the facilities or services of the type proposed in the area to be served by the project; or

(c) Three years have lapsed since the submission of the application for the certificate of need which was denied.

(5) Revocation of a certificate of need.

(a) The secretary may revoke a certificate of need for fraud, misrepresentation, false statements, misleading statements, evasion or suppression of material facts in the application of a certificate of need, or in any of its supporting materials.

(b) The secretary shall send written notification of a revocation of a certificate of need to the person to whom the certificate of need had been issued.

(i) The notice of revocation shall include a statement of the reasons for such revocation.

(ii) A copy of a notice of revocation shall be sent to the appropriate health systems agency and, if a hospital project, to the hospital commission.

(6) Transfer or assignment of a certificate of need. A certificate of need which has been issued to one person shall not be transferred or assigned to another person without the written approval of the secretary.

(a) The person to whom the certificate of need was originally issued shall submit to the department a written request that the certificate of need be transferred to another person and give the full name and complete address of the other person.

(b) The person to whom the current holder of the certificate of need wishes to transfer the certificate shall send a written request for such transfer on a form and in such a manner as prescribed and published by the department.

(c) The secretary, after the department's consultation with the appropriate health systems agency and, for a hospital project, the hospital commission shall:

(i) Transfer the certificate of need;

(ii) Deny the transfer of the certificate of need and send written notice of the denial and the reasons for such denial to the persons who requested the transfer; or

(iii) If the person, who wishes to receive the certificate of need, plans to modify the project for which the certificate was issued, notify such person that an application for a new or amended certificate of need is necessary.

(7) Secretary's failure to act. If the secretary fails to issue or deny a certificate of need in accordance with the provisions of chapter 248-19 WAC, the applicant for the certificate of need may seek a writ of mandamus from superior court pursuant to chapter 7.16 RCW. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-440, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-440, filed 11/30/79.]

WAC 248-19-450 CIRCUMSTANCES FOR WHICH AN AMENDED CERTIFICATE OF NEED IS REQUIRED. (1) An amended certificate of need shall be required for any of the following modifications of a project for which a certificate of need was issued:

(a) An addition of a new service;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(b) An expansion of a service beyond that which was included in the certificate of need application on which the issuance of the certificate of need was based;

(c) An increase in the inpatient bed capacity; or

(d) A significant reduction in the scope of a project for which a certificate of need has been issued without a commensurate reduction in the cost of the project, or the project cost increases (as represented in bids on a construction project or final cost estimate(s) acceptable to the person to whom the certificate of need was issued) when the total of such increases exceeds twelve percent or fifty thousand dollars, whichever is greater, over the maximum capital expenditure specified by the secretary in issuing the certificate of need: PROVIDED, HOWEVER, That the review of such reductions or cost increases shall be restricted to the continued conformance of the project with the criteria contained in WAC 248-19-380 and 248-19-400.

(2) An application for an amended certificate of need shall be submitted in accordance with the provisions of WAC 248-19-280.

(3) An application for an amended certificate of need may be reviewed under the expedited review process set forth in WAC 248-19-340.

(4) The department shall provide a written determination as to the requirement for an amended certificate of need within twenty-one days after receipt of a request for such determination. [Statutory Authority: RCW 70.38.155. 81-09-012 (Order 210), § 248-19-450, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-450, filed 11/30/79.]

WAC 248-19-460 VALIDITY AND EXTENSIONS. (1) A certificate of need shall be valid for two years: PROVIDED, That one six month extension may be made if it can be substantiated that substantial and continuing progress toward commencement of the project has been made.

(2) A project for which a certificate of need has been issued shall be commenced during the validity period for the certificate of need.

(3) Applications for extensions of the validity period of certificates of need shall be submitted simultaneously to the department, the appropriate health systems agency and, if a hospital project, the hospital commission, at least one hundred and twenty calendar days before the expiration of the certificate of need, and shall contain such information as may be required by the department to determine the extent of progress toward commencement of construction or other action necessary to a project.

(4) An application for an extension of a certificate of need which is submitted less than one hundred and twenty calendar days before the expiration of the certificate of need shall not be reviewed, unless the applicant can demonstrate to the satisfaction of the department that unforeseen occurrences during the last one hundred and twenty days of the validity period of the certificate of need prevented commencement of construction as previously anticipated by the applicant.

(5) Commencement of the project shall not be undertaken after the expiration of the certificate of need unless a new certificate of need application has been reviewed and a new certificate of need has been issued by the secretary. [Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-460, filed 11/30/79.]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-19-470 MONITORING OF APPROVED PROJECTS. (1) The department in cooperation with the health systems agencies, and the hospital commission in the case of hospital projects, shall monitor the costs and components of approved projects so as to assure conformance with certificates of need that have been issued.

(2) The department shall require periodic progress reports from those applicants to whom certificates of need have been issued.

(a) Progress reports shall be required at least annually and at no greater frequency than quarterly.

(b) Progress reports shall be submitted in the form and manner prescribed and published by the department.

(3) Information required on approved projects may include:

(a) Actual project costs;

(b) Changes in the project;

(c) Financing arrangements, different than approved under the certificate of need;

(d) Project commencement date;

(e) Progress toward completion of construction; and

(f) Project completion date.

(4) The information required on approved projects may vary according to the nature of the projects.

(5) Progress reports on a project for which a particular certificate of need has been issued shall terminate when the project has been completed and the department finds that it has received all the information necessary to determine that the project has been completed in accordance with the certificate of need which had been issued and the provisions of chapter 248-19 WAC. [Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-470, filed 11/30/79.]

WAC 248-19-475 WITHDRAWAL OF A CERTIFICATE OF NEED. (1) The secretary may withdraw a certificate of need if the department determines, after consultation with the appropriate health systems agency and, in the case of a hospital project, the hospital commission, that the holder of a certificate is not meeting the timetable specified in the certificate of need application for making services or equipment available or completing the project and is not making a good faith effort to meet such timetable.

(2) In reviewing a proposed withdrawal of a certificate of need, the department shall adhere to the provisions of WAC 248-19-310, 248-19-320, 248-19-325 and 248-19-430.

(3) The review period for a proposed withdrawal of a certificate of need shall not exceed ninety days unless extended by the department to allow sufficient time for the conduct of a public hearing pursuant to the provisions of WAC 248-19-320. The review period of the appropriate health systems agency and, in the case of a hospital project, the hospital commission shall not exceed sixty days unless extended by the department at the written request of the health systems agency to allow sufficient time for the conduct of a public hearing pursuant to the provisions of WAC 248-19-320. Such extension shall not exceed thirty days.

(4) The findings of the department's review of a proposed withdrawal of a certificate of need shall be stated in writing and include the basis for the secretary's decision as to whether the certificate of need is to be withdrawn for a proposed project. A copy of the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

department's written findings and statement of the secretary's decision on the proposed withdrawal of a certificate of need shall be sent to:

(a) The holder of the certificate of need;

(b) The health systems agency for the health service area in which the proposed project is to be located;

(c) The hospital commission, if the proposed project is for a hospital; and

(d) In the case of a project proposed by a health maintenance organization, the appropriate regional office of the United States Department of Health and Human Services.

(5) The written findings and statement of the secretary's decision on the proposed withdrawal of a certificate of need shall be available to others who request the certificate of need unit to provide access to a copy of such findings and statement.

(6) The department shall send to the appropriate health systems agency a detailed, written statement as to the reasons why a decision which the secretary has made is inconsistent with any of the following:

(a) The health systems agency's recommendation as to the action to be taken;

(b) The goals of the applicable health systems plan; or

(c) The priorities of the applicable annual implementation plan.

(7) When a certificate of need is for multiple services or multiple components or the proposed project is to be multiphased, the secretary may take individual and different action regarding withdrawal of the certificate of need on separable portions of the certificate of need. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-475, filed 4/9/81, effective 5/20/81.]

WAC 248-19-480 RIGHT AND NOTICE OF APPEAL. (1) Any affected person may request and shall be afforded the opportunity for an administrative hearing on the secretary's decision to issue or deny a certificate of need for a project or a separable portion of a project, to grant or deny an exemption requested under WAC 248-19-405, to suspend or revoke a certificate of need, or to withdraw or not withdraw a certificate of need.

(2) To be effective, a request for an administrative hearing shall be in writing and received by the department within thirty days after the person requesting the hearing received the particular decision of the department which is being appealed or, if a reconsideration hearing was requested and denied, thirty days after the denial of the request for the reconsideration hearing.

(3) An administrative hearing shall be conducted in accordance with the provisions of chapter 34.04 RCW.

(4) The decision of the secretary shall be subject to review in an administrative hearing to establish a record of the decision of the secretary. The determination of the official who conducts such an administrative hearing shall be made in writing within forty-five days after the conclusion of the hearing. The official who conducts such an administrative hearing may make a proposed decision, findings of fact and conclusions of law, pursuant to RCW 34.04.110, or the official may remand the matter to the secretary for further action or

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

consideration.# The written determination shall be sent to the applicant, the appropriate health systems agency, the hospital commission in the case of a hospital project, and the department. The department shall make any written determination available to others upon request.

NOTE:

#Chapter 34.04 RCW provides entitlement to judicial review to any person aggrieved by a final decision in a contested case, whether such decision is affirmative or negative in form.

[Statutory Authority: RCW 70.38.135. 82-19-055 (Order 244), § 248-19-480, filed 9/15/82; 81-09-012 (Order 210), § 248-19-480, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-480, filed 11/30/79.]

WAC 248-19-490 CERTIFICATE OF NEED PROGRAM REPORTS. (1) The department shall prepare and publish annual reports containing information on certificate of need reviews in progress, reviews completed in the preceding twelve month period, and a general statement of the findings and decisions made in the course of those reviews.

(2) Upon request, the department shall provide notification to health care facilities and to other persons of the status of the department's review of projects subject to review and the findings made in the course of such review. [Statutory Authority: RCW 70.38-.135. 81-09-012 (Order 210), § 248-19-490, filed 4/9/81, effective 5/20/81. Statutory Authority: Chapter 70.38 RCW. 79-12-079 (Order 188), § 248-19-490, filed 11/30/79.]

WAC 248-19-500 PUBLIC ACCESS TO RECORDS. The general public shall have access in accordance with the provisions of chapter 42.17 RCW to all applications reviewed by the department and to all other written materials essential to any review by the department pursuant to the provisions of chapter 248-19 WAC. [Statutory Authority: RCW 70.38.135. 81-09-012 (Order 210), § 248-19-500, filed 4/9/81, effective 5/20/81. Dear Ms. Chaney:

This is to inform you, as a person who expressed an interest in Certificate of Need review requirements for helipad construction at Children's Orthopedic Hospital, that the department has reversed an earlier decision and has determined that the project is not subject to Certificate of Need review. Enclosed are copies of correspondence setting forth the change in our determination.

Sincerely,

Frank Chestnut

The Honorable Ken Jacobsen
Washington State Representative
7307 40th NE
Seattle, Washington 98115

Dear Representative Jacobsen:

I am writing to advise you of further developments regarding the helicopter pad at Children's Orthopedic Hospital (COH).

The Department had advised COH that the project was reviewable under the Certificate of Need (CoN) program. This was based more on a concern regarding an apparent rapid escalation in the number of air ambulance projects under consideration than on a clear interpretation of the rules and regulations surrounding the CoN program.

COH has sued the Department, contending that the project is not reviewable under existing rules. Our Assistant Attorney General agrees with their position, pointing out that the project is not a new service or a substantial change in service, and does not exceed the capital or operating cost thresholds established by the CoN program.

We are going to reverse our initial position and declare the project not subject to review, rather than consume unnecessary time and money in litigation.

Please call me at 753-3327 if you would like to discuss this matter further.

Sincerely,

Bruce Ferguson

October 7, 1985

Beatrice Farrar Ryan, Interim Director
Seattle Department of Construction and Land Use
400 Municipal Building
Seattle, Washington 98104

Dear Ms. Ryan:

This is in response to your letter of October 2 concerning Certificate of Need review requirements related to the construction of a helipad at Children's Orthopedic Hospital. As I advised you by telephone last week, at this time we are not reconsidering our determination of non-reviewability for that project and do not have any plans to reconsider it. We are gathering information to determine whether the acquisition of a helicopter by or on behalf of Airlift Northwest is properly subject to review, but that determination is separate from that of the helipad construction.

Sincerely,

Frank Chestnut

Dear Hermia,

Enclosed is a letter to Sparks, in which we provide some important information relevant to the certificate of need for Children's Ortho. Hosp.

also, the Laurelhurst Comm. Club Board has taken a stance strongly supporting our anti-hellport efforts — including partial funding for hiring a lawyer to investigate COH's certif. of need issue.

cordially,
Anita Francis

Kristina M. Sparks, Supervisor
Project Review Unit
Certificate of Need Program ET-33
Department of Social and Health Services
Olympia, Washington 98504

Dear Ms. Sparks:

Thank you very much for your letter of December 28. I understand that Children's Orthopedic Hospital has responded to your request for information and I am eager to see a copy of that response.

In the meantime, I want to ask you about the procedure used for developing a certificate of need application. Specifically, who determines the scope of the application? The plan, as publicly stated (in The Weekly article by Nick Gallo enclosed and marked "Note A") is for COH to be part of a consortium of five hospitals that would all be served by Airlift Northwest. Although the cost for COH may be under the certificate of need minimum, for the consortium as a whole the cost will be well over that minimum. Can Airlift Northwest be required to file a certificate of need application?

The Swedish Hospital proposal for a Level III neonatal intensive care unit (NICU) was recently withdrawn because of opposition from COH and University Hospital. The certificate of need process served a useful purpose in forcing Swedish to consider the views of other hospitals and to withdraw their plan which would have led to a duplication of facilities. The two enclosed documents were part of that Swedish NICU application and show clearly that physicians at both Swedish Hosp. and the University Hosp. consider the present system of transport for neonates to be quite adequate (See note B, from a research study conducted in this area, and note C, a letter by Dr. French of Swedish). The certificate of need process is the only means available to review need for facilities on both a regional and a medical need basis. Since the present transport system has been stated to be adequate by professionals working in this area, a certificate of need review is clearly needed to avoid additional unnecessary and costly helicopter services.

Enclosed also is a copy of a page from the 1984-85 budget of COH. They indicate that COH does not currently provide (1) an emergency helicopter service, (2) ambulance services, (3) a 24-hour emergency room coverage by a paid physician, nor (4) an emergency communications system. This is clear evidence (provided by COH in their budget document) that their proposed helicopter service is a NEW SERVICE. It is ample justification for your requiring a certificate of need regarding their proposed helicopter service and the associated medical service changes that will give them a trauma center status. We know that emergency cases are not now referred to COH—they go instead to Harborview and University Hospital. Sometimes, children are transferred by ambulance to COH later from these trauma centers. COH cannot argue that it currently provides emergency helicopter services, nor even a very high level of emergency services (since it is not staffed by a paid physician on a 24-hour basis). If COH wishes to undertake a broad expansion of its emergency service capabilities, it should go through the certificate of need process and state its case in ways that can be carefully reviewed and considered

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

by all concerned.

Thank you for your consideration of this air ambulance service issue, which has potentially profound impacts on this area and the cost of care.

Sincerely,

Anita M. Francis

William Alan Hodson, M.D.
Professor and Head
Neonatal and Respiratory Diseases
Department of Pediatrics RD-20
University of Washington
Seattle, WA 98195

Dear Al:

As you are aware, our Level II special care nursery at SHMC is planning to become a ventilatory-capable unit, i.e. Level III. As such, I feel it would be beneficial from a regional resource point of view to have written interhospita guidelines of care. Currently, in our Level II capacity we have seven distinct categories of patients that require transportation to either University Hospital's NICU or COHMC's IICU, as shown on the policy sheet (enclosed).

Once ventilator capability is established at SHMC, we shall continue to transfer categories 2, 4, and 6. I anticipate that in addition, until we are definitely established, pregnancies of less than 30 weeks gestation will continue to be referred to University Hospital. We shall however be willing to handle the 1-2/month that University Hospital currently cannot accommodate.

One other point of regional resource use is the question of transportation of sick babies. I am certain all of us concur with the concept of in utero transpor being the ideal mode of infant transfer. However, if a neonate becomes ill post-delivery and needs transportation for ventilator care, I feel the current transpo team system should continue to be the only way to move that infant. If an outsid physician calls SHMC to have a baby transferred for more intensive care, I would like to utilize the current transport team to have them bring the infant to us. I do not feel forming a competing transport system is the ideal way to use commur resources. SHMC would be willing to consider a form of compensation for the use of the transport team.

I would appreciate any comments or concerns you might have regarding the above-mentioned guidelines.

Sincerely,

Charles E. French, M.D.
Director of Neonatology

Kristina Sparks
Certificate of Need Unit
Office of State Health
Planning & Development
MS ET-33
Olympia, WA 98504

Dear Ms. Sparks,

This correspondence is in response to your request for information regarding Certificate of Need review for our helistop.

As I mentioned to you this week in our phone conversation, much of the information you requested is currently unavailable since helicopter services, as a part of our long standing air ambulance service, are currently being negotiated.

I can tell you that the cost of constructing a helistop is less than $50,000, and that our existing air ambulance service has been in existence since the early 1970's.

Please feel free to call me at (206) 526-2004 if you have further questions.

Sincerely,

Dorothy F. Teeter

February 20, 1985

Anita M. Francis
Jerry B. Schneider
5003 Forty-Fifth NE
Seattle, Washington 98105

Dear Ms. Francis and Mr. Schneider:

Thank you for your February 8, 1985 letter regarding Children's Othopedic Hospital and Medical Centers' (COH&MC) pending construction of a landing facility to receive incoming helicopter air ambulances. In Kristina M. Sparks' absence, this matter has been referred to me. Per your request a copy of the COH&MC February 9, 1985 response to our request for additional information is enclosed.

We have requested additional information regarding Airlift Northwest, its nature, its historic involvement in the provision of air ambulance services to consortium member and non-member hospitals, and its costs of acquiring the proposed helicopter air ambulance.

Upon receipt of the aforementioned requested information, we will determine whether or not the expenditure to acquire the helicopter air ambulance by, or on behalf of, one or all of the consortium hospitals, and/or whether or not this project constitutes either a new institutional health service or a substantial change in service by, or on behalf of, one or all of the consortium hospitals. At the time the department makes its determination of reviewability, we would be pleased to inform you of our decision.

Sincerely,

Charles H. Pugh

A. N. SHINPOCH
Secretary

STATE OF WASHINGTON

DEPARTMENT OF SOCIAL AND HEALTH SERVICES

Olympia, Washington 98504-0095

October 30, 1985

NOV - 4 1985

Rob Childs
Air Lift Northwest
325 9th Avenue
Seattle, Washington 98104

Dear Mr. Childs:

The department has recently received information concerning the capital costs of the Agusta 109A MKII helicopter air ambulance vehicle operated since July 15, 1985, by Air Lift Northwest (ALNW). The information was supplied directly by Agusta Avaiation Corporation (ACC), the manufacturer, and Hospital Air Transport (HAT), the Oregon firm which completed the conversion of the helicopter to air ambulance standards. This new information indicates that ACC's selling price of the air craft to General Electric Credit Corporation was $1,595,000 in February 1985 and that HAT added $44,000 to the capital asset valuation by their adding of "a stretcher platform, plumbed oxygen, and suction, medical radios and logs..." for a total asset valuation of $1,639,000. Based on the total value of the air ambulance, the department determines that Air Lift Northwest has made a capital expenditure in excess of the expenditure minimum. This expenditure is subject to Certificate of Need review under RCW 70.38.105(4)(d) and WAC 248-19-230(1)(c), as a capital expenditure by or on behalf of a health care facility in excess of the expenditure minimum.

The department has come to this conclusion because the definition of a capital expenditure, WAC 248-19-220(8), states, in part "...where a person makes an acquisition under lease or comparable arrangement,...which would have required Certificate of Need review if the acquisition had been made by purchase, such acquisition shall be deemed a capital expenditure." The department, therefore, concludes that the service contract with HAT, which results in your having the helicopter available for your use, constitutes a "comparable arrangement" under the rules of the Certificate of Need program.

Furthermore, the department also concludes that ALNW is the applicant. Since the Air Lift Northwest interhospital agreement establishing ALNW states "whereas COHMC, HMC, PMC, and UH wish to jointly share the risk of founding and providing a patient air transportation program...". ALNW, therefore, acts for and as the hospitals involved in the matter of the patient air transportation program.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It also appears that the department may have erred in its determination as to whether or not the development of this helicopter air ambulance service constituted a new institutional health service. RCW 70.38.025(11) and WAC 248-19-220(27), define a new institutional health service, and describe it as the annual operating costs of the service for a twelve-month period. Therefore, all expenses, including lease expenses, should properly be considered in the annual operating costs.

Enclosed are application guidelines and other materials to assist in the development of a Certificate of Need application. If a preapplication conference is desired, please contact Mr. George Haase of my staff at (206) 753-0905. Based on the information available to the department at this time, the applicable review criteria would be WAC 248-19-370(1), (2), (3); WAC 248-19-380(1), (2), (3); WAC 248-19-390(1) (2), (3), (4), (5); and WAC 248-19-400(1), (4).

If you have any questions, please do not hesitate to contact me at (206) 753-5857.

Sincerely,

Kristina M. Sparks, Supervisor
Project Review Unit
Certificate of Need Program HB-31

NOTICE OF PUBLIC HEARING
File No. CC 84-022
(Master Use Permit No. 8402935)

The following public hearing will be held by Dr. Bud Nicola, Health Officer of the City of Seattle, to consider the medical need for the proposed helipad facility of the Children's Orthopedic Hospital at 4800 Sand Point Way N. E. in Seattle.

Hearing Date: October 24, 1985 (Thursday)
Time: 6:00 p.m. to 9:00 p.m.
Place: City Council Chambers
11th Floor, Municipal Building
600 4th Avenue, Seattle, WA 98104
(Use 5th Avenue entry after 6:00 p.m.)

This hearing will only address the question of medical justification for the helipad. Dr. Nicola will conduct a fact-finding study, including public input through a public hearing. Dr. Nicola's findings and report will form the basis of DCLU's recommendation regarding medical needs for the proposed facility.

Written representations on the medical need issues (either in support or protest) should be addressed to Dr. Nicola, Health Officer, 700 Yesler Building, Seattle, WA 98104, no later than the hearing date. For further details, please call 625-5200.

The Department of Construction and Land Use (DCLU) is responsible for the review of the Master Use Permit application for the helipad facility. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use, if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

Based on these criteria, the Department of Construction and Land Use will make a recommendation to the Hearing Examiner, who will in turn make his recommendation to City Council. Again, the hearing on October 24 will only address item (a) above. All three items will be the subject of a public hearing before the Hearing Examiner at a later date.

Date of Notice: October 3, 1985.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Associate Director for Operations
Airlift Northwest
325 Ninth Avenue
Seattle, Washington 98104

Dear Mr. Childs:

The department has received your letter of November 12, 1985 requesting a clarification of, and background information concerning, the department's determination that the acquisition of the helicopter is subject to Certificate of Need review.

To clear up any misunderstanding, the October 30, 1985 letter was a formal determination of Certificate of Need applicability relative to the helicopter air ambulance of Airlift Northwest (ALNW). The department determined that ALNW made a capital expenditure in excess of the expenditure minimum to acquire the Agusta A109 Mk II. The letter of November 8, 1985 requires that a certificate of need application be filed with the department by December 30, 1985.

The additional information you requested will be sent under separate cover. If I may be of further assistance, please contact me at (206) 753-5857.

Dear Ms. Teeter:

This is to inform you that the construction of a helipad at Children's Orthopedic Hospital is subject to Certificate of Need review under the provisions of 70.38 RCW and 248-19 WAC. We consider a capital expenditure by a health care facility that enables on-site landing by an emergency services helicopter to be a capital expenditure which substantially changes the services of the facility under the provisions of WAC 248-19-230(1)(b).

Enclosed are Certificate of Need application materials. I would encourage you to meet with staff from this office, the Puget Sound Health Systems Agency and the Hospital Commission prior to development of your application so that we can identify potential issues and discuss elements of your proposal that should be emphasized in your application.

The Honorable Ken Jacobsen
Washington State Representative
7307 40th NE
Seattle, Washington 98115

Dear Representative Jacobsen:

I am writing to advise you of further developments regarding the helicopter pad at Children's Orthopedic Hospital (COH).

The Department had advised COH that the project was reviewable under the Certificate of Need (CoN) program. This was based more on a concern regarding an apparent rapid escalation in the number of air ambulance projects under consideration than on a clear interpretation of the rules and regulations surrounding the CoN program.

COH has sued the Department, contending that the project is not reviewable under existing rules. Our Assistant Attorney General agrees with their position, pointing out that the project is not a new service or a substantial change in service, and does not exceed the capital or operating cost thresholds established by the CoN program.

We are going to reverse our initial position and declare the project not subject to review, rather than consume unnecessary time and money in litigation.

Please call me at 753-3327 if you would like to discuss this matter further.

Sincerely,

Bruce Ferguson

Seattle, Washington 98154

Dear Mr. Olejko:

The department has received your letter of May 17, 1985, requesting, on behalf of Children's Orthopedic Hospital and Medical Center (COHMC), further consideration of the May 7, 1985 determination that the construction of a helipad at the hospital facililty is subject to prior Certificate of Need approval.

After a review of the information provided in your letter, I must inform you that the department's original determination remains unchanged. The reasons for this position are as follows:

- a capital expenditure, per WAC 248-19-220(8), will be, or has been, made relative to the construction of a helipad;
- that the helipad is required for, and inseparably linked to, the proposed on-site landing of an emergency services helicopter; and
- that the on-site landing of an emergency services helicopter would constitute a substantial change in the services of the facility per WAC 248-19-230(1)(b).

I would like to again encourage you to meet with the staff from this office, the Puget Sound Health Systems Agency, and the Washington State Hospital Commission prior to the development of your application so that we can identify potential issues and discuss elements of your proposal that should be emphasized in your application.

Sincerely,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

February 21, 1985

Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

The Puget Sound Health Systems Agency (PSHSA) has prepared the following in response to your questions about the appropriate use of helicopter transport in emergency medical situations.

1. In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?

Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care enroute can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services. The EMS system features substantial ground transport services throughout the northwest region, each of which is capable of responding rapidly to calls in the area it serves. Military Assistance to Safety and Traffic (MAST) helicopters transfer patients from accident sites within a 100-mile radius of Fort Lewis to Harborview in Seattle and to St. Joseph in Tacoma. Interhospital transfers and service to areas outside the range of MAST are provided by the fixed-wing transport of Airlift Northwest. Private helicopter service operating out of Bellingham further supports counties in the northwest section of our region.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The existing EMS system is founded on comprehensive ground transport services and has developed into a well coordinated regional network. As a result, the use of helicopter services can be managed within the present system to better ensure that their use is limited to cases not adequately served by ambulance or plane transport.

2. How frequently is this means of emergency transport required?

Agreement on when medical conditions warrant the use of helicopters has not been reached. The introduction of helicopter transport is so recent that triage guidelines have not yet been developed which might help establish the frequency with which helicopter transport would appropriately be expected.

In the last year MAST completed approximately 220 field trips, most of which were to provide transport of patients from south King, Pierce, and Kitsap counties. Some of these patients were taken to St. Joseph Hospital. Approximately 120 were taken to Seattle hospitals, most of these to Harborview.

The extent to which this level of service approximates the expected need for helicopter transport is not presently known. Efforts are underway to formulate a method to determine the need for helicopter transport and to establish the resources necessary to meet that need. These efforts in Washington and in other parts of the country should be evaluated by clinicians, planners, and administrators in order to prepare guidelines tailored to the special requirements of our region.

3. How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?

Which Seattle hospitals are best suited to meet the medical need?

Helicopter transport is only appropriate for the most critical cases. An evaluation of helicopter transport often cited to support its efficacy in improving outcomes suggests that major improvement occurs only in the more severe classifications representing a fraction of all trauma patients. This study by William G. Baxt and Peggy Moody indicates that helicopter transport is required for only a small subset of trauma patients especially when high quality ground transport systems are available.

MAST helicopters are presently transporting patients within King County directly to Harborview or to University Hospital (and occasionally other hospitals) by way of ambulance from the University of Washington soccer field.

While we cannot confirm that this arrangement is adequate, PSHSA recommends transport to only the most specialized trauma centers in Seattle, of which University and Harborview hospitals are excellent examples. Consideration of additional sites should evaluate not only unmet patient

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

care needs, but also the trade-offs which will result in meeting those needs. Limiting the number of helipads may be an important component in ensuring limits on the growth of helicopter services and in fostering effective and cooperative use of the EMS system as a whole.

It is critical that the inappropriate use and proliferation of helicopter transport services be discouraged. Unfortunately, we are in the midst of "air wars" throughout the country as hospitals vie with one another to establish helicopter programs. The number of programs in the country doubled between 1980 and 1983, and the National Medevac Conference in 1983 opened with spokesmen suggesting that the number of programs would (and should) double again in five years. It is not at all evident, especially in areas served by MAST, that additional programs are needed and the impact of further growth may be adverse for the community as a whole. Particular patient care requirements of an institution may not be sufficient to outweigh the additional direct and indirect costs which may result from expanded helicopter services.

PSHSA is especially concerned that individual institutions will establish helipads and eventually separate helicopter programs in an effort to meet particular patient care objectives which might be met satisfactorily under the current arrangement of emergency services.

A conservative approach to the development of helicopter transport programs is advised for several reasons:

a) The present system is extremely cost-effective. MAST operations are provided at no additional cost to residents above the support of federal tax subsidies.

b) In our region, the need for additional helicopter services which would be sufficient to support such an expensive service at an individual institution is unlikely. To justify the program, transportation services would tend to be over-utilized with transport provided in cases which would more appropriately be handled at other levels in the EMS system.

c) Facility costs would tend to increase since helicopter services are generally "loss leaders," powerful marketing tools which may increase hospital utilization but which would not necessarily guarantee the additional revenues required to cover the additional costs incurred.

d) If unnecessary and used inappropriately, helicopter transport services established outside the current system have the potential to adversely affect the EMS programs now serving the region. The development of private programs could result in the elimination of MAST (as specified in federal guidelines). Second, the ambulance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and plane support systems in place might begin to experience volume reductions which could jeopardize both the quality and financial viability of the services they provide.

In summary, should additional need for helicopter services be found in the area, a consortium approach rather than an institutional approach to the provision of these services is recommended. This approach will avoid duplication, support the development and implementation of appropriate triage guidelines, and encourage continued reliance on a regional EMS system. It will prevent the introduction of such services as marketing tools for individual institutions which needlessly drive the cost of hospital care up while reducing reliance on the existing EMS system.

5. What alternatives are available for transporting patients and what are the medical implications?

Helicopter transport has a vital place in the emergency medical service system. The alternative of not providing such service does not exist. The real alternative is to allow proliferation of helicopter transport services which will unnecessarily increase the cost of hospital care without significantly benefiting the community.

RE: HELICOPTER PADS AT HOSPITALS

Dear Mayor Royer,

In response to your recent inquiry regarding our views on the addition of helicopter pads at several of our hospitals, I submit the following.

Medical Considerations

There has been for the past two years a big push on the East Coast regarding the need for helicopters in pre-hospital care programs. We have never seen the need for a helicopter in our program, due to the compressed areas we cover and the large number of hospitals within the City limits.

We currently receive approximately 100 critically ill patients per year within the City of Seattle by Military Assistance for Safety and Traffic (MAST) helicopter and Coast Guard helicopter. The University of Washington and several other hospitals have combined funds and operate two fixed winged aircraft (Airlift Northwest) to pick up severely injured patients in the Northwest United States and Alaska. These aircraft operate out of Boeing Field. Airlift Northwest is planning in the near future to include one helicopter in their operations for local use. This could bring the total number of patients transported by helicopter to 150 per year.

The need for helicopter pads within the City is a slightly different matter. There are three different hospitals in the City that receive the majority of all helicopter patients. They are Harborview Medical Center, University of Washington and Children's Orthopedic Hospital. According to Dr. Michael K. Copass, Medical Director of the Emergency Room at Harborview Medical Center, approximately 60% of all helicopter transports are children. For the most part these patients are major trauma and direct delivery to the hospital of destination leads to decreased morbidity and mortality.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Currently these patients are either brought to the helipad at Harborview Medical Center and then transferred to the hospital of destination by ambulance or medic unit, or rarely the helicopter lands at the northend of the parking lots north of Husky Stadium and then is transferred to the hospital of destination.

In our efforts to make Seattle a kid's place, we need to provide the finest and fastest emergency care available for the critically ill children who have to go to Children's Orthopedic Hospital by helicopter. It is important that they have a spot as close as possible to Children's Orthopedic Hospital to land. The other priority would be the University of Washington. Harborview currently has the helipad. With these three important hospitals having helipads, I feel that we are providing the best possible care.

There are numerous code requirements for the construction of helicopter pads and helistops. The costs associated with the construction are therefore significant. There would have to be a real need to justify these costs. Additionally, the hospitals would be required to obtain Federal aviation approval for any helicopter pad.

Aircraft operating at low altitudes over the central business district pose a significant problem in the event of a crash. If there was an increase in helicopter operations, the opportunity for incidents occurs. For emergency planning purposes, the Fire Department would therefore have to prepare for this kind of event.

Very truly yours,

Resources-City.
Argument of fiscal resource, partic. if combined w/ over-use of air paths. VA

Seattle
Department of Construction and Land Use

Beatrice Farrar Ryan, Interim Director
Charles Royer, Mayor

August 30, 1985

Bud Nicola, Director
Health Department
7th Floor, Yesler Building

RECEIVED
SEP 4 1985
OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT
OF PUBLIC HEALTH

Dear Mr. Nicola:

I am writing to ask your help.

As you know, this Department has received an application from the Children's Orthopedic Hospital to establish a helipad on hospital grounds. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life threatening emergencies.

We must make a recommendation to the City Council and our report must examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas as part of the analysis.

The question of medical need is beyond our area of expertise and this is where I am asking for your Department's assistance. In the past, helicopters have made emergency landings at the Graves athletic field and patients are then transported by ambulance to either Children's Orthopedic or to the University of Washington Medical Center. This request by Children's Orthopedic would mean those patients destined for Children's would instead land on hospital grounds with those destined for the University of Washington continuing to land at Graves field. The University of Washington may subsequently apply for a permit for a helistop on the grounds of the U. W. medical campus.

You have agreed to sponsor a public hearing and to give us your opinion on the question of medical need. The questions I would like your opinion on are:

1. What are existing emergency services in Seattle and how does the service fit into the existing services?
2. What emergency services does COH offer that are unique and unavailable elsewhere?
3. Is there a medical need for emergency helicopter service to serve the hospitals in this immediate area, (Children's and University of Washington primarily)? What, if any, would be the effect on the well-being of a patient transported by helicopter versus helicopter and ground transport as it is presently done? Are direct flights versus air/ground transports medically significant in terms of patient morbity and mortality?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Is the current site at Graves athletic field adequate, or is there a medical need to locate such facilities on the hospital grounds? Or are there alternative sites? Would one such facility either at COH or U. W. be a preferred location?
5. What data are available regarding the number of emergencies that are likely to be generated by the population to be served by the helicopter services? How many landings per week will result?
6. If there is an established medical need, how would you define "occurrences involving life-threatening emergencies," as the use must be restricted to such occurrences? Are there other restrictions we should consider, based on existing medical care facilities capabilities?
7. How would you suggest we monitor the occurrences to ensure that the use is restricted to life-threatening emergencies should the use be permitted? Can we ensure that the service is used for emergency purposes only?

We have asked Children's Orthopedic Hospital for more information to support their application for the helistop (see attached). This information is necessary for your consideration of these questions. As soon as we receive it, we will send you a copy. As you know, we are happy to help with the scheduling and public notice of the hearing.

Thank you for your assistance. If you have questions, please call me at 625-2262 or Katy Chaney at 625-4274.

Sincerely,

Katy Chaney

Seattle, Washington 98104

Dear Mayor Royer:

In response to your request, staff at Puget Sound Health Systems Agency have prepared the enclosed responses to your questions regarding helicopter transport in emergency medical situations.

Given the time and resources available to us, we have been unable to convene either an outside technical review panel or to undertake a formal public policy development process leading to definitive criteria. You should view our comments as a staff position paper.

I hope the enclosed comments will be of use to you. Please do advise me should you require further comment from Puget Sound Health Systems Agency.

Sincerely,

Larry A. Thompson

February 21, 1985

Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

The Puget Sound Health Systems Agency (PSHSA) has prepared the following in response to your questions about the appropriate use of helicopter transport in emergency medical situations.

1. In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?

Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care enroute can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services. The EMS system features substantial ground transport services throughout the northwest region, each of which is capable of responding rapidly to calls in the area it serves. Military Assistance to Safety and Traffic (MAST) helicopters transfer patients from accident sites within a 100-mile radius of Fort Lewis to Harborview in Seattle and to St. Joseph in Tacoma. Interhospital transfers and service to areas outside the range of MAST are provided by the fixed-wing transport of Airlift Northwest. Private helicopter service operating out of Bellingham further supports counties in the northwest section of our region.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The existing EMS system is founded on comprehensive ground transport services and has developed into a well coordinated regional network. As a result, the use of helicopter services can be managed within the present system to better ensure that their use is limited to cases not adequately served by ambulance or plane transport.

2. How frequently is this means of emerg y transport required?

Agreement on when medical conditions warrant the use of helicopters has not been reached. The introduction of helicopter transport is so recent that triage guidelines have not yet been developed which might help establish the frequency with which helicopter transport would appropriately be expected.

In the last year MAST completed approximately 220 field trips, most of which were to provide transport of patients from south King, Pierce, and Kitsap counties. Some of these patients were taken to St. Joseph Hospital. Approximately 120 were taken to Seattle hospitals, most of these to Harborview.

The extent to which this level of service approximates the expected need for helicopter transport is not presently known. Efforts are underway to formulate a method to determine the need for helicopter transport and to establish the resources necessary to meet that need. These efforts in Washington and in other parts of the country should be evaluated by clinicians, planners, and administrators in order to prepare guidelines tailored to the special requirements of our region.

3. How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?

Which Seattle hospitals are best suited to meet the medical need?

Helicopter transport is only appropriate for the most critical cases. An evaluation of helicopter transport often cited to support its efficacy in improving outcomes suggests that major improvement occurs only in the more severe classifications representing a fraction of all trauma patients. This study by William G. Baxt and Peggy Moody indicates that helicopter transport is required for only a small subset of trauma patients especially when high quality ground transport systems are available.

MAST helicopters are presently transporting patients within King County directly to Harborview or to University Hospital (and occasionally other hospitals) by way of ambulance from the University of Washington soccer field.

While we cannot confirm that this arrangement is adequate, PSHSA recommends transport to only the most specialized trauma centers in Seattle, of which University and Harborview hospitals are excellent examples. Consideration of additional sites should evaluate not only unmet patient

NOTICE: IF THE UMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS TO THE QUALITY OF THE DOCUMENT.

care needs, but also the trade-offs which will result in meeting those needs. Limiting the number of helipads may be an important component in ensuring limits on the growth of helicopter services and in fostering effective and cooperative use of the EMS system as a whole.

It is critical that the inappropriate use and proliferation of helicopter transport services be discouraged. Unfortunately, we are in the midst of "air wars" throughout the country as hospitals vie with one another to establish helicopter programs. The number of programs in the country doubled between 1980 and 1983, and the National Medevac Conference in 1983 opened with spokesmen suggesting that the number of programs would (and should) double again in five years. It is not at all evident, especially in areas served by MAST, that additional programs are needed and the impact of further growth may be adverse for the community as a whole. Particular patient care requirements of an institution may not be sufficient to outweigh the additional direct and indirect costs which may result from expanded helicopter services.

PSHSA is especially concerned that individual institutions will establish helipads and eventually separate helicopter programs in an effort to meet particular patient care objectives which might be met satisfactorily under the current arrangement of emergency services.

A conservative approach to the development of helicopter transport programs is advised for several reasons:

a) The present system is extremely cost-effective. MAST operations are provided at no additional cost to residents above the support of federal tax subsidies.

b) In our region, the need for additional helicopter services which would be sufficient to support such an expensive service at an individual institution is unlikely. To justify the program, transportation services would tend to be over-utilized with transport provided in cases which would more appropriately be handled at other levels in the EMS system.

c) Facility costs would tend to increase since helicopter services are generally "loss leaders," powerful marketing tools which may increase hospital utilization but which would not necessarily guarantee the additional revenues required to cover the additional costs incurred.

d) If unnecessary and used inappropriately, helicopter transport services established outside the current system have the potential to adversely affect the EMS programs now serving the region. The development of private programs could result in the elimination of MAST (as specified in federal guidelines). Second, the ambulance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and plane support systems in place might begin to experience volume reductions which could jeopardize both the quality and financial viability of the services they provide.

In summary, should additional need for helicopter services be found in the area, a consortium approach rather than an institutional approach to the provision of these services is recommended. This approach will avoid duplication, support the development and implementation of appropriate triage guidelines, and encourage continued reliance on a regional EMS system. It will prevent the introduction of such services as marketing tools for individual institutions which needlessly drive the cost of hospital care up while reducing reliance on the existing EMS system.

5. What alternatives are available for transporting patients and what are the medical implications?

Helicopter transport has a vital place in the emergency medical service system. The alternative of not providing such service does not exist. The real alternative is to allow proliferation of helicopter transport services which will unnecessarily increase the cost of hospital care without significantly benefiting the community.

Dr. Bud Nicola
Health Officer
700 Yesler Building
Seattle, WA 98104

Dear Dr. Nicola:

The essence of the debate about the Children's Hospital helipad should be focused on possible locations that would be satisfactory to all the parties concerned. To date, COH has rejected the notion put forward by many people that it continue to use the soccer field as a landing site. COH has given three main objections to this idea: (1) the field is muddy during several months of the year, (2) landing at the field would add 25 minutes to the trip and (3) the patient's life would be endangered by the transfer from the helicopter to an adjacent ambulance. It is difficult to take the first argument seriously as it could be solved rather easily by using some existing paved area or by developing a new paved area specifically built for helicopter landings and ground transportation access. It is also hard to believe that it could take more that five minutes to transfer a patient from the helicopter to an adjacent ambulance. Since it is only a three-minute ride from the soccer field to the door of the emergency room at COH, it seems reasonable to estimate that using Soccer Field would add no more than 10 minutes to the overall trip. There is little indication in the literature that this much additional time would be critical to the survival or longer term outcome for the patient in the great majority of the cases that are likely to be transported to COH by helicopter. For example, if a helicopter was needed to transfer a patient from a hospital in Bellingham to COH, it is likely to take 70 minutes if the helicopter lands at COH and 80 minutes if it lands at the Soccer Field. If the patient was reasonably stable and could be transported by a Bellingham-based ground ambulance, the trip could be made in 90 minutes or less, safely and at much less cost to the patient. The important question here is how often would 10 minutes make a substantial difference in outcome? COH and other responsible physicans must examine this question in considerable detail before any credible judgments on the medical need for helicopter service to the COH doorstep can be made. It is important to note that COH has used the Airlift Northwest helicopter to bring 14 patients to the heliport at Harborview Hospital over the past few months. These patients have endured a transfer to a ground ambulance and a 30-minute ride to COH. If these 14 patients had been landed at the Soccer Field, they would have arrived at COH about 27 minutes earlier. If minutes are so critical, why has COH not been using the Soccer Field as a landing site since they began using the helicopter service in May of this year? If an additional 27 minutes does not matter, why does the 10-minute increment added by a Soccer Field landing matter? Again, it is up to COH and other qualified physicians to answer such questions in a forthright manner using credible data.

The third argument revolves around the assertion that tubes may fall out when a small patient is moved from one transport vehicle to another, causing unneeded difficulties. It is hard to imagine that this is a problem that cannot be solved, given the vast technological resources available to the medical community today. Surely there are people clever enough to find a way to solve this problem to the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

satisfaction of all concerned.
The three arguments that COH has used to prove that they cannot continue to use the Soccer Field as a landing site simply do not hold up when examined in an objective manner. Unless COH can provide more convincing evidence that the Graves Field landing site is not satisfactory from a medical need point of view, they should continue use it and abandon their plans for a helipad on their premises.

Yours sincerely,

Jerry B. Schneider

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

October 23, 1985

Dr. Bud Nicola
Director, Health Department
7th floor
Yesler Building
Seattle, Washington 98104

Dear Dr. Nicola:

I am writing this letter in response to an inquiry from Children's Orthopaedic hospital concerning my professional judgement as to the placing of helipads near selected and designated institutions for the management of the critically ill.

By way of background I am a Board Certified General Surgeon who had been working in trauma for approximately five years. My previous employment was within the state of Maryland as the state medical Director for Emergency Medical Services and as such coordinated the response of the Maryland State Police Helicopter Program which transferred approximately 2,700 critical patients last year. They transported these victims to designated centers for trauma, neonates, pediatric trauma, burns, spinal cord injuries, penetrating eye injuries and replantation centers. During my tenure in Maryland the majority of hospitals upgraded helipads to enable them to access this rapid air transport service.

At this time I am the Medical Director and Chief Executive Officer of Boston Med Flight - a helicopter program, originating in Boston and serving the New England region. This hospital consortium represents Boston University Hospital, New England Medical Center (to include the Kiwanis Pediatric Trauma Institute), Massachusetts General Hospital, the Massachusetts Eye and Ear Infirmary, Boston City Hospital, Beth Israel Hospital, Brigham and Women's Hospital and Children's Hospital Boston. Within Boston there are concerns from various agencies as to the need for the receiving centers to have adequate helicopter landing areas.

Following the designation process hospitals begin to receive not only inter-hospital referrals but also patients directly from scenes of accidents. Patients who previously would have succumbed in the prehospital phase now, because of the emergence of E.M.S. systems and helicopter availability, survive to reach hospital. For many institutions there is a learning process to be able to manage these injuries. There is no doubt that the time from accident to definitive care is at a premium in managing these types of patients and that any increase in time from scene to trauma center may translate out to an increase in mortality or morbidity. Many agencies in their R.F.P.'s for specialty center designation mandate the close proximity of a helipad to decrease transit time to a minimum.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There are concerns other than that of time which may be of critical importance. An unstable patient should not be handled unnecessarily or transferred from one vehicle to another in their critical state. The experience with pediatric trauma in Baltimore may illustrate this point. At the time of implementation of the program Johns Hopkins did not have a well-equipped helipad and indeed the state police helicopters used to land a few blocks away from the hospital and rely on surface ambulance to complete the transfer. The physicians working within the pediatric trauma center recognized this deficiency and collaborated with community groups, architects and health planners and built a helipad directly on the roof of the hospital. This is served by a dedicated elevator which now takes patients from the helipad directly into the pediatric rescusitation area. Within this area all pertinent expertise immediately is available so that the patient has immediate access to the radiology suite, the CAT scanner or the operating room.

Although no community polls were conducted during the implementation of this program, during my stay in Maryland I received no complaints from community groups concerning the helicopter program. They were made aware that air transport was reserved only for those critical patients in direst need. Even with a busy day at the pediatric trauma center in Baltimore only five or six helicopter transports would be flown during a 24 hour period; this did not seem to cause community concern.

I hope that this brief letter addresses some of the points that will be raised at the public hearing on Thurday. If I can provide any further information please don't hesitate to let me know.

Thank you,

Sincerely,

Alasdair Conn, MD

Dr. Bud Nicola, Health Officer
700 Yesler Building
Seattle, Washington 98104

October 23,1985

Dear Dr. Nicola:

In response to the scheduled Hearing on medical need for a helipad at Children's Orthopedic Hospital, we would like to submit a number of questions and recommendations which we feel should be examined and analyzed before a decision is made on this project. We hope this list is not overwhelming-- we have tried to be exhaustive without being exhausting. We do feel that air transport is an important and integral part of emergency medical care; we are not sure that the Airlift Northwest's plan to site a helipad at COH has been as carefully thought out as it should, given the potential impacts on such things as health care costs, enviromental safety and quality, and availability of emergency health care delivery systems to patients without adequate financial resources.

We also wondered if it would be possible to review your decision before it is submitted to the Department of Construction and Land Use. We think that it is very important that a draft opinion be circulated to all parties concerned for comment before it is completed and submitted to DCLU. Thank you for your consideration of this matter. If we can be of any further assistance, please feel free to contact us.

Sincerely,

Citizens Concerned About Helicopter Transport

Liz Anderson Ruth Engelberg Anita Francis Jerry Schneider

QUESTIONS FOR CONSIDERATION

I. Questions concerning the evaluation of the existing service

1. Since the inception of Airlift Northwest, what data specifically relate to problems occuring while transporting children and, in particular, with regards to the different systems used?
   a. Fixed wing to ground ambulance
   b. Helicopter to ground ambulance
   c. Ground ambulance to emergency room door

2. If a problem occurred, was the prognosis and outcome altered? There have been 17 patients delivered to COH via Airlift Northwest during the months May to August. 14 went to Harborview initially and were then transferred by ground; 3 were delivered directly to COH's emergency room. These 17 could provide a basis for studying outcome and role of transport.

3. Do assessments for helicopter needs agree across agencies, like Puget Sound Health Systems Agency, Department of Public Health, and Washington Medical Association, as well as across hospitals who may not be either financially or politically involved?

4. What populations are presently well-served by the current transport system and what populations are not? Will this program make a difference in both of these populations?

II. Questions concerning the role of Airlift Northwest as part of existing emergency transport services

1. Medic 1 has been described as one of the best ground transport systems in the nation, with a very fast response time. What will the response time of a helicopter be, taking a call at Harborview, picking up a crew at COH, and then going out to the site? Will it compare favorably or unfavorably with Medic 1, from the time the call is received until the patient is in the hospital?

2. MAST presently plays an important role in emergency medical care, providing emergency transport,without charge, to a wide geographical area. What will its role be, in relation to Airlift Northwest?

   a. Has there been an agreement reached between Airlift Northwest and MAST in terms of which service will transport what patients and under what circumstances?
   b. Does MAST have any plans to purchase and train pilots and crew with smaller helicopters?
   c. Could MAST meet the needs of COH with a smaller, quieter aircraft and a better trained team?
   d. Will the helipad that COH is intending to build accomodate MAST helicopters?
   e. If the Airlift Northwest helicopter is on a call, will MAST be used?

3. Presently, we understand the Airlift Northwest does interhospital transports. Will they also do field pickups?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

III. Questions concerning utilization plans for helipad

1. What population of patients do you anticipate being transported by helicopter?

a. All neonates
b. All intubated patients
c. All patients with critical illnesses
d. Trauma patients requiring surgery

2. Should one assume that all patients that the flight team is sent to will automatically be transported to COH? What are the possibilities of the patient being treated at the referring hospital, if the flight team deems it appropriate (i.e., dying or untreatable cases)? Will COH return the patient to the community hospital, at some point in time, via helicopter or ground ambulance?

3. Will the helicopter be used for transporting organs for transplants? Do you see this service expanding to include this type of use?

4. Are there utilization forecasts for the helipad for at least five years following project completion, as required in the Certificate of Need legislation?

IV. Questions concerning procedures for sending out the Airlift Northwest helicopter

1. Who will be responsible for making the decision to transport by helicopter? Who will have authority to call Airlift Northwest--physicians, residents, nurses?

2. What will happen when a call comes in and the helicopter is out on a mission? Is there a backup helicopter and crew?

3. Will a triage system exist when two or more calls come in at the same time? Further, if triage can work when the helicopter is unavailable, could a similar system be used to determine cases that will not be compromised going to an alternate site?

4. If helicopter transport becomes the "standard of care" regardless of true indications for its use, how will it use be controlled and calls be monitored for true emergencies?

V. Questions concerning site procedures and risks

1. How many yards will the helipad be from the ER door at COH? What is the likelihood that an ambulance will have to be used to transport the patient from the pad to the ER door, as they do at Harborview?

2. What would the transport procedure be during inclement weather? Where would the patient be taken and who would treat the patient if the pilot was unable to land at COH?

3. Will Airlift Northwest need to refuel at the COH pad site?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Noise data, provided by COH, indicate that 15-20 percent of individuals who are sleeping will be awakened by the helicopter noise. This is a particular problem for senior citizens, who are living only yards from the helipad. Can this risk be controlled, minimized by use of a compromise site?

VI. Questions concerning on-board procedures and risks

1. How likely is it that tubes or life support systems will disengage during transfer, either on board the helicopter or during other points of transfer?

2. How accessible is the patient in the helicopter? Can tubes be easily manipulated inside the aircraft? How might tracheostomy or resuscitation efforts be conducted?

3. What part does helicopter noise and vibration within the cabin play in the condition of the patient and the monitoring of medical equipment on board?

VII. Questions concerning stabilization of patients before transport

1. What role does patient stabilization play in transporting a patient safely? Can stabilization provide a system for judging when time is crucial and when it is not?

2. Is there any provision in the Airlift Northwest contract for flight teams to educate or instruct referring hospital personnel in patient stabilization, thus eliminating some of the need to transport quickly and directly to COH?

VIII. Questions concerning experiences with EMS helicopters in other states

1. Why did Stanford University recently decide not to purchase helicopter transport?

2. Did Portland recently deny two hospitals permission to build helipads? If so, why?

3. Currently, there is a lawsuit in progress regarding establishing a helipad in a residential area in Denver. What are the circumstances involved in that case?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

RECOMMENDATIONS

1. An independent peer review of all Airlift Northwest flight records from 1982 to the present to determine the true incidence of these transfer problems and whether or not a change in outcome of the patient was related to transport difficulties (Clinical scholars might be likely candidates for doing such a review).

2. A one on one confidential and anonymous interview between all, both past and present, Airlift Northwest flight physicians and Dr. Nicola to assess the data from actual flight physicians. If there were problems, they would certainly remember as they were the most involved.

3. Any records received from Airlift Northwest should indicate the level of training and experience of the flight doctors and nurses aboard. Were they Board Certified, intensivists, or residents with/without intensive care training? Could inexperience have played a role in deciding to land at the ER door vs. IMA field, rather than actual needs of the patient?

4. Review the three cases that landed at the ER door and determine whether an additional transfer would have effected the ultimate outcome of the patient.

5. In cases where COH indicates that there has been a death, review to determine what actual prognosis and condition the patient was in at the time of the pickup. For example, what was the actual birth weight, stabiiization efforts, etc..

6. Determine what, if any, risks to the patient occur when a tube must be reinserted.

7. Review data on monitoring a patient in three different modes of transportation- ambulance, fixed wing, helicopter. What are inherent problems of each?

8. Review all flight records of MAST so as to determine whether or not any of the patients were compromised by the additonal transfer.

9. Determine patient origins of patients transported to COH via Airlift Northwest for past three years.

10. Examine medical need as it pertains to the student population at Laurelhust Elementary School. The effects of aircraft flying over a school population in terms of stress, safety, and decrease in learning capability due to noise have been documented.

11. Examine medical need as it pertains to impacts on the elderly, with continued and unexpected noise from aircraft landing and taking off close to their homes. Sleep disruption is a powerful impact and one that is well documented.

12. Examine possibilities of alternative sites and triage systems which would allow a balance between the medical needs of patients and of the community.

Councilwoman Cynthia Sullivan
King County Council District 2

402 King County Courthouse
Seattle, Washington 98104
(206) 344-3483

October 30, 1985

Dr. Bud Nicola, Director
King County Health Department
400 Yesler Building, 7th Floor
Seattle, Washington 98104

Dear Dr. Nicola:

I am concerned that in the review process that is being conducted by the Health Department that the following issues are adequately evaluated prior to the decision being made on whether or not to grant the Children's Orthopedic Hospital (COH) authority to construct a helipad. My concerns are primarily about whether costs to the County and county residents will be increased if this facility is built. For example, will the costs for this service be spread across all users of COH, and if they are not and the service will be provided on an ability to pay basis, then is the service one for truly medical emergency services, or is it that the poor just do not have the same kind of medical necessity. If costs are spread across all hospital users, will this impact the payments King County makes to COH for the care and treatment for children and youth on the counties continuing contract.

A couple of issues which may reach beyond the bounds of this specific facility but are brought in to focus during this process are:

a. Are there other agencies that should be more involved in the process of approving this kind of facility. Examples of such agencies include the Emergency Medical Services Council, King County Health Planning Board, and the Puget Sound Health Service Agency.

b. Is there anything that we, the King County Council and the Health Department, can or should do to push for a regional health plan? If so, what? How? When?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I recognize that all of the above issues are not resolvable during the review process for the COH helipad, but these are issues which this process has brought to the forefront. If we can find a means to explore these questions and perhaps some direction for the County move on these regional health issues.

Sincerely,

Cynthia Sullivan

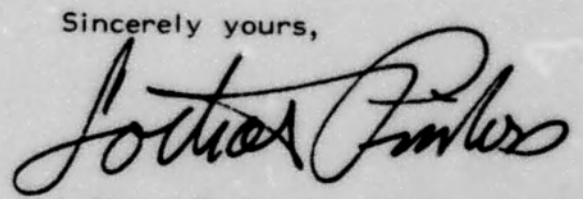
Director, Public Health, King County
7th Floor
400 Yesler Way
Seattle, Wa 98104

Dear Bud,

I'm enclosing copies of some correspondence dating 1983 dealing with pediatric transport costs and times. The last figures on the second page are difficult to read, but the actual amount is $1463. These are 1983 dollars and represent air to ground transportation and ground to hospital. The figures for the helicopter are grossly different and while as I understand it from Dr. Copass, they do not charge the full cost to the patient, somebody has to pay the $2 - $3000 actual costs for those transports. I'm also enclosing the guidelines for perinatal care Chapter 8. Lastly, the reference that I had made was the pamphlet published by the neonatologist at the University entitled, Immediate Care and Transport of the Sick Newborn by Bethany Farris,RN and William E Truog, MD.

As we discussed, the actual deliniation of medical necessity or medical resonableness for helicopter is very scarce. We have made a start of it, at a State level, and may succeed in this in the next six months or so. The next meeting of the WSMA committee on EMS Standards will be in December and dealing with this subject.



If the preponderance of evidence suggests to you that a helipad should be permitted at COH, May I make the following suggestion. Since data is so sparce and since the Children's personna is so aggressive and resistant to review, I really think we need more data. I suggest that individual patient records should be reviewed for medical necessity by an outside panel which includes some people well established in emergency medical services fields as well perhaps out of County reviewers. I would also suggest a conditional use permit, for six to nine months, that would enforce this kind of record keeping and permit a retrospective judgment about the medical necessity for helicopter transport as well as gathering data on frequency

of use, etc. If these items all seem appropriate, then an additional conditional use permit would be issued. If the preponderance of data suggested inappropriate use, then denial of an extension might be a reasonable course of action in the future.

I do not envy you your King Solomon role in "dividing up the baby" but the results of your efforts will be quite helpful on a full State basis.

Sincerely yours,

L.H. Pinkers, M.D. FACS

MEMO FOR THE RECORD

RE: Transports to COHMC for August, 1985

Total admissions to COHMC for August 1985		1,071
Ambulance transports to the Emergency Room directly excluding prearranged transports with the transport team		82
Total prearranged newborn ground transports		42
	to COHMC	34
	to UW	8
Total prearranged fixed wing transports		52
	to COHMC	30
Total prearranged rotary transports		34
	to COHMC	6

On an annual basis there are 400-450 ground neonatal transports worked out through the transport team. Eighty to 85% of these go to COHMC.

RECEIVED
JAN 29 1985
Dept. of Construction & Land Use

January 25, 1985

William Justen, Director
Dept. of Construction and Land Use
600 4th Avenue
Seattle, Washington 98104

Dear Mr. Justen:

Members of the land use committee of the Laurelhurst Community Club have reviewed the environmental checklist submitted by Children's Orthopedic Hospital on its heliport proposal. It is an inadequate estimate of the probable impacts of this proposal and we reiterate our resolution that asks for an environment impact statement.

The heliport was pubically discussed by Treuman Katz (COH Chief Executive Officer) at a well-attended community club meeting two years ago. It was discussed as part of a total proposal for development anticipated by the hospital which includes a new clinic, a new office building, and a substantial increase in the number of beds for patient care. Additionally, we understand a trauma center tied directly to the heliport will be developed. To consider less than the total development planned for the hospital would be contrary to the intent of the state environmental policy act.

Some specific deficiencies we have found in the COHMC checklist are as follows:

Section A.7. Future related activity: COHMC has not mentioned its plan for establishing a trauma center that would be supported directly by the heliport. A full disclosure of this plan should be required.

Section A.10.Approvals. No mention is made of the possibility that COHMC will be required to submit a certificate of need (CON) application by DSHS soon. Our recent resolution asks that a CON be required so that information on medical need and costs will be available. We have reason to believe that DSHS will place such a requirement on COHMC.

Section B.1. Earth: No mention of the current drainage problems experienced from COHMC runoff by residents of Laurelon Terrace, which is adjacent to the hospital, is given. The construction of the heliport will increase current drainage problems by some unestimated factor.

Section B2.1. Air: No discussion of the amount of jet engine exhaust and the toxic substances it will deposit in the adjacent neighborhood is given. Mitigation measures for this problem should be discussed.

Section B.3. Water: Toxic substances would be added to the water runoff from the heliport. No mention of this is made. The response to item B3.c1 (water runoff) is not correct. Fuel spills in particular could enter the city's storm drains. This possibility and any planned measures to mitigate it should be addressed.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Section B.4b. Plants: The response to item 4b is very misleading; the paved area of the heliport will cover 1600 square feet. If the current "Kitchen Garden" is replaced with 1600 square feet of paving, how can the response of 4d be accurate?

Section B.5c. Migration route: The helicopter flight plan as verbally described calls for flying over a wetlands that is part of a major migratory route for many waterfowl, including Canada geese, herons, mallards, bitterns, as well as shorebirds and beaver and other animals. No mention is made of the impact on these animals.

Section B.7.Environmental health: The response to this item fails to recognize the release of toxic substances into the neighborhood from a twin jet helicopter. Moreover, jet fuel will be stored on the site. Leaks and explosions could occur as could helicopter crashes on landing or take off. For these reasons, the issue of fire hazard and explosion near the emergency room entrance should be addressed. An evaluation by the Seattle Fire Dept. of plans for a worst case scenario for fire and explosion at the landing site should be required. Other safety measures such as a safety fence, safety signage, rules for fueling and maintenance activities on the hospital site, and ground supervision during operation at the hospital should be discussed.

Section B.7b. Noise: The response here is very deficient. Detailed noise data must be developed using measurements from the actual helicopter proposed for use. A noise exposure contour map for the helicopter approach and departure routes as well as for the heliport are needed. A full discussion of noise mitigation measures proposed by the applicant should be provided together with suggestions as to how they could be enforced.

Section B.8. Land use; The city commerical land use code requires that no structure higher than the heliport surface be allowed within 200 feet of the center of the helipad. This standard should also apply to major institutions. There are currently two structures that are less than 200 feet from the proposed location. Item 8c. does not mention these structures.

Section B8.1 Compatability with existing plans: Since COHMC has indicated several times that it has no intention of preparing a Master Plan, it is interesting to note that a response to item B8.1 was avoided entirely.

Section B.10.c Aesthetics: Impacts on the 135 housing units in Laurelon Terrace, directly adjacent to the proposed helipad, and to residents on 44th N.E. who have a direct view of the site should have been discussed. There will certainly be "aesthetic impacts" from the heliport, especially to those particular residents. The response states that replacing the "Kitchen Garden" and three trees with a 1600 square foot paved pad with a big red "H" painted in its center, surrounded by a chainlink fence would not produce any aesthetic changes. This response is clearly wrong.

Section B.11. Light and glare: The intensity, extent, and height of the heliport lighting system is not discussed adequately. Laurelon Terrace and other nerby residents are already adversely impacted by the all-night lighting system in use at the nearby parking garage. No mitigation measures are suggested by the applicant.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Section B.14. Transportation: This section must be expanded upon by the applicant; not only a helipad, but a transportation service is being proposed. The following factors should be taken into account:

(a) The anticipated number of helicopter trips per day (or per month) should be indicated. The frequency of use clearly is related to the impact.

(b) The helicopter would have to fly from its base to the hospital to pick up its flight crew and equipment. It would then fly to the patient and take the patient to the hospital; thus, every patient picked up generates 2 flights to the hospital.

(c) Every time the helicopter lands, an ambulance would have to be called to the site as hospital personnel are not allowed to transfer a patient from a helicopter because of liability insurance rules. This traffic should be included.

(d) Potential distraction and increased accident potential due to low flying helicopters over arterial streets and intersections should be discussed. The helicopter flight patterns should be described relative to these arterials.

(e) Other items that should be provided include: a map of planned helicopter flight patterns, a discussion of the affect various wind conditions may have on the direction of flight paths and on the vertical clearance ability of the helicopter, and plans for alternate landing sites in case of fog or other problems.

(f) What type and size of helicopter will be used? Helicopters vary greatly in the amount of noise, vibrations, and fumes they emit.

(g) Where would the helicopter be based? Is any maintenance, cleaning, or fueling of the helicopter planned at the hospital site?

(h) Who decides whether to send the helicopter or ground transport on a mission? How will the helicopter be dispatched and what controls are proposed to limit use to only those types of flights (life-saving emergencies) which are permitted?

(i) Who would be allowed to use the heliport? How about Navy Search and Rescue, MAST, etc.?

Section B.16. Utilities: It is not clear from the response if additional storm drains would be needed.

Also, while COHMC states that the large sign was installed on 16 January, it was not actually in place until 18 January. We know that the City will honor a full comment period. It is unfortunate that the large sign was placed only on Sandpoint Way where cars zoom by to other neighborhoods. A large sign should be placed on the adjacent arterial of the most affected community as well.

Clearly, many of the impacts of this proposal would fall on the residents of the area near the hospital and those who live along the flight paths used. A description of these impacts together with appropriate mitigation measures should be included in an environmental impact statement. We hope you agree with us that such a study is clearly indicated by the deficiencies of COHMC's responses to the questions on the environmental checklist.

Moreover, since the Airlift Northwest helicopters would serve the needs of five hospitals (Harborview, University, Providence, Mason, and COHMC), the EIS should cover impacts in the neighborhoods adjacent to these other hospitals as well. The COHMC proposal should not be allowed to be separated from this larger, city-wide context.

We would appreciate receiving a copy of the report which gives your decision and its rationale as soon as it becomes available.

Yours sincerely,

John C Kehoe
President
Laurelhurst Community Club
5208 NE 50th - Seattle - 98105

RECEIVED
DEC 17 1984
Dept. of Construction & Land Use

Mr. William Justen, Director
Department of Construction and Land Use
600 4th Avenue
Seattle, Washington 98104

Dear Mr. Justen:

As you are no doubt aware, the major institutions code requires that DCLU conduct a study of alternatives whenever the City Council must decide on a helipad application. In the case of the pending request by Childrens Orthopedic Hospital (COH) I want to suggest that DCLU staff examine the following alternatives and determine their costs and benefits in terms of neighborhood impact:

Alternative 1: Have 1 helipad in city, located at Harborview Hosp. --to serve all area hospitals.

Alternatives 2-4: Have 2 helipads in city
a. one helipad to serve Harborview, V.Mason, Swedish and Providence Hosps.--located at Harborview
b. a second helipad, to serve Univ. Hosp. and COH--located at either:

(alternative 2) (1) University Hospital
(alternative 3) (2) UW intramural field (Graves' Field)
(alternative 4) (3) Sandpoint Naval Station area

Alternatives 5-7: Have 3 helipads in city
a. one helipad to serve Harborview, V. Mason, Swedish and Providence Hosps.--located at Harborview
b. second and third helipads, to serve Univ. Hosp and COH--located at:

(alternative 5) (1) Univ. Hosp. and COH
(alternative 6) (2) Univ. Hosp. and intramural field
(alternative 7) (3) Univ. Hosp. and Sandpoint Naval Station area

Childrens Orthopedic Hospital and University Hospital are currently designated as Level III facilities for neonata' care. In October, 1984, Swedish Hosp. (not currently a member of Airlift Northwest) applied for a Certificate of Need for a Level III neonatal facility. If it is approved, all three hospitals will be providing this service. It is also possible that Group Health Cooperative Hospital should be included in your analysis as well as the West Seattle, Ballard, Northgate, and Northwest Hospitals. At least, they should be contacted as to their expectations with respect to their membership in Airlift Northwest and their need for helicopter transportation. Airlift Northwest will probably be getting a helicopter that will land at Harborview and serve adjacent hospitals in the early part of 1985.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I feel that DCLU ought to obtain 5 and 10 year projections on the expected costs and revenues for the proposed Airlift Northwest venture into helicopter transportation as they figure directly into the assessment of alternative location patterns for helipads to serve Seattle hospitals. Interhospital competition patterns as well as regional referral patterns are also interwoven into the issue of how many helipads in what locations are needed. I am sure that such questions will arise at the hearings on this issue (as they have already at the one public meeting sponsored by the Laurelhurst Community Club in November) and that members of the City Council will want answers, not unanswered questions, when the matter reaches them for a decision. This information has to come from the hospitals and would be included in a Certificate of Need application. COH has so far indicated that it does not intend to develop and file such an application. In my opinion, DCLU should encourage COH to develop such an application at the earliest possible time so that a reasonable asssessment of this issue can be made by DCLU and the City Council.

Also, enclosed are additional petitions from residents near COH who are opposed to the helipad at COH. This brings the total number of signatures obtained so far to about 350. Additional petitions are forthcoming.

Yours sincerely,

Jerry B. Schneider

INTRODUCTION

Childrens Orthopedic Hospital and Airlift Northwest contest the Notice of Violation filed on August 30, 1985 against 4800 Sandpoint Way.

The hospital and Airlift Northwest sought a reconsideration hearing pursuant to Seattle Municipal Code 23.90.

The matter was heard before the Hearing Officer on October 31, 1985.

Parties to the proceeding were: Childrens Orthopedic Hospital by attorney Rand Kuler; Airlift Northwest by attorney Steve Milam, and Department of Construction and Land Use by Hermia Ip.

Seattle, Washington 98105

Dear Ms. Francis and Ms. Anderson:

Thank you for your letter of March 28, 1985, about the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on hospital grounds (CC 84-022).

In your letter, you asked why a citizen committee was formed for the five-acre site which COH acquired recently, and why is it not possible for our Department to establish a similar committee for the existing COH campus. Enclosed please find a copy of the COH-CARE and City Agreement which explains the specific terms and functions of the committee. As stated in the agreement, that committee was formed as a stipulation for the property transaction to provide community input and coordination on the future development of that particular site. With the helipad proposal, the SEPA Ordinance and Land Use Code provide for a different format of citizen participation, which involves public notices, comments, hearings and appeal processes. However, we will encourage COH to discuss their helipad proposal with the community as well as to consider preparation of a Master Plan. We are hopeful that they will initiate the process.

You also recommend that this Department conduct an in-depth investigation on medical needs, cost, environmental impacts and alternative sites for the helipad. We must find that the Code requirements are fully met before we can recommend approval of the permit. However, we do not necessarily involve staff in the gathering and research of medical and other data necessary to support the proposal. The burden of proof is on the applicant to satisfy the Code requirements. We review and evaluate the information provided in making our recommendation. The information and our analysis is also subject to review and comment before the Hearing Examiner at the required public hearing. At this stage, COH is still working on preparation of the environmental checklist information which we required in February. We have recently reminded them that, in addition to SEPA review, they must thoroughly address the merits of the proposal based on the Council Conditional Use criteria for the helipad (see letter attached). We will keep you informed of responses from COH.

March 28, 1985

William J. Justen, P.E.
Director
Dept. of Construction and Land Use
400 Municipal Building
Seattle, Wash. 98104

Dear Mr. Justen:

Thank you for your letter of 20 March. We do not understand your position as expressed in your second paragraph, that you cannot form a citizens advisory committee. We know that no formal master planning effort can be required under the current code. But, we see no reason why an advisory committee (with staff support from the city) cannot be devised to deal with COH expansion plans. Why has such a committee been established for the 5-acre parcel at N.E. 70th and Sand Point Way when no development is planned for the next few years? Our problems are both larger and more immediate. Your letter does not address this point as also described in our previous letter.

We agree with your point that helicopter transport programs and policies require a regional approach. However, your view of the city's responsibilities in this matter seem very limited in relation to the requirement in the code (23.48.05) that states that: the helistop must be needed to save lives, should be located so as to minimize impacts upon surrounding residential property, should be used only for life-threatening emergencies, and that the Director's report shall examine alternative locations for the helistop. We believe that this statement requires you to include medical need and cost issues as well as land use and environmental impact concerns. The PSHSA memo represents a good start on this issue. Our letter to you of 12-17-84 outlines some ideas as to the major alternatives that we believe need to be studied. Our main concern is that we have the opportunity to participate in the scoping of the study your department is required to conduct as stated above. When will this study by initiated? What resources will be allocated by DCLU to conduct it? Will an outside consultant be employed by DCLU? How will other hospitals (e.g., UW, Harborview, Providence, Mason, etc.) and other affected communities (e.g., Montlake, Windermere,etc.) be represented?

We have recently learned that a helicopter service has been started at Valley General Hospital in Renton and at St. Luke's in Bellingham. We have also heard that 3 Tacoma hospitals are about to begin a helicopter service. Evergreen Hospital in Kirkland already has a helipad and is considering initiating a service in the near future. These actions indicate that this issue needs a regional study and that Seattle's response should relate to and harmonize with the activities of the other hospitals in the region. The PSHSA is clearly the key agency in this situation and we urge you to encourage and support further work on this issue by them that would complement your study of the alternatives.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We have enjoyed working with Mrs. Hermia Ip and feel she has done a fine job on this issue to date. We will keep her posted with any information that we develop on this issue. We realize that her time is a scarce resource and hope you will see to it that she gets the help she needs to conduct (for the first time we believe) the study of alternatives required in the major institutions code.

It would be most helpful if you would send copies of your letters to Frank Chestnut of the DSHS in Olympia and Larry Thompson of the Puget Sound Health Systems Agency. This will allow a higher level of coordination to take place as this issue moves through the review and hearing process.

Sincerely,

Anita Francis

RECEIVED
APR 9 - 1985
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Mr. Tom Byers
Office of the Mayor
Municipal Building
Seattle, Wash. 98104

Dear Tom,

We appreciated having the opportunity to talk with you and Mrs. Hermia Ip last week about our problems (present and potential) with Children's Orthopedic Hospital. Subsequent discussions have identified the following points that we feel need further discussion:

1. We feel that the PSHSA "policy guidance" paper is a good start but is not sufficient to be a base for a formalized city policy on the use of helicopters for medical transport to hospitals located in the city. What can be done to enable the PSHSA to continue its work on this issue while there is still a little time before decisions have to be made?

2. What will DCLU be able to do with current staff resources to implement the requirements of the major institutions code (Section 23.48.05) regarding helistops? Will outside consultants be required? If so, are plans being made to identify and hire some appropriate assistance?

3. William Justen has written a letter to us (3-20-85) that states that "while the City of Seattle has the responsibility to address the land use implications of hospital helipads, the role of assessing the need and cost effectiveness of such facilities in medical practices is beyond the function of the city government." But, the code states that a conditional use may be permitted if the Council finds that: the helistop is needed to save lives, is located so as to minimize impacts upon surrounding residential property, is used only for life-threatening emergencies, and that the report shall examine alternative locations for the helistop.(Section 23.48.05). Our interpretation of this indicates that DCLU is required to conduct a broad and deep investigation of medical need, cost, environmental impacts, and alternative sites. Do you agree with our interpretation of the code?

4. You should know that COH administrator (Treuman Katz) was invited to talk with the Land Use Committee of the Laurelhurst Community Club at a meeting on Tuesday evening, March 25. He was invited about 3 weeks prior to this meeting and agreed to come. He cancelled out a few days before the meeting and refused our request to send a substitute. We have tried to improve our communications with him in a constructive way but have not been successful.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. As you may know, the current contract that defines the relationship between Airlift Northwest and the participating hospitals was established on April 15, 1982. It was to expire on Feb. 15, 1985. We presume that it has been extended by amendment until a new contract can be negotiated. We believe that this new contract is a vital piece of information that should be carefully examined before any decisions are made regarding the heliport.

Any help you can give us with the above questions will be greatly appreciated. We would also appreciate help in reaching goals specific to COH, which we discussed at our meeting with you:

1. For COH to prepare a master plan
2. For COH to decentralize
3. to establish sincere, honest communication between COH and the impacted neighborhood.

Thanks for your help and interest, Tom.

Sincerely,

Anita Francis

Seattle, WA 98105
April 3, 1985

Charles Royer
Mayor, City of Seattle
1200 Municipal Building
Seattle, Wash. 98104

Dear Mayor Royer:

Your response (26 March) to our letter (7 March) regarding the proposed helicopter service to Children's Orthopedic Hospital is appreciated as is a concurrent letter from William Justen. However, both letters seem to presume that we have not read and understood the major institutions code.

In you letter you refer to the "triggers" in the major institutions code which can require the preparation of a master plan. Be assured that we have looked at them carefully and have concluded that none apply in the COH situation. COH has told us they have no intention of preparing a master plan, now or ever. And, they can expand significantly without being affected by any of these "triggers." As we stated before, the major institutions code offers us no protections from the expansion plans being developed by COH. We are concerned about more than just the helipad proposal. It has simply triggered the community into action.

In William Justen's letter (20 March, copy to you), he refers to the major institutions code and states that the city can deal only with the land use aspects of the helipad issue. Our reading of section 23.48.05 of the master institutions code indicates that the city can indeed undertake a broad and in-depth study that can include medical need and cost as well as environmental impact issues. We have written to William Justen about this.

Your request to the PSHSA for a policy guidance study was timely and welcome. However, much more work needs to be done before an acceptable policy statement can be formulated. We urge you to request some follow-on work from the PSHSA and to provide them some support to investigate this issue in more depth.

We would greatly appreciate your interest in and attention to this issue.

Yours sincerely,

Anita Francis

RECEIVED
FEB 4 1985
Dept. of Construction & Land Use

Dear MR. Justen.

As concerned citizens of the community surrounding Childrens Orthopedic Hospital we oppose the construction of a helipad

We have numerous concerns covering the noise pollution, frequency and timing of the flights, the danger associated with potential accidents (not only to those of us in the community but also the people within the hospital) and the economic impact to property values.

It is our belief that at there are other viable alternatives to this proposal that have not been adequately considered and deserve some attention. One possibility being a better landing pad at the University field or cooperative use of the univ. hospital landing facility.

In conclusion it is our belief that this proposal requires an in depth study prior to any action. Thank you in advance for your consideration.

SINCERELY,

Mark & Juanita Bunch

Resolution, November 14,1985

The Board of Trustees of the Laurelhurst Community Club supportsthe development of a regional plan for the siting of heliports for emergency medical care. This plan should be based on an analysis of the medical need, the potential adverse impacts on communities, and the costs of helicopter services.

The designation of sites should be limited to the minimum necessary to meet the needs of the region. Where there is a choice, the location of the heliports should be limited to sites where overflights and landings will have the least impact on residential communities.

Criteria for use must be established in the regional plan so that helicopter service is limited to emergencies. These criteria should define conditions, such as difficulty of access, time constraints, and life-threatening situations, which make helicopter transport the only reasonable choice.

The Hospital's projections for helicopter use and its contract for services with Airlift Northwest indicate the proposal is for a commercial transportation service which is costly, may not be limited to medical emergencies, and includes financial incentives for overuse.

Quality emergency care has been satisfactorally provided by helicopter transport to the University's intramural field and Harborview's trauma Center. At this time, the Board of Trustees of the Laurelhurst Community Club opposes the approval of a helistop at Children's Orthopedic Hospital until a medical need for the helistop on campus is substantiated.

December 30, 1985

RECEIVED
DEC 3 1 1985
DEPT. OF CONST. & LAND USE

Beatrice Farrar Ryan, Director
Department of Construction and Land Use
400 Municipal Bldg.
Seattle, Wa 98104

Dear Ms. Ryan:

The report submitted by Dr. Nicola, Director of Public Health, is an inadequate basis for a Council Conditional Use decision on the application for a helistop at the site of the Children's Hospital. The report does not contain an analysis based on the criteria set in the Code, nor does it address the issues before our community.

Specifically, the Code requires that the medical need be determined and the alternative sites for meeting that need be evaluated. Presumably, the intent of the Code is to allow siting of helistops only if the need can be substantiated, to limit the use of the helistop to meeting that need, and to site helistops where the least adverse effects on the community will be felt. Dr. Nicola does not provide the Council with the analysis necessary to assure that intent is met in its siting decision.

A major conclusion in the Nicola report is that 5 to 10 percent of all children transported (to COH by air?) fall into a category of patients where a 3 to 5 minute delay may be lifesaving. This conclusion is drawn from Nicola's conversations with transport physicians. The lack of any documentation of what questions were asked, how many physicians were interviewed, and what control of bias was maintained makes this conclusion highly questionable, particularly in light of the successful use of the soccer field for landing emergencies to date.

Major assumptions in the report are false. Nicola's conclusions are based on the assumption that the number of cases transported by air (also undocumented) will remain the same even if a helistop on campus is permitted. He also assumes that all pediatric trauma cases will go to Harborview, the regional trauma center. COH states in its environmental analysis that it expects trauma patients to be flown in and has indicated to us that it is emerging as a trauma center.

We question Nicola's premise in commenting that the consortium of hospitals sharing a helicopter service is a sensible approach which will make it easier to establish a systematic approach to provision of services. A consortium may or may not achieve this end. In the case of Airlift Northwest, the basis of agreement is financial. Three hospitals, which receive substantial government funding, are underwriting a very expensive operation which is not financially feasible to other hospitals. There are no rules limiting use and directing service based on need and quality care. The COH proposal, as indicated by its projections for helicopter use and its contract for services with Airlift Northwest, is for a commercial transportation service which is costly, is not limited to medical emergencies, and includes financial incentives for overuse.

The recommendation for an interim conditional use permit is based on undocumented conclusions and false assumptions. It is not acceptable. Specific conditions to assure that use will be limited to emergencies must be established before a permit is granted. Those conditions cannot be specified until medical need is defined as it applies to the Orthopedic Hospital. Revoking a hospital's permit for misuse is not a viable option in any case and certainly unworkable when there are no specified standards for use.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Laurelhurst Community Club has asked that the designation of hospital helipad sites be limited to the minimum necessary to meet the needs of the region. Where there is a choice, we have asked that the location be limited to sites where overflights and landings will have the least impact on residential communities. Given the adverse impact of helicopters on the quality of the residential living environment, we know these requests are both reasonable and responsible.

We have additionally asked that criteria be established to assure that helicopter service is limited to emergencies. These criteria should define conditions such as difficulty of access, time constraints, and life-threatening situations which make helicopter transport the only reasonable choice.

We do agree with the Nicola recommendation that emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use, rather than a hospital-by-hospital provided service. This plan should be based on an analysis of the medical need, the potential adverse impacts on communities, and the costs of helicopter services. An ongoing evaluation of helicopter use which includes review by health care consumers as well as physicians and administrators should be a part of the plan.

We believe the Hospital should provide the City with an analysis of its proposal addressing the issues of medical need and alternative locations. It has not and very likely will not do so. Therefore, we must rely upon your department to provide the factual analysis needed by the Council or to simply recommend denial based on a lack of information.

We remind you that the Orthopedic Hospital has refused to disclose its plans for future development. It will be impossible for the Council to make an informed decision on the helistop without knowing the Hospital's intent for growth and development.

Sincerely,

Liz Anderson Anita Francis Kate Hemer Jerry Schneider

Re: Application for Helipad at Cildrens Orthopedic Hospital and Medical Center (COHMC), Application No. CC84-022.

Dear Mr. Justen:

This letter concerns our opposition to the proposed helipad at CHOMC. We have been residing at above address for over 20 years. Our residence is located on 45th Ave. N.E., directly East of CHOMC, and we have been enjoying our neighborhood in the absence of noise, except when coast guard and military helicopters were landing on CHOMC grounds occasionally in past years (approximately up to 10 years ago). Granting permission of a helipad with several helicopter flights day and night, threatens to disrupt living and sleeping patterns in the neighborhood.

We do believe that with modern life saving and transport techniques other than helicopters, just as many lives can be saved. We believe tnat helicopter technology is too expensive and represents nothing but a flashy status symbol to the hospital using them. We believe that the use of the UW meadows of landing (presently used) should be continued. If children are too sick to be transported by any other means, helicopters should take them to the UW hospital helipad for treatment at that facility.

Sincerely,

Hugo W. Schimmelbusch

Dear Mr. Justen:

RE: Proposed helipad at Children's Orthopedic Hospital

As a neighbor of COH, I am concerned about the proposed helipad, and believe that COH should be required to prepare an environmental impact study regarding this project.

Many of us in the nearby neighborhood have questioned the projected number of helicopter landings per month at COH, and wonder if only the truly "life saving" cases will be flown in, or rather if the helicopter landings will become frequent in order to make the service financially viable. Several medical authorities have wondered aloud if eventually broken legs and hang nails might be treated using the helicopter service.

This possibility raises the issue of environmental impact. What about the noise level on a regular on-going basis? What about the possibility of an accident or crash involving the helicopter? What about the air pollution from helicopter engine emissions?

I ask that DCLU require COH to conduct an enviromental impact study to address these and other issues.

Sincerely,

Jane Johnson

Re: Application #CC 84-022
Helicopter Pad - Children's Orthopedic Hospital -

To Whom It May Concern -

My wife and I live in close proximity to Children's Hospital and we wish to be good neighbors, as we wish them to be to us.

This is a residential neighborhood where we want a reasonable peace and quiet. To have helicopters flying in and out, with all their noise is simply not acceptable. I don't think the hospital has really proved its point that the University playfield is not efficient.

I hope you will deny the hospitals application & let the helicopters leave as they have been doing for years on the University playfield or at the University Hospital -

Thank you - Charles R. Hough -

Dear Mayor Royer:

In response to your request, staff at Puget Sound Health Systems Agency have prepared the enclosed responses to your questions regarding helicopter transport in emergency medical situations.

Given the time and resources available to us, we have been unable to convene either an outside technical review panel or to undertake a formal public policy development process leading to definitive criteria. You should view our comments as a staff position paper.

I hope the enclosed comments will be of use to you. Please do advise me should you require further comment from Puget Sound Health Systems Agency.

Sincerely,

February 21, 1985

Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

The Puget Sound Health Systems Agency (PSHSA) has prepared the following in response to your questions about the appropriate use of helicopter transport in emergency medical situations.

1. In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?

Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care enroute can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery

Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services. The EMS system features substantial ground transport services throughout the northwest region, each of which is capable of responding rapidly to calls in the area it serves. Military Assistance to Safety and Traffic (MAST) helicopters transfer patients from accident sites within a 100-mile radius of Fort Lewis to Harborview in Seattle and to St. Joseph in Tacoma. Interhospital transfers and service to areas outside the range of MAST are provided by the fixed-wing transport of Airlift Northwest. Private helicopter service operating out of Bellingham further supports counties in the northwest section of our region.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The existing EMS system is founded on comprehensive ground transport services and has developed into a well coordinated regional network. As a result, the use of helicopter services can be managed within the present system to better ensure that their use is limited to cases not adequately served by ambulance or plane transport.

2. How frequently is this means of emergency transport required?

Agreement on when medical conditions warrant the use of helicopters has not been reached. The introduction of helicopter transport is so recent that triage guidelines have not yet been developed which might help establish the frequency with which helicopter transport would appropriately be expected.

In the last year MAST completed approximately 220 field trips, most of which were to provide transport of patients from south King, Pierce, and Kitsap counties. Some of these patients were taken to St. Joseph Hospital. Approximately 120 were taken to Seattle hospitals, most of these to Harborview.

The extent to which this level of service approximates the expected need for helicopter transport is not presently known. Efforts are underway to formulate a method to determine the need for helicopter transport and to establish the resources necessary to meet that need. These efforts in Washington and in other parts of the country should be evaluated by clinicians, planners, and administrators in order to prepare guidelines tailored to the special requirements of our region.

3. How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?

Which Seattle hospitals are best suited to meet the medical need?

Helicopter transport is only appropriate for the most critical cases. An evaluation of helicopter transport often cited to support its efficacy in improving outcomes suggests that major improvement occurs only in the more severe classifications representing a fraction of all trauma patients. This study by William G. Baxt and Peggy Moody indicates that helicopter transport is required for only a small subset of trauma patients especially when high quality ground transport systems are available.

MAST helicopters are presently transporting patients within King County directly to Harborview or to University Hospital (and occasionally other hospitals) by way of ambulance from the University of Washington soccer field.

While we cannot confirm that this arrangement is adequate, PSHSA recommends transport to only the most specialized trauma centers in Seattle, of which University and Harborview hospitals are excellent examples. Consideration of additional sites should evaluate not only unmet patient

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

care needs, but also the trade-offs which will result in meeting those needs. Limiting the number of helipads may be an important component in ensuring limits on the growth of helicopter services and in fostering effective and cooperative use of the EMS system as a whole.

It is critical that the inappropriate use and proliferation of helicopter transport services be discouraged. Unfortunately, we are in the midst of "air wars" throughout the country as hospitals vie with one another to establish helicopter programs. The number of programs in the country doubled between 1980 and 1983, and the National Medevac Conference in 1983 opened with spokesmen suggesting that the number of programs would (and should) double again in five years. It is not at all evident, especially in areas served by MAST, that additional programs are needed and the impact of further growth may be adverse for the community as a whole. Particular patient care requirements of an institution may not be sufficient to outweigh the additional direct and indirect costs which may result from expanded helicopter services.

PSHSA is especially concerned that individual institutions will establish helipads and eventually separate helicopter programs in an effort to meet particular patient care objectives which might be met satisfactorily under the current arrangement of emergency services.

A conservative approach to the development of helicopter transport programs is advised for several reasons:

a) The present system is extremely cost-effective. MAST operations are provided at no additional cost to residents above the support of federal tax subsidies.

b) In our region, the need for additional helicopter services which would be sufficient to support such an expensive service at an individual institution is unlikely. To justify the program, transportation services would tend to be over-utilized with transport provided in cases which would more appropriately be handled at other levels in the EMS system.

c) Facility costs would tend to increase since helicopter services are generally "loss leaders," powerful marketing tools which may increase hospital utilization but which would not necessarily guarantee the additional revenues required to cover the additional costs incurred.

d) If unnecessary and used inappropriately, helicopter transport services established outside the current system have the potential to adversely affect the EMS programs now serving the region. The development of private programs could result in the elimination of MAST (as specified in federal guidelines). Second, the ambulance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and plane support systems in place might begin to experience volume reductions which could jeopardize both the quality and financial viability of the services they provide.

In summary, should additional need for helicopter services be found in the area, a consortium approach rather than an institutional approach to the provision of these services is recommended. This approach will avoid duplication, support the development and implementation of appropriate triage guidelines, and encourage continued reliance on a regional EMS system. It will prevent the introduction of such services as marketing tools for individual institutions which needlessly drive the cost of hospital care up while reducing reliance on the existing EMS system.

5. What alternatives are available for transporting patients and what are the medical implications?

Helicopter transport has a vital place in the emergency medical service system. The alternative of not providing such service does not exist. The real alternative is to allow proliferation of helicopter transport services which will unnecessarily increase the cost of hospital care without significantly benefiting the community.

Re: File No. Z853959 - Request For Reconsideration of Notice of Code Violation

Dear Ms. Ryan:

We represent Airlift Northwest and Dr. Michael Copass, Medical Director for Airlift Northwest, who received on September 2, 1985, a Notice of Violation of Land Use Code. The Notice states that the Airlift Northwest and Michael Copass are in violation of the Land Use Code for "using or permitting the use of the premises as a landing pad for helicopters . . . ." The notice does not indicate the facts upon which this allegation is based. It indicates that this activity is in violation of the following code sections: 23.40.02C[sic]; 23.48.05A[sic]; and 23.90.02B[sic].

Seattle Municipal Code Section 23.40.020C identifies the elements which must be proven in order to obtain a variance. Seattle Municipal Code Section 23.48.005 states that a helistop is a council conditional use in the major institution classification. Seattle Municipal Code Section 23.90.002B states:

> It is a violation of this Land Use Code to use or cause to be used any structure or land or to construct, locate or cause to be constructed or located any structure within the City of Seattle in any manner that is not permitted by the terms of any permit or authorization issued pursuant to this Land Use Code . . . .

The first two cited code sections suggest that the alleged violation relates to an impermissible structure. The language in

Ken Eikenberry Attorney General
112 Administration Building, University of Washington
Seattle, Washington 98195

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the notice suggests that the violation relates to an unauthorized use under Seattle Municipal Code Section 23.90.002.

APPELLANTS' INTEREST IN RECONSIDERATION

Children's Orthopedic Medical Center (COHMC) is the owner of the land described in the notice. Application of the terms of this notice would wrongfully subject Airlift Northwest and Dr. Michael Copass to penalties in the event of any similar occurances in the future.

OBJECTIONS TO NOTICE

Seattle Municipal Code Section 23.40.020C does not apply because there is no "structure" at issue.

Seattle Municipal Code Section 23.48.005A does not apply because Airlift Northwest and Dr. Michael Copass did not use a "helistop" on the premises of COHMC. This term is defined at 24.08.090 as "an area on a roof or on the ground used by helicopters . . . for the purpose of picking up or discharging passengers or cargo. . . ." There is no such designated area on the subject land. Helicopter landings have been so rare that it is impossible to identify "an area on . . . the ground used by helicopters . . . for the purpose of picking up or discharging passengers or cargo . . . ."

Seattle Municipal Code Section 23.90.002B has not been violated by Airlift Northwest and Dr. Michael Copass because they did not use the land or cause it to be used in an impermissible manner. Seattle Municipal Code Section 23.90.002B states that a violation occurs only if a person or entity used land in an impermissible manner or causes land to be so used. It cannot be shown that Airlift Northwest and Dr. Michael Copass are responsible for any helicopter landings.

Furthermore, the rare instances of helicopters landing on the subject property have occurred only on the occasion of direct and immediate life threatening emergencies where time, indeed seconds, could determine the difference between life and death.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

REQUESTED RELIEF

Airlift Northwest and Dr. Michael Copass respectfully request that the notice and determination of code violation be withdrawn.

Very truly yours,

Steve Milam
Assistant Attorney General

Resolution passed by the Board of Trustees of the Laurelhurst Community Club, June 10, 1985 (unanimously)

Be it resolved that the Board of Trustees of the Laurelhurst Community Club opposes the establishment of a helipad and associated increased level of emergency service at Children's Orthopedic Hospital and Medical Center. The Board has been concerned for some time with questions about medical need, safety and environmental impact and has been disappointed with COH's lack of cooperation in sharing information about their proposed plans. In addition, alternative landing sites at other locations such as University Hospital and the intramural field are reasonable alternatives and should be investigated. However, COH's recent challenge to the requirement made by the Washington State Department of Social and Health Services that COH file a Certificate of Need application, impels us to oppose the granting of any permit that will allow COH to proceed with the proposed helipad and associated emergency treatment capability expansions. Information about the multiple costs and benefits of the COH proposal will not be available to the City of Seattle, the residents of the Laurelhurst community and other impacted communities, other affected hospitals,medical prepayment agencies, and current providers of emergency medical ground transportation unless a Certificate of Need is prepared by COH.

UNIVERSITY OF WASHINGTON
SEATTLE, WASHINGTON 98195

Office of the Executive Director of Hospitals

Harborview Medical Center
University Hospital

May 20, 1985

Anita Francis
5003 45th N.E.
Seattle, WA 98105

Dear Ms. Francis:

This letter is written in response to your letter to me dated March 7, 1985. Your understanding is correct in regard to University Hospital's plans to operate a helipad on the roof of its new east wing addition. The primary purpose of this helipad is to reduce the time required to transport critically ill patients. It would also increase patient safety by eliminating the need to shift patients from one transport vehicle to another. It will also reduce costs to the patient by eliminating the cost of the ambulance transport. Currently, patients are transported to the University Hospital by helicopter and ambulance. Helicopters now land on the University campus at the IMA fields to the north and east of the hospital. It is then necessary to transfer the patients to an ambulance and transport them to University Hospital. The ability to land the smaller patient transport helicopter on the University Hospital will make it possible to proceed directly from the helicopter to the hospital more quickly without the need for an intermediate transport via ground ambulance. This will significantly reduce medical risk to the patient and eliminate the cost of the ambulance portion of the transport. In our assessment, these factors constitute a substantial benefit to the patient.

You ask whether it makes sense to have two helipads so close together. My response would be that it makes sense to have helicopter landing capability at Harborview, University and Children's Orthopedic hospitals. These are the hospitals which typically deal with the most critically ill or injured patients in our society and are the hospitals of last resort. This will provide immediate access to adult critical care and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the Burn and Trauma Unit at Harborview Medical Center, the High Risk Obstetrical Units at University Hospital and the Pediatric Critical Care and Neonatal Intensive Care Units at Children's Orthopedic Hospital. A helicopter landing site should be located close enough to the emergency entrance of each of these hospitals so transfer via ground transport vehicle, with its associated patient discomfort, delays, medical risk, and cost, is unnecessary. Consequently, the determining factor for siting of the helicopter landing facilities is more the location of these types of tertiary referral hospitals than the relative proximity of these hospitals to each other.

In your letter, you requested a copy of the agreement between the University and Children's Orthopedic Hospital which species the types of pediatric patients that go to each institution. I have enclosed a copy of the agreement between the University of Washington Department of Pediatrics and the Children's Orthopedic Hospital and Medical Center Department of Medicine which defines the relationship. Section VI details the specifics of this arrangement.

In your letter, you also requested a copy of the contract between Airlift Northwest and the various participating hospitals. Enclosed is a copy of the contract which is currently in effect for Airlift Northwest.

Sincerely,

Robert H. Muilenburg

Mr. William Justen
Director, Department Construction & Land Use
600 47th Avenue
Seattle, WA 98104

Dear Mr. Justen:

I am writing to let you know that the proposed Heliport Pad at Children's Orthopedic Hospital and Medical Center (COHMC) is unnecessary and will be detrimental to our neighborhood. The current transport system of landing at the University of Washington intramural fields is quite successful and does not jeopardize patients. It is only a few minutes away.

I am currently a physician at COHMC. Previously, I was involved in patient transports for over two years while serving in the United States Public Health Service. It should be noted that COHMC does not have a burn unit or a trauma unit. Thus, patients with these complications would be taken to Harborview Hospital.

Finally, I feel strongly that the disruption to our children both those in the hospital and those at home would be significant if helicopter transports land at COHMC. At the least COHMC should be required to make an environmental impact study on their proposal. I would be most willing to discuss these concerns freely at any future time.

Thank you for your attention to this matter.

File CC 84-022

THE CHILDREN'S ORTHOPEDIC HOSPITAL AND MEDICAL CENTER

Treuman Katz
Chief Executive Officer

April 26, 1985

Representative Ken Jacobsen
404 House Office Building
Olympia, Washington 98504

Dear Representative Jacobsen:

On April 3, 1985, Ms. Nancy Greenawalt, a COHMC staff person, wrote a letter to you regarding an amendment to Engrossed Substitute House Bill 397 which would have required a Certificate of Need review for on-site use of aircraft transportation of patients to and from a hospital. Children's Orthopedic Hospital and Medical Center opposed that amendment because it could have hindered our plans to establish helicopter transport service in emergency medical situations.

In that letter Ms. Greenawalt indicated that COHMC had "widespread support including that of Mayor Charles Royer and the Puget Sound Health Systems Agency." That statement is inaccurate. Ms. Greenawalt is new to COHMC and misunderstood the situation. COHMC has not asked for nor received formal support for our position from either Mayor Royer or the Puget Sound Health Systems Agency. It is important to the Hospital that we have a good relationship with the community built on mutual trust. I am sorry that the misunderstanding occurred because it could jeopardize that relationship.

You can be assured that the Hospital has followed and will continue to follow formal channels in seeking approval for helicopter transport service.

Sincerely,

Treuman Katz

Re: The Children's Orthopedic Hospital and Medical Center
Helipad Proposal

Dear Ms. Chaney:

Thank you for your letter of April 17, 1985, and for your assistance in connection with our request for the City's approval of the construction of a helipad at COHMC. If I may, I would like to request that you amplify or explain some of your comments regarding the standards for the City's review of our application for council conditional use approval.

You enclosed a copy of Section 23.48.05, which set forth the criteria for approval of a helipad. When you allude in the April 17 letter to our need to justify "the medical need for the helipad facility," I believe that is a reference to Section 23.48.05A.1.a. This provision of the applicable code section requires a showing that the "helistop is needed to save lives."

Your letter appears to say that we are required to show the cost-effectiveness of the helipad's usage and development. I could not find a provision in Section 23.48.05 requiring such an analysis. I would appreciate your assistance in explaining the need for this type of analysis.

In your letter, you indicate that you are concerned about the proliferation of helipads and the resultant undesirable effects on neighborhoods. It would be of assistance to us if you would provide us with examples of such undesirable effects, or amplify your concerns sufficiently so that we could be sure that we address the City's specific concerns.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(3) Finally, you indicate that the City's review cannot proceed without an analysis of the helipad in light of the goals and objectives of the Puget Sound Health Systems Agency and the State Department of Social and Health Services Certificate of Need Program. We would very much appreciate a clarification of this statement. The Puget Sound Health Systems Agency's goals and objectives are simply an interpretation of those of the State Department of Social and Health Services Certificate of Need Program. The proposed helipad is exempt from certificate of need review under the policy of the legislature embodied in the Health Planning Act (Chapter 70.38 RCW) and the regulations of the Department of Social and Health Services interpreting that Act. I presume that the Seattle Department of Construction and Land Use is not going to assume the role of the Certificate of Need Program and ask us to address our arguments to it as if a Certificate of Need were required where one is not. In any case, please advise us of your thought about this matter.

Again, thank you for your assistance. We very much appreciate the dialogue between COHMC and the Department of Construction and Land Use on this matter.

Sincerely,

Dorothy F. Teeter

Dear Hermia,

I am sending you documentation of our meeting of February 7th. I would like written confirmation from you that these are the issues about which we provide further documentation. We would also like a written confirmation from you that this will complete the information you require to determine the environmental impact status on this project. I have also enclosed the site map that you requested.

Although you may not know the exact schedule for hearings on our helistop, will you please provide us with an estimated schedule as to when the city council will be considering this project?

I am also hoping to hear from you this week as to your determination of what, if anything, will be required from DCLU to complete our short stay remodel.

Thank you for your assistance.

Sincerely,

Dorothy F. Teeter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In a meeting with Hermia Ip, our DCLU land use technician last week, a fairly thorough discussion of the helistop issues occurred. DCLU is requesting the following additional information from us:

1) Description of current helicopter transport procedure, including documentation of frequency, time lost from landing at the playfield, and patient safety/outcome issues. Explain more clearly why we aren't willing to use the playfield instead.

2) Documentation of noise level. The city is recommending that we hire a consultant to measure the decibel noise at various times and locations--e.g. landing, take off, approach paths, etc. They also want to know more specifics about the mitigating measures COHMC will take to muffle the noise, and the duration of the noise at approach, landing, and take off.

3) Documentation of the frequency of helicopter transports at different times of the day. (Can we say, for example, that nighttime helicopter transports will be less frequent than daytime; can we categorize the types of admissions that we get now at night, and figure out how many of them should have been helicopter transports.) What mitigating measures will COHMC take to decrease the frequency of helicopter transports whenever feasible (cost, ground transport, etc.).

4) Description of the quantity and quality of exhaust from the helicopter, and the mitigating measures COHMC intends to take to control emissions.

5) Description of the light and glare generated by the helicopter, and how far away it can be seen. Depiction of exact location of ground lights of surrounding helipad.

6) Description of the fenced barrier COHMC will construct as required by FAA, and a description of the existing landscaping around the helistop.

7) Description of how far it will be from the helicopter to the Emergency Room, and how long this transfer takes.

RE: Answers to DCLU questions on Environmental Checklist

Attached is a memo from Susan Killen of Shapiro Associates which addresses the following:

1. A larger scale map of the area surrounding Children's Orthopedic Hospital detailing the flight path into and out of COHMC.

2. An estimate of the number of MAST flights to COHMC per year.

3. A discussion of circumstances which would necessitate deviation from the proscribed flight path.

4. A quantitative estimate of the noise levels for a MAST helicopter.

In addition per your request, I have enclosed a landscape plan indicating the species and square footage of plant life including and surrounding the helistop.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. COH Flight Path

The COH flight path, along the Ship Canal, across Union Bay and onto Sand Point Way, was selected by Airlift Northwest in consideration of three factors: (1) safety, (2) noise abatement, and (3) prevailing wind direction. According to Airlift Northwest (Jim Jackson, December 4, 1985), the three pilots "always" use the same flight path in their approach to COH. The only time that they would deviate from their normal flight path is when the prevailing wind direction requires them to perform a "pedal turn," which enables them to back the helicopter into the helistop. This situation occurs only when strong east winds in excess of 30 knots exist. According to NOAA Sea-Tac data, strong easterly winds occur in Seattle less than 1% of the time. Even under these circumstances, the Airlift Northwest's flight path approach to COH does not change. The "pedal turn" maneuver is performed over the COH parking structure north of the proposed helistop.

Inclement weather does not affect the helicopter's flight path to COH because the helicopter would not be used during adverse weather conditions (Gene Hill, November 15, 1985). In the event that two helicopters were attempting to use the COH helistop at the same time, a situation that has yet to occur, one helicopter would retreat along the flight path and "orbit" over either Graves Field or out over the water near Husky Stadium.

2. Comparative Noise Analysis: AUGUSTA vs. MAST

This report presents a comparison of the general noise from the MAST (Military Assistance in Safety and Traffic) and the AUGUSTA Model A-109 helicopters. This study was requested by the City of Seattle's Department of Construction and Land Use in order to supplement the noise data in the Environmental Checklist on the proposed helistop prepared for the Children's Orthopedic Hospital and Medical Center (COHMC). Actual helicopter noise level data for the AUGUSTA was measured at COHMC by Seton, Johnson & Odell and is presented in their noise evaluation report. There is no actual noise level data taken on the MAST helicopter at COHMC. Noise level data for the MAST helicopter in this analysis is from several Federal Aviation

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Administration reports and from a conversation with the manufacturer of the MAST helicopters, Bell Helicopter Company.

The MAST helicopter is a Bell 212 with the military designation UH-IN. The following range of noise measurement levels was measured from a distance of 500 feet, and represents averages of noise values taken of a Bell 212 at optimal performance levels:

1. Flyover at 110 knots	Peak levels of 80-90.5 dBA
2. Approach	78-93.3 dBA
3. Takeoff	80-87 dBA

Sources: Charlie Cox, Bell Helicopter Company, personal communication, December 4, 1985; and Helicopter Noise Exposure Curves for Use in Environmental Impact Assessment, November 1982, Federal Aviation Administration.

Noise is measured in decibels (dBA) on a logarithmic scale designed to approximate human response to sound. Each incease of 10 dBA in the noise level is subjectively judged as an approximate doubling of loudness. A 3 dBA change is generally the smallest increment that can be perceived by the average person.

Compared to the noise measurements taken for the AUGUSTA Model A-109 by Seton, Johnson & Odell on May 12 and 15, 1985 in the vicinity of the proposed COHMC helistop, the MAST helicopter produced higher noise levels than the AUGUSTA. The MAST noise levels range from 7-17 dBAs for the flyover to 8-23 dBAs for the approach, and 3 dBAs for the takeoff higher than the AGUSTA. Note that the noise levels recorded for the MAST helicopter represent averages of noise values obtained during flight tests conducted by the Federal Aviation Administration, while the AUGUSTA noise level measurements were obtained at COHMC.

The MAST helicopter produced higher noise levels than the AGUSTA due to the phenemenon of "blade slap." Blade slap is the popping noise resulting from the tip of the blade slicing through the air turbulance generated by

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the trailing edge of the blade. According to the Federal Aviation Administration report, the noise signature of a helicopter is composed of contributions from several sources that include the main rotor, tail rotor, engine and transmission noise. In general, it is the main rotor and tail rotor that dominate the noise produced by a helicopter. The main rotor provides the lift and thrust forces for the helicopter and generates sound as a result of the inherent aerodynamic forces on the blade. The MAST helicopter records high noise levels due to the effect of "compressibility blade slap." The MAST helicopter peak noise level in a flyover occurs well before overhead passage and is caused by the highly directional compressibility blade slap.

Summary Statement

Based on available date, the MAST helicopter has noise levels somewhat higher than the AUGUSTA, primarily due to blade slap and aircraft design.

3. Frequency of MAST Helicopter Landings

The frequency of MAST helicopter landings at COHMC would continue to remain low. Under current plans, the MAST helicopter would continue to use the soccer field much as it does today; however, there is the possibility the helistop could be used if the situation warrants it. Based on the existing use, this would annually be in the range of 0 to 11 round trips.

THE CHILDREN'S ORTHOPEDIC HOSPITAL AND MEDICAL CENTER

December 17, 1985

Julia Gibb, Land Use Specialist
Department of Construction and
Land Use
Seattle Municipal Building
Room 400
600 - 4th Avenue
Seattle, WA 98104

Dear Ms. Gibb:

Per our discussion last week, I asked our consultants, Shapiro & Associates, to review and comment on the letter submitted to DCLU from Citizens Concerned about Helicopter Transports. Those citizens questioned the validity of noise and safety data in the COHMC environmental checklist. In the attached documents, Shapiro & Associates not only verify and support the accuracy of their data, but also defend the methodology of the noise study and the qualifications of the acoustical engineer who conducted the tests. It appears to us that we have more than adequately demonstrated that noise and safety issues were addressed, and that for the purposes of this process, are not significant issues. Additionally, Cliff Portman had expressed concern that alternative sites were not sufficiently pursued. A mitigated DNS requires COHMC to explore alternative solutions which meet the objective of the original proposal. Since one of our objectives is to minimize the number of handlings necessary to bring a child to COHMC, it is clear that there are no alternative sites which meet that objective except a helistop at COHMC.

COHMC is very concerned that this process has taken and may still take an unjustified length of time. In the interests of public safety and accountability, every conceivable issue has been reviewed and addressed by Shapiro & Associates through the environmental checklist. COHMC believes that a DNS is highly justified. The children of Washington need access to the technology available to save their lives. It is wrong to deny them their only chance, when in fact COHMC has more than met every requirement to obtain a land use permit. This is not only our opinion, but also that of the Washington State Department of Transportation, Aeronautics Division. At their initiative the state DOT contacted COHMC to offer their assistance and support in an attempt to expedite this process. Under separate cover they will contact DCLU, city

COHMC HELIPAD
ADDITIONAL NOISE AND SAFETY INFORMATION

The following provides additional clarification of the noise and safety information contained in the Environmental Checklist for the proposed helistop at Children's Orthopedic Hospital and Medical Center (COHMC).

The resume for Russ Altermatt is attached. Mr. Altermatt authored the "Helipad Noise Evaluation" for COHMC. The entire report was submitted with the checklist.

The sites selected for study and used to measure background noise were chosen in consultation with Hermia Ip (DCLU) and Kurt Horner (King County Health Department). The site selection rationale is discussed in greater detail on page 7 of the noise report. The consultant coordinated efforts to ensure the background noise monitoring would be conducted at those sites that were most likely to be affected by helicopter flyovers and, therefore, would reflect the "worst case" conditions.

The actual background noise measurements were taken on different days and at different times at all selected sites to obtain an average (an average is an approximation and is a standard basis for noise impact assessment) for both day and nighttime background noise. The method of monitoring these sites is discussed on page 9 and a summary of all measurements is found in Table 2, page 10. The background noise reported on page 10 is an accurate measurement of noise at those monitored sites.

Tables 4 and 5 are correct. It is important to note that Table 5 was provided only to give additional information on the helicopter landings with average monthly figures and should be treated separately from Table 4.

The comparison of background noise with helicopter noise was made in terms of DNLs rather than Ldns since measurement in DNLs is used as standard terminology by EPA. It should also be noted that DNL and Ldn indicate the same measurement (Day-Night Level) and, therefore, the change in the measurement terminology used will not alter the impact analysis. Further discussion is found on page 2 of Mr. Altermatt's report.

The measurement of one helicopter landing provides sufficient information to determine whether the landing of a helicopter would be expected to create a significant noise impact since the "magnitude" of the impact could be ascertained. Of course, monitoring of additional landings would provide more precise information; however, it is unlikely that the magnitude would change significantly.

Mr. Altermatt, in conversations with Airlift Northwest, discussed the differences in take-off and landing with the "fully" loaded helicopter versis the "partially" loaded helicopter as described in the letter to Hermia Ip from the Citizens Concerned About Helicopter Transport (November 15, 1985). Mr. Altermatt determined through these discussions and professional judgement that the differences are insignificant and the conclusions drawn remain valid.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As stated in Table 4 and referred to in the "Citizens" letter, the maximum noise from the helicopter take-off is measured to be 84 dBA at Location 1; the lowest night Leq is 41, not 33. This helicopter noise may be sufficient to arouse some people from sleep as discussed on page 17. The increase in noise would be significant in terms of dBA increase; however, in accounting for the time duration, the increase would be insignificant. There is no standard that clearly defines the guidelines for duration and significance. The average monthly figures presented by Mr. Altermatt's report showed an objective calculation to provide guidance in resolving the duration issue.

The Seattle/King County noise regulations are also included in Mr. Altermatt's noise report (pages 2-5) to provide additional contextual information; however, helicopters are exempt from these regulations (page 5).

Although noise measurements during the helicopter landing were only taken at Site 1, the data was applied to the other sites with attenuation over distance incorporated into the estimate. The interpolation of data taken at Site 1 and used to predict measurements at the other sites did not include absorption by air and, therefore, is an overstatement of noise as opposed to an underestimate and, therefore, is considered a "worst case."

The factors influencing attenuation that would be caused by buildings and open windows is too complex to be quantified realistically. Mr. Altermatt indicated (conversation 12/12/85) the attenuation figures could be between 20 and 30 dBA, plus or minus.

Mr. Altermatt also indicated (conversation 12/12/85) that a significant impact would be an increase in sound of more than 3 dBA (a doubling of sound).

The risk figure of 5.48 accidents per 100,000 flight hours presented in the Checklist considers all turbine-powered rotorcraft (Annual Review of Aircraft Accident Data, U.S. General Aviation, 1981). The figure of 11.16 accidents per 100,000 is used for all rotorcraft, not 13.38 per 100,000 as cited in the "Citizens" letter. The 5.48 figure was considered more appropriate since it was known that the helicopter was turbine-powered (also, twin-engines provide additional safety). The number of flights would be 20 for this calculation since the 48-minute average flight time recorded by Airlift Northwest includes the flight to pick up the staff as well as the flight to delivery the patient (hence, the 40 round trips discussed in the Environmental Checklist). The predicted number of years between accidents based in the above data would be 95.04. If one uses the accident rate for air taxi service presented in the "Citizens" letter (short-haul helicopter service most similar in distance and take-offs and landings to Airlift Northwest) of 5.78 accidents, the number would be adjusted to 90.1 years between accidents. Also, it should be noted that fewer than 40% of the COHMC-related figures are at night.

The assumptions for flight time per trip (48 minutes) used for noise assessment is the actual average figure derived from records kept by Airlift Northwest and is the best available information.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In reseaqrching these data, several factors should be kept in mind. First, additional studies of emergency helicopter accident rates are still being conducted; therefore, the data used is the best availiable data until these more current studies are completed. Second, a mishap could occur at any point on the trip. The number of years predicted between accidents based on number of flight hours would be similar to the conclusions drawn regardless of the location of the helip-ad. Third, FAA data show the accident rate to have decreased by more than half over a seven-year period, one could project the accident rate will decrease further. Finally, when predicting the statistical probability of risks of any kind, a multitude of factors enter into any conclusion. All precautions are taken by Airlift Northwest to ensure the safest and best service.

EDUCATION: B.S., Engineering Physics, Oregon State University, 1971 - Coursework in Acoustical Engineering

REGISTRATION: Professional Engineer in Electrical Engineering, 1979, Oregon

PROFESSIONAL MEMBERSHIPS: Acoustical Society of America Institute of Noise Control Engineering
Audio Engineering Society

EXPERIENCE: Mr. Altermatt joined Seton, Johnson & Odell in 1981 as acoustical engineer with primary responsibility for all of the firm's work requiring analysis of industrial noise, transportation related community noise, architectural acoustics, and mechanical systems noise. Representative projects include:

Transportation:
-traffic impacts on a proposed residential development
-traffic impacts of Elliott Bay Marina
-truck traffic impacts of Port Angeles log yard
-traffic impacts of proposed industrial facility at Cherry Point, WA
-construction noise from bridge construction
-impact of freeway and light rail operation

Industrial:
-community noise impacts of proposed bulk loading terminal
-community noise impacts of proposed resource recovery facility
-noise study of an asphalt batch plant
-evaluation of machine noise in an electronics plant
-industrial noise survey for OSHA compliance in a steel fabrication shop

Architectural:
-evaluation of HVAC systems noise in classrooms
-sound isolation in multifamily development affected by aircraft noise.
-acoustical design of a school music room
-acoustical analysis/design in churches
-acoustical design for office interiors

Prior to this period, Mr. Altermatt held similar positions with two other consulting firms and the Puget Sound Naval Shipyard. He has a total of 8 years experience specializing in acoustical engineering.

ATTACHMENT FOR APPLICATION REQUIREMENTS FOR COUNCIL APPROVALS

Application #CC-84-22

In addition to the information you must show IN DETAIL on your plans, you must provide complete, detailed, and accurate information on the items below, if applicable, to assure that your request receives a thorough review. DCLU will base its decision on your request substantially on the information that you provide on this form and on the required plans. Use additional paper if necessary.

This information supplements information required on the Environmental Checklist for projects subject to SEPA. If you have fully answered these questions on another form required by this application, you make make a cross reference in the space provided for response below instead of answering the question again.

All applicants for Council approvals must have a pre-application conference with the Land Use Review staff. Call 625-4509 for an appointment.

1. Describe the proposal, including the type of use proposed (e.g., rezone for what use, type of major institution); whether it is a new use or expansion of an existing use; the characteristics of the use, or changes anticipated by the expansion (number of clients, students, staff, employees or residents; hours of operation; types of programs; types of deliveries; what type of structures are proposed (e.g., townhouses, apartments).

   Construction of an emergency helistop on the COHMC campus is being proposed. Such a helistop will support our existing air ambulance service. There are no anticipated changes in operations due to constructing this helistop.

2. Describe the existing use of the site.

   Hospital grounds.

3. Is any demolition proposed?

   No.

4. Describe the anticipated benefits the proposed use or development would provide (for example, providing low income housing or a community service).

   The anticipated benefit is greater safety in transporting critically ill or injured patients to COHMC. Current practice necessitates an extra transfer from the helicopter to a waiting ambulance to transport the child to COHMC. Such delays are costly and can mean the difference between recovery, death, or irreversible damage for the patient.

5. In the case of public facilities, describe the public necessity for the facility.

   Not applicable.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. What are the potential impacts of your proposal on the neighborhood (e.g., traffic congestion, increased parking demand)?

The potential impact on the neighborhood is the additional noise level of the helicopter during landing and take off.

7. Please describe what measures would mitigate negative impacts of the proposal on adjoining properties (e.g., noise from construction, autos, equipment, outdoor play areas; light and glare, fumes and odors) or on public streets (e.g., traffic, parking and utilities).

The proposed location of the emergency helistop is sited directly outside the COHMC Emergency Room, in the heart of the campus. This location should minimize the noise that accompanies a helicopter, since it is located as far away from the majority of residential property surrounding the campus. Flight paths, both ingress and egress, are directed over the least populated areas; the final approach and departure will be over the parking garage, west on Sand Point Way, and then over Lake Washington. This pathway is intentionally planned to affect the fewest residences possible.

8. If you are requesting any waiver or change in development standards, please provide your reasons or justification.

Not applicable.

9. Attach required transportation plan determined upon in the preapplication conference for your proposal.

Not applicable.

10. Attach pre-application conference form.

Addressee: Elizabeth Anderson

Hermia Ip
Department of Construction and Land Use
Municipal Building, 600 4th Avenue
Seattle, Washington 98104

Dear Ms. Ip,

The following comments on the report prepared by Shapiro and Associates for Children's Hospital, dated October 8,1985, have been developed by various members of the Laurelhurst community. They are intended to be of use to DCLU as they review this report prior to making a determination of significance with regard to the application by Children's hospital for a permit to build a helipad on their campus.

1. The noise section of this report was prepared by Russell Altermatt, an employee of Seton,Johnson and Odell, Inc. We note that Mr. Altermatt is a registered engineer in the State of Washington but that does not mean that he has suitable credentials as an acoustical engineer as Washington has no such category. What are the credentials of Mr. Altermatt in the noise assessment field? Our review of his work indicates that his capabilities and experience in the conduct of noise studies may be very limited and that the city should prepare their own assessment of noise information. A second opinion is imperative.

2. Figures 1 and 2 in the Shapiro report are very important in terms of its contents. Yet, the scale of Figure 1 is entirely inappropriate to a clear definition of the intended flight path of the helicopter. Our observations of four helicopter landings at COH have shown us that the helicopter actually turns south a considerable distance north of the location shown on Figure 1 (i.e.directly over the apartments in Windermere Circle instead of over the parking garage as shown in Figure 1 and as described in the text on page 18).Figure 1 is incorrect and misleading. It should be redone at a larger scale and more accurately. Figure 1 is also intended to show the relation (distance) between the helipad and the school playground and Laurelhurst City Park (see page 11). These are NOT SHOWN on the map. Figure 2 should show the location of the proposed helipad. It should also be a scale map with the scale indicated on the map. One cannot possibly interpret the findings of the Shapiro report without a map that shows the location, to scale, of the major subject of the report in relation to the many residential structures in the immediate vicinity and objects near the proposed helipad, such as the oxygen tank, gas meter,campus streets, etc. Figure 3 is cited on page 3 of the report but is missing from all of the copies made available to the community for review. Both of the figures included in the report are misleading and not appropriate to a clear presentation of the textual material.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. The noise section of the report is very deficient for several reasons. The main purpose of a noise analysis is to determine how much additional noise, beyond normal background noise, is likely to be produced by the proposed action. The noise measurement sites selected for the purpose of measuring BACKGROUND NOISE LEVELS were generally inappropriate, as we shall show, and have led to results that are higher than they should be. On the other hand, the methods used to measure the HELICOPTER NOISE were severely deficient and have produced noise levels that are lower than they would have been had the study been conducted properly. The net result is that the increase in noise reported has been understated substantially. The background noise measurements were all taken near existing sources of noise in the neighborhood. Substantial noise is emitted continuously from Children's Hospital and two of the stations (numbers 1 and 2) are located very near the hospital. The other three stations were located adjacent to Sand Point Way, a heavily used arterial. No stations were located such that the true background noise level experienced by the people who live in the residential areas adjacent to the hospital could be recorded. The result is that the background noise levels reported on page 10 of Altermatt's report are high by at least three dB(A). Comparison of the background noise figures in Table 4 with those in Table 5 in Altermatt's report (page 20) shows that his conversion is incorrect. The appropriate figure in column 1 of Table 5 should be 50 rather than 52. The helicopter figure of 55 should be more like 58, giving a difference of +8 rather than the figure shown. The figure of 68 shown in column 3 of Table 5 is very suspect. Noise experts have told us that they normally get measurements of 70 adjacent to the I-5 freeway during rush hour. It is absolutely absurd to think that a background level of 68 is a reasonable figure for location 3. Location 3 is also an inappropriate location to measure background noise as it too distant from the scene of the action to have meaning. One can note that presence of the N.A.'s in column 3 of Table 4 as confirmation of this point. More importantly, the entire concept of Table 5 is incorrect. The comparison of background noise with helicopter noise should be made in terms of Ldns rather than DNL in dB(a)s. Clearly, this analysis is an insufficient basis for assessing the true impact of helicopter noise in this situation. As one critic pointed out, the use of average DNL is like a man with one foot in a fire and one foot in ice and saying "on average, he is comfortable." Using average noise figures is inappropriate.

Were the background measurements actually taken or was 1 site measured and that informatioin used TO PREDICT what background noise of other sites would be? This is the method used in the measurement of helicopter noise. Ms. Ip asked them to include their methodology in their report. Also, the city asked specifically that four sites be measured for helicopter noise; they did not comply with that request. We asked to have noise measured at Laurelon Terrace, as they will be most impacted. That also was not done.

Moreover, these figures are based on only one landing of the helicopter. In order to be credible, at least six landings should be measured so that a measure of the deviation about a mean noise level

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

can be derived. One cannot obtain a standard deviation measurement with only one measurement or observation. We feel that the noise study is seriously deficient in terms of the way the background noise and helicopter noise measurements were taken. Persons present at the test noted that the helicopter was not loaded fully (like it would be in actual operation) for this test. More detail on the observations of citizens who observed the noise test are contained in letter to Hermia Ip, dated May 24,1985. Briefly, it only had two instead of three adults aboard, carried no isolette and may or may not have had a full load of fuel (the capacity of the Agusta fuel tank is 146 gallons and a gallon of aviation fuel weighs about 6.5 pounds, giving a total weight of 950 pounds for a full tank). If the helicopter was carrying a half-tank of fuel, it may have been about 500 pounds lighter than normal. Add another 180 pounds for a missing passenger and another 200 pounds for the missing isolette and you have an underload of nearly half a ton. We suspect that the Agusta used in the noise tests was operating with only about half of the load it would carry under normal operating conditions and so the noise measurements made under these conditions have little credibility. A fully-loaded helicopter would have to have a higher rotor speed to lift or lower this additional weight and so would have made more noise as noise is proportional to rotor and engine speed.

Referring to Table 4 one can see that the maximum noise from the helicopter on take-off was measured to be 84 at location 1 (which is located about 100 yards from the landing site). This is an increase of about 50 over the nighttime reading of 33 measured at site 1 (Table 2). This is a tremendous increment of noise and is sure to interrupt the sleep of many of the residents of the area. It is also well beyond the maximum permissible sound levels allowed in King County in residential areas (55 dB(A)) as stated in 25.08.410 of the land use code. Furthermore, the report nowhere mentions the usual 5 dB(A) penalty that is assigned to the whine generated by jet engines.

4. The noise report deals with only the noise characteristics of the Agusta helicopter currently operated by Airlift Northwest. However, it is clear that if a helipad were to be built it would also be used by MAST helicopters, currently Hueys(UH-1H). On page 17,the report indicates that an "obstaqcie free area of 85 feet in diameter" is planned; this is certainly large enough for a Blackhawk or Huey to land. The noise characteristics of Hueys are much more intense than those reported,since the Hueys are significantly louder than the Agusta 109's. It is also possible that MAST's Hueys will be replaced with new BLACKHAWKs in the near future.
Our investigations show that BLACKHAWKs are twice as heavy as the Huey and are likely to be even noiser. For comparison, the unloaded weight of the Agusta is 3,900 lbs. while a Huey weighs 6,000 and the BLACKHAWK weighs 11,000. Additionally, the Agusta is 35 feet long while the BLACKHAWK is 57 feet long. A proper noise study should include tests with Hueys and projections for BLACKHAWKs. It is not likely that conditions that would require MAST to land at the soccer field while Airlift Northwest lands at the hospital could be sustained on either a logical or operational basis. This is especially true since Airlift Northwest flights are supposed to be limited to INTERHOSPITAL transfers while MAST will handle field pick-ups of patients which are more likely to be in critical condition requiring stabilization in a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

hospital. The Shapiro report notes that (page 17) "the helistop will be PRIMARILY used by a helicopter flown by Airlift Northwest..." Would this heliport be restricted to use by ALNW's Agusta or not?

5. On page 20 of the Altermatt report, the assumption is made that the peak noise levels would occur at site one. No evidence is given in support of the assumption and it cannot be presumed to be correct. Measurements should have been conducted at other sites so that some evidence that peak noise levels were in fact measured. It is our understanding that the DCLU did instruct COH to make sure that the noise was measured at at least four sites. The fact that this was not done diminishes the credibility of the results severely.

6. On page 14 of the Altermatt report, it is stated that the maximum noise level measured was 73 dB(A) at a flying height of 500 feet. This is higher than noise measurements typically found alongside the I-5 freeway during rush hour. What would the level be if the helicopter flew at less than 500 feet? What would it be at an altitude of 1000 feet. There is no evidence provided as to what the noise characteristics of other possible flight paths might be and none are discussed under the heading of mitigating actions. Obviously, there can be no way to insure that all pilots flying under all conditions will follow exactly the same flight path Nor will all pilots conform to one specific altitude. Under such circumstances, a variety of flight paths must be examined before any reasoned judgments can be made regarding the most likely noise pattern impact on adjacent residential areas.

7. The building noise reduction factor used by Altermatt (25 dB(A)) on page 17 is high by at least 5 dB(A). Further, is assumes that all windows are closed at all times. This is certainly not the case for the homes located near the hospital as they have an unobstructed western exposure and get very hot during the summer months. The windows in these homes are usually open during this time. A home with open windows can be expected to attenuate noise only by a factor of 10 dB(A), not the 25 dB(A) figure used by the consultant.

8. The summary of the forecast noise impact given by Altermatt on pages 18 and 19 is deficient in several respects. He does not define the term significant impact used in point number 1 and this conclusion is faulty because the whole analysis is faulty. He offers no evidence to support conclusion number 2. Such evidence should include the number of people living within each of several isonoise contour lines. The consultant did not bother to determine how many people of various types live in the impacted community and so cannot possibly determine how many lives would be impacted by the noise generated by the helicopter. Drawing such unsupported conclusions is unprofessional and illustrates a bias that cannot be tolerated in a study of this type. The third conclusion has been shown to be faulty due to methodological deficiencies regarding the measurement of background noise (too high) and helicopter noise (too low with too few measurements on too few helicopter types). It is not sound. The fourth conclusion lacks any supporting evidence. If the consultant had been in some of the homes during a helicopter landing then he would have some basis for making such a conclusion. He was not and his conjectures are not sufficient to reach such a conclusion. There is more to noise that what you see on a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

noise meter and vibratory effects are among the characteristics that one does not see on a noise meter.

To compare helicopter noise with that of a passing truck, as is done in this report, is ridiculous. If a truck were flying in the air and descending in your direction, it would be a better comparison.

8. On page 21 of the Altermatt report, point number one is invalid since he does not discuss the "worst case" as he should. Point number 4 fails to recognize that the hospital buildings will reflect noise to the north while noting it will shield the residential areas to the south. This is another example of the bias exhibited by Altermatt in his analysis of the most likely noise pattern on adjacent residential areas. Point number 5 suggests that noise barriers could be placed in the vicinity of the helipad but we have seen no inclination on the part of COH to consider this option. The statement by the consultant that a noise barrier that would reduce noise levels by 5 dB(A) is insignificant is beyond belief as the quantity of noise is very substantial in a neighborhood where background noise levels are generally well below the maximums allowed in King County. He then goes on to state that the presence of noise barriers would make it more difficult for the helicopter to land and produce even more noise. Yet he offers no evidence to support this statement which would have to come from the examination of a preliminary design of a noise barrier setup, a projection of the attenuation effects of such noise barriers and an examination by helicopter pilots as to their likely effects on their ability to make swift and safe landings on the helipad. It is interesting to note that fences 2.5 and 3.5 feet high are proposed on page 17 of the Shapiro report. How high would a noise barrier have to be to be effective in this location?

9. Contours of noise levels should have been prepared using the Federal Aviation Administration (FAA) Integrated Noise Model Version 3.8. This is the newest FAA approved computer model for predicting aircraft noise exposure and is a standard technique used in studies of this type.

10. In the residential area near the hospital, background noise has increased steadily over the past few years due to heavily increased traffic on Sand Point Way and activity at Children's Hospital. When background noise in a neighborhood approaches 55 dB(A), there should be an effort to keep the noise below 55, the city standard.

11. On page 2 of the Shapiro report, regarding plans for future additions, expansion, or further activity related to this proposal, COH answers, "No." Yet, on #9, page 2, they state they are expanding the short stay (surgical) unit, remodeling third floor C Wing, and expanding the oxygen storage facility. Are none of these activities related to future plans related to the helistop and helicopter usage? Do they deny any plans to develop a trauma center, which would clearly be related to helicopter usage? Mr. Katz, (COH's CEO) has stated that COH is becoming a trauma center. Apparently there are no state statutes which regulate this; therefore, the implications that this has on the surrounding community should be explored in an environmental impact statement as this is the only opportunity available for such a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

review.

12. On Page 8, a discussion of types and levels of long-term, as well as short-term impacts is asked for. What types and levels of noise created by the project on a long-term basis can be expected? Nowhere in the report are projections of numbers of cases that might be expected in the future--5 or 10 years, at least. The number of cases expected is clearly related to impact and some consideration should be given to this concern.

13. On page 13 we note that the copies of the Shapiro report we received from the hospital were not signed and were undated. We do trust that our copies are the same as were submitted to the City, and merely note this factor for the record.

14. On page 14, the statement is made that the helistop is located 85 feet due north of the hospital. This measurement is to the edge of the helistop and is misleading because the distance on the sidewalk from the center of the proposed helistop to the emergency room entrance is 225 feet (75 yards or three-fourths the length of a football field). The patients would have to travel this distance in the open. This distance is actually LONGER and the patient would be exposed to the elements longer than would be the case at the soccer field. The statement also says that 15-30 patients are expected via helicopter each month but gives no evidence in support of this forecast. We do know that only 11 patients were transported to COH via MAST during all of 1984. What is the reason for the substantial rise from 11 per year to an estimated 180-360 per year? Since national studies have shown that overuse is a substantial problem once a helicopter service is installed, a more rational procedure for estimating the number of flights is essential to a credible environmental analysis. The Shapiro study contains no such material. It is also very important to note that there would be FOUR FLIGHTS over the neighborhood for every patient. If one takes the COH estimates, this means that 720-1440 FLIGHTS are projected each year. It is not clear whether this estimate includes MAST flights or not. In fact, nothing is clear about the expected level of use of the proposed helipad as no solid work has been done on this topic. This issue is further confused by the statement on page 27 that refers to an additional 30-40 helicopter trips per month. W have found that these numbers vary all over the place depending on which COH or Airlift Northwest person is talking and the group that is listening.

In fact, in the Shapiro report, 3 different sets of estimates for number of flights are given: page 14 &17 say 15-20 per month, page 27 says 30-40 per month, and page 2 of the unpaginated Appendix B says 20-40 per month. And, nowhere in the report is there any indication of how these numbers were arrived at. Since the impact of number of flights per month is so profound, such an undocumented situation is simply not acceptable.

15. On page 14, statements are made that the helicopter would be used only for emergency situations. Yet, no definition is offered as to how this would be determined. Only examples are cited and no evidence is given as to why such patients must come to COH. Instead, reference is made to the regional status of COH which is a self-designation that

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

does not recognize the substantial capabilities of Mary Bridge Hospital, Tacoma General, and other hospitals in the region to deal with near drowning, severed arteries and the other examples given. In community meeting, when we asked COH for a Master Plan, we were told they couldn't share one with us because competition is so intense between hospitals right now. From this statement made by the hospital administrator, I think it's safe to assume that other hospitals in the region offer some of the same services that COH would be transporting patients by helicopter to receive. In most situations, it is the time between the initial call and arrival at the nearest hospital that is critical. Once the patient has been stabilized, transport to other facilities should be considered. This report suggests, without supporting evidence, that all children in the region should be brought to COH. A review of the evidence on patient origins reveals that 96% of COH patients come from the state of Washington. Yet, the report tries to make it sound like large numbers come from Montana, Alaska and Idaho. These points are made to show that all the material in the Shapiro report must be examined with great care and constant questioning.

16. On page 15, the description of the existing procedures used at the soccer field do not distinguish between patients who are enclosed in an isolette which has its own life support system and those who are not in an isolette. Since there is a substantial difference between these two type of patients, the procedures used should be described separately instead of the confusing way it has been done. We have been told that there were only 2 of 11 patients who were neonatal patients in an isolette that were brought to COH by MAST in all of 1984. Yet the text in the Shapiro report makes it sound like all patients who have been landed at the soccer field have been in isolettes. On the following page, it is stated that the TRAVEL TIME from the soccer field to COH is 20-30 minutes. A very reasonable estimate of the travel time is 3 minutes. This misstatement is followed by a series of items that describe conditions at the soccer field that make it sound like it rains all the time in Seattle. None of the problems cited are of a type which could not be solved easily with the application of some dollars and common sense.

In the second paragraph of page 16, an estimate is made that it would take 1-2 minutes to transfer the patient from a helipad at COH to the emergency room entrance. Yet, in the same paragraph, they state that landing at the soccer field will take an additional 15-25 minutes. Why can a transfer be made in 1-2 minutes at one location while it takes 12-22 minutes in another? This is just another example of the bending of the numbers to fit preconceived conclusions.

17. The discussion of alternative helistop locations on page 16 is seriously deficient. It is clear that alternatives have not been seriously examined and this is a strong reason why DCLU should make a determination of significance. The land use code requires that alternataives be examined. The Shapiro report has not done this in any suitable way. DCLU should expect the applicant to examine the alternatives as specified in the code. Since this has not been done, the only way it can be done is to make a declaration of significance and insure that an adequate study of the alternatives is developed at the EIS scoping meeting. One of the alternatives should be the do-nothing alternative which would involve a continuation of a few MAST

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

flights to the soccer field each year. Another should determine what can be done at the soccer field to provide for a suitable landing site for both MAST and Airlift Northwest helicopters.

A final comment on the alternatives section in the Shapiro report is the statement that the proposed COH site would not interfere with existing campus traffic. In fact, people who have observed the several landings at COH have noted that traffic has been disrupted by the landings. In fact, a substantial traffic hazard exists at COH as drivers have a tendency to watch the helicopter instead of the road and collisions can be expected to result on Penny Lane, a factor which has been ignored in the Shapiro report. Such predictions are supported by collisions resulting from drivers watching the helicopter land at St. Luke's Hospital in Bellingham.

18. On page 17, it is stated that the helicopter would be used to transport critically ill or injured infants, children or adolescents. Does this definition satisify the city requirement that only life-threatening emergency patients be transported by helicopter? The Shapiro report does not address the essential question. Yet, DCLU must have an operational definition of the term "emergency" before it can make its recommendations on this application to the Hearing Examiner and City Council.

19. On page 18, a description of the proposed flightpath is given. People who have observed the several helicopter landings find it to be inaccurate. First, the helicopter has been observed to have arrived from a different direction each time it has landed at COH. The pilot of an Airlift Northwest helicopter has told us that wind conditions may cause him to use a flight path that is different from the one described. The helicopter has never turned sharply at the Penny Lane entrance to COH and turned south to touch down as described. Instead it has turned over the Windemere Circle residential area and has turned slowly to the south and made a very gradual and slow descent to a landing at the hospital. The noise impact on the homes in the Windermere Circle area is very great during this maneuver yet there were no noise measurements made in this area during the noise test. Witnesses testified to this effect at the recent Medical Need Hearing held by Dr. Nicola.

20. The section on air quality impacts from jet engine emissions on page 19 is very deficient. It does not indicate what the content of the emissions from the jet engines will be nor does it discuss the possible health effects of these emissions. Anyone who has been close to a helicopter landing knows that the quantity of foul-smelling jet exhaust fumes is huge, much like being on the ground at a major airport. The lighthanded way that this issue is treated in the Shapiro report is further evidence that a full environmental impact statement should be required. The statement on page 21 that no toxic substances would be released into the environment is simply not true, as jet exhaust contains several toxic substances.

21. On page 20, Appendix A, it is noted that the rate and volume of surface water runoff will be negligible. However, residents of the multi-family dwellings downhill and west of the proposed helistop

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(Laurelon Terrace) have had chronic problems with water runoff due to expansion of COH, the most recent being the large parking garage. Recently there has been flooding (up to auto hubcaps) of the Laurelon Terrace parking lots and excess moisture in building crawl spaces. To subject this delicate situation to yet an increased area of "impervious surface" without exploring the impact in some detail seems foolhardy and unfair. We wonder whether Don Smith, whose opinion is noted on page 20, actually inspected the area and talked to residents. What additional projected runoff does he anticipate? On page 20, it is mentioned that "a catch basic COULD be provided to regulate drainage of the helistop surface...", but there is no commitment to do so. Since there have been almost continual problems with poor water drainage in this area, due to the large surface area taken up by COH buildings, streets, parking lots, and sidewalks, the proposed heliport, although perhaps not large itself, will cause a further deterioration of this situation and the situation should be examined in detail.

22. The discussion of safety on page 21 is seriously deficient in a number of respects. The fact that $20 million of liability insurance is required in the Airlift Northwest contract indicates the risk that is involved. The (erroneous) conclusion in the Shapiro report that one accidnet might occur every 95 years is based on 3 assumptions, each of which is challengeable.

(1) Their figure of 5.48 accidents per 100,000 flight hours is, unfortunately for us all, too low. In the FAA statistics, the accident rate varies greatly by the TYPE OF FLYING being considered. Personal/business flying and aerial application (spraying) have accident rates over 30.00 per 100,000 flight hours while search & rescue operation and highway traffic advisory flying have a rate of 12.09 per 100,000 flight hours, and air-taxi type operations have a rate of 5.78. For all helicopters, undifferentiated by type, the rate is 13.38. (Review of Rotorcraft Accidents, National Transportation Safety Board, August, 1981). The FAA figures are not categorized for hospital-based helicopter flying specifically, so it is not clear from this data which accident rate figure is appropriate. The rate of 5.78, which is closest to the figure used in the Shapiro report, is for air-taxi type operations. But, hospital-based helicopter services can hardly be called air-taxi's and use of their accident rate figure is misleading. As pointed out by Dan Reich, flight director of the Denver hospital flight program (in JAMA, 253:17, page 2476), hospital-based helicopters typically "involve more takeoffs and landings (the maneuvers most likely to result in crashes) than in the industry in general. Also, 40% of hospital flights are at night." If higher speed is used because of an emergency situation, that could increase the accidnet rate also (FAA report, page 11). In fact, a study is currently underway to determine whether there are more accidents per flying hour in hospital-based helicopter programs than in other activities involving use of helicopters. The medical director of the St. Joseph Hospital Lift Flight Program in Omaha, Neb., a nationally-recognized emergency medicine researcher, states that the rate for emergency medical service helicopter crashes in the U.S. is 21 per 100,000 flight hours (JEMS, June 1985, p.30). Unfortunately, Poulton does not give the source of his information. In conclusion, there seems to be very little reason to support the notion that the air-taxi

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

accident rate applies to the hospital-based helicopter service, as used in the Shapiro report. It is possible that search & rescue operations are more similar and their accidnet rate of 12.09 per 100,000 flight hours would be appropriate. If Dr. Poulton is correct, the figure to be used is 21/100,000 flight hours.

(2)The second assumption on which the accident projection is based is the average total flight time to service COH of 48 minutes. No information is given as to what is included in this figure, but it seems too low. Were flights to and from Harborview and/or Boeing Field included? It is necessary to review the likely data to obtain a more reasonable figure.

The helicopter is based at Boeing Field at night and Harborview Hospital during the day. Flights must come in to COH to pick up the crew and equipment from either of those 2 places, taking abouta 10 minutes from lift off to touch down from Harborview to COH or 20 minutes from Boeing Field to COH. It then must go out to where the patient is. Ground ambulances would braing a patient in faster than the helicopter up to distances of about 50 miles. If the distance is less than that, the helicopter is making unwarranted pickups in the city. At 100 miph, 50-60 miles whould take 25-30 minutes out and the same to return to COH. The plane then must return to Harborview or Boeing Field. The range of time would appear to be:

	Harborview	Boeing Field
From Hangar	10	20
Pick-up and	30	30
return	30	30
To Hangar	10	20
Totals	80"	100"

(3) The third assumption involves the number of flights to be expected per month. The figure that was used in the calculation was unstated, but working backwards from their figures, the number of flights they used was 20 per month. Their own estimates vary from 15 to 40 per month. Since a "worst case scenario" is surely appropriate in such a serious situation as this, and since helicopter use will no doubt increase over time, 40 cases per month is a better figure to use than 20.

Using their assumptions, we get the following result:
Flight time (48 min.) X no. of flights/mo. (20), divided by 60 = hours fly /mo. Hrs. per month x 12 = hrs. fly/year (192). 100,000 flight hours divided by hrs. fly/yr = no. of years it would take to reach 100,000 hrs. =(520.8). Divided this by the expected accident rate (5.48) = probable no. of years between each accident = 95.04.
If one uses a flight time of 80 minutes and 40 flights per month and expected accident rate of 12.09, the probable no. of years between each accident is 12.92.

However, if use all worst assumptions, we get an even more dire prediction: flight time of 100 minutes, and 40 flights per month, and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

expected accidnet rate of 21 per 100,000 hours, the probable number of years between each accident is only 5.9.

It seems likely that the insurer's for Airlift Northwest were aware of this alarming accident rate, since the liability insurance carried on the helicopter, according to the ALNW contract is $20 million dollars.

We would also like to point out that some city officials are under the impression that the FAA governs the safety of helicopters. The fact is, they do so only on a limited basis and apparently do not monitor the situation at all. It is up to the city to consider safety aspects of the helicopter and to be prepared to monitor and somehow enforce a flight plan agreement if this proposal is approved. Enclosed is a copy of the FAA form filed on this heliport proposal, which indicates how insubstantial is their involvement. Note that type of helicopter to be used is not even considered, although FAA data reports show differences rates of accidents among type of aircraft, ranging from 2 per 100,000 hours flown to around 50 per 100,000 hours flown. There is also no indication of the proposed flight path on this form. (See exhibit 1, NOTICE of LANDING AREA PROPOSAL.)

Finally, people who have examined the Airlift Northwest helicopter closely have noted that the windshield wipers have been removed because that tend to scratch the windshield. It does not seem a safe thing to do. But, what agency is in a position to monitor such things and look out for the safety of the residents of the area?

23. On page 22, mention is made of the fact that a large oxygen storage tank is located just a few feet west of the proposed helicopter landing site. However, no mention is made of the fact that COH has plans to greatly enlarge the size of this storage tank. It is clear that further discussions of the significant omission are needed. It is also noted that the discussion of this issue with A.J. Fenstermaker of the Seattle Fire Department was held in February, long before the study by Shapiro and Associates was initiated. This indicates that this topic was not investigated by Shapiro and Associates as part of their study. Why such an important safety hazard is treated so lightly is beyond comprehension.

Should a crash or major fire emergency occur at this site, it could result in serious loss of life. Therefore, specific procedures for built-in fire protection for the site should be required, following National Fire Protection Association standards as determined by the Seattle Fire Department. The fire code requirements for a H-3 heliport should be applied, since larger aircraft, such as Navy rescue helicopters may use the site also. To vaguely allude to "fire fighting foam" on the site, as is done in the Shapiro report, is totally inadequate.

Also, related to fire hazard, we question the statements that there will be no re-fueling capabilities at the helistop because we can imagine situations where having fuel available would be very important. For example, a helicopter returns from a long flight and receives a call to go to another distant location but has insufficient fuel on board. While re-fueling capabilities may not be contemplated

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

initially, we feel they will be once the helicopter is established and operating.

24. The report does not address the fact that with increase in use of the helipad, noise generated by the helicopters will impair teaching of students in the elementary school 1 1/2 blocks away. Nor does it address the particular safety risks of flying over ak playground where 350 students might bek playing at recess. The proposed flight path suggests not flying over the school, but the pilot himself concurred that the flight path will change as weather conditions vary.

In summary, we find that the environmental checklist is seriously deficient in a number of important respects. Further, now that the state has required Airlift Northwest to submit a Certificate of Need application, it is clear that some of the information that is needed to properly evaluate this proposal will be revealed during this process. In the meantime, we think that DCLU should make a finding of significance and require a full EIS by the applicant. Particularly important is the need for a careful and detailed examination of alternatives which should be done by the applicant. These should be defined in a scoping meeting and we look forward to participating in such a meeting the near future.

Also, in Katy Chaney,s letter to Dorothy Teeter of COH on 2/20/85, she asks specifically for informatioin regarding economic costs of this proposal and how they influence the use of this service. Yet, there is no cost information or cost analysis included in this report. A copy of the contract COH signed with ALNW was also requested by Ms. Chaney. Any cost analysis would be deficient if itk did not also include an examination of the inter-hospital contract and the contract between Harborview and Seattle Jet Center as well.

We are very concerned about the apparent lack of agreement between the City and COH on the scope of the definition "life-saving emergency", as stated in the Land Use Code. As Ms. Chaney said in her letter of 6/5/85 to Ms. Teeter, "It is important for COH to document the medical need and circumstances under which the helipad facility will be used. The analysis should discuss the medical need and effectiveness of the helipad service compared with the current ground transportation service. Further, the discussion should document the capital improvement and operational costs of the helipad, and show how such expenditure will be recovered by the reasonable use of the facility without abusing the level of frequency or critical usage." The reasons for this request was clearly shown in the letter of Chaney to Teeter of 2/20/85:"WHAT IMPLICATIONS DO THE ECONOMIC DATA HAVE ON THE PROBABLE FREQUENCY AND EXTENT OF USE?" None of this information is given in the Shapiro report.

We are also concerned about the ability on the City's part to monitor and enforce any limits on the types of landings at the site. Those upon whom the condition is placed are those who shall decide whether it applies in any particular case. Some credible review procedure would be essential if the proposal is approved.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Since the medical emergency aspects of this proposal are of great importance in evaluating it, we feel that a thorough discussion of these aspects is warranted. According to provisions in the Major Institutions Code, a helistop on a hospital campus must be limited in use to life threatening emergencies. At the "Medical Need Hearing" conducted by Dr. Bud Nicola, COH testified that all ALNW helicopters would be landed directly on campus regardless of the condition of the patient aboard. In other words, the hospital is not willing to accept any restrictions put on the use of this proposed landing site. This isk further substantiated by information supplied in the Shapiro report, Attachment A, pg. 14. They state that "the use of the helicopter would be limited to severely ill or injured children requiring transport." We feel that someone needs to differentiate between those emergencies that involve seriously ill or injured children and those that are actually life-threatening as the city code dictates.

It is obvious from their statements that the hospital is now purporting that the only acceptable means of transportation for these patients is the helicopter. Statistics provided from Medic One would easily disprove this notion. To most parts of King County, their longest response time is twelve minutes. An ALNW helicopter would barely have their engines revving at Harborview in this same time frame and would still face trip to COH to pick up a flight team before proceeding to administer care to a designated patient. On page 14, this report states that an emergency would be identified by a physician in an outlying area (outside King County (?) Outlying needs defining) and helicopter transport agreed to by the Medical Director of ALNW. The Medical Director of ALNW, Dr. Copass, to our knowledge has no experience in pediatrics and certainly has a vested interest in not only the success of ALNW but in the volume of flights executed. Is he the appropriate person to be deciding what patients will receive helicopter to transport? We think nothing less than a review board involving peers, and citizen participation should be set up if this permit is granted.

We take exception to the fact in this report COH continually mentions that this service would be used to transport severely injured children, as these cases specifically go to HARBORVIEW which is our regional trauma center and COH does not have the capabilities to deal with traumatic injuries.

It is further stated on page 14 of this report that this helistop is needed because "delay in providing the most sophisticated care can mean the difference between successful recovery and death." We would like to see the DATA that would support such a claim. Our research has shown that in most emergency cases the biggest difference in patients outcomes is due to tne quality of care administered and stabilization of the patient before transport, not the speed of such transport.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In this report, examples of emergencies requiring helicopter transport are given on page 14. Consultation with pediatric physicians revealed this information:

The first example is that of a near-drowning victim. The City should require COH to produce the current data available on this type of case. Are these not surviving at present because of the current method of transportation by ground? This is a serious allegation and should be substantiated.

The second example listed is that of "severed arteries." These cases involve traumatic injuries requiring the services available only at Harborview. COH does not have a vascular surgeon on staff and could not care for this type of case.

The third example is that of "hypoplastic heart." This is a universally FATAL condition that COH has not treatment nor cures for.

The fourth and fifth examples are, respectively, that of premature births at outlying hospitals, and overwhelming infection. Both of these emergencies are handled well by current methods of stabilization at the scene and ground transport.

The sixth example is that of "ingestion of toxic substances." These do not require helicopter transport to COH. They require treatment at the closest emergency room available.

On page 15 of Attachment A, COH suggests that the current system of landing at the UW soccer field is inadequate because it substantially increases the patients' risk of death or injury. Yet, they offer no data that would support this claim nor have they offered any such data to Dr. Nicola. They offer a list of tasks that are associated with transferring a patient from the soccer field to COH. It is our understanding that in most cases the only support system that must be moved outside of a self-contained isolette is an I.V. pole and this does not require reconnection.

All of the concerns raised in this section will NOT be eliminated by locating the helipad on COH's campus, as the distance from the helipad is 85 ft. (according to the Shapiro report) from the emergency door. Harborview currently transfers their helicopter patients to ambulance in order to transport them 100 yards to their ER door. Yet, there has been no suggestion from Harborview that this is a less than adequate situation.

COH maintains in this report that the additional transfer at the soccer field increases risk to the patient but is unable to support this claim with any factual information. These transfers have been taking place for 11 years, so certainly if there is information to support this notions, COH should have submitted it to DCLU along with this report. All of the medical need information in this report has been supplied by COH--they have not sought any outside expertise or analysis with regard to this matter.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The hospital does not anywhere in this section address if changes in outcome from the underlying disease process has taken place which is directly related to transport from a helicopter to a ground system.

On page 16, they suggest that travel time from the soccer field to the COH campus is 20-30 minutes. We have timed this trip and it takes less than 3 minutes. The amount of time spent transferring the patient from helicopter to ambulance is exactly the same amount of time required to transfer the patient from helicopter to a gurney or ambulance when the aircraft lands on; the COH campus. A helicopter cannot land directly in the emergency room of COH!

The risks that are identified and associated with inclement weather or night operations on page 16 are the same risks a pilot will be experiencing with a helipad sited at COH, with additional risks to the surrounding community. Muddy conditions of the soccer field can be dealt with by siting the pat near the soccer field instead of the COH campus.

On page 16, the hospital makes the statement that "the reduced transport time reduces the risk of permanent disability or death." Again, they offer NO DATA to support such a claim.

The information provided by COH in the Shapiro report supports the premise that this proposed service is not desired primarily to provide transport for life-threatening medical emergencies. Rather, it is a service that, once established, is intended to become the standard means of transport to COH with no regard to patient condition and obviously with no regard to impacts felt by the surrounding community. This report presents many unsubstantiated claims and "screams" for data.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Over the past number of years all trauma cases, including pediatric cases, have gone to Harborview Hospital. Indeed, the ALNW barochure says "Harborview Medical Center provides the only Level 1 emergency trauma care in the WAMI region and the NW Regional Burn Center (Airlift Northwest, undated brochure, page 1). The most critically ill neonates have gone to University Hospital. Are changes planned in this distribution? If so, COH should be required to show how and why. What cases will COH in fact receive?

It is important that the therapeutic outcome of patients that were landed at the UW soccer field versus the emergency room door at COH be presented. This has never been done.

The noise study was inadequate, safety issues were inadequatly handled, and many other issues mentioned in this response were inadequately investigated. In addition, requests for information from Katy Chaney (as well as the community) have been ignored. An environmental impact statement is the only opportunity available to obtain this information which is so critical to an adequate evaluation of the true impact of this proposed heliport.

Sincerely,
Citizens Concerned about Helicopter Transport

The Hon. Charles Royer, Mayor
Seattle Municipal Building
Seattle, WA 98101

Dear Mr. Royer ,

Several months ago I wrote to you , protesting against the planned landing of helicopters at Childrens Orthopedic Hospital without an investigation of the merits of a claimed need that would turn one of Seattle's finest neighborhoods into an airport environment. Your reply , that COH would indeed be asked to show such a need, was indeed satisfactory. In the meantime COH appears to have taken advantage of a legal loophole to avoid having to show this need and , continuing its policy of bad faith and duplicity towards the residents of this neighborhood , has started to land helicopters on its grounds even before a helipad has been constructed. The history of COH's encroachment on this neighborhood. is a matter of record and so are its broken promises to respect the quality of living here. After the latest violation of both the peace and safety of local residents I have protested to Ms Ormsby of the D.C.L.U. and am enclosing a copy of my letter.

Sincerely yours
Albert A. Feldmann

Municipal Building
Seattle, WA 98101

Subject: COH Helicopter Landings

Dear Ms Ormsby,

Further to our telephone conversation of Aug. 28. I want to reiterate my protest against the violation, by the Childrens Orthopedic Hospital, of the safety of the many residents of this densely populated area in flying helicopters at low altitude over their homes and landing them on the hospital grounds. I also want to protest against the environmental pollution caused by the engine noise of these helicopters, which is about to turn one of this city's most quiet neigborhoods into a heliport area.

With regard to the specific instance of this week's landing I heard the noise but was not an eye witness .However, I have spoken with eye witnesses and given them your name and address so that they can send you written affidavits of their observations for potential appearance as witnesses in Court .Let me add that as Vice President of the Laurel Crest Condominium Owners Association , I represent 79 families in addition to myself in this protest. The administration of Mayor Royer has done a creditable job of keeping Seattle a very liveable city and your handling of this violation by an institution whose motto appears to be " the public be damned " ,will be a good indication whether this administration is capable of protecting us against such encroachments in the future or not.

Sincerely yours
Albert A. Feldmann

RECEIVED
NOV 12 1985
Dept. of Construction & Land Use

Ms. Beatrice Ryan
Interim Director
Dept. of Construction
& Land Use
600 4th Avenue
Seattle, Washington 98104

Dear Ms. Ryan:

Since writing to your office last, and since the public hearing held on October 24, 1985, my concern about a helicopter landing at Children's Orthopedic Hospital in Seattle has continued and increased--not decreased.

I fully support and welcome a state review and state regulations as well as a full certificate of need filing as reported in an article in the Seattle Times of November 7, 1985.

As a ten-year resident of Laurelon Terrace contiguous to the planned site of the helipad and in direct path of diagonal flight plan, too, I am especially concerned about the safety factor and also the detrimental effect on residents' health who live in this condominium complex of 136 units. It was alarming and distasteful to find that Mr. Truman Katz of COH, when asked about the effects on Laurelon Terrace, did not even know where Laurelon Terrace was, and when told just shrugged it off. Are Laurelon residents considered expendable?

As a thirty-two year resident of Laurelhurst, I among many others highly resent being represented as uncaring and as a wealthy, selfish citizen. Generalizations and stereotyping by news media is dangerous ans careless--yes, libelous--and untrue. Hundreds and hundreds (and upwards) of hours, thousands of dollars over many, many decades have been contributed to COH by residents of Laurelhurst.

However, these same residents do not believe that the horrendous expense of a helicopter (puchase, maintenance, salary, insurace) is necessary; nor is a helicopter necessary when three other hospitals --one within short distance of COH--have identical landing facilities and trauma services already in place--this is duplication of services; since no problems are recorded (present and past) of landings at the UW soccer field, it seems that there is no medical justification for this COH plan; and finally, the residents do not believe that further institutional encroachment in a family-residential neighborhood is wise or fair.

Please proceed carefully and slowly in final assessment of all assertions and merely implied needs by COH. Please ponder seriously why COH does not want a certificate of need, a state review, and/or open communication with Laurelhurst and Laurelon Terrace residents.

Thank you.

Sincerely,

Re: Hearing on Conditional Use Permit For Proposed Helipad at Children's Orthopedic Hospital

Ladies and Gentlemen:

Franklin & Watkins, Inc., P.S. represent the Laurelhurst Condominium. The Laurelhurst is a complex of 56 apartments located at 4545 Sand Point Way N.E., Seattle, Washington. The Laurelhurst residents are concerned about the proposed helipad at Children's Orthopedic Hospital ("COH"). The Board of Directors of the Condominium Association has asked Franklin & Watkins to express the Condominium Association's views to the City Council.

In general, the Laurelhurst is in accord with the positions of the Mountlake Community Club, the Laurelhurst Community Club and the View Ridge Community Club. The area residents are concerned about three major factors. First of all, they are concerned about the safety and environmental impacts of the proposed helipad. It is undisputed that helicopters traveling to and from the COH helipad would generate significant additional noise and constitute a potential safety hazard in the neighborhood.

There has been previous testimony to indicate that the safety hazard would increase as the frequency of helicopter flights increases. The helicopter service is likely to be used as frequently as possible since the cost of the transportation decreases the more it is used; hence, an ever-increasing safety risk and escalating noise problems from helicopter traffic would be likely to result.

Secondly, COH has failed to demonstrate that there is a medical need for the helipad which is not currently being met by

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the MAST service with other existing services. The MAST service is currently provided free of charge. The military and other helicopters such as Airlift Northwest land at the University of Washington fields and are transported to COH or the University of Washington Hospital via ground transport. There has been no showing that any lives have been lost as a result of the additional overland transport or that allowing helicopters to land at COH would actually save any lives. COH has asserted that additional risks are caused by existing services, but they have not translated those allegations of risk into the necessary medical showing of concrete evidence of harm.

Third, it appears to the Laurelhurst residents that the main interest of COH (and University of Washington Hospital, which is also proposing to secure a helipad) is in promoting the hospitals' services. Apparently, a helipad will enhance the existing services of the hospital and perhaps draw in more health care users from out of the region. While this may be an appropriate economic consideration for COH, it is not sufficient for the Department of Construction and Land Use, which must base the issuance of a conditional use permit on a finding of medical need, i.e., that the helipad is necessary to save lives.

In conclusion, the Board of Directors of the Laurelhurst Condominium Association oppose the issuance of a conditional use permit to COH for the helipad as a medical need has been demonstrated.

Very truly yours,

FRANKLIN & WATKINS, INC., P.S.

Leo C. Johnston
4200 Northeast 50th Street
Seattle, Washington 98105

Dear Mr. Johnston:

Your letter identifies the key issues associated with the Children's Orthopedic Hospital (COH) Helipad proposal. I have heard from many of your neighbors, who are also disturbed and concerned about helicopter traffic in the Laurelhurst neighborhood.

Beatrice Farrar Ryan, Interim Director of the Department of Construction and Land Use (DCLU) tells me that she and her staff are currently reviewing COH's environmental checklist and a recent report from the Seattle-King County Department of Public Health on the medical need for a helipad facility.

Additionally, DCLU has issued a Notice of Violation (NOV) to COH because they have been landing helicopters without permit. I hope that the NOV will serve to curtail the landings until a permit decision is made.

Thank you for sharing your concerns and comments about this difficult situation. Please do not hesitate to call Cliff Portman, Senior Land Use Specialist, at 625-4509 if you have further questions or witness additional helicopter landings.

Sincerely,

Charles Royer

Gentlemen:

While I am not one to complain about petty annoyances and have been slow to involve myself with my neighbors in the Laurelhurst area, I feel more and more constrained to speak out against the helicopter pad proposed for the Childrens Orthopedic Hospital.

First, while I am not an expert in such matters, I cannot believe that the helicopter proposal, taken as a whole, would be economically feasible. This is not to say that I do not value the lives of children that might be saved. On the contrary, I feel that many more lives could be spared through using this money in other areas of medicine.

In addition, the noise of helicopters landing and taking off in this residential area is of no small consideration. There are many elderly and infirm persons living within close proximity to the proposed pad, and I feel sure that the extreme noise must be anything but beneficial to their health. Another helicopter landed at the hospital today, and I can attest to the fact that the noise was extremely irritating even to me, and I am not one of the older residents of the area. I can just imagine how the noise must affect the young patients in the hospital, much closer than most of the neighbors.

I hope that adequate consideration will be given to both sides of this issue before permission is granted for construction of a helipad at this location.

Very truly yours,

Dale C. Johnson

In addition, the noise of helicopters landing and taking off in this residential area is of no small consideration. There are many elderly and infirm persons living within close proximity to the proposed pad, and I feel sure that the extreme noise must be anything but beneficial to their health. Another helicopter landed at the hospital today, and I can attest to the fact that the noise was extremely irritating even to me, and I am not one of the older residents of the area. I can just imagine how the noise must affect the young patients in the hospital, much closer than most of the neighbors.

I hope that adequate consideration will be given to both sides of this issue before permission is granted for construction of a helipad at this location.

Very truly yours,
Leo C. Johnston

Gentlemen:

SUBJECT: APPLICATION #CC84-022

I am writing to request that you require the Children's Orthopedic Hospital & Medical Center (hereinafter COH) to file an Environmental Impact Statement in regard to the construction of a helipad site on their premises. Secondly, I ultimately, strongly urge you to vote AGAINST permitting such construction at COH.

My concerns are: 1. The environment & safety of the residents.
2. The actual need of such a site.

The environmental issues involved in allowing a heliport to be built at COH are noise, health & pollution. COH has indicated they intend to lease a twin engine helicopter. In November, 1984, a single engine KIRO helicopter came & landed, or hovered over COH. The vibrations rattled my windows so hard when it flew by my house that I was afraid they would shatter. The noise was deafening. This was approximately 11:30 a.m. I reside four blocks away from the proposed location of the helipad site, close to where the KIRO helicopter was that day. The twin engine that COH plans to use will be louder still with a much higher decibel rating.

This noise & rattling of windows was most distressing. Surely, the children of the residential area, as well as the hospitalized children will be terrified waking up at night hearing such noise.

When asked what impact this could possibly have on public services, COH responded that the Fire Department could conceivably be involved. Obviously, the possibility of a helicopter crash in this residential area exists.

I am futhermore concerned that COH has made no provision for the jet fuel run-off that accompanies the use of these helicopters in their plans.

I find COH's assumption that building such a helipad site would have no environmental impact completely and totally ludicrous. Apparently, they must feel this way as they have refused to file such a statement to date.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Secondly, I question if there really exists a true need for a helipad site at COH. For years COH has used the Intramural field at the UW with seemingly no transport-related injuries to their patients. Karen Cummings, COH Nursing Administration, admitted there has been no actual deaths than can be attributed to the helicopter service via the UW field. Indeed, Mrs. Cummings and the remainder of the COH administration refuse to produce any documentation of specific incidents where patients have suffered any problems at all directly related to such transports.

COH maintains that traffic congestion in the area on football game days at the UW presents a problem to using the Intramural field. However, traffic lanes from the field toward COH are blocked off by the police department hours before game time. An ambulance transporting off this field would have a straight, unimpeded lane of traffic all the way to the COH emergency room.

They also feel the poor condition of the Intramural field no longer makes it a viable alternative to helicopter service. Why not improve the field, put in a landing pad with the funds set aside for the proposed site at COH, and accept the gracious offer to use the landing strip at the Sand Point Naval Air Station on game days. True, this would extend the ambulance ride to the hospital from 3 to 7 minutes, but I feel that the six Saturdays a year that this would involve does NOT justify the use of COH putting in their helipad and disrupting the peace and quiet of the longtime residents. Something we should all be able to do is to enjoy our homes.

Lastly, I would like to remind you that the Laurelhurst neighborhood has been situated here long before the arrival of COH. COH knew there would be certain concessions to be made when doing business in this beautiful residential area.

Make no mistake about it, COH has been a tremendous asset to our local community and the State of Washington as a whole. We all appreciate knowing there is competent medical care nearby when our children become ill. But, emotions aside, and unlike the media would have us believe, this is STRICTLY A MARKETING ISSUE. This is one that COH hopes will attract more patients, and thus more revenue to enable them to survive in an ever-increasing competitive market. (Please see enclosed article). Unfortunately, they are trying to do this at the expense of our community's health and welfare, not to mention our pocketbooks as this will surely result in lower property values should this helipad be built.

Again, <u>PLEASE</u> require COH to file the Environmental Impact Statement & do NOT approve Application #CC84-022, the construction of the helipad at COH.

Thank-you for your time and attention to this matter.

Wide use of helicopters seen as productive hospital marketing tool

The use of helicopters for Houston's Hermann Hospital 'has been a tremendous success for the hospital in terms of generation of patients,' says one hospital official there.

less than one death per 100 casualties, compared with 4.5 deaths per 100 casualties in World War II. It is unknown how much helicopters contributed to the improved survival rates, because the medical care of injured soldiers also improved.

The use of hospital-based helicopters began in Europe, and came to the United States in 1972.

As the number of helicopters has grown, so has their sophistication and price. The state-of-the-art hospital helicopter is powered by two turbine engines, gulps 80 gallons of fuel an hour, and even may include air-conditioning. Purchase price for the Bell 222, for example, is about $1.2 million.

Additional costs include the helicopter's medical gear and the installation of a landing pad, lighting, fuel storage tanks, and communications equipment.

Many hospitals hire a helicopter service, which typically provides the helicopter, three pilots, and a mechanic. The hospitals provide the flight nurses and paramedics, and, sometimes, also physicians.

EVEN WITHIN the helicopter industry, some experts think that hospitals are buying more expensive helicopters than they need.

Floyd Helm, vice president of Rocky Mountain Helicopters, which operates helicopters for 21 hospitals, adamantly asserts that hospitals don't need two-engined machines, which cost twice as much as the single-engine craft. The two-engine helicopters aren't really safer, but are becoming increasingly popular because "manufacturers want to sell more expensive machines," he said.

The helicopter programs almost always are successful. "We have never started a program that became financially unfeasible," Helm said.

A helicopter that flies one mission per day usually is financially justifiable, said Washington Hospital Center's Dr. Champion.

Staffing for Hermann Hospital's five helicopters includes 16 pilots, 17 flight nurses, five mechanics, eight dispatchers, a program director, and three office staff members.

Last year, the five Hermann helicopters flew 3,670 missions, including 1,086 auto accident victims, 488 stabbing and gunshot cases, and 339 neonates. On any given day, 75 to 100 of the hospital's 625 patients came in by helicopter.

THE HELICOPTER program "has been a tremendous success for the hospital in terms of generation of patients," said Larry Bowermon, the hospital's chief financial officer.

The success is even richer than it appears, because the helicopter patients use more services than the average patient. In addition, the advertising mission of the helicopter brings in an unknown number of patients, Bowermon said.

The cost of the program is more than $3 million per year for the three helicopters stationed in Houston. The direct charges to the patient — $160 per lift-off, plus $8 per mile one way — pay for only a third of the program's cost.

Hermann also has begun a long-distance air transport program aptly called "Life Flight LD." The program rents jets from Houston's Hobby airport for an average of 16 flights a month, often to Mexico and South America.

"We are going all over the world," said Marguerite Badger, Hermann's director of flight operations.

Unlike the helicopter service, however, the long-distance patients pay the service's full costs. A round trip to Mexico City costs between $5,000 and $6,000.

Bowermon said that in Houston, helicopter overuse "is not an issue in the least. We're very selective about who can call in" for a helicopter.

As in other cities, police officers, firefighters, ambulance crews, hospitals, and physicians can request the helicopter, but ordinary citizens cannot.

ONLY A FEW helicopter programs have failed. One was shared by three Fresno, Calif., hospitals in a bid to make Fresno a major referral center for accident victims in the San Joaquin Valley.

"One of the primary motivations was to increase occupancy," said James Berg, administrator of Sierra Hospital, one of the three.

The helicopter was "a damn good thing for care," although "in some instances a ground ambulance or even the patient's car would have been good enough," he acknowledged.

The hospitals' program was wiped out primarily by the California Highway Patrol, which also had a helicopter in Fresno. Because the highway patrol controlled the ambulance dispatch system, its own chopper would be whirring to the scene before the hospitals had heard of the accident. The result was a paltry 15 to 30 runs per month for the hospitals' helicopter.

When the hospitals canceled the program, an enterprising television reporter came out to Berg's home, thrust a microphone in his face, and asked, "How many people are going to die as a result of your closing this service?" Berg replied that the other helicopters in the area would pick up the slack.

MORE DISQUIETING than the alleged overuse of helicopters is the number of crashes. On July 14, the U. of Massachusetts Medical Center in Worcester sent its twin-engine Messerschmitt to Martha's Vineyard to pick up a patient with a type of meningitis. On the return trip the helicopter's engines lost power over Rehoboth, Mass., and plummeted into some power lines. The pilot and a physician died; a flight attendant and the patient survived.

On Sept. 1, a brand new twin-engine Bell 222, just delivered to the U. of Tennessee's hospital in Knoxville, crashed on its maiden voyage and burst into flames. Luckily, all four aboard escaped, with only a flight nurse suffering second-degree burns.

"There is a serious crash every year," Dr. Champion acknowledged, "but, by and large, helicopters are pretty safe."

After both crashes, the hospitals immediately ordered replacement helicopters.

"We believe the benefits created by its use certainly outweigh the risk," said a spokeswoman for the U. of Massachusetts Medical Center.

—Doug Lefton

New form of arthritis drug approved

The Food and Drug Administration has approved the first suppository form of a non-steroidal anti-inflammatory drug, aiding patients who cannot take oral medication or who need a nighttime supplement.

The drug is a new formulation of Indocin, available in capsule form since 1965 and in sustained-release form since 1982. Called Suppositories Indocin (indomethacin), the product is available this month from Merck Sharp & Dohme.

The drug may be prescribed for the treatment of active stages of moderate to severe osteoarthritis and moderate to severe rheumatoid arthritis in patients who do not respond to aspirin and rest. It also is indicated for moderate to severe ankylosing spondylitis, acute painful shoulder, and acute gouty arthritis.

In a study of 175 patients with rheumatoid arthritis, the incidence of upper gastrointestinal adverse effects was comparable for the suppositories and capsules. Suppositories were found to create higher incidence of lower gastrointestinal effects, however.

A study of 45 healthy persons found that the number of gastric mucosal abnormalities was significantly lower among patients taking suppositories or a placebo than among those taking capsules of the medication.

Each suppository contains 50 mg. of indomethacin, and provides a more rapid rate of absorption than capsules.

Similar adverse reactions — headache, dizziness, nausea, and indigestion — have been noted in the use of both the capsule and suppository form.

The new form of Indocin should not be prescribed for patients with nasal polyps associated with angioedema, bronchospastic reaction to aspirin, a history of proctitis, or recent rectal bleeding.

Arizona denies aspartame request

The Arizona State Health Dept. again has denied a petition filed by an Arizona State U. professor to ban soft drinks containing the artificial sweetener aspartame, according to *Food Chemical News*.

The health department said the petition by Woodrow C. Monte, PhD, director of food services at the university and the Arizona Consumers Council, had failed to present sufficient data and evidence to establish their claim that aspartame is a harmful substance.

Aspartame, manufactured by G.D. Searle & Co. of Skokie, Ill., was approved for use in soft drinks by the Food and Drug Administration (FDA) in July, 1983. Since then, most major soft drink companies have included it in their drinks.

According to the health department, there are no indications that aspartame decomposes in beverages over time or because of higher temperatures.

My dear Mr Justen:

This has been my home for twenty three years and I have enjoyed the quiet neighborhood except for the year or more when COH was expanding their building. Bulldozers would start roaring at 6:30 AM and continue until dark at night. COH has no consideration of the many elderly people who live in this area. The noise, dirt and dust in the air made it very unpleasant & unhealthful to live here. In the beginning COH promised this would be just a cottage hospital. It's anything but that now with all the additions they have made. They promise a limited number of flights. If they did not keep their promise to keep the hospital small why should we believe they will keep the number of flights to a minimum.

The danger of a helicopter crash in a densely populated area is another grave concern.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I hope, Mr Juster, that you will consider our views and complaints and do what you can to keep this Helipad from being built here. I thank you for your consideration of the matter.

Dear Mr. Justin:

Before the department proceeds without full investigation to approve the construction of the helipad by C.O.H. I wanted to voice my concerns. Of paramount importance is of course the issue of whether or not it is economically beneficial to the community to construct the helipad. Certainly the construction costs and possible purchase and maintenance of a helicopter would raise health care costs at C.O.H. I ask you, can you afford it?

Naturally, there are also the issues of noise creation to nearby residents and, not to be overlooked, the issue of whether or not the need for the helipad has been established.

Thank you for your consideration. I trust a complete E. I. S. will be forthcoming. Please keep me informed.

Sincerely,

Re: Helipad at Children's Orthopedic Hospital

Dear Mr. Justin:

We are writing to express our opposition to the helicopter landing pad on the Children's Orthopedic Hospital grounds. We own property in the Laurelon Terrace condominums.

It is hard to oppose something as humanitarian as a helipad on the grounds for the children. Especially is this true when you believe in the work and care which is performed there and support it each year.

However, when you analyze it you realize the current method works within a very short period to serve the same purpose. The child has to be handled the same number of times whether landing near the U of W baseball field or at the helipad. The exposure from potential helicopter difficulties is considerably reduced under the current program. The noise and disturbance to both neighbors and those at the hospital is much less now. Helicopters can be very noisy and dirty.

Respectively,

Charles R. Trzcinski M. Rea Trzcinski

Dear Mr. Justen: RE: COHMC Helipad Proposal

I live near the Children's Orthopedic Hospital and I am very concerned about the proposal to build a helipad just outside the emergency entrance of the hospital. The noise of helicopters would be very disturbing to our neighborhood. I also question the safety of flying helicopters over such a heavily populated area as this area of Laurelhurst. The press always portrays Laurelhurst as an area of "posh" single family dwellings. Actually most of the residences near the hospital are apartment buildings and multiplex units with a low-income housing complex recently built at the northwest corner adjoining hospital property. There are a lot of people who would be disturbed by the noise of helicopters and the possibility of a crash over this neighborhood or into the hospital itself would be an ever-present danger.

I could understand COH being granted a helistop at the proposed site if that were the only alternative and really necessary to save lives. I have attended the public meetings in which the COH administrators have presented their case for the helipad and I have found their arguments completely unconvincing. From their own testimony it appears that the present arrangement of landing at the U of W intramural field is a satisfactory arrangement. If COH is granted this helipad, then the University of Washington Hospital, which is presently sharing helicopter service with COH, will have a much stronger argument for installing a helistop atop the new wing of their building. This will in turn promote competition between the two hospitals, increase the number of helicopter flights and also increase medical costs.

I doubt that the intent of the DCLU Major Institutions Land Use Code was to allow those institutions to ignore the concerns of the neighborhood. Yet I fear that that is the way COH is interpreting it.

Please keep me informed of developments in this case. Thank you.

Re: COH Helipad - Laurelhurst Area

Gentlemen:

I am an owner and tax payer living in the Laurelhurst Community.

This letter is to protest the building of a Helipad at COH. I am against the idea absolutely. Helicopters are noisy and often unsafe to fly near a residential area. Just ask any Bellevue businessman near their Helipad. We had a business near there for several years and the noise is deafening.

Also when we first moved to Seattle we lived in View Ridge above Sand Point Naval Airport. The noise from planes and helicopters was very loud and rattled the dishes in the cupboards. As you probably know many of the planes crashed either on the runway or Lake Washington. We were lucky it was not on a home!

I am a supporter of COH and have been for many years but they are getting out of bounds for the area. Possibly they should think about a suburban location so they may expand like they propose to do.

If Washington Retirement Center is built--which I am also against--the complaints from them about the noise will really "burn your ears".

This letter is to register my vote against the Helipad at COH.

Very truly yours,

Ila M. Schulze

Dear Dr. Catanzaro:

Thank you for your letter of January 7, regarding the proposal to build a helipad at Children's Orthopedic Hospital.

The application is for a Council Conditional Use permit which, after review by the Department of Construction and Land Use and a public hearing conducted by the Hearing Examiner, will come to the Council's Land Use Committee for consideration. The Council's decision on the proposal will be made on the merits of the case contained in the official record.

So that your comments will be placed in the official record for consideration by the Councilmembers when the application comes before us, I am forwarding your letter to the Director of the Department of Construction and Land Use with the request that your name be added to the mailing list so that you will be kept informed of all hearings and meetings on this permit application.

I appreciate your concerns. Thank you for taking the time to forward them to me.

Dear Councilman Kraabel:

As president the Board of Trustees for the Laurel Crest Residential Park, I am writing in opposition to the proposed Helipad at Childrens' Orthopedic Hospital. I represent the 82 home owners and residents of this condominium.

To our knowledge, Childrens' Orthopedic Hospital and Medical Center has not documented a need for a helipad. Dr. Michael Copass, Director of Northwest Airlift, has stated publicly that the present plan of landing the helicopter in the intramural field has created no problems. Concerns have been raised about the need to transport premature infants to the hospital in terms that make one wonder if the planned Helipad will be located in the neonatal intensive care unit. If the pad is located outside the building, the infants will still need to be transported into the building and to the special care unit. The neonatal intensive care unit is not located in the emergency department but in another area of the hospital. To my knowledge we have no data, only hearsay, that a helipad at the hospital would benefit any critically ill child.

There are environmental concerns related to noise and safety in the surrounding residential area. I believe that these have repeatedly been brought to your attention. We certainly share these concerns.

In this time of increasing social consciousness about rising costs of health care and local and federal efforts to contain these costs, the construction of new helipad raises many concerns. The American Medical Association News (21 Sept 1984) pointed out that the cost of operating a helicopter ambulance is upward of one million dollars per year. How can Childrens' Orthopedic Hospital and Medical Center justify such an ongoing expense, particularly in view of the fact that helicopter ambulance service is currently

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

available. How will these costs compare with the current system? How will additional costs be covered? I am certain that many of the parents of children at the hospital could suggest many ways of spending the additional money to benefit more children.

If the statistics presented by the Hospital spokespersons are correct, the anticipated 15 landings per month will not result in a cost effective operation. Increasing those landings for sake of using fancy technology and making the operation "cost effective" when something less expensive would accomplish the same goal (safe, timely transport of critically ill children) is not justified. The cost of air lifting one patient to a hospital is in the thousands of dollars. How will this additional cost be managed?

Your role in approving the construction of a helipad is related to land use. I would hope, however, as an elected city official, you would be concerned with cost effective medical care in our community. I would appreciate your advice on who may be in a better position to be certain that cost issues are addressed before permission is granted for Childrens' Orthopedic Hospital and Medical Center to construct a helipad.

Sincerely,

Marci Catanzaro

SEATTLE CITY COUNCIL MEMBER

Dolores Sibonga
Seattle City Council
600 Fourth Avenue
Seattle, WA 98104

Dear Councilwoman Sibonga:

As president the Board of Trustees for the Laurel Crest Residential Park, I am writing in opposition to the proposed Helipad at Childrens' Orthopedic Hospital. I represent the 82 home owners and residents of this condominium.

To our knowledge, Childrens' Orthopedic Hospital and Medical Center has not documented a need for a helipad. Dr. Michael Copass, Director of Northwest Airlift, has stated publicly that the present plan of landing the helicopter in the intramural field has created no problems. Concerns have been raised about the need to transport premature infants to the hospital in terms that make one wonder if the planned Helipad will be located in the neonatal intensive care unit. If the pad is located outside the building, the infants will still need to be transported into the building and to the special care unit. The neonatal intensive care unit is not located in the emergency department but in another area of the hospital. To my knowledge we have no data, only hearsay, that a helipad at the hospital would benefit any critically ill child.

There are environmental concerns related to noise and safety in the surrounding residential area. I believe that these have repeatedly been brought to your attention. We certainly share these concerns.

In this time of increasing social consciousness about rising costs of health care and local and federal efforts to contain these costs, the construction of new helipad raises many concerns. The American Medical Association News (21 Sept 1984) pointed out that the cost of operating a helicopter ambulance is upward of one million dollars per year. How can Childrens' Orthopedic Hospital and Medical Center justify such an ongoing expense, particularly in view of the fact that helicopter ambulance service is currently

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

available. How will these costs compare with the current system? How will additional costs be covered? I am certain that many of the parents of children at the hospital could suggest many ways of spending the additional money to benefit more children.

If the statistics presented by the Hospital spokespersons are correct, the anticipated 15 landings per month will not result in a cost effective operation. Increasing those landings for sake of using fancy technology and making the operation "cost effective" when something less expensive would accomplish the same goal (safe, timely transport of critically ill children) is not justified. The cost of air lifting one patient to a hospital is in the thousands of dollars. How will this additional cost be managed?

Your role in approving the construction of a helipad is related to land use. I would hope, however, as an elected city official, you would be concerned with cost effective medical care in our community. I would appreciate your advice on who may be in a better position to be certain that cost issues are addressed before permission is granted for Childrens' Orthopedic Hospital and Medical Center to construct a helipad.

Sincerely,

Marci Catanzaro

Dear Ms. Francis and Ms. Anderson:

Thank you for your letter about the Children's Orthopedic Hospital application for a permit to install a helistop on the hospital grounds. Many people have called and written to mc and to the Department of Construction and Land Use (DCLU) to express their concern that the proposed helistop may adversely affect their neighborhood.

The Major Institutions Code has specific standards which limit the physical expansion allowed to occur before a master plan is required. These limitations should prevent the aggressive expansion you describe.

I asked DCLU Director William Justen to respond to your other specific concerns. If you have not already heard from him, I'm certain you will soon. I also asked him to provide me with a copy of his reply.

I appreciate your interest in the development and environment of your neighborhood and, again, thank you for taking the time to write.

Sincerely,

Charles Royer

Mr. William Justen, Director
Dept. of Construction and Land Use
600 4th Avenue
Seattle, WA 98104

Dear Mr. Justen,

The Children's Orthopedic Hospital has been my respected neighbor for more than 20 years. I strongly support the fine health care given there.

I wrote to you on November 30, 1984 concerning the projected helipad at COH and am writing again on the appearance of the sign at the hospital indicating the 14-day period before your group decides on the necessity of an EIS for the project.

Mr. Justen, I strongly believe that helicopters flying over your home or my home, with the imminent hazard, noise, and air pollution that helicopters provide, do create a need for an environmental impact study.

But there are additional questions:

1. Why is COH in such a hurry?

2. Why are they not in favor of an EIS?

3. Why aren't they willing to proceed in a cooperative manner when they must realize how much concern their actions have caused?

I believe that COH wants to get its helipad in before other hospitals (University and Swedish) complete theirs and before citywide (not just Laurelhurst) concern prevents the building of any more such helipads.

I will continue to support the fine health care presently given at COH, but I believe that the attitude of the current administration must be considered separately. If there is an actual need for a helipad at COH, a need overriding obvious environmental concerns, then such a helipad will ultimately be established. But, in the meantime, the hospital must be willing to take the steps required of any other business that wishes to impact an area. And one of the first steps that must be required on the COH helipad project is an Environmental Impact Study. I hope that your group will support this view.

Sincerely,
Joy Scott

Dear Dr. Catanzaro:

Thank you for your recent letter in which you forward the opposition of the Laurelcrest Residential Park to the proposed helipad at Children's Orthopedic Hospital. I understand that your opposition is based on environmental grounds and concern with the increasing costs of health care.

When considering a specific land use issue, the City Council sits as a quasi-judicial body. Because the Council will be involved in the decision on COH's application for a helipad, the Councilmembers must be very careful to maintain an appearance of fairness to all parties. We must limit our review of the issue to the official record and testimony received at open, public meetings. For this reason, I am not able to discuss the merits of this helipad application with you.

The City's Department of Construction and Land Use (DCLU) is currently conducting an environmental review of the helipad application. Once their review is completed, a public hearing will be scheduled on the helipad application before the City's Hearing Examiner. A sign will be placed at the proposed helipad site, and notice will be sent to those who reside 300 feet from the Hospital boundaries 30 days prior to the public hearing. The community is encouraged to participate in the hearing because the testimony received will comprise a portion of the official record. I am forwarding a copy of your letter to Mr. William Justen, Director of the Department of Construction and Land Use, to ensure it is included in the record and a hearing notice is sent to you.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Thank you again for taking the time to forward the views of the Laurelcrest Residential Park.

Dear Mr. Justin,

We are yet more neighbors very concerned with the proposed construction of a helipad by Childrens Orthopedic Hospital right in our neighborhood.

We are even more concerned by the rumor that COH may not even be required to file an environmental impact statement. This seems absurd considering the enormous number of residences they would be affecting. COH seems to already have a workable system for transporting ill patients to the hospital, but if they feel they need to change the existing arrangement, they should at least be required to prove the need is great. A large, influential organization should not be able to adversely affect a large neighborhood without at least proving a need and answering the communities questions. This is the least that should be required.

Thank you for your attention. We hope the community will be listened to by your department.

Sincerely,

SUBJECT: Application No. CC-84-022
Children's Orthopedic Hospital Helipad

Dear Mr. Justen,

We are very concerned about the adverse impact of this helipad upon the health, safety, and welfare of the residential neighborhood surrounding Children's Orthopedic Hospital. We are writing to request that COH be required to submit a full Environmental Impact Statement which addresses the following questions:

(1) The noise and vibration levels of helicopter overflights upon nearby residences.

(2) Will large and exceptionally noisy helicopters (e.g. military MAST helicopters) be turned away from the proposed COH helipad even if they are carrying patients requiring emergency care?

(3) The health effects of the noise and vibrations from helicopter overflights on nearby children and elderly residents, especially nighttime flights which could disrupt sleep.

(4) The danger of helicopter crashes in the surrounding residential areas.

(5) What proportion of helicopter flights to COH will handle non-emergency cases, including patients already stabilized in the field or at other medical facilities?

(6) Has COH fully explored all other alternative landing sites, including the possibility of improving the present landing site at the University athletic field?

Thank you very much for your concern. Please keep us informed of this application process.

Dear Mr. Justin.

I would like to express my opposition to the helipad proposal for the Children's Orthopedic Hospital.

I have tried to imagine my own grandchild being transported to the hospital and I really can't believe that the three minute ride in an ambulance (well equipped) would be the difference between surviving or not surviving.

I really feel a helipad would be a grave mistake in a residential area. The residents have been very patient with the expansion of the hospital but this proposal is unacceptable.

Sincerely,

Joan F. King

Application CC 84-022

Dr. Marci Catanzaro, President
Laurelcrest Residential Park
4801 Terrace Drive Northeast
Seattle, Washington 98105

Dear Dr. Catanzaro:

Thank you for your recent letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. I agree that providing emergency care for children is a City-wide concern, but there have been numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

You are right that, while the City of Seattle has the responsibility to address the land use implications of hospital helipads, the role of assessing the need and "cost effectiveness" of such facilities in medical practices is beyond the function of the City government. The Puget Sound Health Systems Agency is the appropriate agency to address and set policies on these issues. Their contact person and address is: Larry Thompson, Executive Director, Puget Sound Health Systems Agency, 601 Valley Street, Seattle, Washington 98109; phone number 464-6143.

Further, you may contact the State Department of Social and Health Services regarding the requirement of a Certificate of Need for the proposal. We understand this agency is in the process of determining whether a Certificate is necessary or not. The contact person is: Christiana Sparks, Certificate of Need Program, State Department of Social and Health Services, Mail Stop FT-33, Olympia, Washington 98504; phone number (206)753-5857.

Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and you will be notified of future public hearing schedules and decisions. I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

Katy Chaney

Re: COH Helipad

Dear Mr. Justen:

I am writing to you to advise you that I think it is important that Children's Orthopedic Hospital be required to file an Environmental Impact Statement in regards to their desires to place a helipad, about 300 feet from my living quarters.

The hospital is a definite drawback for anyone living nearby. I bought my property before they put in their unsightly parking garage and spoiled the view from my front window. We hear sirens at all hours of the day and night and now they want to put a (89 decibels at 200ft.) noisy helipad just outside the emergency entrance to the hospital.

Needless to say I would hope the residents are given some consideration in the present situation.

Yours truly,

Mrs Patricia Lundquist

Re: Children's Orthopedic Hospital Helipad

Dear Mr. Justen:

My family and I live at 4324 N. E. 44th Street, Seattle, Washington, just one block away from Children's Orthopedic Hospital. Everything that is done by COH affects the neighborhood and my family.

My understanding is that there are currently hearings concerning having a helipad at the Hospital. To say the least, we are very concerned regarding the helicopter traffic and strongly feel that an environmental impact study is needed because of the affect the helicopter traffic would have upon the environmental health.

My major areas of concern are as follows:

1. Noise. Helicopters make a lot of noise. There would be a lot of stress on my family and my neighbors as well as children in the hospital.

2. Safety. There is always a possibility and fear of helicopter crashes.

3. Polution. There will be emissions from the helicopter and the effect on air quality needs to be determined.

4. Traffic. The flight pattern noise and visual distraction caused by the helicopter will tend to tie up traffic in the area.

I am not sure of exactly what goes into an invironmental impact statement, but of concern to me is the fact that they are currently using helicopter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

facilities provided at the playing fields of the University of Washington. Other than institutional ego, there does not seem to be any reason why this cannot continue. The landing area at the University is not surrounded by residential properties and the landing area at the University is further away from any arterials.

Due to an ordinance passed by the City Council, it is my understanding that large institutions are basically exempt from zoning concerns. This should not mean that they are also exempt from environmental concerns. Given the proposed frequency of flights that will be coming into the Hospital, an environmental impact statement is definitely needed.

I would appreciate being notified as to any hearings regarding this matter.

Very truly,

MULLAVEY, PROUT, GRENLEY, SONKIN, FOE & LAWLESS

Mr. Wm. Justin
Dept. of Construction & Land Use.
City of Seattle
600 Fourth Avenue
Seattle, Washington 98104

Dear Mr. Justin,

As a resident of the area surrounding Childrens' Orthopedic Hospital, I am writing to express my concern and opposition to the proposed construction of a helipad on the hospital grounds. Noise pollution from automobile traffic is already a significant problem in the area due to the existence of two major arterials in the neighborhood (N.E. 45th Street and Sandpoint Way). The takeoff and landing of helicopters would only add to the decibel level for the residents whose homes are within range of the helicopter route.

I <u>strongly oppose</u> the new COH landing site, and I urge you to consider recommending that the hospital find an alternative method for transporting patients. As a private citizen, I plan to do all that I can to prevent the helipad from being built.

Thank you for your consideration.

Sincerely,

Gail J. Gordon

Subject: Children's Orthopedic Helipad

Gentlemen:

As residents of the westernmost portion of Laurelhurst, we are well acquainted with the comings and goings of helicopters from the U.W. soccer fields.

Many approach and departure paths are nearly overhead and within a few hundred feet of ground level.

Nearly all craft are of the heavier Huey type verses the lighter "traffic copter" variety.

I would honestly call their landings and takeoffs a spectlacle of noise . . . "WHOP, WHOP, WHOP, WHOP." All ordinary nome activity ceases. No conversation can be exchanged without mental distr tion.

Allowing C.O.H. this additional service will routinely permit the total disruption of residential solitude to an even greater number of people.

Keep helicopters for very critical cases and keep them at the soccer fields. The good of mankind is not served by the total interruption of hundreds of people in their homes in trade for the two to three minutes saved in transport time.

Sincerely,

M Cochran

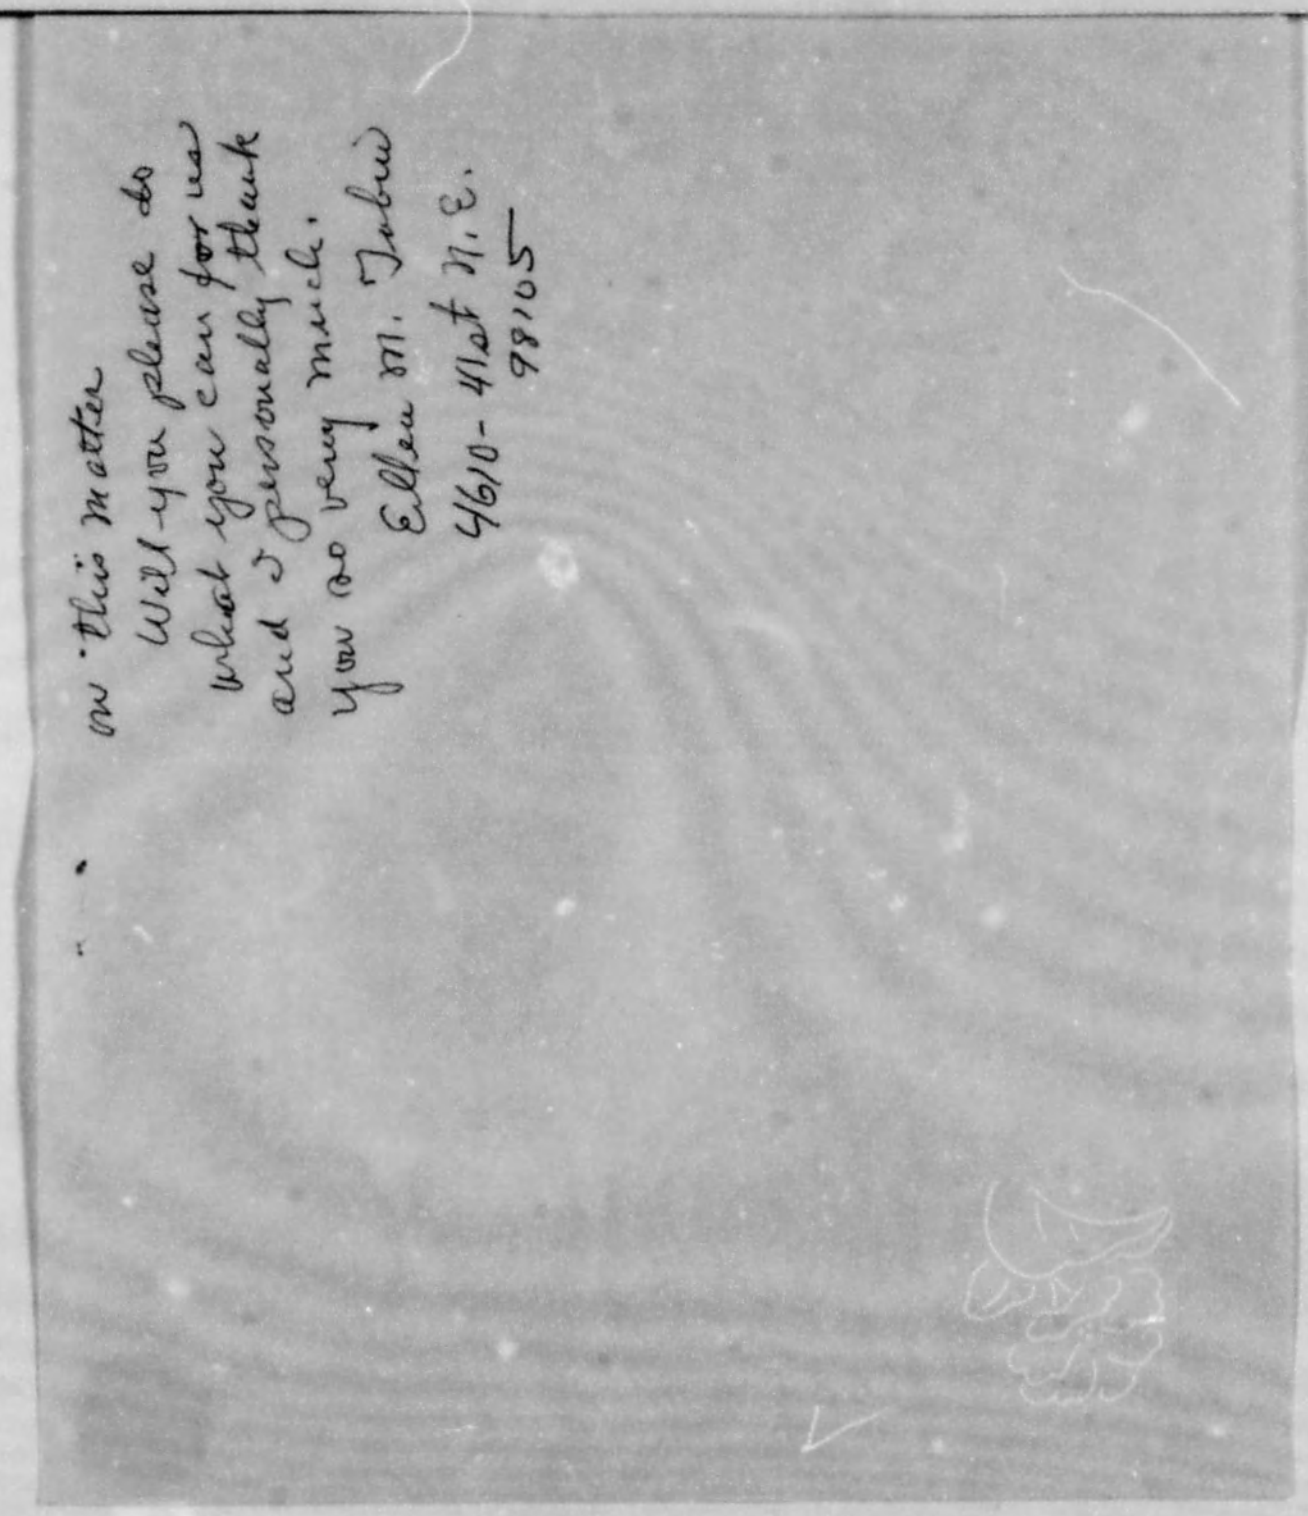
re: #cc84022

To Whom It May Concern:

COH does not need a helicopter pad.

First, ambulance sirens can be turned off so as not to disturb hospital patients but the noise of the helicopters cannot be controlled. Thus noise will affect both patients and neighborhood residents.

Second, there is no data to support COH'S claim that in emergency situations particular patients are or, have been, endangered by being transported by ambulance from the UW parking area now used.



Apparently it is a matter of convenience for COH to have a helicopter land at the hospital, since no information has been disseminated to the community which proves that without a doubt the pad is necessary.

If COH is concerned about its community relations and hopes to continue to receive community support it should continue to rely on ambulance service.

Mr. William Justyn;

Dear Sir:

I am an owner of a condominium in Landhurst and am definately against building a heliport on the Orthopedic property.

I am an elderly lady and we have many more here (where the heliport will be built). It will be right on our back doors, and as you know the noise will be very, very, bad.

It seems to me that we older people as well as others in the Terrace deserve consideration

Dear Mr. Justin:

You undoubtedly know that recently the Children's Orthopedic Hospital announced a plan to build a helicopter pad on the hospital grounds. I wish to register my disapproval of this proposal.

Helicopters would be noisy and possibly even dangerous to the people in the neighborhood. Many residents of Laurelon Terrace think that there should be further study of this proposal and we are contributing to a fund to prevent the construction of a helipad.

We are sure that you will give this matter careful consideration. The decision is very important to all of us.

Sincerely yours,

Herdis Benediktson

Gentlemen:

Please enter this letter as a protest against the construction of a Heliport for the Childrens' Orthopedic Hospital CC 84.022.

We feel that:

1. The need for such construction has not been established satisfactorily.

2. A Heliport does not belong in a residential neighborhood.

3. The Orthopedic originally got into this area by agreeing to retain the decor and atmosphere of a residential neighborhood, which it has not done.

   A. The addition of a Heliport is contrary to their original stated intent and should not be allowed.

Thank you.

Very truly yours,

W. H. Kurtz

Seattle, WA 98104

Dear Mr. Justen:

I am against the building of the heliport on the grounds of The Children's Orthopedic Hospital as it would be a noisy intrusion of my privacy and disturbing to me constantly with its 15 minimal and unknown and limitless maximal flights a month.

I live below the hill which the hospital built up to make the entrance to the new hospital. I have experienced the noise and glare and turmoil that is involved with a helicopter flight and landing and want none of it.

A carefully prepared impact statement of the facts from all points of view should be prepared and it will show that old people are human beings too and need to be protected as well as babies. There are six neighbors door to door all between 84 to 90 years of age who are concerned. I am 89 years old.

Sincerely,

AK-FYI

Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

As you may know, the neighbors of Children's Orthopedic Hospital (COH) and many others in adjacent areas are quite upset by the hospital's intentions to expand. Your successful effort to get the major institutions code passed has largely stripped us of the zoning protection we used to have. The code encourages an institution to prepare a master plan but a master plan is not a requirement. COH has indicated that it has no intention of preparing a master plan although we know it wants to expand until it rivals the nationally known children's hospitals in Boston, Philadelphia and other places.

We have recently become aware of the fact that you have created an advisory committee to work with COH on its plans for developing a 5-acre parcel at N.E. 70th and Sand Point Way. We understand that this committee consists of north end representatives, city employees, and city council members as well. We are astonished and discouraged that a piece of property for which there are no current plans for development is given this type of attention by elected officials while our overwhelming and immediate problems with COH go unaddressed. Our requests for assistance from DCD employees in dealing with COH have met with no success. Our efforts to communicate with city council members about these problems have been cut off by their incorrect interpretation of the "fairness doctrine". Consequently we have had to spend precious time researching this doctrine and educating the council members about their responsibilities as representatives of Seattle citizens.

We feel that our problems with COH deserve your close attention and that a city staff person should be assigned to help us as a committee to deal with COH. This committee should consist of persons representing all the residential areas immediately adjacent to the coh campus. A major task of this group would be to work with COH to prepare a master plan that would (hopefully) lead to a reduction of friction between COH and its impacted community. This is an urgent need and we ask for swift action on your part.

We appreciated your request to the Puget Sound Health Systems Agency for a policy guidance study of helicopter transportation to hospitals in Seattle. We were quite disappointed that you did not respond to Larry Thompson's letter of January 7 asking for some resources to do a proper study of this issue. You now have a brief report from the PSHSA that indicates that much more work needs to be done on this city-wide topic.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We urge you to follow up on this beginning with a more comprehensive, in-depth investigation of this emerging issue. A formal public policy study that will establish definitive criteria (as suggested by Larry Thompson) is urgently needed.

If you should decide to initiate an effort to repeal the major institutions code, be assured that you would have our support. Your interest in this issue would be greatly appreciated.

In summary, we ask that you:

1. Assign a city staff person to help us work with COH in preparing a master plan.

2. Follow up on the PSHSA brief report by conducting a comprehensive, in-depth investigation of the role of hospital helicopters in Seattle--to result in a public policy which establishes definitive criteria for their use.

3. Amend the major institutions code to include:
   --a requirement for a master plan
   --community participation in decision-making

Sincerely,

Anita Francis

Dear Ms. Francis and Ms. Anderson:

Thank you for your letter and suggestions on the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on hospital grounds. I appreciate your taking the time to write.

Under the existing Land Use Code, the COH is not required to prepare a Master Plan (Section 23.80.30). We are, therefore, not able to form a citizen advisory committee to function as a planning committee, as you suggested. However, I have assigned Mrs. Hermia Ip, Land Use Specialist of our Land Use Division, to be the project manager for the permit review of COH's proposal. She will continue to keep you informed of the progress of the permit review, and your suggestions will be given careful consideration. If you wish to pursue an amendment to the Land Use Code regarding the circumstances where a Master Plan is required, you may file a petition for Council consideration pursuant to Section 23.94.10. The text amendment procedures involve public notification and a hearing before City Council. Mrs. Ip will be able to explain the process if you have further questions on this matter.

As you are aware, the development of helicopter transport programs and policies requires a regional approach, which should also involve relevant expertise in the medical field. We believe that while the City of Seattle has the responsibility to address the land use implications of hospital helipads, the role of assessing the need and cost effectiveness of such facilities in medical practices is beyond the function of the City government. Therefore, we cannot undertake a comprehensive indepth investigation of these regional issues, as you requested. The staff position paper of the Puget Sound Health Systems Agency dated February 21, 1985 is helpful in providing us with some preliminary guidance. We are also coordinating with the State Department of Social and Welfare Services regarding their Certificate of Need requirement. We understand a determination will be made in about 10 days on whether COH is required to obtain a certificate or not. We believe that particular process will provide further guidance on our permit review process.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Thank you again for your interests and concern with hospital helicopter transportation. If you have any other questions, please do not hesitate to call Mrs. Ip at 625-4509. She will be glad to help you.

Very truly yours,

WILLIAM J. JUSTEN, P. E.

Dear Ms. Francis and Ms. Anderson:

Thank you for your letter about the Children's Orthopedic Hospital application for a permit to install a helistop on the hospital grounds. Many people have called and written to me and to the Department of Construction and Land Use (DCLU) to express their concern that the proposed helistop may adversely affect their neighborhood.

The Major Institutions Code has specific standards which limit the physical expansion allowed to occur before a master plan is required. These limitations should prevent the aggressive expansion you describe.

I asked DCLU Director William Justen to respond to your other specific concerns. If you have not already heard from him, I'm certain you will soon. I also asked him to provide me with a copy of his reply.

I appreciate your interest in the development and environment of your neighborhood and, again, thank you for taking the time to write.

Dear Mr. Justin:

This letter is in regard to the proposed helicopter landing pad on the Children's Orthopedic Hospital grounds.

As residents of Laurelhurst, as well as sharing ownership of two condominiums in Laurelon Terrace, we oppose this latest attempt at Children's Orthopedic Hospital in forcing something on the community that is not in the community's best interest.

We realize this is a touchy subject when it involves children's care. We, however, have heard nothing to convince us that the present use of the University of Washington by the helicopters is that big a problem in the transport of patients to the hospital. We are certainly aware of the problems that this is going to cause to the immediate homeowners. Having recently had the experience of having helicopters pass over at low altitude (during last Spring's gypsy moth spraying), we having experienced the very high decibel noise level created. Even with the present landing site at the University of Washington, we are still subjected to very high noise levels. We can only imagine what the impact would be to the price of real estate within the near vicinity of the proposed hospital landing site.

The hospital, over the years, has certainly not been honest with the community. The parking garage that "was not going to be visible" is the latest example of their less-than-honest relationship with their neighbors!

We have a fine neighborhood and very civic-minded residents, and this further encroachment on the residential nature of the area is not desirable or justified.

Sincerely,

Bob + Phyllis Swenson

Dear Mr Justen

I am concerned about the proposed Helipad for the Children's Orthopedic Hospital in Laurelhurst.

I believe the notion of a helipad in a residential neighborhood, be it for a hospital or any other noble and worthy use, is indeed outlandish and far-fetched. I do not wish a helipad in anyone's residential neighborhood, yours, mine, the medical doctors', the patients'. Esp. When one is available at the nearby U.W. field in Union Bay. The marginal convenience of an on-site pad cannot be justified by the real risk of crashes, and the inevitable noise, air pollution & stressful disturbances a hovering chopper will cause.

Surely an EIS should be prepared to demonstrate the need is justifiable.

Dear Mr. Justin:

I am writing to express my concern about the proposal to implement helicopter service at the Children's Orthopedic Hospital.

Our home is located directly opposite the parking garage on the north side of the hospital. Therefore we anticipate experiencing rather fully the impact of such service. We are particularly apprehensive about the noise level to which we may be subjected.

We sincerely hope that an environmental impact statement will be required of COH in order to address our concern and the concern of others.

Sincerely yours,

Cynthia McFalls

March 11, 1985
F/c CC84-022

Dear Ann Ormsby,

I'm writing to protest the proposed helipad at Children's Orthopedic Hospital.

Reason #1 - it is not needed. The present facility at the UW soccer field works just fine. I know: I work at the University Hospital in Neonatal Intensive Care. We share admissions with COH & receive them the same way, from the same landing spot, & we are the same distance from it as COH. There are no problems with the ambulance part of the transport. The real problem is with the helicopter flight itself - the noise prevents the doctor from being able to monitor the child's heart rate & breath sounds. Both are crucial to the child's safety, though I realize that's not pertinent to the issue here.

Reason #2 - COH proposes to have its helipad in an area where there is considerable pedestrian & vehicular traffic on all sides. I simply can't believe it would be safe. Add to that the fact that helicopters crash far more frequently than other aircraft (look how often Ch. 7's alone has crashed) - & to allow them to fly frequently over a heavily populated area is not sensible, to my way of thinking. I understand the COH environmental impact statement says that the copters would not be panicking wild animals or some such thing - are the large numbers of pets residing here any less sensitive?

Reason #3 - directly below COH is a large condo

II

complex. They are old converted apartments & far from soundproof. They are mainly populated by middle aged & elderly people. Many of them are former Laurelhurst residents who have become widowed, or who can no longer keep up a big house but who want to be near old friends & neighbors. Older people find it quite difficult to get back to sleep after being wakened in the night. I can only imagine that having helicopters coming & going would make life miserable for those residents. I doubt that many could relocate for comparable prices & it seems unfair that they might be forced to do so.

COH asked to insert itself into this neighborhood, promising to keep a low profile, & the neighborhood generously consented. The low profile has been discarded. The real reason they want the helipad is because, after a too-ambitious expansion, they have empty beds & need to generate revenues. Publicity helps - have you heard the commercial that begins "A helicopter hovers over Valley General Medical Center, bearing a critically injured man"? Very effective. Hospitals are not benevolent institutions no matter what they say - they are big businesses & the competition for bucks is fierce.

Probably this protest is useless & they will get their helipad through. But after a day of dealing with the stresses of intensive care, with critically or chronically ill babies, with their deaths & their families who are hurting so badly, I want to retreat to my home & restore myself with peace & quiet. I think everyone deserves that chance.

Sincerely,
Mary L. Vaneck
3524 W. Laurelhurst Drive N.E.

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Gjertrud J. Siqueland
4702 41st Avenue N. E.
Seattle, Washington 98105

Dear Mrs. Siqueland:

Thank you for your letter in opposition to the proposed helipad at Children's Orthopedic Hospital (COH).

The City Council will be involved in the decision on COH's application for a helipad. When considering specific land use issues, the City Council sits as a quasi-judicial body. The Councilmembers must be very careful to maintain an appearance of fairness to all parties. Our review of the issue must be limited to the official record and testimony received at open, public meetings. For this reason, I am not able to discuss the merits of this helipad application with you.

The City's Department of Construction and Land Use (DCLU) is currently conducting an environmental review of the helipad application. The Department is waiting for additional information on the use of the helipad. It is possible the Director of DCLU will make a Threshold Determination within the month. The Director may decide the proposed project could have such a significant impact on the environment to warrant the preparation of an Environmental Impact Statement (EIS). If the Director feels the project will not have a significant impact, he may determine an EIS is not necessary. The Director's decision may be appealed to the City's Hearing Examiner.

A copy of your letter has been forwarded to William Justen, Director of DCLU, to insure it is included in the record and available for his consideration. I will also request that you be notified of any public hearings on the helipad application submitted by Children's Orthopedic Hospital.

An equal employment opportunity—affirmative action employer

January 29, 1985

William J. Justen, Director
Dept. of Construction and Land Use
600 4th Avenue
Seattle, WA 98104

Dear Mr. Justen:

I am against the building of the heliport on the grounds of The Children's Orthopedic Hospital as it would be a noisy intrusion of my privacy and disturbing to me constantly with its 15 minimal and unknown and limitless maximal flights a month.

I live below the hill which the hospital built up to make the entrance to the new hospital. I have experienced the noise and glare and turmoil that is involved with a helicopter flight and landing and want none of it.

A carefully prepared impact statement of the facts from all points of view should be prepared and it will show that old people are human beings too and need to be protected as well as babies. There are six neighbors door to door all between 84 to 90 years of age who are concerned. I am 89 years old.

Sincerely,

Gjertrud J. Siqueland

Councilwoman Jeanette Williams
Seattle City Council
600 - 4th Avenue
Seattle, WA 98104

Dear Ms. Williams:

I love children.

For 20 years I taught 4 & 5 yr. olds in Sunday School

When I retire to my condo in Seattle in two years I intend to volunteer at the Children's Orthopedic Hospital.

I am in favor of doing things to promote the wellbeing of our children.

I am not in favor of building a helipad at COH because:

1. There is already a helipad in the U of W intramural field just three minutes from COH.

2. I think the millions of dollars it will cost to build and operate the helicopter service to decrease the children's arrival time by just a couple of minutes could be put to much better use doing other things for the children.

3. It is not fair to submit us homeowners and residents to the disruption and dangers of helicopters flying overhead in our retirement years when the children already have their helipad 3 minutes away.

Before making your decision, will you please pray and ask God what His will is in this matter.

With prayers that your
hearts will help you
make the right decision,

Dear Mr. Justen: Re: COH Helipad

We, as members of the Marian Blethen Mesdag Orthopedic Guild, wish to communicate to you our continued opposition to the construction of a helipad at Children's Orthopedic Hospital, Seattle, Washington. In the Spring of 1983 we wrote objecting to the Institutional Zoning Ordinance as the helipad was in the Hospital administration's plans at that time.

All of our members live in communities immediate to or adjoining the hospital, and we have lived there for many years. The group has given thousands of hours of volunteer service and thousands of dollars over the past twenty-plus years in support of good medicine.

The decision to oppose the helipad construction has not been made casually. We have studied information for and against the project. We urge the DCLU to require an EIS on this project. An EIS is a necessity, not a choice. Our information indicates there are plans in the immediate future for COH to develope a Trauma Center. These and many other factors lead us to write and express our strong opposition to the construction of a helipad at COH.

Sincerely,

Re: Children's Orthopedic Hospital Helicopter Pad Application dated November 13, 1984

Dear Mr. Justen:

I am writing this letter both to express my opposition to the Children's Orthopedic Hospital's November 13, 1984 application for operation of a helicopter pad on the hospital grounds, and also to express the reasons for my opposition.

I am not a resident of Laurelhurst, nor even of Seattle, yet I have a real and vital interest in opposing the hospital's helicopter pad application. Quite simply, that interest is the continued health and well being of my 89 year old mother who is a resident of the Laurelon Terrace Condominiums, and would be one of the nearest residents to the proposed helicopter pad. There are at least six other residents of Laurelon who are in their late eighties and early nineties, and who would likewise be adversely affected by the proposed helicopter operations.

The available information indicates that operation of the pad on the hospital ground would add very little benefit to children in emergency situations over the present operation from the pad on the University of Washington playfields. The possibility of that slight additional benefit must be balanced against the clearly detrimental affect which operation of a hospital ground pad would have on the health and comfort of my mother and the other nearby residents of Laurelon who are of a similar age.

As a result of my past military service, I am familiar with the noise levels generated by helicopter pad operations. I also experienced, approximately 15 years ago, the noise level generated by a commuter helicopter operation which was operated, on a trial basis, on the roof of a downtown Seattle office building. The noise during landing and takeoff operations totally disturbed work in all offices in the surrounding buildings within an area

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of several blocks, and my recollection is that the helicopter service was discontinued because of that severe noise interference.

In the case of the Children's Orthopedic Hospital's proposed pad, the noise level would be especially detrimental to the health and well being of the nearby residents in the eighty and ninety year old bracket.

I can understand why direct operation of the helicopters to the hospital would result in a cost savings over the present operation, as the ambulance service from the university playfield to the hospital would be eliminated. If that cost savings is a motivating factor in the hospital's pending application, then I am especially critical of the hospital having submitted that application. I am not interested in the hospital saving money at the expense of my mother's health and well being, nor at the expense of the other elderly residents near the proposed pad. I would appreciate your department inquiring into the significance to the hospital of possible cost savings as a motivating factor in their present application. Assuming it is not such a factor, then the objections stated above are nevertheless applicable and the application should be denied.

Very truly yours

H S Siqueland

January 7, 1985

Norm Rice
Seattle City Council
600 Fourth Avenue
Seattle, WA 98104

Dear Councilman Rice:

As president the Board of Trustees for the Laurel Crest Residential Park, I am writing in opposition to the proposed Helipad at Childrens' Orthopedic Hospital. I represent the 82 home owners and residents of this condominium.

To our knowledge, Childrens' Orthopedic Hospital and Medical Center has not documented a need for a helipad. Dr. Michael Copass, Director of Northwest Airlift, has stated publicly that the present plan of landing the helicopter in the intramural field has created no problems. Concerns have been raised about the need to transport premature infants to the hospital in terms that make one wonder if the planned Helipad will be located in the neonatal intensive care unit. If the pad is located outside the building, the infants will still need to be transported into the building and to the special care unit. The neonatal intensive care unit is not located in the emergency department but in another area of the hospital. To my knowledge we have no data, only hearsay, that a helipad at the hospital would benefit any critically ill child.

There are environmental concerns related to noise and safety in the surrounding residential area. I believe that these have repeatedly been brought to your attention. We certainly share these concerns.

In this time of increasing social consciousness about rising costs of health care and local and federal efforts to contain these costs, the construction of new helipad raises many concerns. The American Medical Association News (21 Sept 1984) pointed out that the cost of operating a helicopter ambulance is upward of one million dollars per year. How can Childrens' Orthopedic Hospital and Medical Center justify such an ongoing expense, particularly in view of the fact that helicopter ambulance service is currently

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

available. How will these costs compare with the current system? How will additional costs be covered? I am certain that many of the parents of children at the hospital could suggest many ways of spending the additional money to benefit more children.

If the statistics presented by the Hospital spokespersons are correct, the anticipated 15 landings per month will not result in a cost effective operation. Increasing those landings for sake of using fancy technology and making the operation "cost effective" when something less expensive would accomplish the same goal (safe, timely transport of critically ill children) is not justified. The cost of air lifting one patient to a hospital is in the thousands of dollars. How will this additional cost be managed?

Your role in approving the construction of a helipad is related to land use. I would hope, however, as an elected city official, you would be concerned with cost effective medical care in our community. I would appreciate your advice on who may be in a better position to be certain that cost issues are addressed before permission is granted for Childrens' Orthopedic Hospital and Medical Center to construct a helipad.

Sincerely,

Marci Catanzaro

Sea

December 3, 1984

Councilmember Norm Rice
Seattle City Council
600 4th Avenue
Seattle, Washington 98104

Dear Councilmember Rice,

Please add the following letter to the comments you have received reccommending further study, analysis, and consideration of alternate options for the Helipad requested by Children's Orthopedic Hospital. Since COH is such a vital and commendable institution in our community I want to acknowledge my respect for the services they deliver, but I am also anxious to urge you as a councilmember to remember that any strong, viable community is the result of more than one institution. To you goes the unenviable task of keeping a harmonious balance between all the elements that make Seattle the desirous community it is at present, and I plead with you to keep that balance in mind as you consider this request from COH.

When you make your decision on this helipad, I ask for analysis of its impact in four different categories: will this facility significantly improve the life-saving emergency care over the current procedure; will its influence on the surrounding residential neighborhood be acceptable; will the logistics, safety, and coordination of several helipads within one and a half miles of one another (one projected at the University Hospital and one at Sandpoint) be in conflict with the city's published desire to limit congestion in the University/Northend areas, as well as the desire to promote balanced growth in other parts of the city; and will the installation of a helipad at COH further concentrate care at that hospital to the exclusion and detriment of other hospitals whose facillities would be that much less than COH and less capable of attracting research monies and staff?

As an amateur in all these categories, I can do nothing more than speculate that the answers will corroborate the feeling I have that the request for the helipad is more a luxury than a necessity. No doubt each of us would like all the latest conveniences at our doorsteps, but would forego those for which the pricetag comes in irreversible, environmental damage. The challenge that tests all of us is striking the "quality of life" balance that will preserve our community.

Sincerely,
Elizabeth L. Morrison

RECEIVED
DEC 6 1984
NORMAN B. RICE
Seattle City Council

Dear Mr. Rice:

I am writing to let you know of my opposition to the proposed helipad at the Children's Orthopedic Hospital. I can't believe the administration of this hospital is asking our community to be subjected to such an unjust ordeal.

I feel there are other sternatives that are satisfactory. There are homes not more than 200 feet from the proposed landing site to the east, and a large group of condominiums one block west. These condominiums are occupied by a majority of senior citizens. I have enclosed a copy of a booklet published by the Environmental Protection Agency which states the health hazard noise can be to the elderly.

I have seen all of COH's slides of these tiny infants and have heard their same, rehearsed speeches. I find this an insult. As if one of our community would not want those children to live. I myself have suffered the loss of my seven day old daughter. To say I am not sympathetic and understanding of these babies and their families is ridiculous. But, because of money and politics this hospital is determined to disrupt our lives, destroy the character of our neighborhood, inflict possible health hazards to the elderly, and cause unknown havoc to the residents of Laurelhurst. Children's made a promise in the 1940's to be a small cottage hospital, with lots of lawn and flowering cherry trees. They have continuously lied to the community of their intentions of growth and will continue to do so.

I can only hope that you will see your way clear to deny them the helipad. I can't believe COH is asking this of the community. There are viable options that they refuse to even consider. I also find it interesting the Mr. Katz, Dr. Coppas, and the other proponents of the helipad are neatly tucked away as residents of Mercer Island and the like.

Please read the enclosed literature. It contains only a small portion of the booklet put out by the EPA. I did not include the portions of the booklet detailing the effects noise has on the unborn, learning in young children, and the effects disrupted sleep has on the physical and emotional well being of all age groups. This helipad is definately not meant for a neighborhood surrounded by homes, filled with aged, sick, young, and so varied residents.

Sincerely,

Ramy Hardwick

Mrs. Robert J. (Peggy) Habegger
President, Board of Trustees
Children's Orthopedic Hospital
4530 32nd. N.E.
Seattle, Washington 98105

Dear Mrs. Habegger,

I am writing to you about a deep concern I share with many other COH neighbors---the apparent decision of Children's Orthopedic Hospital to install a helipad.

As a resident of Laurelon Terrace since 1955, as a present condominium owner, the immediate past-president of the Laurelon Terrace Homeowner's Board of Directors, and as an individual, I have been aware of the history, mission and growth of the hospital since it moved into our area. During some of the heavy construction phases, which had significant impact on our lives, I felt that the hospital tried to be a good neighbor, to keep us informed of plans and developments. As recently as the June '84 meeting to inform the community of the latest expansion plans (which recently, I hear, have been at least temporarily abandoned) I was impressed with your personal interest in complaints of noise on the walkway just to the west of the hospital. I felt that you were responsive to reasonable requests.

At the same meeting, however, I asked publicly for Mr. Truman Katz to tell us what further plans they had for a helipad which we had first heard mentioned several years ago. Mr. Katz stated at that public meeting that they had no plans for a helipad at the moment. Such answers to direct questions in June----and the imminence of a helipad in mid-November-does not build cred bility. I feel betrayed!

If you have looked at the map showing the plans for the helipad, you will note that Laurelon Terrace---three blocks and 136 residences---will be the most severely impacted by both approach and return of helicopters whose noise level is only 3 decibels below that of a Huey.

We feel that 15 trips (which will be 30 'single' trips) a month---in the beginning----is totally unacceptable. Once the helipad is in place it will undoubtedly be used for emergency and non-emergency alike. Those of us who live in the area will pay for it in noise pollution, lack of safety, lowering of property values, erosion of our living climate. This is a residential area---it was a totally residential area when Children's Orthopedic elected to relocate here.

I have worked at the University of Washington for 35 years, both in medical research and, most recently, as a supervisor in the clinical laboratory. I do not believe that COH has proven the need for this helipad. At present, truly emergency flights can(and do) land in the University of Washington playfield at "5 Corners". The patient can be transported from helicopter to emergency entrance in less than 5 minutes. (I have seen this happen!) I do not believe the patient would be transferred from helicopter to emergency room from the helipad significantly faster.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It is hard to address this subject because we not only love children, we're proud of the total facility and the wonderful care that COH provides. We want to be good neighbors. But we think the hospital should seriously consider the impact this request will have on all its neighbors and ask themselves "Is it worth the trip?"

I am well aware of the turmoil currently going on in medical centers in response to DRG's, the Deficit Reduction Act of 1984 and the real struggle of hospitals to survive as we know them. I attended a meeting in September in Nashville with 800 other clinical laboratory directors and I know there are tough times ahead that call for creative strategies. But a helipad should not be used as a marketing tool.

To summarize:

1. COH chose to relocate in a residential area. They should abide with compatible use of our common space.
2. COH's neighbors have been very supportive of the hospital and its mission.
3. We are concerned about the number of trips, the noise pollution, the hazards and the undoubted proliferation of use.
4. Who is going to assume responsibility and reimbursement for property damage? (They do crash!)
5. Who will compensate Laurelon Terrace and other close neighbors for diminished property value? You should be aware that Laurelon has many owners who are not affluent, who would be seriously affected if they lost their investment. Many have worked all their lives to acquire their modest home and do not have the luxury to walk away and relocate.
6. We do not feel that the hospital has proven that a helipad is necessary to survival of any type of patient.
7. There will be a helipad at the University Hospital on its new building which will be finished next spring. We don't need helipads a mile apart.
8. COH has access to a "helipad" within 5 minutes of its door.

I invite your comments on my concerns and would be happy to discuss any of these points with you in depth. Laurelon is my home, which I have worked for many years to secure. I don't want to see its peaceful, liveable climate vanish through unnecessary "progress".

Sincerely

Patricia Ann Wood

Seattle, 98104

Dear Mr. Justen,

I have been a COH neigabour for 16 years, & I understand that it is considering a helipad to be installed on the hospital grounds.

A project such as this must be preceded by an EIS. I have good reason to believe that no such study has been made.

In view of the fact that the quality of life in this neigabourhood will be greatly jeopardized by a helipad, with respect to safety, noise + air pollution, I feel very strongly that an EIS must be made before COH can be allowed to consider such a project.

I offer this to your most serious consideration.

Sincerely yours,

Linda Giddens

Re: Application No. CC 84-022

Gentlemen:

I would like to be on record as opposing the proposed helipad at Childrens Orthopedic Hospital.

I live in a condominium complex just below the hospital and feel the construction is not only unnecessary but also dangerous. The hospital has an adequate helicopter landing strip only a few blocks from the hospital.

The residents of this area should be given some consideration.

Thank you,
Lucille A. Conrad

Mayor Charles Royer
600 4th Avenue - Floor 12
Seattle, WA. 98104

Dear Mayor Royer:

After years of support for and cooperation with Children's Orthopedic Hospital (COH), after months of anguished thought, and after weeks of research, the residents of Seattle--especially those who live within a few feet of the proposed site and whose lives will feel the impact--have reached the decision that a helipad ought not be built at COH. The following facts are basic to this decision:

1. A helipad is extremely unwise and unsafe in a densely populated residential area -- made up of condominiums, apartments, senior citizen housing, elementary school, and single family residences. No one can guarantee against helicopter malfunction and crash. Proposed location allows for no margin of error. For the residents living in the 136 units of Laurelon Terrace Condominiums--including a high percentage of senior citizens--the helicopter quite literally would be landing on their roof top or in their yard. Are they considered to be expendable? Will COH pay for loss of life and property in case of crash? Who will really pay?

2. The two-engine helicopter sought by COH would be noisy. It would produce negative environmental impact. The noise would be in addition to ambulance and truck traffic already endured. Emergencies can occur anytime during day or night. The noise would be disturbing at any hour to COH patients and personnel as well as to neighbors . Would you want this in your neighborhood -- day and night?

3. Alternative landing sites are available and workable. The proponents have conceded that the present landings in the UW soccer field (3 minutes from COH by ambulance) have been safe, satisfactory and no problem. Another site is available at Sand Point Naval Station (6 minutes away). A helipad at University Hospital (5 minutes from COH) will be ready for use by Spring, 1985.

4. Does every hospital in Seattle need a helipad? Why this sudden proliferation--helicopters have been available for decades. Has it become a status symbol to have a helipad? Has a helipad become a marketing tool of the medical profession/hospital administration? Do you know that hospitals in other cities USA have stopped their helicopter service because of the high risk safety and expense factors measured against negligible benefits observed for patients. Millions of dollars are being spent on each--aircraft, landing pad, maintenance of both, pilot salary and insurance. This is horrendous and excessive duplicationof expenditures. This causes costs at hospitals to rise and rise and rise!

5. The reasons given by COH for justification of helicopter service sound good--to a point--and are emotionally charged. However, one crucial point has been overlooked and/or omitted: COH located by choice in a densely populated residential neighborhood. The projected total of 30-40 flights a month (15-20 in and 15-20 out) would be detrimental and dangerous to the residents who live within a few feet from the landing pad. Since COH chose to live in this location, it has a responsibility for the safety and well-being of these residents. IF COH wishes to continue in its present location,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

we believe it must abide by the rules for a quiet and safe residential neighborhood.

Is this additional institutional encroachment in a densely populated residential neighborhood right? Is endangerment of life, property, and environment right? Is duplication of excessive expenditures right? Is it right and is it fair that the rights of the residents living next door to COH are abridged and ignored? The opponents of the helipad are concerned.

This is a city-wide concern which demands our attention. Study of how many helicopters are needed in our city, and closeness of location of helicopter service/helipads (e.g., University Hospital and COH) demands high priority planning.

In the meantime, PLEASE:

1. Visit site at Laurelon Terrace Condominiums.
2. Formulate a public statement policy for quality of life and community values for the City of Seattle.
3. Act now to prevent tragedy from helicopter accidents before they occur.
4. Stop building plans for a helipad at COH.

THANK YOU.

Sincerely,

Dear Mr. Duston,

This letter is written with the intent to let you know that our family is <u>strictly</u> opposed to the helipad at COH.

We are already in the early morning flight path of jets which sound as if they will go through our roof. We are also in the flight path of the small aircraft by Union Bay. We are in the path of numerous helicopters reporting traffic not to mention the ones used to bring emergencies to the soccer field at UW.

I feel if you allow unrestricted helicopter use at COH, you will undermine the fragile tranquility of an area already bounded by traffic, boats and planes.

Sincerely,

Department of Construction and Land Use,
Seattle Municipal Building,
Seattle, WA 98104

Gentlemen and Ladies,

I wish to express my unrelenting opposition to the application before your department by the Children's Orthopedic Hospital to build a helicopter pad. Ref: CC84-022.

In transferring its operations from its site on Queen Anne Hill to the Laurelhurst area years ago, the hospital's management faithfully assured the Laurelhurst residents that the hospital would remain a "cottage" hospital. Look at it now! It is an enormous establishment far in excess of any impression of a "cottage" hospital. To the huge building, enlarged several times, has been added a big concrete garage, all of which dominate a quiet residential area, and would endanger the community further with frequent helicopter service, which can only grow in volume as time goes by.

It is chic now for a hospital to have its own helicopter service, whether it needs it or not. Still, once the hospital has it, the pressure will be strong from every medical side to use it, regardless of the effect of the noisy helicopter on the residential community.

When Mayor Royer campaigned for office as mayor, his concern was for the maintenance of neighborhoods as places where residents might enjoy life. Believe me, enticing helicopters into this community violates the mayor's promise!

I have lived in my house at this address more than 31 years, and have lived in other houses in this neighborhood with an exception or two since 1947. I do therefore take strenuous exception to anyone or anything that tries to deteriorate my enjoyment of my home, as I am positive this intrusion by helicopters would do.

A number of years ago I was one of a group from the northeast area of the city -- I believe the mayor was one of this group -- that fought the installation of a civilian airport on the site of the present Warren Magnuson Park when the Navy gave up its airfield there. The basic reason we fought that civilian use was because of the enormous amount of airplane noise that we expected from it. The COH's helicopter would be closer and might be a lot noisier, especially at night.

If it keeps on this way, that hospital will render this area unliveable. But why should its directors care? They don't live here.

Most sincerely yours,
Richard S. Moody

January 28, 1985

RECEIVED
JAN 30 1985
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Mr. William Justin, Director
Department of Construction & Land Use
600 - Fourth Avenue
Seattle, WA 98104

Dear Sir:

As an owner of a condominium in the Laurelon complex directly below the Children's Orthopedic Hospital, I am writing to express my view regarding the proposed helipad on the grounds of COH.

It would be difficult to find anyone in the city of Seattle who is not aware of the wonderful work done by COH in caring for sick children, not only from our city, but also from the entire northwest and Alaska. Because of this, it is extremely difficult to oppose the administration of the hospital; it is tantamount to opposing home and motherhood.

However, I think it is time to consider the people who live in the area around the hospital. The hospital has expanded its facility several times over, and most recently the construction of an enormous parking garage has had a very negative visual impact on the neighborhood. COH's latest proposal, the construction of a helipad on COH grounds, will impact even more negatively on the neighborhood. Helicopter noise is extremely loud, the helicopter will have to come in low to land, and the result will be very unpleasant for people living in the area.

I understand that it has been shown that it takes around two minutes to bring a patient from the present 5-corners (Union Bay) landing place to COH. Does this small amount of time justify inflicting noise and stress on the neighborhood? In addition, many residents are concerned about the safety of such an operation. It cannot be guaranteed.

No one would wish to put a deterant in the way of a child receiving medical treatment, but it would not appear that a helipad on COH grounds would make enough difference in this way to warrant inflicting the stress of noise and a safety hazard on the neighborhood. It is time that the rights and feelings of the residents be considered. It is, after all, a residential neighborhood and a helipad has no place there.

I hope that those who will make this decision will seriously consider the rights and wishes of the community, realizing that it has the best interests of the children at COH at heart. The helipad is <u>not</u> necessary; it is a bad idea.

Sincerely,

Eugenia Neubert

Dear Sirs:

I wish to join the group against the helipad at COH. After reading pro and con statements the past several weeks, I do not feel the facility is cost effective for the service provided above that which now exists. The service proposed becomes a prestige trip rather than medical necessity.

News services have shot photos of similar service at other sites, and that type of helicopter is noisy. The noise is a pollution to the neighborhood.

Thank you
David S Belvin

Dear Sirs,

I strongly oppose a helipad at COH for the following reasons:

1) It is not necessary. The most cost effective would be COH purchase of its own ambulances

2) Noise & disturbance to patients in the hospital and to adjacent elderly housing would be totally unacceptable

3) Environmental impact study has not been done

Sincerely yours,
Helen B. Belvin

Dept of Construction and Land Use
c/o Mr William Justin
600 4th Ave
Seattle, WA 98104

I hereby respectfully request that Childrens Orthopedic Hospital file an Environmental Impact Statement for its planned construction of a helipad. As a home-owner in Laurelhurst, I am deeply disturbed about both the risks and the noise resulting from helicopter landings within a residential area and feel that the small benefits (saving of a couple of minutes over using the University playfield as is presently being done) do not justify the clear disadvantages. I am myself an MD (as is my wife) but can still not accept the "medical expertise" telling about what great advantages would be gained by bringing the helicopters about a mile closer to the hospital than where they can land now.

Yours sincerely,

Mr William Justin, Director
Department of Constructions and Land Use
600- 4th Ave
Seattle WA 98104
Dear Mr. Justin,

This letter is to urge you not to grant a Conditional permission to build a Helipad on the hospital grounds.

There are two other suitable landing areas in close proximity to the hospital which have been used without harm to patients and others to be built at the Port of Seattle Both helicopters have been transporting patients from these areas to both safely smoothly, successfully and swiftly. Their skills are constantly being upgraded Helicopters are known to navigate readily.

Recent studies done by the Port of Seattle have proven the noise of an overhead helicopter is very, very stressful That type of stress contributes to a myriad of illnesses, not the least of which is hypertension. That type of stress would deprive many older people living here, peace and tranquility they deserve to enjoy

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

To compound the stress of noise would be the stress of fear of a helicopter crash into this densely populated residential area, the prospect of killing many people, including patients and crew, the destruction of property.

Soon Cottage will begin their fund drive to collect this year, $9 million+ to pay for just one part-year. This in addition to the $1 million plus they'll need for this helipad. There must be an end or at least a slowing down of these constant requests to pay for all the sky-rocketing costs each year.

I urge you to deny permission to build a helipad at Cottage because it would be unsafely, it would duplicate an existing facility and would not enhance the safe transport of patients in an appreciable manner.

Sincerely

Anna Hyatt

DEPT OF CONSTRUCTION AND USE
LAND USE DIVISION

Dear Hermia,

I am writing you this letter to again express concern about C.O.H.'s plans to build a helipad on their property. When I met with you in December at the Dept. of Construction and Land Use you were very helpful in outlining and explaining the process through which C.O.H. must go in order to obtain a permit to build such a facility. At that time I related to you some of my initial concerns about the construction of this proposed helipad. Since that meeting I have written the enclosed letter to the orthopedic guilds of Childrens Hospital which addresses some of those some issues and raises additional questions that as of this date remain unanswered.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please take the time to read it so that you will have a better understanding of why so many Seattle citizens are opposed to these plans and are hoping that at the very <u>least</u> the D.C.L.U. will require C.O.E to file an environmental impact statement. Your decision will effect the quality of our lives here in Seattle for many years to come. Please consider the issue carefully.

Thank you again for your time, efforts and cooperation.

Sincerely,

Elizabeth Anderson

As long time residents of the Laurelhurst Community, we would oppose a helipad at Children's Orthopedic Hospital, as well as any furthur expansion such as office towers or more buildings.

When the Hospital first came to the community in the early 1950's, many promises were made by the Board and Administration that they wanted to be more than accommodating to their neighbors who were there first. Such promises as no blocking the view of the neighbors to the east, no entrances on N.E. 45th, all parking on-site, and low or no noise problems that might adversely affect the neighborhood.

As administrators and board members have come and gone, it seems that the main emphasis now is how big can the Hospital be made, and damn the neighborhood.

The community has been ignored, mislead, abused, and frankly lied to regarding the Hospital's plans, and the City of Seattle should support the community's wishes in attempting to avoid furthur deterioration.

The Laurelhurst community has been a great supporter of the Hospital in the past, both in money and donated hours, and its high time that the Hospital administration and board recognize its responsibilities to the community that so graciously welcomed them in originally.

Very truly yours,

Norman and Pauline Heartland

Mr. William Justen
Director, Department of Construction and Land Use
600 Fourth Avenue
Seattle, Washington 98104

Dear Mr. Justen:

Please help! Our neighborhood has a monster living in it. That monster is called Children's Orthopedic Hospital. No one would say the beast is all bad, and many would praise the work it does. I would too in medical terms. The problem is the way, like a nasty parent behind closed doors, it maltreats those closest to it, its neighbors. We have lived from one misrepresentation to the next. Our streets have been turned into hospital parking lots until we fought boldly for other arrangements. Our lives are disturbed by ambulances careening through the night, and our eyes are sore from the sprawling buildings which were in the beginning supposed to be a small neighborly hospital. At night we suffer the fumes of whatever they burn; many times my husband has awakened convinced that something was on fire in our house. The one thing of value which the hospital has not destroyed in its path is a luscious wild blackberry patch beyond its parking lot.

This unreliable association has destroyed the affection and the faith of those close to this hospital whose administration has a record of saying whatever the neighbors want to hear and then of doing whatever the hospital's leaders want to do. Their request for a helipad terrifies us, and this letter is a plea to you to provide us with an environmental impact statement on this dastardly possibility. No one, not even the doctors I've talked to, believe that the helipad already nearby at the University is not sufficiently close. The noise pollution and further insult of a helipad in our neighbor-hood is more than we should have to face.

Will you please help us?

With hope and gratitude for any efforts you can make,

Marilyn S. Layton

Re: Children's Orthopedic Hospital
Application CC 84-022

Dr. Marci Catanzaro, President
Laurelcrest Residential Park
4801 Terrace Drive Northeast
Seattle, Washington 98105

Dear Dr. Catanzaro:

Thank you for your recent letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. I agree that providing emergency care for children is a City-wide concern, but there have been numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

You are right that, while the City of Seattle has the responsibility to address the land use implications of hospital helipads, the role of assessing the need and "cost effectiveness" of such facilities in medical practices is beyond the function of the City government. The Puget Sound Health Systems Agency is the appropriate agency to address and set policies on these issues. Their contact person and address is: Larry Thompson, Executive Director, Puget Sound Health Systems Agency, 601 Valley Street, Seattle, Washington 98109; phone number 464-6143.

Further, you may contact the State Department of Social and Health Services regarding the requirement of a Certificate of Need for the proposal. We understand this agency is in the process of determining whether a Certificate is necessary or not. The contact person is: Christiana Sparks, Certificate of Need Program, State Department of Social and Health Services, Mail Stop ET-33, Olympia, Washington 98504; phone number (206)753-5857.

Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and you will be notified of future public hearing schedules and decisions. I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

Katy Chaney

RECEIVED
JAN 9 1985
Dept. of Construction & Land Use

William J. Justen, Director
Dept. of Construction and Land Use
600 4th Ave.
Seattle, WA 98104

Mr. Justen:

As president the Board of Trustees for the Laurel Crest Residential Park, I am writing in opposition to the proposed Helipad at Childrens' Orthopedic Hospital. .. represent the 82 home owners and residents of this condominium.

To our knowledge, Childrens' Orthopedic Hospital and Medical Center has not documented a need for a helipad. Dr. Michael Copass, Director of Northwest Airlift, has stated publicly that the present plan of landing the helicopter in the intramural field has created no problems. Concerns have been raised about the need to transport premature infants to the hospital in terms that make one wonder if the planned Helipad will be located in the neonatal intensive care unit. If the pad is located outside the building, the infants will still need to be transported into the building and to the special care unit. The neonatal intensive care unit is not located in the emergency department but in another area of the hospital. To my knowledge we have no data, only hearsay, that a helipad at the hospital would benefit any critically ill child.

There are environmental concerns related to noise and safety in the surrounding residential area. I believe that these have repeatedly been brought to your attention. We certainly share these concerns.

In this time of increasing social consciousness about rising costs of health care and local and federal efforts to contain these costs, the construction of new helipad raises many concerns. The American Medical Association News (21 Sept 1984) pointed out that the cost of operating a helicopter ambulance is upward of one million dollars per year. How can Childrens' Orthopedic Hospital and Medical Center justify such an ongoing expense, particularly in view of the fact that helicopter ambulance service is currently

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

available. How will these costs compare with the current system? How will additional costs be covered? I am certain that many of the parents of children at the hospital could suggest many ways of spending the additional money to benefit more children.

If the statistics presented by the Hospital spokespersons are correct, the anticipated 15 landings per month will not result in a cost effective operation. Increasing those landings for sake of using fancy technology and making the operation "cost effective" when something less expensive would accomplish the same goal (safe, timely transport of critically ill children) is not justified. The cost of air lifting one patient to a hospital is in the thousands of dollars. How will this additional cost be managed?

I suspect that your office is not one that is concerned with cost effective medical care. I would appreciate your advice on who may be in a better position to be certain that these concerns are addressed before permission is granted for Childrens' Orthopedic Hospital and Medical Center to construct a helipad.

Sincerely,

Marci Catanzaro

Dear Mr. Benson:

I love children.

For 20 years I taught 4 & 5 yr. olds in Sunday School.

When I retire to my condo in Seattle in two years I intend to volunteer at the Children's Orthopedic Hospital.

I am in favor of doing things to promote the wellbeing of our children.

I am not in favor of building a helipad at COH because:

1. There is already a helipad in the U of W intramural field just three minutes from COH.

2. I think the millions of dollars it will cost to build and operate the helicopter service to decrease the children's arrival time by just a couple of minutes could be put to much better use doing other things for the children.

3. It is not fair to submit us homeowners and residents to the disruption and dangers of helicopters flying overhead in our retirement years when the children already have their helipad 3 minutes away.

Before making your decision, will you please pray and ask God what His will is in this matter.

With prayers that your
hearts will help you
make the right decision,

MAYOR'S OFFICE

The Honorable Charles Royer
Mayor of Seattle
Municipal Building
Seattle, WA 98104

Re: Heliport
Children's Orthopedic Hospital

Dear Mayor Royer:

The Washington State Department of Transportation is concerned that emotional and irrational statements are being put forward by the Citizens Concerned About Helicopter Transport (CCAHT) to defeat a proposal by Children's Orthopedc Hospital (COH) to establish a heliport on their property.

In a letter to the Department of Construction and Land Use (DCLU) dated November 15, CCAHT has attacked several aspects of a study done for COH by Shapiro and Associates. As an example of some of their misleading statements relating to the use of the helicopter they state:

1) That the noise monitoring locations do not measure the noise in the residential areas they are concerned with. They fail, however, to recognize that the helicopter noise will be higher at these monitoring sites and will diminish to lower readings in a measureable amount (similar to the stated background noises) in the residential areas of concern.

2) They question a one landing test and accuse Airlift Northwest of causing false results because a patient was not onboard and full fuel "may" not have been used. Their weight calculations are wrong because an Agusta does not use aviation gas and normally would not operate with full fuel. The difference in noise measurement at any weight would be negligible.

3) MAST helicopters are noisier, but their use is limited, by statute, to critical life threatening emergencies where no alternative exists. Their criticism of their occasional use completely ignores the concern for patient survival.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4) Their criticism of future expansions of COH does not logically relate to the helicopter proposal since they will occur even if no heliport is provided. They should be disregarded in your decision.

5) CCAHT criticizes the use of air taxi accident figures from the National Transportation Safety Board, but Airlift Northwest is a Part 135 air taxi operation. For this reason the rest of their argument , especially relating to search and rescue is non-sensical. They obviously have no knowledge of what is involved in search and rescue operation versus Airlift Northwest's operation.

6) CCAHT states that the FAA only monitors the safety of Airlift Northwest operations on a "limited basis". This is totally untrue. The FAA aggressively monitors the safety, training and maintenance of Part 135 operators.

7) CCAHT illogically states that the insurers required $20,000,000 insurance. As everyone who has bought insurance knows, it is the insured that sets the limit to be purchased. An examination of relative premiums charged would be the only basis for assessing risk.

Throughout the narrative supplied by CCAHT, there is a constant thread of accusation that ignores common sense and demonstrates no concern for the needs of children in need of critical transport. Helicopter transport services have gained nationwide popularity because they have demonstrated their worth in saving lives.

Children's Orthopedic should be supported in its decision to provide this vital service at a very small cost to the local residents.

Sincerely,

Bernice Stern

Seattle, Washington 98104

Re: Helicopter - COH

Dear Ms Ryan et al:

I write to voice deep concern over the following:

1. On 12-6-85 at 10:17 a.m. a low-flying (approximately 200 feet) MAST helicopter circled several times over the Laurelhurst area, the Laurelon Terrace Condominium area, and the Laurelhurst Elementary School. School was in session. Hundreds of children's lives were endangered as well as hundreds of residents' lives.

   The MAST helicopter could not land on site repeatedly used by other helicopters at Children's Orthopedic Hospital because of inadequate space; therefore, it landed in the parking area after circling several times. Time was lost and extra transfer of patient required.

2. Please refer to article with picture, entitled "Pilot and doctor killed in crash of emergency medical copter" which appeared in The Seattle Times, December 11, 1985. This emergency medical helicopter ended in tragedy just short of its destination.

3. On Friday evening, 12-13, 1985 at 10:45 p.m., a helicopter landed at COH. Within fifteen minutes it left. The take-off flight upon leaving was unusually low, diagonally over condominiums in Laurelon Terrace; it was so low that residents involuntarily ducked, its bright lights shone through shades; it was terrible and gave us the feeling it might come right through our windows; it barely missed the rooftop. Our safety and peace of mind was in total jeopardy.

PLEASE do all within your power to stop this madness before tragedy strikes here. Thank you.

Dear Ms. Phillips:

Our office received your letter concerning the proposed plan for a helipad at Children's Orthopedic Hospital.

This is a Council Conditional Use question and presents an "Appearance of Fairness" issue. All letters concerning this subject are being sent to William Justen, Director of the Department of Construction and Land Use to be made part of the permanent record.

Thank you for taking the time to write.

Sincerely,

Benita Staadecker
Administrative Assistant for
Councilmember George Benson

JAnuary 25,1985

Council member George Benson
Seattle, City Council
600 4th Avenue
Seattle, Washington 98104

Dear Mr. Benson:

As a person who will be greatly affected by the proposed helipad for Children's Orto. Hospital, I hasten to write to you to object. I live in the condos just below the hospital and on Sand Point Way.

I have a son who is a Doctor and mans a helicopter at nite for emergency work. He has told me about the whole operation and he certainly advised me to write to anyone I could and object. The noise is terrific and although they say, do not know when the flights will occur, that will make it worse. I do believe that we have a right to peace and quiet. There are many older residents in that complex who will be really stressed by the advent of this helipad.

I plead with you for the safety and peace and quiet of the residents in this neighborhood that you scrap any thoughts of this pad. If there were no alternatives then perhaps that would shed a different light on the situation.

Thank you for your time.

Sincerely,

Jean Phillips

Frank Chestnut, Director
Certificate of Need Program
Department of Social and Health Services
Olympia, Washington 98504

Dear Mr. Chestnut:

Earlier this year, Children's Orthopedic Hospital applied to the City of Seattle for a permit to build a helipad on hospital grounds. The helipad is to be used for landing ambulance-type helicopters. In Seattle, this is a Council Conditional Use Permit; and the permit application must meet three tests, the first being that there is an established medical need.

At the time of application, we understood that your department would be requiring a Certificate of Need for such a use, and we delayed the processing of the permit to allow time for the review and action by the State. Later we received a letter from you that stated that a Certificate of Need would not be required for such a use.

Since the City must still make a finding of medical need, we have asked Dr. Bud Nicola of the Seattle-King County Health Department to give us an opinion on this question. To receive public comment, a hearing has been scheduled for October 24.

Yesterday morning we heard that you may be reconsidering the decision on whether a Certificate of Medical Need is required. When I called you today to ask if this was correct, you said you were considering making the Certificate of Need determination for the helicopter only, but not for the air ambulance service to COH. Bud Nicola and I need to have confirmation of this in writing this week so that we can decide whether or not to cancel our October 24 hearing. We have a permit application before us, so we have an obligation to process it and an obligation to the citizens living near the hospital to resolve this issue and not to let it continue to remain open.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Our preference is for you to make the decision on medical need because the Mayor has consistently supported the concept of comprehensive health care planning and believes that the Health Systems Agency is the proper forum to decide issues of medical need.

Please confirm your decision in writing immediately.

Sincerely,

BEATRICE FARRAR RYAN
Interim Director

Albert Feldmann
4873 Terrace Drive N.E.
Seattle, Washington 98105

Dear Mr. Feldmann:

I was disappointed that the State declined to consider the merits of a helipad at Children's Orthopedic Hospital (COH) through the Certificate of Need process. As a result, the City's Department of Construction and Land Use (DCLU) is now reviewing the environmental impact of the proposed facility. DCLU is also responsible for enforcement of code violations.

According to Beatrice Ryan, Interim DCLU Director, DCLU issued a Notice of Violation to COH on August 30 because COH has been using its facility for a helipad without a permit. DCLU included your letter as a supportive document for its code enforcement in this case.

The City's Land Use Code requires a finding that COH needs the helipad to save lives. DCLU has asked Dr. R. M. Nicola, Director of the Seattle-King County Department of Public Health, for his advice as to whether that level of medical need exists. Dr. Nicola will hold a public hearing on this issue, and his findings will form the basis for DCLU's recommendation to the City Council.

I appreciate your writing me to share your concerns. If you have any questions, please call Hermia Ip, the Land Use Specialist assigned to this case, at 625-4509.

Sincerely,

Charles Royer

The Hon. Charles Royer, Mayor
Seattle Municipal Building
Seattle, WA 98101

Dear Mr. Royer ,

Several months ago I wrote to you , protesting against the planned landing of helicopters at Childrens Orthopedic Hospital without an investigation of the merits of a claimed need that would turn one of Seattle's finest neighborhoods into an airport environment. Your reply , that COH would indeed be asked to show such a need, was indeed satisfactory. In the meantime COH appears to have taken advantage of a legal loophole to avoid having to show this need and , continuing its policy of bad faith and duplicity towards the residents of this neighborhood , has started to land helicopters on its grounds even before a helipad has been constructed. The history of COH's encroachment on this neighborhood is a matter of record and so are its broken promises to respect the quality of living here. After the latest violation of both the peace and safety of local residents I have protested to Ms Ormsby of the D.C.L.U. and am enclosing a copy of my letter.

Sincerely yours
Albert A. Feldmann

Subject: COH Helicopter Landings

Dear Ms Ormsby,

Further to our telephone conversation of Aug. 28. I want to reiterate my protest against the violation, by the Childrens Orthopedic Hospital, of the safety of the many residents of this densely populated area in flying helicopters at low altitude over their homes and landing them on the hospital grounds. I also want to protest against the environmental pollution caused by the engin noise of these helicopters, which is about to turn one of this city most quiet neigborhoods int a heliport area.

With regard to the specific instance of this week's landing I hear the noise but was not an eye witness. However, I have spoken with eye witnesses and given them your name and address so that they ca send you written affidavits of their observations for potential appearance as witnesses in Court. Let me add that as Vice Presiden of the Laurel Crest Condominium Owners Association, I represent 79 families in addition to myself in this protest. The administration of Mayor Royer has done a creditable job of keeping Seattle a very liveable city and your handling of this violation by an institutio whose motto appears to be " the public be damned ", will be a good indication whether this administration is capable of protecting us against such encroachments in the future or not.

Sincerely yours

Albert A. Feldmann

Albert Feldmann
4873 Terrace Drive N. E.
Seattle, Washington 98105

Dear Mr. Feldmann:

Thank you for your letter stating your objection to the landing of a helicopter at Children's Orthopedic Hospital (COH) campus. The Department of Construction and Land Use (DCLU) is responsible for reviewing the environmental impacts of the proposed helipad facilities as well as enforcing against code violations. Beatrice Ryan, Interim Director of DCLU, tells me that a Notice of Violation was given to COH on August 30, 1985, because COH has been using their premises as a helicopter landing pad without a permit. Your letter will serve as a supportive document for our code enforcement.

The City's Land Use Code also requires a finding that the helipad is needed to save lives. To make that determination, DCLU has asked the City's Health Officer, Dr. Nicola, for advice on the question of medical need. Dr. Nicola will hold a public hearing in the next few weeks, and his findings will form the basis for DCLU's recommendation to the City Council.

Thank you again for taking the time to write to me. If you have questions, please do not hesitate to call Mrs. Hermia Ip, the DCLU Land Use Specialist assigned to this case. She can be reached at 625-4509.

Sincerely,

Charles Royer

Albert A. Feldmann
4873 Terrace Drive N.E.
Seattle, Washington 98105

Dear Mr. Feldmann:

I'm sorry for my delay in responding to your letter.

Many people in Seattle feel the loss of Victor Steinbrueck personally, almost as if they had been friends with him. As a result, many offered suggestions to both the City Council and me about the best way for the City to honor him.

Because of Victor's special relationship with the Pike Place Market and his role in designing Market Park, I asked the Park Naming Committee to rename Market Park to celebrate Victor's memory. They are currently considering the request.

The City is working with Children's Orthopedic Hospital--and the community--to determine the appropriateness of a helipad. We are asking for the hospital's request to be considered in the context of the need for such a facility, whether Children's Orthopedic Hospital is the best location, or whether another hospital might be more appropriate. If you are interested in the review process, please call Hermia Ip in the City's Department of Construction and Land Use, at 625-4509.

Thank you for writing.

Sincerely,

Charles Royer

Seattle, Washington 98105

Dear Ms. Francis and Ms. Anderson:

Thank you for your letter of March 28, 1985, about the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on hospital grounds (CC 84-022).

In your letter, you asked why a citizen committee was formed for the five-acre site which COH acquired recently, and why is it not possible for our Department to establish a similar committee for the existing COH campus. Enclosed please find a copy of the COH-CARE and City Agreement which explains the specific terms and functions of the committee. As stated in the agreement, that committee was formed as a stipulation for the property transaction to provide community input and coordination on the future development of that particular site. With the helipad proposal, the SEPA Ordinance and Land Use Code provide for a different format of citizen participation, which involves public notices, comments, hearings and appeal processes. However, we will encourage COH to discuss their helipad proposal with the community as well as to consider preparation of a Master Plan. We are hopeful that they will initiate the process.

You also recommend that this Department conduct an in-depth investigation on medical needs, cost, environmental impacts and alternative sites for the helipad. We must find that the Code requirements are fully met before we can recommend approval of the permit. However, we do not necessarily involve staff in the gathering and research of medical and other data necessary to support the proposal. The burden of proof is on the applicant to satisfy the Code requirements. We review and evaluate the information provided in making our recommendation. The information and our analysis is also subject to review and comment before the Hearing Examiner at the required public hearing. At this stage, COH is still working on preparation of the environmental checklist information which we required in February. We have recently reminded them that, in addition to SEPA review, they must thoroughly address the merits of the proposal based on the Council Conditional Use criteria for the helipad (see letter attached). We will keep you informed of responses from COH.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Your suggestion to send copies of our correspondence to Frank Chestnut of the Department of Social and Health Services (DSHS) and to Larry Thompson of the Puget Sound Health Systems Agency (PSHSA) is well taken. We will do so. If you have further questions, please do not hesitate to call Mrs. Hermia Ip at 625-4509.

Very truly yours,

Katy Chaney

Re: Helipad Proposal

Dorothy F. Teeter
Director of Planning
Children's Orthopedic Hospital
P. O. Box C5371
4800 Sand Point Way N. E.
Seattle, Washington 98105

Dear Ms. Teeter:

Pursuant to our letters to you on February 20 and March 12, 1985, we understand you are in process of hiring an environmental consultant (Shapiro & Associates) to prepare the environmental impact information which we requested on the proposed helipad. As we explained, the environmental review (SEPA) process must be completed before we can schedule any hearing date for the Council Conditional Use permit. This first step includes an appeal hearing on our threshold determination (if there is an appeal), and the decision of the Hearing Examiner on the appeal.

While the environmental review process will undoubtedly disclose helpful information for our consideration on the helipad permit, you must also thoroughly address the merits of the proposal based on the Council Conditional Use criteria for the helipad (see enclosed Section 23.48.05 of the Code). I am also enclosing a copy of the "Attachment for Application Requirements for Council Approval" which you submitted earlier, for you to expand with more information. As required by Section 23.48.05, the medical need for the helipad facility must be justified, as well as the cost/effectiveness of its usage and development and potential alternative locations for the helipad and services must be discussed. As you know, we are concerned about the proliferation of such facilities resulting from competitive pressures currently at work within the health care industry. This proliferation could create undesirable environmental impacts for neighborhoods with medical facilities nearby. Therefore, in order for our review to proceed, your analysis must include a discussion of how the proposed facility meets the goals and objectives of the Puget Sound Health Systems Agency and State Department of Social and Health Services Certificate of Need Program. We would like to review, in the near future, how you propose to conduct the analysis to ensure your approach will meet our needs.

If you have further questions, please do not hesitate to contact Hermia Ip at 625-4509. She will call you soon to arrange a meeting to discuss our requirements.

Very truly yours,

WILLIAM J. JUSTEN, P. E.

LAND USE DIVISION

Mr. Russ Altermatt
Seton, Johnson & Odell
133 S.W. Second
Portland, Oregon 97204

Dear Mr. Altermatt:

Glenn and I have visited and reviewed the area around the Children's Orthopedic Hospital's helipad and its flight path to determine what we believe to be the best locations for noise monitoring. We looked at sites within the line of sight of the facility, as well as sites along the flight path. We also looked at the land use in the vicinity.

We have tentatively selected the following four sites (see attached map):

1. The east side of 44th Avenue N.E. between N.E. 47th Street and N.E. 50th Street. The approximate address of the site is ~~4420~~ 4720 44th Avenue N.E. Shrubbery and the slope of the hill provide a limited visual buffer. The grade rises from 122 feet at the helipad to 150 feet along 44th Avenue N.E. These are single family houses along this street.

2. A multiple-family housing complex (yellow/cream-colored buildings) across from COH on the west side of Sand Point Way, directly south of N.E. 50th Street. As you can see from the map, these residences are both along the flight path and within the sight range of the helipad. The ground floor of the complex is approximately at 54 feet while the helipad is due east at 122 feet.

3. A highrise, south of Site 2, located on the east side of Sand Point Way, southwest of 40th Avenue N.E. This is the tallest building in the area and, although a residence, is also located in a commercial area along Sand Point Way. This building is located along the flight path.

4. A lowrise, multiple-family complex located west, adjacent to the COH property. This complex caters primarily to the elderly and residents have voiced unified opposition to the project. The noise monitoring should be done on the northeast portion of the complex, the portion that would both experience the flight noise as well as the landing. The complex is between 40th and 42nd Avenues N.E., north of N.E. 45th Street.

After reviewing the proposed sites for your concurrence and prior to finalizing the noise monitoring locations and considerations, you should contact Curt Horner with the City of Seattle Environmental Health Department at (206) 587-2722. He is familiar with the project and is on the Mayor's noise committee. He will also, in all likelihood, review the project for DCLU regarding noise. His perspective on the site selection, as well as his viewpoint on the issues and concerns to be addressed, are important.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As soon as we have defined the monitoring locations, please call me so we can draw up the scope of services and contract, and get approval from the City's Land Use Department (which is overseeing the City's Land Use requirements). If you have any questions, please don't hesitate to call.

Sincerely,

DEPT. OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Anita Francis
5003 - 45th Avenue N.E.
Seattle, Washington 98105

Dear Ms. Francis:

Thank you for sending me a copy of Ms. Greenawalt's letter to legislators concerning the helicopter transport facility planned for Children's Orthopedic Hospital. I spoke to the hospital director, Treuman Katz, about this matter on April 24, and I understand that he has since sent a letter to each legislator explaining that Mayor Royer and the Puget Sound Health Systems Agency have not endorsed the helipad, and that Ms. Greenawalt's letter was in error.

I have also been informed by Frank Chestnut of the Department of Social and Health Services that the creation of hospital-based helipads will be subject to Certificate of Need review. This will provide an opportunity for a full, public discussion of the issues through the Puget Sound Health Systems Agency's formal review process. I believe that approach is most appropriate. It will allow a thorough examination of the medical issues associated with helicopter transport in the context of health system planning, rather than the land use process.

The Mayor has long been a supporter of cooperative health planning as a means of reducing duplication and costs, and assuring access to care for those who have been without that access in the past. His position concerning the helipad at Children's will be predicated in large measure on the evidence presented to the Health Systems Agency on the following issues:

- Will the proposed service have a demonstrable medical benefit to patients?
- If so, are there alternative methods which could be employed to achieve equal benefit at lower cost or with less community impact?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

- Will those who face economic, social, and geographic barriers to care have greater access to needed services because this project is approved?

I believe the community has similar concerns, and I hope you and your neighbors will take part in the Health Systems Agency's review so that we can achieve the best possible result for all concerned.

Since these issues will be reviewed within the context of the health planning process, it might be appropriate to postpone the meeting I had offered to convene between the community council and the hospital administration. However, I am certainly willing to convene such a meeting at any time if the parties feel it would be useful.

I appreciate the effort you have made to keep the Mayor fully aware of your views on this matter, and I look forward to working with you until it is resolved.

Sincerely,

Tom Byers

re: Orthopedic Hospital
Helipad

As a longtime resident of Laurelhurst I object strongly to the proposed Helipad at Orthopedic Hospital.

The residential community was in place long before the Hospital, and further disruption to that community is wrong — particularly since the real need is highly suspect, and perhaps the Helipad is to be used to promote public relations and to try to be competitive to those hospitals that already are so served by helicoptor

Dear Mr. Kehoe:

A while ago I met with the Laurelhurst Community Club Board and discussed the issues facing your neighborhood. During the meeting I agreed to provide a status report on the problems that were mentioned, and that report is enclosed.

I have asked Beatrice Ryan, Interim Director of the Department of Construction and Land Use, to notify your community club when the department expects to make additional revisions to the zoning code. Cliff Portman, Senior Land Use Specialist, supervises staff who work on projects in the Laurelhurst area. Please call him, 625-4509, to discuss ways the City can make it easier for the community to stay informed.

I have also written a letter (enclosed) to Treuman Katz, Administrator of Children's Orthopedic Hospital, stressing the need for COH to provide opportunities for neighborhood residents and hospital staff to share information and views on a regular basis. I believe such a mechanism is essential for maintaining a healthy and strong neighborhood, as well as a first rate children's medical institution.

I look forward to meeting with you again and enjoying another delicious pot luck dinner.

Institution Issues

University of Washington Stadium Expansion

The City Council approved, with conditions, the UW's Master Plan on June 10. One of the conditions clearly states that Master Plan approval does not constitute approval of the stadium expansion project. That project will require City Council approval of a parking management program.

Katy Chaney and Patrick Doherty have met with U.W. Campus Planning Director H. S. Thomson regarding the scope of the environmental impact statement and transportation management plan for the stadium expansion. Issues discussed included: increased vehicular and bus traffic and parking, increased police enforcement of restricted parking areas, increased METRO transit coordination, increased used of private buses, and contractual parking arrangements with other nearby facilities, possibly requiring shuttles. All members of the U.W. Interdepartmental Task Force were requested to offer suggestions regarding the scope of the DEIS and TMP at our last monthly meeting (6-17-85). These concerns and issues were presented to Mr. Thomson and discussed at the City-University meeting held on July 1, 1985.

Children's Orthopedic Hospital

- Helipad. COH has hired an environmental consultant, Shapiro Associates, to conduct a technical study on noise impact and other checklist items. An actual helicopter demonstration was conducted in May to gather noise measurements. The results of the study may be available in a few weeks. The State has also reversed its earlier decision to require a Certificate of Need.

- Short Stay Clinic. DCLU has completed its environmental review, and the project received a Declaration of Non-significance.

- Transportation Management Program pursuant to an earlier permit for the garage. The Seattle Engineering Department Ridesharing Office has been working with COH to enforce the conditions of an earlier permit (X-81-069) for the garage construction. Under that permit, COH was required to provide incentive and reward for their carpool employees with reduced parking fees and guaranteed preferential

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

parking spaces. After extensive negotiation, it appears COH is becoming more cooperative and we will be able to develop an acceptable program in compliance with the earlier permit conditions.

Neighborhood Commercial Area Policies

Sand Point Shopping Center

The current zoning is Community Business (BC) which has a 60 foot height limit and no maximum size limit for business establishments. The Mayor recommended NC2/40 feet. NC2 limits grocery stores to 25,000 square feet; all other uses are limited to 15,000 square feet unless an expansion (up to 25,000 square feet) is approved through a conditional use process. Billboards are prohibited in NC2 areas.

The 40 foot height along Sand Point Way is appropriate due to the location along a major arterial, the function of the zone as a shopping area for surrounding neighborhoods, and the scale of the surrounding single family area. While a significant topographic break exists between the commercial area and the single family residential area to the north (Burke-Gilman Trail) and south, the 40 foot height is more appropriate than the existing 60 foot limit.

Laurelhurst Business Area

A narrow strip of single family land has been proposed for Lowrise 2/Residential Commercial (L2/RC). This designation recognizes the existing commercial parking lots which were developed in the single family zone under the transition rule of the old residential zoning code (Title 24). The L2/RC zone is a residential zone with a 30 foot height limit (same as single family zoning), which allows limited commercial development at the ground level of a residential structure. Single purpose commercial development and parking structures are prohibited. Accessory commerical parking lots may be allowed in an RC zone, but only through a conditional use process. If approved, substantial screening and landscaping would be required. A minimum of 15 percent of the lot area must be landscaped, including specific requirements for landscaped setbacks along all property lines, and screening when abutting and across the street from a residential zone.

The restrictive heights and the combination of residential and limited commercial activity of the L2/RC provide a transition between the commercial area along Sand Point Way and the single family area to the south. Northeast 44th

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

provides a better zone boundary than the property line which currently separates the SF 5000 from the BC along Sand Point Way.

30th and Blakeley

The Mayor recommended a 40 foot height limit for this area. Judging by the surrounding zoning and development and the Land Use Committee's general direction in terms of designating heights, it is not likely that the Committee will recommend the 65 foot height limit.

Land Use Issues

Washington Retirement Park

The City recognized the need for this facility and imposed substantial conditions to mitigate impacts to the neighborhood. DCLU will very closely monitor the development to ensure compliance with the conditions, including the changes required to Nicklas Place N.E., which were initiated by DCLU and confirmed by the Council.

The hospital beds/nursing care facility will require a Certificate of Need.

DCLU will be the major agency involved with subsequent reviews, such as Certificate of Compliance, Master Use and Building Permits. The project does not require any further Council review.

4017 Northeast 45th Street (15-unit building)

The plans for this proposal have been specially routed to Engineering for review regarding traffic, parking and drainage. The referral comments have been received. The proponent's architect has been apprised of the neighborhood's concerns. DCLU will invite the developer and neighborhood representatives to meet, with DCLU acting as a mediator, to attempt to deal with the major concerns.

St. Bridget

St. Bridget's PUD is in for building permits. The applicants have recently contacted DCLU to discuss reducing the project by one center townhouse unit (the end units sell better). All PUD approvals have been finalized and construction and grading of the site is expected to start soon. The appli-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLE THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

cants are coming in for separate building permits on each building.

Traffic and Transportation Issues

Sand Point Way Boulevard Project

Phase I is more than 50 percent complete and includes the following improvements:

- Sidewalks, curbs, street trees and underground wiring on the west side of Sand Point Way from Northeast 50th Street to 45th Avenue Northeast. This is the former Coast Guard property being rehabilitated as Burke Gilman Place.

- A signal light at 41st Northeast at the entrance to Children's Orthopedic Hospital. The light will be operated by sensors in the street, as well as pedestrian-actuated.

- A landscaped median with street trees and ground covering, replacing the asphalt center strip from 40th Avenue Northeast to Northeast 65th Street and upgrading the existing street lighting.

- Replacement of broken concrete panels on Sand Point Way Northeast.

- A portion of the project from 55th Avenue Northeast to 57th Avenue Northeast will be omitted from this contract. This section will be constructed in conjunction with a combined sewer overflow control facility during 1985.

Sand Point Way Northeast is a State highway. Washington State Department of Transportation funding which had been earmarked for maintenance has been provided to the City for the Phase I project now under construction. The availability of the WSDOT funding, which amounts to approximately 50 percent of the Phase I costs, is the primary reason the Phase I project is underway. There is currently no funding available for future project phases.

Navy Development

In its comments on the draft EIS, the City argued that the Navy should locate its support facilities closer to Everett, rather than at Sand Point. However, we don't expect the Navy to agree with us since they already own the land at Sand Point, plus existing support facilities that will be

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

expanded. The Navy has already told us that Paine Field is too small for these facilities.

In an attempt to secure funding for necessary road improvements to accommodate increased traffic at Sand Point, the City has requested a minimum of $35 million from the Federal Defense Access Roads Program (Department of Transportation).

Before any specific improvements are made, we will carry out a community planning process to determine the best solution to the problem.

The City will be coordinating a community review of the Navy's Draft Master Plan for the Sand Point expansion. The Sand Point Community Liaison Committee, with representatives from Laurelhurst, will be included in the community review body.

Our latest information is that the Navy plans to brief the City and the community in August or September on the development of the plans. The final draft plan is expected to be released near the end of the year.

Bond Issue Issues

The Seattle 1,2,3 Bond Issue has provided $52,000 and $172,000 has been allocated from the Cumulative Reserve Fund for a total of $224,000 to provide for basic renovation of the community center. An architect has been selected, and a contract for an investigative design phase will be approved in the next couple of weeks. The architect will investigate all conditions and provide updated cost estimates. The community can anticipate a design presentation and discussion in late summer/early fall, with construction anticipated to begin in early 1986.

Unspent Bond Monies

(Please see report attached)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Seattle's Unexpended Capital Project Funds

As of December 31, 1984, the City had 13 active bond funds, with a total fund balance of $121.8 million. Nine of the bond funds have a balance of over $1 million. These are:

	Fund Balance December 31, 1984 (millions)
1960 Street Improvement Bonds	$ 14.3
Sewer Improvement Fund	31.4
Arterial Development Fund	6.3
Park Acquisition Development Fund	5.7
Neighborhood Improvement Fund	1.9
Seattle Center Improvement Fund	3.1
Police Precinct Station Fund	4.1
West Seattle Bridge Fund	35.5
Low Income Elderly and Handicapped Housing	19.4

Approximately $97 million of the $121.8 million total fund balance are reserved for "continuing appropriations." That is, these funds have been legislatively committed to specific projects. Of the remaining $24.9 million, $21.2 million of the unreserved fund balance are in two funds -- Sewer Improvement Fund and the Low Income Elderly and Handicapped Housing Fund. With the exception of approximately $5 million in the Low Income Elderly and Handicapped Housing Fund, the unreserved funds have been committed to specific projects in the 1985-1990 CIP. For example, the West Seattle Bridge Fund is dedicated to the construction of a lower level bridge in the West Seattle Freeway corridor. In addition, over $15 million from the Sewer Improvement Fund are committed to correcting continued sewer overflow problems on Lake Washington and Puget Sound swimming beaches.

Legally, bond funds may be used only for their stated purpose. For example, Senior Housing Bonds must be used for purposes identified in the Senior Housing Bond ordinance, which restricts the funds use to the provision of elderly housing and housing for special populations. That is, Senior Housing Bond Fund money cannot be used for street resurfacing.

However, bond funds can be reprogrammed within the limits of the original legislation. For example, the City recently went through a major reprogramming of the 1960 Street Bond Fund money, for bridge rehabilitation projects not identified in the original legislation. The 1985 CIP identifies the projects financed by these bond funds.

If these funds earn interest above our projections, or if projects are delayed or come in under budget, then additional funds may be available for projects eligible within the limitations of the respective fund. Those funds are then programmed in the Capital Improvement Program process each year. In order to redirect the use of those funds, projects currently funded must be unfunded and funds reprogrammed, again within the constraints of the original bond legislation.

July 24, 1985

Treuman Katz, Director
Children's Orthopedic Hospital
P.O. Box C-5371
Seattle, Washington 98105

Dear Treuman:

Not long ago, I met with the Laurelhurst Community Council and discussed their concerns for the future of their neighborhood. I want to share some of my impressions with you, in the hope that we can work together to improve the relationship between Children's Orthopedic Hospital (COH) and the neighborhood.

Community Council members feel they are being confronted by a host of external threats, ranging from residential zoning issues to commercial development along Sand Point Way N.E. I share their concerns. I've been to more than 70 community council meetings during the past year, and I have rarely seen so many issues confront a single community at the same time. I do not agree with their assessment on every issue, but I can certainly understand why they view the actions of the City, COH, the University, and other institutional actors with great concern.

Against this background, their relationship with COH seems particularly frustrating. Many of the members said there needs to be much more open communication between the hospital administration and the community. They felt past meetings with hospital officials had been one sided, with full presentations of the hospital's good works, but little exploration of community concerns. They also voiced considerable concern about the implications of your decision to appeal the state's decision regarding the applicability of the Certificate of Need process to the helipad.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In light of all the issues they are dealing with, I think we've just got to do a better job of communicating with the neighborhood. These are smart, dedicated people. Their interests will not always coincide with those of COH or the City, but I sense there is more basis for cooperation than has been recognized. For example, when I visited the Medical Center in April, you described to me your strategy of decentralization and cooperative relationships with other health providers as an alternative to further intensive development on campus. That course of action would seem to be exactly what the community wants to support. You also described to me the circumstances in which helicopter transport would be used, and the limits COH is prepared to set on the use of that resource. This seems exactly what the community wants to explore through the Certificate of Need process.

In summary, we need to find some better ways to communicate, resolve differences, and move forward together. I suspect the Community Council would welcome Children's Orthopedic Hospital as an ally in some of the other battles they are waging. I would like to help in that process in any way I can. I offer the resources of my office to help establish this kind of dialogue, and I will make the same offer to the Community Council.

I think we have a good chance to establish a more solid working relationship, and I'll look forward to that result.

Sincerely,

Charles Royer

5003 45th N. E.
Seattle, Washington 98105

Dear Ms. Francis and Ms. Anderson:

Thank you for your letter of May 15, 1985, regarding the proposal of Childrens Orthopedic Hospital (COH) for a helistop. We appreciate your concerns, and we have also reviewed your previous letters and suggestions to Mr. Justen on helistop development.

You should have, by now, received a copy of our letter to Dorothy Teeter, Director of Planning of COH, which discussed the standard of our permit review pursuant to the Council Conditional Use criteria (Section 23.48.05 of the Land Use Code), and the City's SEPA Ordinance. As you know, COH has hired an environmental consultant, Shapiro & Associates, to conduct their technical studies. We will be glad to notify you when the results of their studies are completed and available for public review.

If you have further questions, please contact Hermia Ip, Land Use Specialist, of our office at 625-4509.

Sincerely,

Katy Chaney

DEPT. OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Dear Ms. Ryan:

We have reviewed the DCLU file on the helipad proposal by Childrens Orthopedic Hospital recently and have noted the letter to Katy Chaney from Dorothy Teeter of COH dated April 29, 1985. This letter raises several questions regarding the way in which section 23.48.05 of the land use code should be interpreted. Since this is the first time that this section of the code will be implemented, it seems particularly important that the factions involved be given some guidance from you regarding its interpretation. We have written several letters to William Justen on this topic that outlines some of our thoughts about what information the city should require from a helipad applicant. In our view, the cosideration of alternatives should not be limited to only alternative helipad sites but should also include an analysis of current ground transportation services compared with the proposed helicopter service. Another important issue concerns the referral decision, normally made by a local physician, sometimes with help on the telephone from medical emergency experts at MEDCON at the University of Washington. What is unique about the services provided by Childrens Orthopedic Hospital? What other hospitals offer many or all of the services offered by Children's? We know that Mary Bridge Hospital in Tacoma, Valley General in Renton, Evergreen Hospital in Kirkland and Everett General in Everett all provide pediatric facilities and services. All of these hospitals either have a helipad now or are planning to acquire such a service. In addition, St. Luke's in Bellingham and Island Hospital in Anacortes are currently trying to obtain a helicopter service. Finally, Harborview, the major trauma center for the region has had an active helipad in operation for several years. How are the referral decisions made and what referral pattern alternatives should be included in the DCLU review?

We ask that you review our previous letters to Mr. Justen in the files on this issue and provide us with some guidance on how DCLU intends to interpret this untested section of the code. We look forward to hearing from you in the near future.

Yours sincerely,

Anita Francis

Re: Proposed Helipad (CC 84-022)

Dorothy F. Teeter
Director of Planning
Children's Orthopedic Hospital
P. O. Box C5371
4800 Sand Point Way N. E.
Seattle, Washington 98105

Dear Ms. Teeter:

As you requested, we will amplify our earlier comments on the standards for the City's review on COH's application for a Council Conditional Use permit for the helipad facility.

As stated in Sections 23.48.05.A.1.a. and c. of the Land Use Code, a helistop may be permitted if the Council finds that the helistop is needed to save life and that its use will be restricted to occurrences involving life-threatening emergencies. The intent of the Code is to ensure that the heli pad facility is used not for mere convenience purposes, but for absolute necessity. It is therefore, important for COH to document the medical need and circumstances under which the helipad facility will be used. The analysis should discuss the medical need and effectiveness of the helipad service compared with the current ground transportation service. Further, the discussion should document the capital improvement and operational costs of the helipad, and show how such expenditure will be recovered by the reasonable use of the facility without abusing the level of frequency or critical usage.

We understand that the State Department of Social and Health Services has recently made a determination to require a Certificate of Need for the helipad proposal. Your cost/effectiveness analysis pursuant to the State criteria will undoubtedly disclose similar information necessary for our permit review, and we look forward to receiving the results of your analysis. As we stated in our April 17, 1985 letter, your analysis must discuss how the proposed facility meets the goals and objectives of the Puget Sound Health Systems Agency and State Certificate of Need Program, in order for our review to proceed.

You have also asked us to amplify our concerns on the environmental impacts of the proposal. We have had several discussions with your consultant (Mr. Glenn C. Backman of Shapiro and Associates), and we have asked him to address the potential impacts of the helipad on the surrounding community (e.g., impact on air, noise, environmental health and light and glare). We also expect the discussions to include any cumulative and indirect impact such as increased employment and parking needs, if any. Our environmental review is based on the City's SEPA Ordinance effective October 1, 1984. We have also forwarded a copy of the comments of the Laurelhurst Community Club dated January 25, 1985 to Mr. Backman.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please return this (1)st to Hermia

With reference to alternative helistop locations, Section 12.38.05.A.1. states:

> "The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas."

As stated, the intent of the Code is to examine alternative locations in relation to accomplishing the purpose of the helistop. We believe the purpose of the helistop, as defined in your application,is to support COH's air ambulance service for emergencies. The purpose of the proposed helistop is not to serve the ambulance function of any other hospital in Seattle. Therefore, the analysis on alternative locations does not need to be on a regional basis. Rather, the analysis should focus on alternative locations which can accomplish the same purpose as the proposed location within the context of the COH function, including both direct and referral services.

If you have further questions, please do not hesitate to contact Hermia Ip, Land Use Specialist, of our office at 625-4509.

Sincerely,

KATY CHANEY

May 24,1985

Dear Hermia,

While we shared information over the phone in regard to COH's noise test, we thought it might be beneficial to you to have our objections in writing and on file.

Our main concerns have to do with the inconsistencies in information that we have received regarding measurement site locations, and the fact that an essentially unloaded helicopter was used in the demonstration.

We appreciate your continued sincere efforts in regard to this issue and hope that by sending this memo some fraction of your job is made easier.

Thank you,

Liz Anderson

To: Department of Construction and Land Use
From: Citizens Concerned About Helicopter Transport
Re: COH Helicopter Noise Test

May 24,1985

The Citizens Concerned About Helicopter Transport would like to express the following concerns about the helicopter noise test conducted by COHMC on Tuesdav, May 14,1985.

We would also like to point out the fact that COH once again demonstrated its lack of concern for the surrounding community by notifying the Laurelhust Community Club Board of its intended test only the evening before it was to be conducted. With such little notice, we were unable to alert the community or the residents immediately surrounding the hospital to the proposed flight. The test itself caused great concern for the people living in Laurelon Terrace, the apartment complex adjacent to the proposed helipad site.

1.Based on conversations with Hermia Ip, Karen Cummings, and the gentleman measuring the noise at COH on May 14th, we believe that the information gathered from the test will not be either adequate or valid for the following reasons.

A. It is our understanding that Hermia Ip and a representative from the consulting firm of Shapiro and Associates had agreed upon a minimum of four sites at which the noise levels of the helicopter fly-by, landing, and take-off would be measured. The locations agreed upon were to include two sites east of the hospital in the residential area, one site north of the hospital and one site west of the hospital.

B. When our representative spoke with Karen Cummings minutes prior to the demonstration, she assured us that there were only two sites being monitored and she could not tell us the specific location of the second.

C. When we spoke with the person measuring the noise levels at the first site (4407 44th N.E.), he was unaware that there were measurements being taken anywhere else other than his site.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In short, these two inconsistencies with the information given us with regard to four sites having been agreed upon for measurement, lead us to believe that the test conducted did not comply with the requests of DCLU. Further, the results of the test done on May 14th will be representative of only a very limited portion of the affected community. As we have pointed out in past correspondence with DCLU, the elderly residents of Laurelon Terrace will be severly impacted by the noise generated by such aircraft landing at, and taking off from, the proposed helipad site and yet their specific location was not monitored for noise levels during the test.

2. We believe that the demonstration monitored at COH on May 14th was not representative of what will be a typical patient transfer by helicopter.

A. The helicopter participating in the experiment carried only an empty stretcher, a female flight nurse (weighing approximately 120 pounds), and the pilot. On a typical emergency transfer of a neonate, it is expected that the helicopter will be loaded with an isolette weighing approximately 200 pounds, a patient, and a doctor in addition to the flight nurse and pilot. Because helicopter noise is related to weight on board, we feel that the measurements obtained may not be valid or representative of actual flight noise impacts.

In conclusion, we feel that the completed noise test should be deemed invalid and conducted a second time. We would like to see the noise levels monitored specifically at Laurelon Terrace in addition to the other sites previously established by DCLU. We would also like COH to use a loaded helicopter, so as to provide a more accurate measure of actual transport noise. Because of the inconsistencies which have arisen during the initial test, we would like a representative from the city to attend, if possible, and monitor a second helicopter noise test. Advance notification to the community and to Citizens Concerned About Helicopter Transport would be greatly appreciated.

Re: Proposed Helipad (CC 84-022)

Dorothy F. Teeter
Director of Planning
Children's Orthopedic Hospital
P. O. Box C5371
4800 Sand Point Way N. E.
Seattle, Washington 98105

Dear Ms. Teeter:

As you requested, we will amplify our earlier comments on the standards for the City's review on COH's application for a Council Conditional Use permit for the helipad facility.

As stated in Sections 23.48.05.A.1.a. and c. of the Land Use Code, a helistop may be permitted if the Council finds that the helistop is needed to save life and that its use will be restricted to occurrences involving life-threatening emergencies. The intent of the Code is to ensure that the helipad facility is used not for mere convenience purposes, but for absolute necessity. It is therefore, important for COH to document the medical need and circumstances under which the helipad facility will be used. The analysis should discuss the medical need and effectiveness of the helipad service compared with the current ground transportation service. Further, the discussion should document the capital improvement and operational costs of the helipad, and show how such expenditure will be recovered by the reasonable use of the facility without abusing the level of frequency or critical usage.

We understand that the State Department of Social and Health Services has recently made a determination to require a Certificate of Need for the helipad proposal. Your cost/effectiveness analysis pursuant to the State criteria will undoubtedly disclose similar information necessary for our permit review, and we look forward to receiving the results of your analysis. As we stated in our April 17, 1985 letter, your analysis must discuss how the proposed facility meets the goals and objectives of the Puget Sound Health Systems Agency and State Certificate of Need Program, in order for our review to proceed.

You have also asked us to amplify our concerns on the environmental impacts of the proposal. We have had several discussions with your consultant (Mr. Glenn C. Backman of Shapiro and Associates), and we have asked him to address the potential impacts of the helipad on the surrounding community (e.g., impact on air, noise, environmental health and light and glare). We also expect the discussions to include any cumulative and indirect impact such as increased employment and parking needs, if any. Our environmental review is based on the City's SEPA Ordinance effective October 1, 1984. We have also forwarded a copy of the comments of the Laurelhurst Community Club dated January 25, 1985 to Mr. Backman.

THE CHILDREN'S ORTHOPEDIC HOSPITAL AND MEDICAL CENTER

April 29, 1985

RECEIVED
MAY 1 - 1985
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Ms. Katy Chaney
Director
Land Use Division
Seattle Department of
Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Re: The Children's Orthopedic Hospital and Medical Center
Helipad Proposal

Dear Ms. Chaney:

Thank you for your letter of April 17, 1985, and for your assistance in connection with our request for the City's approval of the construction of a helipad at COHMC. If I may, I would like to request that you amplify or explain some of your comments regarding the standards for the City's review of our application for council conditional use approval.

You enclosed a copy of Section 23.48.05, which set forth the criteria for approval of a helipad. When you allude in the April 17 letter to our need to justify "the medical need for the helipad facility," I believe that is a reference to Section 23.48.05A.1.a. This provision of the applicable code section requires a showing that the "helistop is needed to save lives."

Your letter appears to say that we are required to show the cost-effectiveness of the helipad's usage and development. I could not find a provision in Section 23.48.05 requiring such an analysis. I would appreciate your assistance in explaining the need for this type of analysis.

In your letter, you indicate that you are concerned about the proliferation of helipads and the resultant undesirable effects on neighborhoods. It would be of assistance to us if you would provide us with examples of such undesirable effects, or amplify your concerns sufficiently so that we could be sure that we addre s the City's specific concerns.

P.O. BOX C5371 • 4800 SAND POINT WAY N.E. • SEATTLE, WASHINGTON 98105 • (206) 526-2000

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Finally, you indicate that the City's review cannot proceed without an analysis of the helipad in light of the goals and objectives of the Puget Sound Health Systems Agency and the State Department of Social and Health Services Certificate of Need Program. We would very much appreciate a clarification of this statement. The Puget Sound Health Systems Agency's goals and objectives are simply an interpretation of those of the State Department of Social and Health Services Certificate of Need Program. The proposed helipad is exempt from certificate of need review under the policy of the legislature embodied in the Health Planning Act (Chapter 70.38 RCW) and the regulations of the Department of Social and Health Services interpreting that Act. I presume that the Seattle Department of Construction and Land Use is not going to assume the role of the Certificate of Need Program and ask us to address our arguments to it as if a Certificate of Need were required where one is not. In any case, please advise us of your thought about this matter.

Again, thank you for your assistance. We very much appreciate the dialogue between COHMC and the Department of Construction and Land Use on this matter.

Sincerely,

Dorothy F. Teeter

Dear Ms. Teeter:

This is to inform you that the construction of a helipad at Children's Orthopedic Hospital is subject to Certificate of Need review under the provisions of 70.38 RCW and 248-19 WAC. We consider a capital expenditure by a health care facility that enables on-site landing by an emergency services helicopter to be a capital expenditure which substantially changes the services of the facility under the provisions of WAC 248-19-230(1)(b).

Enclosed are Certificate of Need application materials. I would encourage you to meet with staff from this office, the Puget Sound Health Systems Agency and the Hospital Commission prior to development of your application so that we can identify potential issues and discuss elements of your proposal that should be emphasized in your application.

Sincerely,

Frank Chestnut

LAND USE DIVISION

Mr. Russ Altermatt
Seton, Johnson & Odell
133 S.W. Second
Portland, Oregon 97204

Dear Mr. Altermatt:

Glenn and I have visited and reviewed the area around the Children's Orthopedic Hospital's helipad and its flight path to determine what we believe to be the best locations for noise monitoring. We looked at sites within the line of sight of the facility, as well as sites along the flight path. We also looked at the land use in the vicinity.

We have tentatively selected the following four sites (see attached map):

1. The east side of 44th Avenue N.E. between N.E. 47th Street and N.E. 50th Street. The approximate address of the site is ~~4420~~ 4422 44th Avenue N.E. Shrubbery and the slope of the hill provide a limited visual buffer. The grade rises from 122 feet at the helipad to 150 feet along 44th Avenue N.E. These are single family houses along this street.

2. A multiple-family housing complex (yellow/cream-colored buildings) across from COH on the west side of Sand Point Way, directly south of N.E. 50th Street. As you can see from the map, these residences are both along the flight path and within the sight range of the helipad. The ground floor of the complex is approximately at 54 feet while the helipad is due east at 122 feet.

3. A highrise, south of Site 2, located on the east side of Sand Point Way, southwest of 40th Avenue N.E. This is the tallest building in the area and, although a residence, is also located in a commercial area along Sand Point Way. This building is located along the flight path.

4. A lowrise, multiple-family complex located west, adjacent to the COH property. This complex caters primarily to the elderly and residents have voiced unified opposition to the project. The noise monitoring should be done on the northeast portion of the complex, the portion that would both experience the flight noise as well as the landing. The complex is between 40th and 42nd Avenues N.E., north of N.E. 45th Street.

After reviewing the proposed sites for your concurrence and prior to finalizing the noise monitoring locations and considerations, you should contact Curt Horner with the City of Seattle Environmental Health Department at (206) 587-2722. He is familiar with the project and is on the Mayor's noise committee. He will also, in all likelihood, review the project for DCLU regarding noise. His perspective on the site selection, as well as his viewpoint on the issues and concerns to be addressed, are important.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As soon as we have defined the monitoring locations, please call me so we can draw up the scope of services and contract, and get approval from the City's Land Use Department (which is overseeing the City's Land Use requirements). If you have any questions, please don't hesitate to call.

Seattle, Washington 98108

Dear Mr. Sherrow:

Thank you for your letter and suggestions on the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on hospital grounds. I have asked William Justen, Director of the Department of Construction and Land Use, to respond to your specific concerns, and if you have not already heard from him, I'm certain you will soon. I have also asked Mr. Justen to provide me with a copy of his reply.

I appreciate your interest in the development and environment of your neighborhood and, again, thank you for taking the time to write.

Sincerely,

Charles Royer

MAYOR'S OFFICE

AK- FYI

Mayor Charles Royer
600 Fourth Ave.
Floor 12
Seattle, Wn. 98104

Dear Mayor Royer,

As a concerned citizen and resident of the neighborhood around Children's Orthopedic Hospital, I try to stay in touch with the proposed developments at the hospital. Since there are four major projects on going at this time, and little advanced notice to the neighborhood as to the plans, it is rather difficult. However the issue that inspired this letter is the proposed helipad.

I have written letters and stayed in contact with the DCLU and Mr. William Justin. The fourteen day period for public comment on the helipad ended on January 30, 1985 and I waited until February 7, 1985 to contact Mr. Justin's office about the decision concerning the necessity for an environmental impact statement on the helipad. During this conversation I was informed that a decision would not be reached for at least six weeks. The reason for this delay was that they were waiting for more information about the noise level and other impact from COH. I then asked if they would like more information from myself or other citizens about what we thought or knew about helicopters and was told that the time for public comment was over.

Waiting for more information about the impact from COH.

Public comment period is over.

Is the fox watching the hen house?

I believe that the information provided by COH will be bias in their favor, and further that Mr. Justin should be allerted to this fact. Yes, we need more information and this is what I am requesting in the form of an enviromental impact statement.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Over the next twelve months COH is planning; 1) a new professional building; 2) expanding the short stay unit; 3) expanding the emergency room into a major trama center and; 4) building a helipad. Perhaps a master use plan would be appropriate, or even a certificate of need for the over all projects. As individual projects the codes do not require any major application or notification on the part of the COH. However, the impact of the total of the parts certainly will be significant.

Please advise me as to your thoughts on the helipad and the need for an environmental impact statement.

Sincerely,

Dale E. Sherrow, Jr.

Ms. Dorothy Teeter
Director of Planning
Children's Orthopedic Hospital
4800 Sand Point Way N. E.
Seattle, Washington 98105

Dear Ms. Teeter:

Pursuant to your meeting last week with Hermia Ip, Land Use Specialist of our Land Use Review Section, this is to confirm that the following information is required for our review of the Children's Orthopedic Hospital (COH) application for a helistop on the hospital grounds (CC 84-022):

1. A detailed description on the current emergency air transportation procedures, and the procedures involved with the proposed helistop facilities. Explain the benefits gained by the proposal, perhaps in terms of time, distances, extent of efficiency and any other pertinent factors. Why are such facilities needed at this particular location of COH and at this time?

2. We understand Airlift Northwest will be contracted to provide the helicopter services. Where will the helicopters be stationed? Use a map to show their flight paths, altitude and the geographic areas impacted. What kind of helicopters will be used, and what noise levels are generated by such equipment? What devices, if any, do these planes have for noise control?

3. How will the existing noise levels of the hospital and the surrounding community be impacted? Provide measurements on existing noise levels on site and at typical recipient points in the surrounding community. Based on the experience of similar services in comparable neighborhood environments, project the probable noise levels caused by the proposal. What mitigating measures are proposed?

4. For each landing and takeoff of the helicopter, what time duration is necessary? What time span is involved for any noise impact?

5. How frequent will the helistop services be used? Identify the average case and worst case. Based on the hospital's history and other pertinent considerations, what is the probable occurrence of night-time use versus day-time use?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. What economic costs are involved with the helistop services? What implications do the economic data have on the probable frequency and extent of use? In COH's contract with Airlift Northwest, is there a stipulation on a minimum use? What arrangement, plan and/or agreement does COH have with other hospitals in Seattle regarding the use of the helicopter services? Please submit a copy of COH's contract with Airlift Northwest.

7. What will be the potential impact on air quality? What quantity and quality of exhaust will be generated by the helicopters? What mitigating measures, if any, are proposed?

8. What will be the potential impact on light and glare? What sources and extent of light will be generated, both on campus and on the helicopters? What mitigating measures are proposed to minimize impact on the residential neighborhood?

As Mrs. Ip mentioned at the meeting, the Department has received numerous citizen phone calls and letters from the community, expressing their concerns with the environmental impacts of your proposal. We encourage you to review the file and incorporate, as much as possible, any pertinent community input in your response to this letter. If you have further questions, please do not hesitate to call Mrs. Ip at 625-4509.

Very truly yours,

Re: Children's Orthopedic Hospital Helicopter Pad Application dated November 13, 1984

Dear Mr. Justen:

I am writing this letter both to express my opposition to the Children's Orthopedic Hospital's November 13, 1984 application for operation of a helicopter pad on the hospital grounds, and also to express the reasons for my opposition.

I am not a resident of Laurelhurst, nor even of Seattle, yet I have a real and vital interest in opposing the hospital's helicopter pad application. Quite simply, that interest is the continued health and well being of my 89 year old mother who is a resident of the Laurelon Terrace Condominiums, and would be one of the nearest residents to the proposed helicopter pad. There are at least six other residents of Laurelon who are in their late eighties and early nineties, and who would likewise be adversely affected by the proposed helicopter operations.

The available information indicates that operation of the pad on the hospital ground would add very little benefit to children in emergency situations over the present operation from the pad on the University of Washington playfields. The possibility of that slight additional benefit must be balanced against the clearly detrimental affect which operation of a hospital ground pad would have on the health and comfort of my mother and the other nearby residents of Laurelon who are of a similar age.

As a result of my past military service, I am familiar with the noise levels generated by helicopter pad operations. I also experienced, approximately 15 years ago, the noise level generated by a commuter helicopter operation which was operated, on a trial basis, on the roof of a downtown Seattle office building. The noise during landing and takeoff operations totally disturbed work in all offices in the surrounding buildings within an area

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of several blocks, and my recollection is that the helicopter service was discontinued because of that severe noise interference.

In the case of the Children's Orthopedic Hospital's proposed pad, the noise level would be especially detrimental to the health and well being of the nearby residents in the eighty and ninety year old bracket.

I can understand why direct operation of the helicopters to the hospital would result in a cost savings over the present operation, as the ambulance service from the university playfield to the hospital would be eliminated. If that cost savings is a motivating factor in the hospital's pending application, then I am especially critical of the hospital having submitted that application. I am not interested in the hospital saving money at the expense of my mother's health and well being, nor at the expense of the other elderly residents near the proposed pad. I would appreciate your department inquiring into the significance to the hospital of possible cost savings as a motivating factor in their present application. Assuming it is not such a factor, then the objections stated above are nevertheless applicable and the application should be denied.

Very truly yours

Herman S. Sigueland

PAUL KRAABEL
SEATTLE CITY COUNCIL

February 14, 1985

Mr. Paul Kraabel
Seattle City Council
1100 Municipal Bldg.
Seattle, 98104

Dear Sir:

The Mayor has requested a "Certificate of Need Study" of helicopter landing sites for Seattle hospitals. Montlake Community Club supports this, and in addition requests that the Council prepare legislation that would require a "Master Plan" for helicopter service before any helistop building permits would be issued. This plan would be prepared by hospital administrations and a Council committee.

If all area hospitals should decide to have helistops, added costs would result without a significant gain in patient care. Without some organization in control such proliferation may be forced by economic pressures. Now is the time to act.

montlake Community Club therefore supports the Laurelhurst Club in requesting a hold on the construction of pads until a logical location pattern can be agreed upon.

The City should try to control helicopter population in our sky. The various uses that result in operation below 2000 feet altitude should be subject to the requirement for a City license. The number issued for each need could be limited. Thus , for example, the various radio stations would find a way to share trafic spotting choppers.

The City should not allow commercial presures to prevail over the citizens desires for quiet overhead.

Earl E. Wheatley, Pres.
Montlake Community Club

Dept of Construction & Land Use
Municipal Bldg
Seattle WA

Dear Sirs:

I am writing because I am concerned about the development of helicopter service at Childrens Orthopedic Hospital

Everyone recognizes the value and importance of Childrens Orthopedic Hospital to the community and to the Pacific Northwest. Everyone wants to save lives wherever possible But does it not, too, to be balanced by some of its obvious disadvantages?

First, the overwhelming financial cost to the hospital, but mostly to the patients involved.

Could the service from Grades

field not be expanded and imprisoned for these "few" cases they expect.
In my view University Hospital and Childrens could cooperate further in this kind of service

Noise is a big unpleasant factor from the hospital mentions how it could effect the patients already there Lights would be still worse

The competition among hospitals to fill beds needs to be regulated adding helipads will only promote this Ambitions, competing helicapter services add to the problem

There are dangers in flying over heavily populated areas

Expanded use of helicapters except in cases of true emergency could badly effect the use of the military helicapters which are already giving good service

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and are paid for by taxpayers.

Orthopedic Hospital moved into this community saying they would only be a "cottage" hospital. They have not kept promises made. In the case of the large concrete garage they promised it would ~~only~~ be ~~one~~ no higher than the present parking lot. It is a very unsightly two story structure for those of us who live near it. Their policy of secrecy about their plans is very disturbing.

I wish you success in solving these problems. I dont mean to stand in the way of progress, but there are valid neighborhood considerations.

Sincerely yours
Claire Marston

Dear Ms Ryan

In general I am a booster of Childrens Hospital but re the case of the illegal landing of helicopters over this complex - and so low over our housetops - I must object stongly. For one with normal hearing the noise is destracting enough but for a wearer of double hearing aids, it is definitely deafening. There are two sides to all questions, we would like to see the lives of the patients saved but what about the effect on we who live here and have for years.

Respectfully,
Edna Lincoln

Re: Unauthorized Helicopter Landing at
Childrens Orthopedic Hospital

Dear Ms. Ryan:

I am writing to protest the unauthorized landing of helicopters at Childrens Orthopedic Hospital. Last night August 27 at about 8:15 p.m. a noisy, thrashing, vibrating helicopter came over my roof and landed at the hospital. This is a residential neighborhood and I do not approve of turning my home into a landing field. I am in the path of these noisy obtrusive objects and can do nothing to avoid the racket. This is the second time this has happened and it seems the hospital is acting with complete disregard for the people that dwell in its vicinity. This is a detriment to the neighborhood and I am sure if one put one's condominium up for sale and one of those helicopters came over at the precise time you were showing the condominium you would be unable to make a sale, therefore it is lowering the property value as well.

It seems that Childrens Orthopedic Hospital has a pattern of expansion that is oblivious to the neighborhood concept. The original plans called for a cottage type of institution and they have added on continuously so that they sprawl all over the hill in ever uglier proportions.

The hospital should not be allowed to invade a peaceful neighborhood with ever increasing noise polution. Their ambulance sirens are enough to contend with as it is. Everyone knows they are trying to become a trauma center as their patient count has fallen and they are just trying to attract more business. However this latest attempt to attract business should be weighed in relation to the deteriorating effect it is having on the surrounding neighborhood.

I would be very interested to know your views on the subject and what can be done to keep the hospital from transgressing on other people's rights.

Yours very truly,

Pat Lundquist

Re: Unauthorized Helicopter Landing at
Children's Orthopedic Hospital

Dear Ms. Ryan:

I am writing to protest the alleged unauthorized landing of helicopters at Children's Medical Center and Hospital, Sand Point, Northeast Seattle. I understand that authorization for such landings has not been given as it has not been proven that such activity is necessary to save a child's life. Helicopters do land two minutes away by ambulance.

This is a residential neighborhood and, to date, the residents have been more than generous to the Medical Center as it has grown, annually, in physical size to accommodate its needs. However, the noise factor and the possibility of accidents are a real problem here. The landing at a nearby play field, just two minutes away by ambulance, has been adequate to date. I see no reason to change this arrangement.

I am hoping that you will take all opinions into consideration before permission is given for helicopter landings on the hospital grounds. Please know that I, of course, am interested in and proud of the Medical Center and all it is doing for children of our State of Washington. However, the surrounding neighborhood deserves to be kept to the standard it has been and not reduced to an uncomfortable place to live and/or sell their homes.

Yours very truly,

Subject: COH Helicopter Landings

Dear Ms Ormsby,

Further to our telephone conversation of Aug. 28. I want to reiterate my protest against the violation, by the Childrens Orthopedic Hospital, of the safety of the many residents of this densely populated area in flying helicopters at low altitude over their homes and landing them on the hospital grounds. I also want to protest against the environmental pollution caused by the engine noise of these helicopters, which is about to turn one of this city's most quiet neigborhoods into a heliport area.

With regard to the specific instance of this week's landing I heard the noise but was not an eye witness. However, I have spoken with eye witnesses and given them your name and address so that they can send you written affidavits of their observations for potential appearance as witnesses in Court. Let me add that as Vice President of the Laurel Crest Condominium Owners Association, I represent 79 families in addition to myself in this protest. The administration of Mayor Royer has done a creditable job of keeping Seattle a very liveable city and your handling of this violation by an institution whose motto appears to be " the public be damned ", will be a good indication whether this administration is capable of protecting us against such encroachments in the future or not.

Sincerely yours,

Albert A. Feldmann

Seattle
Department of Construction and Land Use

August 30, 1985

Bud Nicola, Director
Health Department
7th Floor, Yesler Building

Dear Mr. Nicola:

I am writing to ask your help.

As you know, this Department has received an application from the Children's Orthopedic Hospital to establish a helipad on hospital grounds. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

We must make a recommendation to the City Council and our report must examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas as part of the analysis.

The question of medical need is beyond our area of expertise and this is where I am asking for your Department's assistance. In the past, helicopters have made emergency landings at the Graves athletic field and patients are then transported by ambulance to either Children's Orthopedic or to the University of Washington Medical Center. This request by Children's Orthopedic would mean those patients destined for Children's would instead land on hospital grounds with those destined for the University of Washington continuing to land at Graves field. The University of Washington may subsequently apply for a permit for a helistop on the grounds of the U. W. medical campus.

You have agreed to sponsor a public hearing and to give us your opinion on the question of medical need. The questions I would like your opinion on are:

1. What are existing emergency services in Seattle and how does the service fit into the existing services?
2. What emergency services does COH offer that are unique and unavailable elsewhere?
3. Is there a medical need for emergency helicopter service to serve the hospitals in this immediate area, (Children's and University of Washington primarily)? What, if any, would be the effect on the well-being of a patient transported by helicopter versus helicopter and ground transport as it is presently done? Are direct flights versus air/ground transports medically significant in terms of patient morbity and mortality?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Is the current site at Graves athletic field adequate, or is there a medical need to locate such facilities on the hospital grounds? Or are there alternative sites? Would one such facility either at COH or U. W. be a preferred location?
5. What data are available regarding the number of emergencies that are likely to be generated by the population to be served by the helicopter services? How many landings per week will result?
6. If there is an established medical need, how would you define "occurrences involving life-threatening emergencies," as the use must be restricted to such occurrences? Are there other restrictions we should consider, based on existing medical care facilities capabilities?
7. How would you suggest we monitor the occurrences to ensure that the use is restricted to life-threatening emergencies should the use be permitted? Can we ensure that the service is used for emergency purposes only?

We have asked Children's Orthopedic Hospital for more information to support their application for the helistop (see attached). This information is necessary for your consideration of these questions. As soon as we receive it, we will send you a copy. As you know, we are happy to help with the scheduling and public notice of the hearing.

Thank you for your assistance. If you have questions, please call me at 625-2262 or Katy Chaney at 625-4274.

Sincerely,

Katy Chaney

Attn.: Ann Ormsby

De ar Ms. Ormsby,

I am writing in connection with the application for conditional use permit filed by the Childrens' Orthopedic Hospital allowing the hospital to const ct a helipad on their property.

While I am in agreement that such a facility might make transfer of patients to the hospital more convenient and on some occasions might aid ina life-threatening situation, I feel that these advantages are outweighed by the effect of the noise on residents of the immediate neighborhood, many of whom are senior citizens and a number in poor health.

I understand that there have been three recent landings of helicopters at the site, even though no land use permit has been granted. I object to such flaunting of authority and urge that the hospital's application be denied. (My wife, Mrs. Kathleen McHigh Johnston, withes that her objection also be registered.)

Ve ry truly yours,

Leo C. Johnston

Ms. Dorothy Teeter
Director of Planning
Children's Orthopedic Hospital
4800 Sand Point Way N. E.
Seattle, Washington 98105

Dear Ms. Teeter:

Pursuant to your meeting last week with Hermia Ip, Land Use Specialist of our Land Use Review Section, this is to confirm that the following information is required for our review of the Children's Orthopedic Hospital (COH) application for a helistop on the hospital grounds (CC 84-022):

1. A detailed description on the current emergency air transportation procedures, and the procedures involved with the proposed helistop facilities. Explain the benefits gained by the proposal, perhaps in terms of time, distances, extent of efficiency and any other pertinent factors. Why are such facilities needed at this particular location of COH and at this time?

2. We understand Airlift Northwest will be contracted to provide the helicopter services. Where will the helicopters be stationed? Use a map to show their flight paths, altitude and the geographic areas impacted. What kind of helicopters will be used, and what noise levels are generated by such equipment? What devices, if any, do these planes have for noise control?

3. How will the existing noise levels of the hospital and the surrounding community be impacted? Provide measurements on existing noise levels on site and at typical recipient points in the surrounding community. Based on the experience of similar services in comparable neighborhood environments, project the probable noise level caused by the proposal. What mitigating measures are proposed?

4. For each landing and takeoff of the helicopter, what time duration is necessary? What time span is involved for any noise impact?

5. How frequent will the helistop services be used? Identify the average case and worst case. Based on the hospital's history and other pertinent considerations, what is the probable occurrence of night-time use versus day-time use?

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. What economic costs are involved with the helistop services? What implications do the economic data have on the probable frequency and extent of use? In COH's contract with Airlift Northwest, is there a stipulation on a minimum use? What arrangement, plan and/or agreement does COH have with other hospitals in Seattle regarding the use of the helicopter services? Please submit a copy of COH's contract with Airlift Northwest.

7. What will be the potential impact on air quality? What quantity and quality of exhaust will be generated by the helicopters? What mitigating measures, if any, are proposed?

8. What will be the potential impact on light and glare? What sources and extent of light will be generated, both on campus and on the helicopters? What mitigating measures are proposed to minimize impact on the residential neighborhood?

As Mrs. Ip mentioned at the meeting, the Department has received numerous citizen phone calls and letters from the community, expressing their concerns with the environmental impacts of your proposal. We encourage you to review the file and incorporate, as much as possible, any pertinent community input in your response to this letter. If you have further questions, please do not hesitate to call Mrs. Ip at 625-4509.

Very truly yours,

P. O. Box 80181
Seattle, Washington 98108

Dear Mr. Sherrow:

Thank you for your letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. We have received numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

As you know, we are reviewing the environmental checklist submitted by COH, and we have requested additional information necessary for our threshold determination. I am enclosing a copy of our letter to COH dated February 20, 1985. We do not preclude any comment from the public, although our official comment period has expired as of January 30, 1985. Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and will be given careful consideration in our review process. You will also be notified of future public hearing schedules and decisions on this proposal. Further, you may contact the State Department of Social and Health Services regarding the requirement of a Certificate of Need for the proposal. We understand this agency is in the process of determining whether a Certificate is necessary or not. The contact person is: Charles H. Pugh, Certificate of Need Program, State Department of Social and Health Services, Mail Stop ET-33, Olympia, Washington 98504; phone number (206)753-5857.

I appreciate your interest, and I am glad you took the time to write. If you have other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

WILLIAM J. JUSTEN, P. E.
Director

RE: Orthopedic Hospital helipad controversy

Dear Editor,

I am absolutely amazed at the selfish attitude of some Laurelhurst residents regarding the use of helicopters for delivery of patients to Children's Orthopedic Hospital. How can anyone even attempt to obstruct the saving of a human life!

Incidentally, we went through an identical controversy some fifteen years ago when the use of a similar facility was proposed for Harborview Hospital. Thanks to the compassion and common sense of responsible officials, the protests were denied and the helipad approved. Since that time hundreds of patients have benefited and in many cases lives were saved because this capability exists.

Harborview Medical Center and Children's Orthopedic Hospital offer specialized medical treatment not available at any other hospital in the state. If a patient's life can be saved or their recovery enhanced, these hospitals should be used regardless of some periodic minor irritation to adjacent residents.

The selfish position of some Laurelhurst residents was emphasized by the suggestion, at a recent meeting on this subject, that a Chehalis child being rushed to Orthopedic by helicopter could have stopped at some other hospital enroute. I wonder if the spokeswoman was suggesting Madigan General?

Let's end this foolish debate and grant whatever permits are required for authorization of the helipad.

Sincerely,

Gordon F. Vickery

DEPT. OF CONSTRUCTION & LAND USE
LAND USE SECTION

Dear Mr. Welsh,

I understand that Representative Joanne Brekke, as chair of the House Social and Health, will hold a public hearing on September 9 in Seattle regarding the medical need for helicopter services in the state. I will not be able to attend the hearing. However, I support the need for Children's Orthopedic Hospital to have a Helipad on their campus.

I am a family practice physician in Forks, a town of 3000 on the Olympic Peninsula. We transport several premature infants and other ill children to Children's Orthopedic Hospital each year. In transporting children from Forks to Seattle, there is already an inherent delay in awaiting the helicopter from Seattle. To require a transfer by ground ambulance from Harborview Medical center to Children's Orthopedic Hospital would add unnecessary delay which might affect the care of the child adversely. Many times the high level of care provided at Children's Orthopedic is time dependent: this is especially true in the care of premature infants with severe lung disease requiring ventilator assistance.

On August 20, we transported a premature boy whose lung collapsed at the Forks airport. He was in critical condition on arrival in Seattle. I feel that his life would have been endangered by further ground transport in Seattle. I understand he is now doing quite well and nearing discharge.

I realize that there is some impact on the homeowners near the hospital, but I would still encourage helicopter transport services at Children's. That institution plays a vital role in treating severely ill children from outlying regions and I think that helicopter services at Children's are an integral part of that kind of care.

Sincerely,

Richard Gibson

Enclosed you will find a letter that I have sent to the citizen's group opposing the helipad at COH. It expresses my sentiments.

In my opinion there is no comparison between brief episodes of noise and the saving of human lives. I live on the Sol Duc river which is patrolled by helicopter for various reasons--fisheries, forest use, etc. The sound of a helicopter is less bothersome and lower pitched than jet engine noise. I can't see how sporadic helicopter landings could greatly disturb the citizens of Laurelhurst.

Children's Orthopedic is an established resident of the community and deserves as much consideration or more than private citizens because of the importance of the work done there and the lives saved.

Thank you very much.

Very sincerely,

Susan L. Shane

Susan L. Shane CRN

September 5, 1985

Dear Neighbors of COH:

I am sorry that you object to a helicopter landing site at the hospital. I hope you are still open to considering the issue f m all sides.

I grew up in the Sand Point/View Ridge area. We were always very proud of our famous neighbor--Children's Orthopedic Hospital. We supported it with our donations, our guild memberships and always had the calendar hanging in the kitchen.

I always knew I would be a nurse and went on to specialize in perinatal nursing, caring for mothers and their newborns. I moved to Forks, Wa. 10 years ago. I am now a Nurse Practitioner and work in a tiny clinic where I give care to expectant mothers. You can imagine how distressed we were when our patient Jackie Amsdill came in one morning fully dilated yet 2½ months away from her due date.

Our little hospital and dedicated doctor and nurses flew around and made ready for the birth of little Blayne, just 3 lbs. We were so grateful for the Seattle perinatal team that came by helicopter to assist Blayne with life saving state-of-the-art techniques that a small hospital like ours can't offer. Blayne's condition was deteriorating and we knew his only hope was to get to an expert neonatal intensive care unit within a short period of time. Thank goodness the physician made the decision to land right at COH and not stress a critically ill, fragilepremie by unloading at the always windy football field and making yet another transfer via ambulance.

We're glad to report that little Blayne is doing pretty well and will likely grow up. Think how thrilled his parents must be. Babies have not come easy to this family. They know the pain of losing a baby. Fewer minutes and less stress in transport DID make a difference to this baby--it probably saved his life.

The sound of a helicopter coming in to land is a welcome sound in our isolated logging town. It means someone may live who otherwise would not have. Can't you think of it in your neighborhood as a brief and noisy reminder that some tiny baby now lives because of the hospital and the helicopter team? Can't you be proud to support such a wonderful mission and help to send babies back to the waiting arms of their mothers?

You should look up and cheer and teach your children to rejoice that a little girl or boy will live and parents' hearts will not be broken with grief.

You can make the difference. Be supportive of the wonderful work the hospital does and help them in any way you can. There is NO better or comparable facility in the Northwest. Aren't we lucky? Someday, it might be there for your child or grandchild.

Very sincerely,

Susan L. Shane CRN

Hospital defends chopper landings

By S.L. Sanger
PI Reporter

Children's Orthopedic Hospital yesterday defended three helicopter landings outside the hospital this month, saying each was necessary to preserve the life of a critically ill youngster.

The hospital is embroiled in a controversy with its neighbors in the Laurelhurst area of Seattle over a proposal to build a helicopter landing pad outside its emergency room entrance.

"We hope there is not the impression that we are forcing the issue of building our own helipad. That is not our intention," Treuman Katz, the hospital's chief executive officer, told a news conference at Children's.

"The decisions to land at COHMC were made by physicians attending to the patients inflight and cleared by the county's director of the Emergency Medical System," Katz said.

Complaint calls

"Each decision was made in order to preserve the life of a critically ill infant.

"We have received 10 to 14 complaining calls for each landing."

Complaints vary from concerns about noise and safety to a feeling the hospital is going to expand, said Katz.

Most recent use of a helicopter at the hospital occurred Tuesday night when a 1-month-old boy was flown in from Chehalis. The baby, with severe meningitis, was comatose and suffering breathing problems, said Dr. John Neff, hospital medical director. The boy was in serious condition yesterday.

The first flight this month, during the late afternoon of Aug. 3, involved a 1-day-old boy transferred from Bremerton Naval Hospital. The boy died the next day of a perforated bowel.

'No choice'

The second, on the mid-afternoon of Aug. 20, was a premature boy, a few hours old, transferred from Forks with severe breathing problems because of a collapsed lung. This boy survived and is doing "fairly well," Neff said.

"We had no choice but to land at the hospital when children are as critical as these three," Neff said.

Use of the proposed helipad would depend "on the situation," but would occur "solely for critically ill patients," he said.

For years, ill children have been landed by helicopter at a nearby University of Washington playing field, minutes away from the hospital by ambulance.

Jane Cassels, a flight nurse for Airlift Northwest, said helicopter flights in the area [illegible] said the flights conferring [illegible] every move is life-threatening [illegible] critically ill patients and it is preferable to avoid unnecessary transfers from one mode of transport to another.

In city's hands

Karen Cummings, assistant hospital administrator, said efforts are continuing to construct a helipad. The issue now rests with the city's Department of Construction and Land Use.

Sharon East, an opponent of the helipad, said during a telephone interview after the news conference that "no one wants to deny any child emergency care."

But, she said, in the case of the Chehalis child Tuesday, the helicopter could have stopped at some other hospital between Chehalis and Seattle. "Children's is not the only one that treats children," she said.

SUBJECT: Heliports

Attention Ms. Hermia Ib

Members of the Montlake Community Club at the January meeting considered the issue of helicopter landing pads. Laurelhurst Community Club has asked us to support them in apposing the construction of such a landing facility at Childrens Orthopedic Hospital.

Montlake Community Club recommends that the DCLU require preparation of an EIS for this project. The EIS should adress the problem of noise. We believe that the disturbance from helicopter service will be so great that a finding of non-significance is not supportable.

Mayor Royer has asked that the medical community consider the best distribution of helistops needed to serve the hospitals and people of the city. This may be done through the certificate of need study, but should also receive attention from the DCLU. Helicopter landing pads should not be allowedwithout study of the cost in noise, increased hospital fees and accident potential versus actual medical service improvement.

Montlake Community Club asks that the DCLU not issue any permits for heliports to serve hospitals until these questions have been adequately studied.

Several snow slides had taken place along the Portage road (Fig. 20) during the earthquake. These were reported to have travelled further out from the toe of the slope than they usually do. Since the past winter had been one of lighter-than-normal snow fall, the presence of broken trees in some of the slides also indicated that the slides had not all followed customary paths.

(d) Whittier

No observations of unusual snow or rock slides were made during the flight to Whittier. At Whittier the oil tanks at the head of the Passage inlet were examined; one of these was said to be leaking and was noticed to be tilted. It was at least partially full at the time of the earthquake and therefore it must be deduced that some soil movement had taken place below it. Other tanks, also containing liquid, were undamaged, but no detailed soil information on the tank foundations was available. At Whittier, the 6-story Brucker building was founded on bedrock, while the 14-story taller reinforced concrete structure was reported to be founded on 20 to 50 ft of dense sand and gravel over bedrock. The damage to the larger building seemed to be no more severe than that suffered by buildings of similar construction and size in Anchorage considerably more distant from the earthquake. This result may be attributable to the depth and type of soil at Anchorage in contrast with the relatively shallow depth at Whittier or to difference in strengths of structures

A cross section through the wharf at Whittier is shown in Fig. 21, and Fig. 22 shows typical damage to the floor slab of the warehouse behind the wharf. It appears that the fill on which the warehouse floor

Re: Childrens Orthopedic
Hospital Helipad
CUP Application

Dear Ms.Ipp:

In response to the helipad application by Childrens Orthopedic Hospital, The Laurelhurst Community Club passed the following resolution, expressing their concerns with this proposed project:

> Be it resolved that the Laurelhurst Community Club's Board of Trustees is seriously concerned about a proposal to develop a helipad at the Children's Orthopedic Hospital. The LCC recognizes and actively supports the valuable services which COH provides to the community. However, many residents of the community are concerned about the potential impact a helipad will have on the community and its residents. There are also questions about the necessity of such a facility at COH since other landing facilities are available nearby. The LCC requests that these issues be carefully evaluated by those agencies responsible for approving such a facility, and specifically that an environmental impact statement and certificate of need be required.

Thank you for your consideration of this matter.

Sincerely yours,

Ruth Engelberg

Re: Childrens Orthopedic
Hospital Heliport
CUP Application

Dear Director Justen,

Childrens Orthopedic Hospital has again acted upon their application to build a heliport at their main facility. This Hospital was established in a high density residential neighborhood, and has continued to expand into the major facility it is today. Each expansion is to have minimal impact on the adjacent communities. Yet, each seems to have a greater impact than the last. When is Enough, Enough?

We recognize, of course, that COH offers a great service to the community. However, each expansion of this facility must be looked at with an ever increasing critical eye. Any new project should be a major benefit for the Hospital to warant further impact on the adjacent communty.

Does COH have a clear cut need for a Heliport? It now uses the University of Washington Hospital and University of Washington Intramural fields to provide the same capability which COH now wishes to duplicate a few minutes away. The heliport appears to be a nice addition, but not necessary bases on a preliminary analysis.

Your careful consideration of this issue would be greatly appreciated.

Sincerely,

Leonard Miller
President

Dear Mr. Justen: Re: COH Helipad

We, as members of the Marian Blethen Mesdag Orthopedic Guild, wish to communicate to you our continued opposition to the construction of a helipad at Children's Orthopedic Hospital, Seattle, Washington. In the Spring of 1983 we wrote objecting to the Institutional Zoning Ordinance as the helipad was in the Hospital administration's plans at that time.

All of our members live in communities immediate to or adjoining the hospital, and we have lived there for many years. The group has given thousands of hours of volunteer service and thousands of dollars over the past twenty-plus years in support of good medicine.

The decision to oppose the helipad construction has not been made casually. We have studied information for and against the project. We urge the DCLU to require an EIS on this project. An EIS is a necessity, not a choice. Our information indicates there are plans in the immediate future for COH to develope a Trauma Center. These and many other factors lead us to write and express our strong opposition to the construction of a helipad at COH.

Sincerely,

CC: Mayor Charles Royer

Re: Case #CC84-022
Helicopter Landings
Childern's Orthopedic Hospital

Gentlemen:

This letter is to strongly protest the current plans of Childern's Orthopedic Hospital to build a helicopter facility on the hospital site.

Peace and quiet have always been synonymous with a quality neighborhood. Noise pollution from a helicopter will destroy the peace and quiet of many Laurelhurst homeowners. It is simply not fair to subject this prime area to the racking of helicopters throughout the day and evening hours.

The hospital has operated for years without such a facility, and has done so without any great problems.

I urge you to consider the well being of the surrounding neighborhood of the hospital and deny this application.

Thank you for your consideration.

Yours truly,

S.W. Baker

Re: Proposed helestop
Childrens' Orthopedic Hospital
Opposition statement

Dear Sir:

Although I live within close proximity to the proposed addition to the Childrens' Orthopedic Hospital, I am writing out of concern for others who would be much more adversely affected by such a facility than I, namely the many senior citizens living in the immediate area and, for that matter, the many young patients in the hospital.

From my experience with helecopters, I cannot help but feel that the noise level from the machines would most certainly be irritating to both groups as well as to other neighbors, if not actually damaging to the hearing of these people. While that noise level probably would not be high enough to immediately damage a person's hearing, tests have shown that prolonged or recurrent noises of as little as fifty Db can be harmful to the hearing.

I hope that the noise fac tor will be given serious consideration. You are undoubtedly aware of the noise monitoring instruments and expertise available through the Seattle-King County Health Department.

Very truly yours,

Leo C. Johnston

Dear sir

As a neighbor of Children's Orthopedic Hospital I am concerned about the building of a Helipad there. This is a residential neighborhood and I believe a helipad is inappropriate.

An environmental impact study should certainly be required.

Thank you
Yours truly,
Margaret N. Bingham

Dear Mr. Juntea:

Our home in Laurelhurst is just a few blocks away from the Childrens Orthopedic Horpital.

We have lived here over thirty years and have watched addition after addition made to the horpital. The sound of sirens has increased as well as traffic because of its growth.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Now we are faced with a possible helipad at COH. We are very concerned about the impact this will have on our neighborhood.

The noise of a helicopter landing and taking off at all hours of the day and night will be extremely disruptive and nerve-racking.

There is definitely a safety factor - the possibility of a crash over the hospital or over homes.

Air pollution is becoming

Eleanor Haldane
4123 - 43rd Ave. N. E., Seattle, Washington 98105

more and more of a problem in Seattle and the emissions of a helicopter will add to that.

Our quiet, residential neighborhood has patiently endured the ever increasing traffic from the University of Washington, the hospital, the Sand Point Naval Air Station and the possible threat of a retirement home. Now we are faced with a helipad.

My husband and I strongly urge you to conduct an environmental impact study. Sincerely,

Eleanor Haldane

Re: The Proposed Helipad at COH

Dear Mr. Justin:

We are concerned about the proposed helipad at Children's Orthopedic Hospital because of the affect that it may have on the neighborhood. We feel that a decision should not be made until an environmental impact study has been completed. Reasons we think a study is necessary include the need to assess: 1) the safety factor in a populated area 2) the noise factor for the neighborhood as well as the noise affecting the young hospital patients and 3) the air pollution emissions factor from helicopters flying so close to homes.

Thank you for consideration your department can give in this important matter.

Sincerely,

Office Of The Mayor
City of Seattle

Charles Royer, Mayor

September 25, 1985

Albert Feldmann
4873 Terrace Drive N. E.
Seattle, Washington 98105

Dear Mr. Feldmann:

Thank you for your letter stating your objection to the landing of a helicopter at Children's Orthopedic Hospital (COH) campus. The Department of Construction and Land Use (DCLU) is responsible for reviewing the environmental impacts of the proposed helipad facilities as well as enforcing against code violations. Beatrice Ryan, Interim Director of DCLU, tells me that a Notice of Violation was given to COH on August 30, 1985, because COH has been using their premises as a helicopter landing pad without a permit. Your letter will serve as a supportive document for our code enforcement.

The City's Land Use Code also requires a finding that the helipad is needed to save lives. To make that determination, DCLU has asked the City's Health Officer, Dr. Nicola, for advice on the question of medical need. Dr. Nicola will hold a public hearing in the next few weeks, and his findings will form the basis for DCLU's recommendation to the City Council.

Thank you again for taking the time to write to me. If you have questions, please do not hesitate to call Mrs. Hermia Ip, the DCLU Land Use Specialist assigned to this case. She can be reached at 625-4509.

Sincerely,

Charles Royer

Re: Application #CC84-022

Dear Mr. Justin:

We would like to go on record as being strongly opposed to a Helicopter Pad being installed at the Children's Orthopedic Hospital.

The current place of landing on the field north of the University of Washington Campus seems quite adequate to us and the noise of such a landing seems to be unreasonable for those living near and below the Hospital.

Certainly some consideration should be given to the scores of people and homes in this area. No one we have talked to seems to feel the necessity of such a move and we feel this landing should not be further considered.

We hope this information will be passed on to those involved in this plan.

Thank you for your consideration in this matter.

Ann Ormsby
Land Use Review
402 Municipal Building
Fifth and Cherry
Seattle, WA 98104

Dear Ann Ormsby:

As a resident of Laurelhurst I wish tc protest the construction of a helicopter landing pad at Children's Orthopedic Hospital for the following reasons:

Doctors with whom I have discussed the proposal put little medical value on a helipad at COH because of the proximity of a helipad at University Hospital. Even some of the doctors on the staff of COH are of this opinion.

Competition among Seattle's hospitals runs high and so does the emphasis they place on their marketability. I believe that many trustees of COH and their doctors are strongly motivated by a desire to enhance the hospital's prestige and to acquire more patients.

In spite of COH's declaration that a helicopter would be used infrequently, the desire to prove the operation cost efficient (and it will be very expensive) would make for frequent and unnecessary use.

I believe that the benefits to be gained by installing a helipad at COH are greatly outweighed by the misery it would cause many residents in Laurelhurst and the losses they would sustain in the value of their property.

Sincerely yours,
Helen R. Pinkney

Re: Helipad Proposal and Short Stay Remodel

Dorothy F. Teeter
Director of Planning
Children's Orthopedic Hospital
P. O. Box C5371
4800 Sand Point Way N. E.
Seattle, Washington 98105

Dear Ms. Teeter:

Thank you for your letter and list of additional information which you will submit for our environmental review for the helipad proposal. I believe you have also received our letter and list of questions dated February 20, 1985. While we have listed as many issues as we can foresee at this time, we may need to require further clarification if your supplemental information does not provide the level of detail necessary for our analysis.

You also asked about the time frame of the permit process. We are enclosing Section 23.80.10 of the Land Use Code, which specifies the procedures. It is not possible to identify when the City Council will consider this project because of the complex review and appeal processes. However, you may keep in mind the following milestones:

1. The first step is to complete the environmental review (SEPA) process. This includes an appeal hearing on the threshold determination of significance or non-significance (if there is an appeal), and the decision of the Hearing Examiner on the appeal.

2. A public hearing before the Hearing Examiner on the merits of the Council Conditional Use. Section 23.80.10.D. requires that notice of the hearing shall be made at least 30 days before the hearing. The hearing date cannot be scheduled until SEPA review is completed.

3. The Hearing Examiner will submit his/her recommendation on the Council Conditional Use to City Council within 14 days after the hearing is closed. The Hearing Examiner's recommendation is subject to reconsideration by the City Council on request by parties of record.

4. City Council will consider the proposal, and may or may not require further public hearing and/or reopening the record.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

With reference to your proposed short stay unit remodel and addition, we have determined that a separate environmental review is required. We understand that the existing waiting rooms will be changed to additional surgery rooms because of increased demand for minor surgeries. You also propose to construct a new one-story waiting room, about 30 ft. by 24 ft., on the east side of the existing short stay unit. This proposed construction and remodeling is not exempt under the Seattle SEPA Ordinance (111866). However, we understand the proposed work is not functionally related to the proposed helipad. Therefore, we will consider the proposal as a separate project for permit and SEPA review purposes. If you wish to pursue this proposal, please submit the required application forms, environmental checklist, plot plans and fees. The large sign notification is also required.

Thank you for your attention. If you have further questions, please do not hesitate to call Hermia Ip, Land Use Specialist of our office, at 625-4509.

Very truly yours,

WILLIAM J. JUSTEN, P. E.

Dear Ms. Gibb:

As a very long term member of the Children's Orthopedic Hospital and Medical Center staff I am wri[illegible]ng in support of the request for a conditional land use permit to build a helistop outside of the emergency room.

Because I have been a part of Children's since its beginnings in Laurelhurst (and before that, on Queen Anne) I can fully appreciate the impact of the hospital on the community. However, as a part of the hospital management team I can speak with confidence when I say that the institution has always endeavored to do those things mandated by growth and need in a fashion which would be the least traumatic to the area.

The noise generated by the helicopters is not of long duration and would be fairly infrequent. The approach route used by the helicopters is designed to minimize flight over residential areas for reasons of safety as well as noise reduction. Utilization of the helistop would be based on need and the nature of the emergency. These decisions are made by the medical team on board during the flight and not by the hospital. It is NOT focused on convenience. One needs to see first hand the myriad of complicated and risky maneuvers required if a child needs to be repeatedly transferred from air to ground transport, etc. To risk the life of a child is a terribly high price to pay for this occasional inconvenience.

Thank you for the opportunity to comment. I trust you will convey my opinions to the Seattle City Council.

Sincerely,

Charles A Seager

Re: Helipad at Children's Orthopedic Hospital

Dear Mayor Royer:

We are writing to express our opposition to the helicopter landing pad on the Children's Orthopedic Hospital grounds. We own property in the Laurelon Terrace condominums.

It is hard to oppose something as humanitarian as a helipad on the grounds for the children. Especially is this true when you believe in the work and care which is performed there and support it each year.

However, when you analyze it you realize the current method works within a very short period to serve the same purpose. The child has to be handled the same number of times whether landing near the U of W baseball field or at the helipad. The exposure from potential helicopter difficulties is considerably reduced under the current program. The noise and disturbance to both neighbors and those at the hospital is much less now. Helicopters can be very noisy.

Respectively,

Charles R. Trzcinski M. Rea Trzcinski

Charles R. Trzcinski M. Rea Trzcinski

Mayor. Charles Royer
600 4th Avenue - Floor 12
Seattle, WA. 98104

Dear Mayor Royer:

After years of support for and cooperation with Children's Orthopedic Hospital (COH), after months of anguished thought, and after weeks of research, the residents of Seattle--especially those who live within a few feet of the proposed site and whose lives will feel the impact--have reached the decision that a helipad ought not be built at COH. The following facts are basic to this decision:

1. A helipad is extremely unwise and unsafe in a densely populated residential area -- made up of condominiums, apartments, senior citizen housing, elementary school, and single family residences. No one can guarantee against helicopter malfunction and crash. Proposed location allows for no margin of error. For the residents living in the 136 units of Laurelon Terrace Condominiums--including a high percentage of senior citizens--the helicopter quite literally would be landing on their roof top or in their yard. Are they considered to be expendable? Will COH pay for loss of life and property in case of crash? Who will really pay?

2. The two-engine helicopter sought by COH would be noisy. It would produce negative environmental impact. The noise would be in addition to ambulance and truck traffic already endured. Emergencies can occur anytime during day or night. The noise would be disturbing at any hour to COH patients and personnel as well as to neighbors. Would you want this in your neighborhood -- day and night?

3. Alternative landing sites are available and workable. The proponents have conceded that the present landings in the UW soccer field (3 minutes from COH by ambulance) have been safe, satisfactory and no problem. Another site is available at Sand Point Naval Station (6 minutes away). A helipad at University Hospital (5 minutes from COH) will be ready for use by Spring, 1985.

4. Does every hospital in Seattle need a helipad? Why this sudden proliferation--helicopters have been available for decades. Has it become a status symbol to have a helipad? Has a helipad become a marketing tool of the medical profession/hospital administration? Do you know that hospitals in other cities USA have stopped their helicopter service because of the high risk safety and expense factors measured against negligible benefits observed for patients. Millions of dollars are being spent on each--aircraft, landing pad, maintenance of both, pilot salary and insurance. This is horrendous and excessive duplicationof expenditures. This causes costs at hospitals to rise and rise and rise!

5. The reasons given by COH for justification of helicopter service sound good--to a point--and are emotionally charged. However, one crucial point has been overlooked and/or omitted: COH located by choice in a densely populated residential neighborhood. The projected total of 30-40 flights a month (15-20 in and 15-20 out) would be detrimental and dangerous to the residents who live within a few feet from the landing pad. Since COH chose to live in this location, it has a responsibility for the safety and well-being of these residents. IF COH wishes to continue in its present location

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

we believe it must abide by the rules for a quiet and safe residential neighborhood.

Is this additional institutional encroachment in a densely populated residential neighborhood right? Is endangerment of life, property, and environment right? Is duplication of excessive expenditures right? Is it right and is it fair that the rights of the residents living next door to COH are abridged and ignored? The opponents of the helipad are concerned.

This is a city-wide concern which demands our attention. Study of how many helicopters are needed in our city, and closeness of location of helicopter service/helipads (e.g., University Hospital and COH) demands high priority planning.

In the meantime, PLEASE:

1. Visit site at Laurelon Terrace Condominiums.
2. Formulate a public statement policy for quality of life and community values for the City of Seattle.
3. Act now to prevent tragedy from helicopter accidents before they occur.
4. Stop building plans for a helipad at COH.

THANK YOU.

Sincerely,

Maryann E. Spangler

Charles Royer, Mayor

February 4, 1985

Ms. Maryann E. Spangler
4013 N. E. 46th Street
Seattle, Washington 98105

Dear. Ms. Spangler:

The Mayor has asked me to respond to your specific questions regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on hospital grounds. There have been numerous phone calls and letters to this Department from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

Before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by City Council. Puget Sound Health Systems Agency has been asked to provide us with health policy guidance on the development of emergency helicopter landing facilities at hospitals in the City of Seattle. While the City of Seattle has the responsibility to address the land use implications of hospital helipads, we rely on the health planning experts to determine the need and cost effectiveness of such facilities in medical practices. Mr. Larry Thompson, Executive Director of the Agency, has indicated to me that the agency's preliminary opinion will be available by February 15, 1985. If you wish to contact Mr. Thompson's office, you may telephone 464-6143 (601 Valley St., Seattle, Washington 98109).

Further, you may contact the State Department of Social and Health Services regarding the requirement of a Certificate of Need for the proposal. This agency is in the process of determining whether a Certificate is necessary or not. The contact person is: Christiana Sparks, Certificate of Need Program, State Department of Social and Health Services, Mail Stop ET-33, Olympia, Washington 98504; phone number (206) 753-5857.

Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and you will be notified of future public hearing schedules and decisions. I appreciate your interest, and I am glad you took the time to write.

If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

WILLIAM J. JUSTEN, P.E.
Director

Re: Children's Orthopedic Hospital Helicopter Pad Application dated November 13, 1984

Dear Mr. Justen:

I am writing this letter both to express my opposition to the Children's Orthopedic Hospital's November 13, 1984 application for operation of a helicopter pad on the hospital grounds, and also to express the reasons for my opposition.

I am not a resident of Laurelhurst, nor even of Seattle, yet I have a real and vital interest in opposing the hospital's helicopter pad application. Quite simply, that interest is the continued health and well being of my 89 year old mother who is a resident of the Laurelon Terrace Condominiums, and would be one of the nearest residents to the proposed helicopter pad. There are at least six other residents of Laurelon who are in their late eighties and early nineties, and who would likewise be adversely affected by the proposed helicopter operations.

The available information indicates that operation of the pad on the hospital ground would add very little benefit to children in emergency situations over the present operation from the pad on the University of Washington playfields. The possibility of that slight additional benefit must be balanced against the clearly detrimental affect which operation of a hospital ground pad would have on the health and comfort of my mother and the other nearby residents of Laurelon who are of a similar age.

As a result of my past military service, I am familiar with the noise levels generated by helicopter pad operations. I also experienced, approximately 15 years ago, the noise level generated by a commuter helicopter operation which was operated, on a trial basis, on the roof of a downtown Seattle office building. The noise during landing and takeoff operations totally disturbed work in all offices in the surrounding buildings within an area

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of several blocks, and my recollection is that the helicopter service was discontinued because of that severe noise interference.

In the case of the Children's Orthopedic Hospital's proposed pad, the noise level would be especially detrimental to the health and well being of the nearby residents in the eighty and ninety year old bracket.

I can understand why direct operation of the helicopters to the hospital would result in a cost savings over the present operation, as the ambulance service from the university playfield to the hospital would be eliminated. If that cost savings is a motivating factor in the hospital's pending application, then I am especially critical of the hospital having submitted that application. I am not interested in the hospital saving money at the expense of my mother's health and well being, nor at the expense of the other elderly residents near the proposed pad. I would appreciate your department inquiring into the significance to the hospital of possible cost savings as a motivating factor in their present application. Assuming it is not such a factor, then the objections stated above are nevertheless applicable and the application should be denied.

Very truly yours

COPY

January 22. 1985

Mayor Charles Royer
600 4th Avenue - Floor 12
Seattle, WA. 98104

Dear Mayor Royer:

After years of support for and cooperation with Children's Orthopedic Hospital (COH), after months of anguished thought, and after weeks of research, the residents of Seattle--especially those who live within a few feet of the proposed site and whose lives will feel the impact--have reached the decision that a helipad ought not be built at COH. The following facts are basic to this decision:

1. A helipad is extremely unwise and unsafe in a densely populated residential area -- made up of condominiums, apartments, senior citizen housing, elementary school, and single family residences. No one can guarantee against helicopter malfunction and crash. Proposed location allows for no margin of error. For the residents living in the 136 units of Laurelon Terrace Condominiums--including a high percentage of senior citizens--the helicopter quite literally would be landing on their roof top or in their yard. Are they considered to be expendable? Will COH pay for loss of life and property in case of crash? Who will really pay?

2. The two-engine helicopter sought by COH would be noisy. It would produce negative environmental impact. The noise would be in addition to ambulance and truck traffic already endured. Emergencies can occur anytime during day or night. The noise would be disturbing at any hour to COH patients and personnel as well as to neighbors . Would you want this in your neighborhood -- day and night?

3. Alternative landing sites are available and workable. The proponents have conceded that the present landings in the UW soccer field (3 minutes from COH by ambulance) have been safe, satisfactory and no problem. Another site is available at Sand Point Naval Station (6 minutes away). A helipad at University Hospital (5 minutes from COH) will be ready for use by Spring, 1985.

4. Does every hospital in Seattle need a helipad? Why this sudden proliferation--helicopters have been available for decades. Has it become a status symbol to have a helipad? Has a helipad become a marketing tool of the medical profession/hospital administration? Do you know that hospitals in other cities USA have stopped their helicopter service because of the high risk safety and expense factors measured against negligible benefits observed for patients. Millions of dollars are being spent on each--aircraft, landing pad, maintenance of both, pilot salary and insurance. This is horrendous and excessive duplicationof expenditures. This causes costs at hospitals to rise and rise and rise!

5. The reasons given by COH for justification of helicopter service sound good--to a point--and are emotionally charged. However, one crucial point has been overlooked and/or omitted: COH located by choice in a densely populated residential neighborhood. The projected total of 30-40 flights a month (15-20 in and 15-20 out) would be detrimental and dangerous to the residents who live within a few feet from the landing pad. Since COH chose to live in this location, it has a responsibility for the safety and well-being of these residents. IF COH wishes to continue in its present location,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

we believe it must abide by the rules for a quiet and safe residential neighborhood.

Is this additional institutional encroachment in a densely populated residential neighborhood right? Is endangerment of life, property, and environment right? Is duplication of excessive expenditures right? Is it right and is it fair that the rights of the residents living next door to COH are abridged and ignored? The opponents of the helipad are concerned.

This is a city-wide concern which demands our attention. Study of how many helicopters are needed in our city, and closeness of location of helicopter service/helipads (e.g., University Hospital and COH) demands high priority planning.

In the meantime, PLEASE:

1. Visit site at Laurelon Terrace Condominiums.
2. Formulate a public statement policy for quality of life and community values for the City of Seattle.
3. Act now to prevent tragedy from helicopter accidents before they occur.
4. Stop building plans for a helipad at COH.

THANK YOU.

Sincerely,

Councilman Jim Street
Seattle City Council
600 - 4th Avenue
Seattle, WA 98104

Dear Mr. Street:

I love children.

For 20 years I taught 4 & 5 yr. olds in Sunday School.

When I retire to my condo in Seattle in two years I intend to volunteer at the Children's Orthopedic Hospital.

I am in favor of doing things to promote the wellbeing of our children.

I am not in favor of building a helipad at COH because:

1. There is already a helipad in the U of W intramural field just three minutes from COH.

2. I think the millions of dollars it will cost to build and operate the helicopter service to decrease the children's arrival time by just a couple of minutes could be put to much better use doing other things for the children.

3. It is not fair to submit us homeowners and residents to the disruption and dangers of helicopters flying overhead in our retirement years when the children already have their helipad 3 minutes away.

Before making your decision, will you please pray and ask God what His will is in this matter.

With prayers that your
hearts will help you
make the right decision,

Re: COH Helipad

Dear Mr. Justen:

We, as members of the Marian Blethen Mesdag Orthopedic Guild, wish to communicate to you our continued opposition to the construction of a helipad at Children's Orthopedic Hospital, Seattle, Washington. In the Spring of 1983 we wrote objecting to the Institutional Zoning Ordinance as the helipad was in the Hospital administration's plans at that time.

All of our members live in communities immediate to or adjoining the hospital, and we have lived there for many years. The group has given thousands of hours of volunteer service and thousands of dollars over the past twenty-plus years in support of good medicine.

The decision to oppose the helipad construction has not been made casually. We have studied information for and against the project. We urge the DCLU to require an EIS on this project. An EIS is a necessity, not a choice. Our information indicates there are plans in the immediate future for COH to develope a Trauma Center. These and many other factors lead us to write and express our strong opposition to the construction of a helipad at COH.

Sincerely,

CC: Mayor Charles Royer

Dear Mayor Royer:

I write re. Children's Hospital's proposed helipad. My husband + I are not some wealthy Laurelhurst homeowners. We live, literally, in the shadow of the hospital. The helicopters would fly directly over our homes day and night (emergencies happen at night too, in case the hospital will argue.)

There are many reasons for a hospital to desire a helipad. One might be the desire to save a few minutes from a baby's emergency trip. Others might include the increased competition for business among hospitals, in light of revised Medicare reimbursement policies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

You have long been a proponent of maintaining the quality of Seattle's neighborhoods. As East coast transplants, we, too, value them. Does an institution which began and has grown up in a residential neighborhood have unlimited rights? Do the neighbors have no rights?

We hope you'll consider the desires of all parties involved in this issue, not just the large + powerful ones. We appreciate your concern for the quality of life in Seattle.

Yours,
Patricia L Scanlon

Dear Mayor Royer:

I wish to express my concern about the planned helipad on the grounds of Children's Orthopedic Hospital which as you know is in the middle of a residential area.

In spite of promises not to enlarge, the hospital has more than doubled in size, added an unattractive garage and is planning an office building. These have affected traffic and our sunlight, but the noise of helicopters arriving from five states would be much more destructive to the Neighborhood.

If they need to have a helipad for an emergency regional hospital, it seems to me the place for it would be at the C.O.H. section of Valley General Hospital near Renton. This is in a less populated area nearer an industrial part of the valley.

I hope you will give all of us in the neighborhood your support in this matter.

Very sincerely yours,
Mary Virginia Ballard

Ms. Ernestine J. Rombouts
Apt. 4675, 41st Avenue N.E.
Seattle, Washington 98105

Dear Ms. Rombouts:

Thank you for your letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. There have been numerous phone calls and letters to me and to the Department of Construction and Land Use (DCLU) from COH neighbors who are concerned that the proposed helistop may adversely affect their neighborhood.

William Justen, Director of DCLU, tells me that before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by the City Council. Your letter and letters from other citizens of the community are included in the official file (CC 84-002), and you will be notified of future public hearing schedules and decisions.

I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Sincerely,

Charles Royer

MAYOR'S OFFICE

Dear Mayor Royer—

I am writing in regards to the proposed building of a helipad at Childrens Orthopedic Hospital. I live directly below the hospital on Sand Point Way and I am very concerned about the noise, amount of helicopter traffic, safety and the possible effect on the value of my home.

I have attended the meeting presented by the Laurelhurst Community Club- and they have been thorough in presenting information about the proposed plan. As a concerned citizen and homeowner, I greatly oppose the building of the helipad for a number of reasons: environmental, personal, safety and financial.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11.6.71

I chose to live in the Laurelhurst area because of its attractiveness safeness and standard of living and I resent late to see the area destroyed and contaminated by the building of an unnecessary helipad. If the proposal goes through, I'm very sure that helicopter traffic & noise will increase & this I cannot tolerate.

I oppose this project very strongly and from any angle or point of view, I cannot and will not support it.

Sincerely,
Ernestine Rowlands

12th Floor
Seattle, WA 98104

Dear Mr. Royer:

I love children.

For 20 years I taught 4 & 5 yr. olds in Sunday School.

When I retire to my condo in Seattle in two years I intend to volunteer at the Children's Orthopedic Hospital.

I am in favor of doing things to promote the wellbeing of our children.

I am not in favor of building a helipad at CHO because:

1. There is already a helipad in the U of W intramural field just three minutes from CHO.

2. I think the millions of dollars it will cost to build and operate the helicopter service to decrease the children's arrival time by just a couple of minutes could be put to much better use doing other things for the children.

3. It is not fair to submit us homeowners and residents to the disruption and dangers of helicopters flying overhead in our retirement years when the children already have their helipad 3 minutes away.

Before making your decision, will you please pray and ask God what His will is in this matter.

With prayers that your
hearts will help you
make the right decision,

Nancy J. Philips

Dear Mayor Royer,

I am writing to protest the proposed construction by Childrens Orthopedic Hospital of a heliPad.

As a nearby resident, I am distressed by changes in our neighborhood: office construction, the Burke-Gilman housing project, Ronald McDonald House, as well as other C.O.H. construction, all of which add to traffic congestion, noise and a shift away from quiet single-family residences.

C.O.H. has failed, in my opinion, to demonstrate a clear need for the heliPad on the proposed site.

Please do all you can to protect the homeowners in our neighborhood.

May I hear from you? Thank you.

Sincerely,

Scott Cobb

February 4, 1985

Ms. Maryann E. Spangler
4013 N. E. 46th Street
Seattle, Washington 98105

Dear. Ms. Spangler:

The Mayor has asked me to respond to your specific questions regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on hospital grounds. There have been numerous phone calls and letters to this Department from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

Before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by City Council. Puget Sound Health Systems Agency has been asked to provide us with health policy guidance on the development of emergency helicopter landing facilities at hospitals in the City of Seattle. While the City of Seattle has the responsibility to address the land use implications of hospital helipads, we rely on the health planning experts to determine the need and cost effectiveness of such facilities in medical practices. Mr. Larry Thompson, Executive Director of the Agency, has indicated to me that the agency's preliminary opinion will be available by February 15, 1985. If you wish to contact Mr. Thompson's office, you may telephone 464-6143 (601 Valley St., Seattle, Washington 98109).

Further, you may contact the State Department of Social and Health Services regarding the requirement of a Certificate of Need for the proposal. This agency is in the process of determining whether a Certificate is necessary or not. The contact person is: Christiana Sparks, Certificate of Need Program, State Department of Social and Health Services, Mail Stop ET-33, Olympia, Washington 98504; phone number (206) 753-5857.

Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and you will be notified of future public hearing schedules and decisions. I appreciate your interest, and I am glad you took the time to write.

If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

WILLIAM J. JUSTEN, P.E.

Dear Mayor Royer,

Thank you for your concern for

1. Cost-effective health care
2. The safety of Seattle's citizens

evidenced in your letter to Larry Thompson of Puget Sound Health Systems Agency concerning projected hospital helicopter use.

You recognize the marketing potential of helicopter use in your statement on the competitive pressures in the health care industry.

If Seattle's hospitals would publicize their future development plans (i.e. C.O.H. plans to become a trauma center), it would be more possible to coordinate the special strengths of each institution and to award helicopter service where it will be most cost-effective and least dangerous to Seattle's population. With careful planning, Seattle could become the nation's showplace of city-wide integrated health care.

Thank you again for your concern. I look forward to your response to P.S.H.S.A.'s policy recommendations.

Sincerely,

Joy Scott

Dear Mayor Royer,

On January 19, I wrote to thank you for the concern for cost-effective and safe health care that you presented in your timely letter to Larry Thompson of the Puget Sound Health Systems Agency.

You state "This trend (helicopter landing facilities at hospitals) could...create severe environmental problems for neighborhoods with medical facilities nearby."

Mayor Royer, you are undoubtedly aware that, during these last two weeks in January, William Justen and the Department of Construction and Land Use will decide whether or not a helipad at COH is environmentally significant and whether an EIS should be made.

Without an EIS, the severe environmental problems that you mentioned in your letter will never be addressed. What other business could begin flying helicopters into a heavily populated residential area without an EIS?

Mayor Royer, please use your influence wherever possible to help the D.C.L.U. decide upon the necessity of an EIS for the projected COH helipad.

Thank you!

Sincerely,

Joy Scott

Re: Application # CC 84-022
Helicopter Pad - Children's Orthopedic Hospital -

To Whom It May Concern -

My wife and I live in close proximity to Children's Hospital and we wish to be good neighbors, as we wish them to be to us -

This is a residential neighborhood where we expect a reasonable peace and quiet. To have helicopters flying in and out, with all their noise is simply not acceptable. I don't think the Hospital has really proved its point that the University playfield is not sufficient -

I hope you will deny the Hospitals application or let the helicopters land as they have been doing for years on the University playfield or at the University Hospital -

Thank you - Charles R. Hough -

Re: Application for Helipad at Cildrens Orthopedic Hospital and Medical Center (COHMC), Application No. CC84-022.

Dear Mr. Justen:

This letter concerns our opposition to the proposed helipad at CHOMC. We have been residing at above address for over 20 years. Our residence is located on 45th Ave. N.E., directly East of CHOMC, and we have been enjoying our neighborhood in the absence of noise, except when coast guard and military helicopters were landing on CHOMC grounds occasionally in past years (approximately up to 10 years ago). Granting permission of a helipad with several helicopter flights day and night, threatens to disrupt living and sleeping patterns in the neighborhood.

We do believe that with modern life saving and transport techniques other than helicopters, just as many lives can be saved. We believe that helicopter technology is too expensive and represents nothing but a flashy status symbol to the hospital using them. We believe that the use of the UW meadows of landing (presently used) should be continued. If children are too sick to be transported by any other means, helicopters should take them to the UW hospital helipad for treatment at that facility.

Sincerely,

Dr. Nicola,
Health Officer

Dear Dr. Nicola,

We, the members of the Florence Ewing Guild, would like to express our concern about the proposed Children's Orthopedic Hospital Helipad to you and the City Council.

Representatives from our Guild attended a Helipad Information meeting on Oct. 9, 1985. The COH Board of Trustees and Dr. John Neff represented COH. Liz Anderson and Kate Hermer represented the concerns of the community.

We feel that the COH speakers left many questions unanswered. We are not convinced that a helipad is needed to save lives or that it would be used only

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in life-threatening situations if built. Enough issues about helicopter transport in general were raised to warrant postponement of the Council's decision until the State has their hearing in January.

As a Guild, we remain committed to raising money for the children at COH. But we want the institution to be truthful with its neighbors. And we hope that COH will be willing to wait until the State establishes its policy.

Sincerely,

Maureen Bitterman, President

Dr. Nicola, Health Officer
King County
503 Smith Tower
Seattle, WA 98104

Dear Dr. Nicola:

I would like to support strongly the provision of a helipad at Childrens Orthopedic Hospital. As coordinator of most transfers during my four years as Patient Services Coordinator at Olympic Memorial Hospital in Port Angeles, Washington I found the provision of air transport to bring safe, efficient access for neonates and children to regional medical centers.

During the past several months the helicopter has landed at our hospital, but its landing at Boeing Field with the subsequent transport to Childrens Orthopedic by ambulance have made for unecessary delay in reaching the hospital as well as added financial expense for the family. A hospital-to-hospital helicopter service would allow for safer continuity of care.

Enclosed you will find a letter written to the editor of the Port Angeles "Daily News" which supports the case very well.

If you have any further questions, please feel free to call me at my present employer, The Clallam County Health Department, 452-7831 X276.

Dear Dr. Nicola:

I want to thank you for the excellent job you did in holding the hearing last week concerning the medical justification for the helipad at The Children's Orthopedic Hospital and Medical Center. You gave all sides a chance to aire their opinions and feelings, and you were absolutely impartial in the process. Personally, I don't enjoy this adversarial role with the community. I am sure that they also feel equally uncomfortable in being viewed as opposing good health care for children and will be glad when this process is over.

After I went home and reflected on the hearing, I felt there were some things I would liked to have said, not so much to you but in answer to some of the community concerns and to the lawyer that represented Laurelhurst. While these thoughts are still fresh in my mind, I would like to share them with you.

The first concerns our abilty to provide objective data concerning the need for the helipad. During the hearing it was stated that the City in the past has been able to study helicopters for police use. I hope that the community understands that a study of helicopters for health related use would be difficult to do. I imagine that the police use of helicopters was studied by choosing two similar neighborhoods and providing for one patrol cars, and for the other helicopters. At the end of a given time period the City probably looked at crime incidence figures. The only way I would know to perform a similar study involving helicopters for medical use would be to take two similar communities such as Port Angeles and Bremerton and provide direct transport to COHMC by helicopter for one and another combination of transportaion for the other, or to do a study using alternate forms of transportation for compa.able cases. In a very short time the community that did not have the direct helicopter service would ask very soon why their patients could not be transported directly by helicopter to COHMC and minimize as much as possible the risks to that child. Not only would it be difficult to control such a study but there would be real ethical and legal problems involving the first death or complication of a child for whom we denied direct helicopter transportation to COHMC. A case by case control study would be even more difficult. That is why it is nearly impossible to perform any type of prospective study.

Scientific retrospective studies also are equally difficult. In a situation where we do not have a helicopter, you cannot compare the different modes of transportation in a retrospective fashion and can only conjecture on a case by case basis whether or not a helicopter would or would not have made a difference.

P.O. BOX C5371 • 4800 SAND POINT WAY N.E. • SEATTLE, WASHINGTON 98105 • (206) 526-2000

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

During this past year, for your review, we have identified three children who died and were transported either by ambulance or a combination of fixed wing and ambulance.

I can go back in subsequent years and probably find three approximately similar cases each year. Although I feel that each of these children would have benefited by direct helicopter transport to COHMC, I can't prove this but only can use my clinical judgment and conjecture that we should have given each child an optimal chance for survival. This type of review is further complicated because medical-legal questions will come up whenever we have alternative forms of transportation, and the death of a child is associated with a less direct mode of transportation.

During this past year we also have transported four children directly to COHMC because of the emergency condition of that child. Two of these children died. One will have some degree of undetermined persistent brain damage, and one child is perfectly healthy. The mortality of 50 percent for the helicopter is not a measurement of success or failure of that form of transportation, but reflects only the fact that we are selecting out the most critically ill children for helicopter transportation.

Finally, a retrospective case review, even if we had alternate modes of transportation, is extraordinarily difficulty because of the incredible variety of illnesses which we confront and the variability of each individual child. That is why I emphasized in my testimony the fact that of our 18 helicopter transports since May, the children transported represented 12 different diagnoses. The two repeating diagnoses, meningitis and head trauma were sufficiently different in age and the type of pathology involved that these cases can't be compared within those diagnostic groups. Thus, we are left with the problem of not having enough cases in any one category to allow us to provide a scientific evaluation. Again, I am left with having to make a clinical judgment in each individual case, and according to the individual cases I would say that the children were young enough and had illnesses of sufficient acuity that transportation by helicopter was justified.

I don't believe that we are unique in having difficulty in coming up with hard scientific data that would justify our proposal for a helipad, and we must use clinical judgments on a case by case basis. It is hard to refute that a critically ill child or infant requires rapid transportation and quick transport to the nearest and best intensive care unit in order to have the optimal outcome for that individual child. That is what our patients and our referring physicians demand of us, and we expect it of ourselves. Unless we have the ability to land safely a helicopter at COHMC, we will never be able to prove to you its benefit. We could only present to you on a year by year basis the number of children who died while in transport, or died shortly after arrival at COHMC, and conjecture that the outcome would have been better if there had been a helipad at COHMC. There is no question in my mind that the risk of helicopter transport for emergency situations is far less than the risk of ground transport through the congested and slippery streets of King County. I am glad we did not have an emergency from the east side last week when I-90 was completely blocked because of a multi-car accident. That sort of event is far more frequent than the rare, but very newsworthy, helicopter accident.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The concern from the neighborhood that was most difficult to respond to last week was the elderly lady whose husband has a heart condition and who lives in the apartments immediately adjoining COHMC. I wish I could remove or alleviate the fear and anxiety factor that goes along with the use of helicopters. I personally don't believe that the noise from the few helicopter landings is a significant factor when one already considers the noise that exists in the neighborhood from traffic and overhead planes. Most of our flights would be in the daytime and very few at night. Although I can't prove it, it seems to me that the noise from an ambulance at code red along Sand Point Way is just as disruptive as a helicopter. The only difference is that we as a society have become accustomed to the ambulance and accept that as a part of our background noise. From a health standpoint, although again I can't prove it, I would imagine the danger of a local resident being hit by a speeding ambulance is as great or greater than the danger of a crash of a helicopter or a heart attack because of alarm from a helicopter noise. Unfortunately, our society has become more accustomed to car accidents and almost accepts those as given risks, yet there seems to be a greater fear of the more dramatic but extraordinarily infrequent helicopter crash. The one argument that I cannot abide by is that because of these factors the helicopter should go to Harborview rather than to COHMC. I believe that there are many apartments in which the elderly live around the Harborview campus, and the Harborview campus seems to be more congested than the COHMC campus. The only differences between the two communities are the socio-economic factors, and I don't think that those should bear a role in the decision as to where a helicopter should or should not land.

Let me end by indicating to you once again my commitment to review with you the use of helicopters at COHMC on an ongoing basis and to assure you and the community that we have no intention of utilizing this service unnecessarily. I do make a plea, however, to let us build a safe and protected area at COHMC where we can land children by helicopter and have direct access to the Emergency Room and Intensive Care Units. Liz Anderson in her testimony indicated that she is not against landing critically ill children at COHMC and I sincerely believe she speaks for the majority of the community.

I hope we can come to a resolution on this issue relatively soon. There are too many critical issues involving the health care of children that we must work together to solve. I look forward to a long and rich association with you and I thank you again for your patience and understanding.

Sincerely yours,

John M. Neff, M.D.

400 Yesler Bldg.
Seattle, Wa. 98104

Sir:

I write in support of the application of Children's Orthopedic Hospital of Seattle, Washington for the construction of a Helistop on the campus of Children's Orthopedic Hospital.

Transportation of the critically ill or injured child is a challenge to all emergency personnel. In recent years advances in technology, treatment, and transport modalities have contributed to a decrease in pediatric mortality secondary to acute illness, poisonings and trauma. While over 100,000 children die each year in the United States, they are widely scattered throughout the country. Each community thus accumulates little experience in caring for the critically ill child. The necessity for adequate, efficient resuscitation and rapid transportation has been clearly demonstrated in patients with severe illnesses or injuries. A response to the need for prompt, efficient delivery of proper medical care has been the development of regional centers to care for specific problems including regionalization of pediatric critical care to children's hospitals. Early reports indicate that regionalization of some facets of critical care may result in lower rates of pediatric morbidity and mortality, particularly trauma. Many cities, Seattle included, have pediatric centers dedicated to the special needs of children. Development of these services is costly and clearly not available in every community, therefore it is imperative that these services are available to all children regardless of their location. The speed and efficiency with which the child is delivered to the regional center may make the difference in outcome.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's Orthopedic Hospital is a regional center. It has a national reputation for excellence in pediatric critical care. It provides the physicians practicing in the region with quick access to its critical care units by means of a regional critical care air transport system called Airlift Northwest (ALNW). Airlift Northwest is a consortium activity of four Seattle area hospitals. Airlift Northwest provides medically configured, ventilator-equipped turboprop jet and rotary winged aircraft, with a medical team of ICU physician and ICU nurse to resuscitate and provide proper medical care en route to critically ill children.

The COH medical teams and ALNW transport very sick children. Children's Orthopedic Hospital accounts for one-third of the use of Airlift Northwest fixed wing activity. It accounts for 12% of the ALNW rotary winged acitivity. In the preceding fiscal year 83% (175 children) of those transported to COH were admitted to an ICU secting. 100% of the children transported by rotary winged aircraft were ICU admissions. 39% (88 children) transported by fixed wing were intubated. 71% of the rotary winged transports were intubated. 11% of the children had central venous lines. 4% had chest tubes; 8% had vasopressor and/or prostoglandin infusions. 3% (6 children) had on-going CPR!.

The children were very young as well as being very sick. 40% of the children were newborns. 50% of the children were less than 6 months of age; 75% were less than 5 years of age. One third (35%) of the children under 6 months of age brought by the helicopter required endotracheal intubation in addition to IV infusions and the administration of medications. These medical interventions are delicate and cannot be disrupted by unnecessary additional transfers. Thus the ALNW service provides an intensive care support to a large number of very small and very fragile patients.

To summarize, Children's Orthopedic Hospital is a regional pediatric center with nationally known critical care excellence. It receives critically ill patients referred by local physicians from the Pacific Northwest region, many of whom are transported by air. Speed of transfer for patients from around the Puget Sound region, a majority of whom need continuous advanced life support, has been accomplished by using a helicopter. The number transported from within the region by helicopter is estimated to be 42 per year or less than one per week.

The continuous delivery of critical care justifies the need to fly a relatively small number of critically ill children directly to the door of the regional pediatric critical care center. COH has, in the helicopter, extended its critical care capabilitites to the smaller communities of the region. It must be argued that any disruption of the components of the critical care transport system extend unwarranted risk to the child and detracts from the level of service provided by Airlift Northwest.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I ask that you permit the placement of the Helistop on the COH campus thus allowing Children's Orthopedic Hospital to have quick access to the critically ill children of the region transported by Airlift Northwest.

Respectfully your,

Michael K Copass

Dr. Bud Nicola
Seattle-King County Health Dept.
400 Yesler Building
Seattle, WA 98104

Dear Dr. Nicola:

Here are some comments for your consideration in forming your opinion about the COH heliport proposal. We realize your time is limited so we will be as brief as possible.

1. An experienced, knowledgeable Seattle land use attorney, in informal conversation with us, has stated his opinion that the process of fact-finding and deciding on this COH heliport conditional use permit is being conducted in the wrong sequence. Specifically,he feels that "medical need" should not be the first decision or opinion in the sequence, but that environmental impacts, which include the important issue of safety and accident risk, should precede the medical need questions. After receiving the environmental checklist report for Childrens Hospital prepared by Shapiro and Associates (the Shapiro report) we can now understand the lawyer's logic. Much of the information presented in the report is erroneous. There are serious problems with the methodology they have used in regard to determining noise and safety impacts specifically. For example, the accident rate figures are based on a ridiculous amount of flight time (45 minutes). Although we are in the process of addressing the obvious flaws in the report and forwarding this information to the City, you probably do not have accurate, well-documented information on which to consider the safety impacts to the community. Therefore it seems that any decision in regard to this issue is premature. Is there any way of postponing your opinion about medical need until the environmental impact questions are investigated?

Also, we hope that you are not using the information about accidnet risk as stated in the environmental checklist report for Childrens Hospital prepared by Shapiro and Associates (the Shapiro report), since that report has many flaws which will be revealed during the environmental review process. The current version of the Shapiro report is a preliminary draft of a full environmental impact statement We question the helicopter accident rate figures and other assertions made in that report.

2. In determining "medical need", as stated in the City Code, it must be shown that the heliport is needed to save lives and it not just more convenient, or nicer, but actually needed for life-saving.(For reference, see Katy Chaney's letter to Childrens Hospital of June 5, enclosed.) The criteria by which you decide whether the helipad at the COH emergency room door is needed to save lives are obviously very

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

important.

RESEARCH on this point is extremely limited. One study showed that the lives of only 10% of(i.e, the worst) trauma cases were actually saved by the use of a helicopter. (Baxt and Moody,1984). Further, the authors surmise that, if the ground ambulance had had a highly skilled team as did the helicopter, even the 10% difference in life-saving by the helicopter might have been less. We have found no other articles which deal with this point. As Baxt and Moody point out, the sometimes-used comparisons of combat-wounded lives saved as helicopter use increased between the Korean and Vietnam Wars are not valid since medical practice and technology had also changed in many significant ways between those 2 wars.

At the medical need hearing, Dr.Copass mentioned work done at Denver and Salt Lake City which he said gives support to the idea that lives are saved by helicopter use. We called him to get references to this work and finally have gotten them but so far have been not had time to conduct the critical review of those research findings that is obviously warranted. We will be submitting that review to you in a few days.

Research about the value of NEONATAL TRANSPORT BY HELICOPTER apparently does not exist. The (enclosed) article about neonatal transfer repeatedly points out that stabilization of the neonate, and not speed of getting to a tertiary care center, is the key to improving survival. Indeed, one study found that survival of neonates was enhanced by transport to a tertiary care center, even with an ambulance that was not specially equipped (much less a helicopter).

It appears that research evidence is sparse, and does not clearly support the need for helicopter service--and especially not to the emergency room door at Childrens Hospital. Most TRAUMA cases go to Harborview; with COH getting NEONATES AND SEVERELY ILL CHILDREN. I could find no published research on the value of helicopter transport for these latter categories of cases.

Your review of ALNW records plus your interviews with physicians who have been involved (flown?) with ALNW--including those involved in the past (noted on the list sent to you by the COH physician)-- is about the only sort of evidence available regarding life-saving medical need. We would like to ask that you share your evidence about this key matter with us.

3. A number of questions are also pertinent which relate to the likelihood that there will be problems in restricting the use of the helipad to life-threatening emergencies.

--It is not clear which cases will go to which hospitals, so we cannot come up with an estimate of the number of cases to expect. COH's estimates vary from 5 to 40 per month (the latter estimate is in the Shapiro report,Attachment B, Helipad Noise Evaluation, page 1). If the number of cases to be expected by COH is quite small, overuse to make up necessary revenues becomes more likely, as Katy Chaney has pointed out (letter to COH, June 5). But if the number of cases is very large,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the safety risks and environmental impact would be significant, especially since each case represents 4 flights over the neighborhood, due to the location of the helicopter and the flight crew. (This is confirmed by Shapiro report, page 14). Therefore, careful evaluation of the number of cases expected is warranted and should be up to COH to supply. They must have done a study like this to determine the feasibility of the project.

It seems imperative that Harborview, University Hospital, and COH develop a plan to cooperate on patient allocation. In COH's "Shapiro report", page 14, examples of types of emergencies that could require helicopter transport to COH include "severed arteries..." These trauma cases are currently taken to Harborview; so clarification is needed as to whether COH is now planning to expand into the care of children with trauma, directly competing with Harborview.

In this same listing of "examples of emergencies that would require helicopter transport are cases with "hypoplastic heart and lungs". Since the survival rate for this condition is nil, we wonder what can be the value of flying such cases in to COH. Unfortunately, flying them it will not save their lives.

5. It is probably not possible to restrict the use of the helipad at Childrens Hospital emergency room door to the ALNW helicopter. Other emergency helicopters such as used by the Coast Guard, MAST, etc. would use it too, although the soccer field at UW has served adequately for years. We have been told that MAST will probably get Blackhawk helicopters, which are much heavier and noisier than ALNW's helicopter and are two times as heavy (as noisy) as a "huey" chopper. A consideration of their "right to use the helipad" is appropriate, too, since they will use it once it is in place.

6. If COH gets a heliport, why won't this set a precedent that every other hospital in town also needs one?

7. We would like to invite you to a fact finding tour of the proposed helipad site from the citizens' perspective. We would want to show you:

A. The homes near the proposed heliport, especially Laurelon Terrace, with firsthand reports from residents as to what it is like in their homes when the helicopter lands.

B. The different flight paths that have been taken by the helicopter pilots over various residences--not just the "minimal path" which they say they will take.

C. The location of the elementary school, which has been under some of the flight paths in the past few months.

D. The location of the "usual landing place" of the helicopters at the UW soccer field--not very far from the main road through that field, and not the same place the helicopter landed on October 15 for the "fact-finding"demonstration for you.

E. The traffic flow problem on the COH grounds whenever a helicopter lands. The proposed landing site is only a few feet from COH's major traffic lane. The traffic can be very heavy there, as it

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

was on the day you visited COH for the helicopter landing, with many school busses, school children running around, parents of sick children walking though, etc. When a helicopter landed at St.Luke's Hospital in Bellingham recently, there were 2 auto crashes due to the distraction caused by the landing. The landing place at the UW soccer field is a much saner place from the standpoint of traffic (auto and foot traffic) alone.

Dr. Nicola, thank you for considering our concerns. We realize you have a difficult task before you and we do not wish to make it any harder. We feel that this is a much more complex issue than COH tries to present it as and we think that since it is precedent-setting it does require very careful consideration. It is likely that the right approach to this problem on the part of City and County officials can be instrumental in preventing the kind of acrimony (including lawsuits) that is going on in other parts of the country over this issue.

Parenthetically, Jerry Schneider did manage to reach an administrator at the Lehigh County Hospital who is sending him information on their 3-year, successful effort to reach a resolution of helicopter use for a 6-county EMS region in Pennsylvania.

Please call us if you would consent to a citizens fact-finding tour. Although you have taken the tour with Childrens Hospital, we are concerned that pertinent, important information was left out.

Sincerely,

Liz Anderson

Ref : COH helipad facility hearing
24. October 1985

Dear Dr. Nicola ,

I want to take this opportunity to reaffirm my statement at the hearing that The Sandpoint Naval Base facility ,which offers a well lit,allweather,year round hard landing place for helicopters ,is about one mile from Childrens Orthopedic Hospital . A careful check established that the distance is actually 1.5 miles and not "over 3 miles " as claimed by Dr. Abelson in his rebuff . There is no rush hour traffic on Sandpoint Road and a helicopter can make its approach and land coming in from Lake Washington ,without endangering the safety of the residents and by keeping the noise problem at an acceptable level. The distance from the U. of Washington playing field ,which was used for landing of helicopters for COH until the hospital decided to violate city ordinances and land them on its parking lot , is 0.9 miles toothe admission wing of the hospital.

Not one shred of evidence was produced by COH that any of the children landed at the U. of Washington playing field and transferred to the hospital by ambulance had suffered injuries or deaths because of that procedure . The point of contention was that the field was badly lit and provided poor access in bad weather .The use of the Sandpoint Naval base will ,ofcourse nullify such complaints .

Judging from the statements made by senior personnel of Childrens Orthopedic Hospital at the hearing ,the hospital intends to use helicopter transportation well beyond the alleged occasional emergency case . Obviously ,even one admission per day by means of helicopter would entail 4 flights (pickup of med. team at hospital, pickup of patient ,delivery of patient and departure of helicopter) and would constitute a nuisance . The figure of one admission a day would tally with the mentioned 30 cases per month . But both the U. of Washington and the U.S. Navy might balk if COH were to turn their landing facilities into a heliport instead of a resort for emergencies only. If surface transportation will indeed become more and more impossible because of traffic problems then perhaps COH should make longrange plans to move out of a heavily residential part of town like Laurelhurst ,which was one of Seattle's finest neigborhoods long before COH moved in. Contrary to statements by COH's administrator that the hospital wants to be a good neighbor ,Dr. Copass declared at a meeting held at the hospital : "we hope you will go along with this but we are going to do it whether you agree or not ". Hardly the picture of a good neighbor.

I urge you to consider the application for the helipad construction very carefully. Once obtained ,even with a promise of use for emergencies only, there will be no means of effective monitoring of such a promise and nothing short of a major accident, such as a helicopter crash involving death and injuries of residents,could reverse the process. And we don't want that, do we ?

Sincerely yours
Albert A. Feldmann

RE: Helicopter Meeting of October 24, 1985 at the Municipal Court Building

Dear Dr. Nicola:

When I spoke at the hearing on October 24, 1985, I took issue with Mr. Albert Feldmann's statement that a helicopter landing at the Sand Point Naval Base would be one mile from COHMC. I said that it was about three miles and my statement generated comments from the audience. On October 28, 1985, I asked Captain Lewis at the Sand Point Naval Base to allow me to drive my car to the helicopter landing site and retrace the only exit route from there through the base to Sand Point Way and subsequently to COHMC. The distance according to the odometer on my 1984 VW Jetta was 2.6 miles. I bring this to your attention to insure that misrepresentations of data as suggested by the audience would not reflect on any other comments that I made.

Sincerely yours,

Herbert T. Abelson, M.D.

Ref : Letter by Dr. Herbert T. Abelson
COH ,dated 28. Oct. 1985

Dear Dr. Nicola ,

By a curious coincidence Dr. Abelson and I had the same afterthought after the hearing last week .We both got into our respective cars (mine is a Honda Civic '83) and checked the distance between Childrens' Hospital and the Sandpoint Naval Base. I never thought of getting the commandant of the Naval Base into the act but simply checked the distance on my odometer from portal to portal . Maybe the road from the entrance of the base to the helicopter landing pad is convoluted enough to add another mile . But a distance of 2.6 miles as against 1 mile (to the U. of W. playing field) is obviously of no consequence for an ambulance in an area that never has any dense traffic. The complaint by hospital personnel was about the poor lighting and the muddy condition of the U. of W. playing field ,which allegedly made access difficult for an ambulance. Obviously ,the Naval base landing pad presents none of these drawbacks.

As I said in my previous letter to you ,there is grave suspicion that COH wants its own helipad to generate a steady traffic of bringing in patients by air and will not restrict it to emergencies . Who will "bell the cat" and monitor the abuse of its privilege by COH when not a single physician could be prevailed upon to testify at the hearing against Childrens' Hospital ,even though a number of them expressed themselves that way privately?

Isn't it strange that COH and the helicopter service would jointly put on such a massive and expensive lobbying effort for a few emergency landings ? How much does it cost to produce a 20 minute color film ? And 1½ hour's worth of prepared statements on top of that .Was it just coincidence that the statements were long in listing the pedigrees and professional connections of the speakersbut short in addressing the problem, i.e. setting up a round the clock air corridor to COH over quiet residential streets of the city ?

Far be it from me to judge Dr. Abelson's veracity in general on the basis of one statement .He based his on jogging along the road ,I based mine on walking along the Gilman trail to 65 th and Sandpoint Naval Base. Perhaps the lesson is to check each statement and all data presented ,very carefully.

Sincerely yours

Albert A. Feldmann

OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT
OF PUBLIC HEALTH

Dear Dr. Nicola:

It is apparent that much has been said about the construction of a Heliport at the Childrens Orthopedic Hospital on Sand Point Way. We believe that much of what has been said is due, in part, to irresponsible reporting by the news media, and we would like to take this opportunity to voice our opposition to the Heliport at that location based on some rather basic thoughts on the subject.

1. We are not convinced that Helicopter Service such as that proposed will be instrumental in saving lives.

   A. The Hospital has not been altogether truthful when presenting their facts. We find it difficult to believe that the three minutes it takes to transport the patient from the University of Washington Intermural Field to the hospital is that critical, when so much time has already been saved in transporting the patient by Helicopter from distant points.

2. The citizens voted against using Sand Point Naval Air Station Airfield for airplanes because of the risk of air traffic in the vicinity of the residential areas.

3. It is understood that the University Hospital also wishes to implement Helicopter Service for their patients. This would certainly increase air traffic in the entire area.

   A. Would it not be more practical to establish a Heliport at the Intermural Athletic Field to serve both hospitals? It would certainly be easier to control the air traffic and such flights could come in across the Lake and present minimal hazard to the residential areas.

Please understand that we, as residents in this area, are all for saving lives and believe that some sort of Helicopter Service may be instrumental in serving that purpose. However, let us not create additional hazards to meet that demand when a safe solution is so readily available.

Thank you.

Very truly yours,

Harald S. Kurtz

Mildred S. Kurtz

29 October 1985

5007 -44th N.E.
Seattle, WA 98105

RECEIVED
OCT 30 1985
OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT
OF PUBLIC HEALTH

Dr. Bud Nicola
Health Officer
700 Yesler Building
Seattle, WA 98104

Dear Dr. Nicola:

I am writing you to urge you to advise DCLU not to allow COHMC to construct a helistop at their location.

I attended the October 24, 1985 meeting in Council Chambers at which time I heard various COH employees render oral and visual support to this project. I viewed the 20 minute video they showed. I noticed they chose to tune out the noise of the helicopter and instead incorporate the sound of the microphone in the interview of Dr. Mel Morse, showing the helicopter running in the background. Under normal circumstances conducting such an interview with someone so close to a running helicopter would be impossible. Even simple phrases must be shouted to be audible at such a range.

Also, I must take exception to Dr. Alan Morgan's testimony on the taped interview that this is merely a matter of nuisance to a "few" of the area's neighbors. On the contrary there are many, many neighbors opposed to this project. The community surrounding COH is mostly residential in nature. There is a senior citizen housing project nearby and also the Laurelon Terrace condominums, 80% of which are occupied by senior citizens. These unfortunate people will receive the major impact of the noise since the flight pattern dictates that the helicopter would most times fly in and out right over their Homes. It is not easy at all for these people to up and move at their age. There is also an elementary school 1 block from the hospital.

COH personnel testified repeatedly of the hazards encountered in transporting a patient on a cold, wet, windy night. However, they stop short of considering the landing of that helicopter at COH, in a residential area, on such a stormy night.

COH has also refused to do a Certificate of Need. This reinforces an apparent lack of concern that they have regarding this project and its impact on this neighborhood, and the well being of it citizens.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The physical and emotional effects of noise caused by the helicopters, or any such equally loud noise on the human body is well documented in many studies, as I am sure you are aware. Increased stress, increased blood pressure, hearing damage, lack of sleep to the body and just the very anxiety in knowing that every transport will involve 4 trips of the helicopter to and from COH are just part of the problems that could lead to serious health disease.

I feel the best solution to this is to upgrade the IMA field at the UW. It would be relatively easy to provide decent paved area with the appropriate lighting and direct road access. COH has not been able to prove that any patient's lives that were transported from the IMA field have been compromised because of such a transport. Indeed, their complaints have been mainly the traffic and the poor conditions of the field. I would think it would be relatively easy for the helicopter pilot to radio ahead for a police escort to assure a speedy, unimpeded, safe trip to the COH Emergency Room at heavy traffic times, or on game days.

I do not feel the flight nurses, nor the flight physicians should be forced into making the decision on how critical a patient really is, thus allowing the very critical ones to go ahead and land right at COH, and the not so critical patients to land at the IMA field and then be transported via ground transport up to the hospital. Not only would this be next to impossible to monitor, but it is grossly unfair to the patients, and could have horrendous legal implications.

I honestly do think that there exists instances where our geography and the critical, life-threatening, illness of a child/infant dictates the use of a helicopter transport. I do not feel that it should be as often as 15-30 times a month. I definitely feel that increased usage of the helicopter transports for non-life threatening emergencies will increase in order for the hospital to justify the cost of the helicopter expense. On October 15, 1985, the helicopter landed at the COH Emergency Room bringing in an infant that was already DOA to the Boeing field, where it had come via fixed wing transport from Wenatchee. This, obviously, was an example of abuse in the use of the helicopter.

COH steadfastly claims that the helistop is not a marketing tool as they are an already proven primary provider for the pediatric patient. This is true, but I think the concept goes beyond this. One can see the value of a helistop to a facility that is seeking to be upgraded to an Acute Trauma Center, which is what COH is planning on becoming. Not to receive the status of an Acute Trauma Center in the near future would possibly mean pediatric patients will be flown directly into UW and Harborview Hospitals for their primary care, since both of these fine facilities have a highly qualified pediatric staff also. The UW also has a level III infant intensive care, the same as COH, which does operate at this time in direct competition to COH for the care of the critically ill infant.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If COH, UW & Harborview had no choice but to share helicopter facilities surely they could arrive at a viable plan for care to these critically ill patients. Perhaps the solution lies in expanding the already affiliated pediatric program at Harborview whereby more experienced COH staffing & equipment is available to render immediate stabilizing care. After the patient is no longer in a life-threatening situation they could be safely transported to COH for extending care via ground ambulance. This would negate the need of transporting the patient initially by helicopter to COHMC as Harborview already has a helistop in place.

Dr. Nicola, for all the above reasons I urge you to reject COH's bid for the helistop. In this day and age of trying to curtail the ever sky rocketing costs of medical care, the idea that 2 hospitals located within a 3 mile radius of each oth , both needing helistops, is at best, ludicrous. Please, as an alternative, consider the combined use of a new fully equipped helistop located at the IMA field for both the UW and COH patients.

Thank-you for your time.

Sincerely,

Kathryn L Peterson

November 8, 1985

RECEIVED
NOV 12 1985
OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT
OF PUBLIC HEALTH

Dr. R. M. Nicola, Director
Seattle-King County Health Dept.
Public Safety Bldg.
Seattle, WA. 98104

Dear Dr. Nicola:

Since writing to you last, and since the public hearing held on October 24, 1985, my concern about a helicopter landing at Children's Orthopedic Hospital in Seattle has continued and increased--not decreased.

I fully support and welcome a state review and state regulations as well as a full certificate of need filing as reported in an article in the Seattle Times of November 7, 1985.

As a ten-year resident of Laurelon Terrace contiguous to the planned site of the helipad and in path of diagonal flight plan, too, I am especially concerned about the safety factor and also the detrimental effect on residents' health who live in this condominium complex of 136 units. It was alarming and distasteful to find that Mr. Truman Katz of COH, when asked about the effects on Laurelon Terrace, did not even know where Laurelon Terrace was, and when told just shrugged it off. Are Laurelon residents considered expendable?

As a thirty-two year resident of Laurelhurst, I among many others highly resent being represented as uncaring and as a wealthy, selfish citizen. Generalizations and stereotyping by news media is dangerous and careless--yes, libelous--and untrue. Hundreds and hundreds (and upwards) of hours, thousands of dollars over many, many decades have been contributed to COH by residents of Laurelhurst.

However, these same residents do not believe that the horrendous expense of a helicopter (purchase, maintenance, salary, insurance) is necessary; nor is a helicopter necessary when three other hospitals --one within short distance of COH--have identical landing facilities and trauma services already in place--this is duplication of services; since no problems are recorded (present and/or past) of landings at the UW soccer field, it seems that there is no medical justification for this COH plan; and finally, the residents do not believe that further institutional encroachment in a family-residential neighborhood is wise or fair.

Please proceed carefully and slowly in final assessment of all assertions and merely implied needs by COH. Please ponder seriously why COH does not want a certificate of need, a state review, and/or open communication with Laurelhurst and Laurelon Terrace residents.

Thank you.

Sincerely,
Maryann E. Spangler

Seattle, Washington 98117

Re: September 9, 1985 Hearing

Dear Representative Brekke:

I am a general surgeon in private practice with consulting or clinical arrangements with most of the facilities and agencies discussing this issue. I am most useful to you, however, as the Medical Director of MAST since its inception in 1969. MAST is a military helicopter medical evacuation (Medevac) service provided to the civilain community by a military facility. While other uniform services do some medevac work, the 54th Medical Detachment at Fort Lewis provides more than 90% of the helicopter medevac missions in Western Washington. This detachment has 7 helicopters and sufficient crews to provide 24 hour, 7 day immediate response with a "second up" crew and helicopter as well.

As I understand it, the question is whether the medical needs of helicopter medevac patients justify the hazards of locating a helipad in a residential area.

First, let me say that my professional bias is that within a radius of about 75 miles, excluding off roads and island sites, most emergency patients can be transported more promptly, more safely, more smoothly, and certainly more cost effectively by paramedic ground ambulances than by helicopter.

Regarding the size of the need for helciopter medevac, MAST does about 200 field pickup missions a year, and before the availability of a reliable inter-hospital fixed wing air ambulance, an additional 200 inter-hospital transfers were done. An average of 14 patients per year are transported to Childrens Orthopedic Hospital (COH) including 2 premature infants per year. Although this incidence of helicopter use/unit population is about 1/10 of that reported by hospital based helicopter's (Emmuanuel Hospital in Portland excluded), the years in business, the availability of helicopters and crews, free service and the requirement by state regulation that the MAST phone number be posted in hospitals, this estimate of the size of of the need seems to be reliable

Re: September 9, 1985 Hearing

It is difficult to project changes. Peripheral hospitals are becoming better staffed and better equipped, but there may be some trend towards shifting complicated patients who will lose money to central hospitals. While I am not expert in neonatology, I understand that the trend is towards transporting high risk undelivered women electively, rather than transporting high risk infants urgently. I would guess that the size of the need for helicopter medevac will slowly increase over the coming years and conforming to population growth.

Regarding the quality of the need for helicopter medevac, two years of activity was reviewed. 24 pts 60% of the missions to COH were inter-hospital transfers with patients presumably stable. These transfers occurred days or hours after the onset of the illness or injury. 9 patients were picked up in the field: 3 were probably unnecessary, 2 involved the same child with congenital pulmonary problems who lives on the other side of Puget Sound, 2 patients with head injuries of undetermined severity and 2 patients from Bainbridge Island one thought to have meningitis and a 1 year old in coma. The question of whether or not 5 minutes of transport either way would have altered the outcome of any of these patients is not positively answered by these records, or in fact by the medical literature. Presumably the outcome of patients who are transferred from hospital to hospital is not minute dependent because of the length of time already past since the onset of their illness or injury. Records of the patients picked up in the field are necessarily limited and we do not regularly follow up with these patients. However, the helicopter flight crews do accompany the patient to the hospital in the ambulance and they have not, to my recollection, mentioned that they should have been able to land on the hospital lawn for any reason. Likewise, neither the private ambulances nor the medic I gound ambulances that transport patients from the helicopter to COH have reported any problem in these transports which have caused them to suggest a change in landing zones. Our pilots, on the other hand, are always concerned that the Graves Field landing zone is not secured and they would prefer not to land on soccer players.

The issue of the importance of transferring a patient from a helicopter to an ambulance has been mentioned. Again I cannot speak to the importance of this in the outcome of the patients care. We deliver our most critically injured patients to Harborview where it is necessary to [illegible] transfer from helicopter to an ambulance then to the Emergency Department and this is the situation in most hospitals in the State. While it does stand to reason that avoiding this additional transfer should be helpful to patient outcome, I do not know of any evidence to that effect.

Representative Joanne Brekke
6525 Sycamore N.W.
Seattle, Washington 98177

Re: September 9, 1985 Hearing

Whether or not the future needs will include patients whose care is more time critical than those in the past is dependent to some degree on local ground rules. MAST delivers patients consistant with the desires of the referring physician, or in the event of critically injured victims, to the hospital indicated by local EMS agencies. In King County, as you know, local EMS agencies have directed that critically injured patients be delivered to Harborview and the question of age is not addressed.

Regarding the hazards of locating a helicopter landing zone in a residential area, I have only anecdotal information. Since MAST has been operating, 7 air ambulance crashes have been brought to my attention. One of these was a fixed wing aircraft and the other 6 were helicopters. None of these accidents have been at the hospital landing zone.

I hope this information will be helpful in your deliberations.

Warm regards,

Jay M. Kranz, M.D.
Chairman, MAST Coording Committee

10 September 1985

Representative Joanne Brekke
Chair, House Comm on Social & Health Svcs.
6525 Sycamore NW
Seattle, WA 98117

Dear Representative Brekke,

I was troubled by the portions of the House hearing on helicopter usage as each group tried to emphasize the justness of its position. I would like to share these additional thoughts with the committee as they apply across the State as well as in the King County area.

Stripped of all of the flag waving and marketing flak, helicopters still are a very useful and sometimes necessary adjunct to the delivery of health care, both in moving patients from one hospital to another in a timely fashion and in prehospital field pick-up. They are expensive instruments to buy, expensive to maintain, expensive to operate and under ideal medical considerations require multiperson crew for the patient care. Individual hospitals are probably not the best operating agency for regional helicopter services. They have an extreme conflict of interest when they use the helicopter as a marketing tool. We need, as a society, to examine other avenues of funding since the expense of operating costs need a broader regional base, if we do not have an actual government subsidy.

Since the utility of the helicopter is really undisputed, I believe that there should be regional planning and cooperation between various agencies that would utilize such a service. The best system would result from mutual discussion and would include an integration of a helicopter service with private air and ground transportation and with prehospital services that exist in radii greater than 30 minutes of ground driving time.

Part of the problem in the "helicopter war" is the fact that there are no agreed upon medical criteria for transport, either in

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the prehospital setting although this is really more uniform, nor in the interhospital setting. If the medical community can agree upon criteria for transport, then some of these other factors may dissipate. I will raise this question with the State Medical Association and see if we can make some progress there.

With respect to the central portion of Western Washington, Airlift Northwest, maybe the most logical local agency to operate a non military helicopter service providing it meets the criteria I state above. Your committee showed remarkable insight in cutting through the emotional flag waving and the imperious nature of the University system with the questions the members asked. I believe that the University needs to have this aspect of its community commitment even further opened up, so that it plans with the community, instead of telling the community what it needs according to the most recent professorial fad.

Lastly, mutual planning and community wide discussion would describe the most appropriate hospitals for helipads. I know of no way to prevent interrupted sleep for neighbors that live in an area adjacent to the hospital that might receive night time flights. Still, if a limited number of medically designated hospitals are agreed to receive patients at all hours by helicopter, it makes much more sense to deliver those patients directly to the hospital, rather than to intervene with some form of helter skelter ground transportation. When I surveyed hospital mounted helipads I was impressed by the complexity of the structure with respect to patient access, fire safety, structural integrity of the building, etc. It's not an easy thing to simply stick a helicopter on top of a building. Ground landing pads are cheaper, but even these require FAA approval for the safety of the landing patterns. They also require the dedication of land where land may not be easily available.

I suspect that the Certifcate of Need unit did not exercise its most appropriate authority in examing existing helicopter services. I hope that they can be impressed on the necessity for doing so and can make retrospective reviews of their prior decisions.

In summary then, helicopters are a very useful and sometimes necessary adjunct to patient care. There should be medically agreed upon criteria for who is transported between facilities and who is transported to facilities. Regional planning is necessary to insure the best use of limited patient care dollars and interrupt the marketing hype currently associated with helicopter services. I hope you will share these thoughts with other members of your committee.

Sincerely yours,

L.H. Pinkers, M.D. FACS

LHP:ys

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

P.S.: Talk with Representative Ballard about this thought. RCW18.73.080 is in need of revision because there have been so many changes in the prehospital emergency medical field since the original bill was written. The EMS division of DSHS and the WSMA probably will be recommending some amendatory legislation in a comprehensive rewrite. Since the original air transportation legislation is in that RCW and since there may be a place for more aggressive planning and service designations, helicopter and other air ambulance would be a logical part of this. Planning and service allotments could then be made upon demonstrated need, distances, medically logical patient destinations, etc.

October 23, 1985

Dr. Bud Nicola
Director, Health Department
7th floor
Yesler Building
Seattle, Washington 98104

Dear Dr. Nicola:

I am writing this letter in response to an inquiry from Children's Orthopaedic hospital concerning my professional judgement as to the placing of helipads near selected and designated institutions for the management of the critically ill.

By way of background I am a Board Certified General Surgeon who had been working in trauma for approximately five years. My previous employment was within the state of Maryland as the state medical Director for Emergency Medical Services and as such coordinated the response of the Maryland State Police Helicopter Program which transferred approximately 2,700 critical patients last year. They transported these victims to designated centers for trauma, neonates, pediatric trauma, burns, spinal cord injuries, penetrating eye injuries and replantation centers. During my tenure in Maryland the majority of hospitals upgraded helipads to enable them to access this rapid air transport service.

At this time I am the Medical Director and Chief Executive Officer of Boston Med Flight - a helicopter program, originating in Boston and serving the New England region. This hospital consortium represents Boston University Hospital, New England Medical Center (to include the Kiwanis Pediatric Trauma Institute), Massachusetts General Hospital, the Massachusetts Eye and Ear Infirmary, Boston City Hospital, Beth Israel Hospital, Brigham and Women's Hospital and Children's Hospital Boston. Within Boston there are concerns from various agencies as to the need for the receiving centers to have adequate helicopter landing areas.

Following the designation process hospitals begin to receive not only inter-hospital referrals but also patients directly from scenes of accidents. Patients who previously would have succumbed in the prehospital phase now, because of the emergence of E.M.S. systems and helicopter availability, survive to reach hospital. For many institutions there is a learning process to be able to manage these injuries. There is no doubt that the time from accident to definitive care is at a premium in managing these types of patients and that any increase in time from scene to trauma center may translate out to an increase in mortality or morbidity. Many agencies in their R.F.P.'s for specialty center designation mandate the close proximity of a helipad to decrease transit time to a minimum.

There are concerns other than that of time which may be of critical importance. An unstable patient should not be handled unnecessarily or transferred from one vehicle to another in their critical state. The experience with pediatric trauma in Baltimore may illustrate this point. At the time of implementation of the program Johns Hopkins did not have a well-equipped helipad and indeed the state police helicopters used to land a few blocks away from the hospital and rely on surface ambulance to complete the transfer. The physicians working within the pediatric trauma center recognized this deficiency and collaborated with community groups, architects and health planners and built a helipad directly on the roof of the hospital. This is served by a dedicated elevator which now takes patients from the helipad directly into the pediatric rescusitation area. Within this area all pertinent expertise immediately is available so that the patient has immediate access to the radiology suite, the CAT scanner or the operating room.

Although no community polls were conducted during the implementation of this program, during my stay in Maryland I received no complaints from community groups concerning the helicopter program. They were made aware that air transport was reserved only for those critical patients in direst need. Even with a busy day at the pediatric trauma center in Baltimore only five or six helicopter transports would be flown during a 24 hour period; this did not seem to cause community concern.

I hope that this brief letter addresses some of the points that will be raised at the public hearing on Thurday. If I can provide any further information please don't hesitate to let me know.

Thank you,

Sincerely,

Alasdair Conn, MD

DR Nicola

Testimony of the Citizens Concerned About Helicopter Transport at the DCLU Medical Need Hearing, Municipal Building, Oct. 24, 1985

My name is Anita Francis. I have a Ph.D. in medical sociology and health services research and am a graduate nurse. I reside at 5003 45th N.E. and speak for the organization: Citizens Concerned About Helicopter Transport.

We have been concerned about the issue of hospital use of helicopters and have been investigating the successes and problems associated with this use for over a year. We have interviewed 20 to 30 physicians and about 10 nurses from this area, most of whom have had experience in neonatal transport and/or pediatric emergency care. We have also interviewed experts in emergency medicine around the U.S. Our library work has involved reviewing professional journals and various other research literature concerning emergency transport and related issues.

Based on this effort, we strongly recommend that a careful study of the role of the helicopter be required. Although the problem currently before us is whether Childrens Orthopedic Hospital should have a helipad, we cannot separate this question from the larger question of what is appropriate for the system as a whole. Giving COH permission to have a helipad without requiring them to do a careful study will set a precedent that other hospitals will eagerly follow. Thus, both the question of COH permission and permission for University Hospital and other hospitals must be addressed now.

It is of critical importance that the role of the helicopter in the existing emergency medical services (EMS) system and neonatal care system be well-defined. The helicopter's role must be carefully planned, well-conceived, and, if allowed to proceed, should be continually monitored. To do this, a justification study should be done. This type of study has been asked for by numerous individuals--local and community physicians and nurses, experts in EMS throughout the U.S., and others concerned that our current, excellent ground transportation system not deteriorate and that issues of cost containment and cost-effectiveness be considered.

Some suggested objectives for such a study are as follows:
1. Determine an optimal allocation of emergency transportation resources.
2. Avoid disruption of the current nationally-recognized EMS system in the Central Puget Sound Region, which includes Medic One, Fire Department Aid Units, private ground ambulance companies, MAST military helicopters, Airlift Northwest's fixed-wing airplane service and also includes emergency care which is available at many of the region's community hospitals.
3. Forecast, as accurately as possible, the economic feasibility of the helicopter service, so that overuse in order to increase revenue is less likely to occur. It is possible that, as Dr. John Neff from COH has suggested, this helicopter service is so vital that there should be public subsidies of the service. A careful projection of its expected utility is needed in order to justify that claim.
4. Explore the concerns expressed by local and community physicians, nurses, and other residents of the Seattle area toward helicopter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

service and its secondary impacts in order to elicit their support, trust, and cooperation. There should be a full range of participants involved in the study, so that both the public and private sector providers and a wide range of consumers are represented.
5. Show whether the proposed plan of increased helicopter usage will have tangible benefits, with specific numbers to indicate that the proposed plan represents a worthwhile addition to the already well-developed current system.

Some specific recommendations as to scope and content are as follows:

1. Describe the current EMS and neonatal transport systems. Include findings on patterns of usage, capabilities and deficiencies, referral patterns, and the components of the system including existing prehospital care transport, caregivers, and institutions. Distinguish between getting care to the patient and transporting the stabilized patient to a hospital for treatment.

2. Include in a geographical framework a description of the current and projected population to be served, its demographic characteristics, and the transportation problems unique to certain parts of the Puget Sound region.

3. Estimate the optimal role and level for each mode of transport. One method of doing this is described by Rhee, et al., Annals of Emergency Medicine, 13:10, October, 1984, as follows:

a. Define which medical conditions are appropriate for each transport mode, e.g., for which medical conditions would patients benefit significantly from helicopter transport to a referral center? These findings can become guidelines for use in deciding on transport if and as the system evolves.
b. Determine the incidence of each of the medical conditions
c. Define the population to be served.
d. Calculate the need for service by multiplying the population to be served by the incidence and by the fraction of the population that will require the transfer. Do this for each of the transport modes.
e. Estimate the fraction of patients with demonstrated need who will actually use the service.

In estimating the need for each mode of transport, it is particularly important to identify in what situations and for what types of cases the helicopter is preferrable and when it is not. A comparison of patients who were transported by helicopter and their outcomes with similar cases moved in other ways is very important to do. About 30 cases would be sufficient to allow some useful estimates to be made.

Ideally, the role of the helicopter in the EMS system should be examined in 2 situations. One should determine how the existing system works, and then what changes the availability of a helicopter service would make, especially its possible impact on ground ambulance capability. Estimates should be made for 5 and 10 years time horizons, at a minimum. From such results, credible estimates of the expected number of flights, based on specific criteria, can be made.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Introduce cost factors. How much do these services cost and how will they be paid for? As is well known, the economics of helicopter transport are weak and results from this component may have a profound impact on the current perceptions and the future evolution of our EMS sytem.

Once this justification study has been conducted, and if use of the helicopter is shown to be warranted, and its role in the overall EMS system as been carefully defined, a set of rules for monitoring its use should be adopted. These rules would need to be agreed upon by all participants, and would include information as to who will be transported, who will make transport mode deicisions, methods for identifying and assessing penalties for misuse of the helicopter, and who has legal responsibility for the care of the patient during each part of the transport.

In contrast to the kind of careful study I have just outlined, is the case study approach, relied upon by COH, at least in its public presentations. A case study approach is of questionable value. I know from personal experience in my research that generalizations based on a few observations are not often true. As the methodologists Campbell and Stanley point out, "Any appearance of absolute knowledge, or intrinsic knowledge, about singular, isolated events, is found to be illusory upon analysis." Only by making carefully measured comparisons is knowledge reliable. And that is what we are asking for here.

A study such as we have suggested here would produce the kind of knowledge base needed to determine where and how the greatest impact on life-saving can be accomplished. Helter-skelter, piecemeal approaches are simply not adequate.

Thank you for giving us this opportunity to speak.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Testimony of the Laurelhurst Community Club at the DCLU Medical Need Hearing, Municipal Building, October 24, 1985

My name is Liz Anderson. I live at 4746 45th N.E. I am here tonight to represent the Laurelhurst Community Club Board.

First, we would like to clarify that we are not opposed to air transport for emergency cases nor to Childrens Orthopedic Hospital. Our community supports the hospital and the good work which it does;many in this community are volunteers, employees, and Guild members, and we are grateful for the fine work done in the hospital. We have difficulty taking an adversarial position against the hospital but feel that the helipad proposal is one that requires, at the least,open, careful, and honest scrutiny.

The goal of the LCC Board and many in the community has been to secure answers to a number of questions which should be addressed before approval for a helipad on the COH premises is granted. Tonight, we will just focus on questions concerning medical need. They are as follows:

1. Helicopter transport is relatively new. What data, prior to 1984, are available that indicate there are problems with the existing system of emergency ground transport? If local data are unavailable, what evidence is available from other comparable metropolitan areas?

2. Is there evidence that there are portions of the population that are currently not receiving satisfactory emergency medical treatment? We are certainly aware that the geography of this state makes ground transport difficult and we would understand that helicopter service could provide a useful adjunct to emergency care transport service in these areas. However. it is also clear that there are many areas that contain large populations that are well-served by ground transport and do not need helicopter service. It is very important that the ground transport system not be allowed to deteriorate because of competition from Airlift Northwest.

3. If emergency medical need can be defined, how many cases would meet the criteria for emergency delivery to the door of COH? Given the predominantly residential character of the COH location, what restrictions could be put upon helicopter landings at COH?

4. If a helipad is sited at COH, how will the service be integrated into a comprehensive regional plan based on a credible projection of need and standards of use and accountability?

5. How can a balance be found between the health needs of the community's residents (Laurelon Terrace, students in the elementary school) and the emergency medical needs of the hospital?

6. Can the emergency medical needs of patients be met by alternative

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

landing sites? Some possible alternatives are:

a) one helipad at the UW Soccer Field shared by UW and COH

b) one helipad at COH for extreme emergencies and another helipad at UW Soccer Field that both hospitals can share for non-emergency, stable interhospital transfers.

c) one helipad at COH and another helipad at the Sand Point Naval Air Station.

Our preferred alternative is to have all emergency cases that require helicopter transport sent initially to Harborview for evaluation and stabilization. There is simply no clear reason why patients cannot be taken to this region's acknowledged regional trauma unit, Harborview Hospital. Some of these patients would then be transferred to other adjacent hospitals by ground transport as indicated by theirk particular requirements. If Harborview's current staff, equipment and space is not wholly adequate for this role, it should be upgraded appropriately with the assistance and cooperation of both University and Children's Hospitals. This might involve the development of some joint practice agreements between University, Children's and Harborview to make such an arrangementk fully workable. We fe[illegible] confident that such a mutually satisfactory arrangement can be developed by the three hospitals if they are required to do so. Perhaps financial support from King County would be appropriate to make this concept a reality and to ensure that the helicopter service is integrated into the county-wide EMS system.

We on the LCC Board have discussed these alternatives as solutions to this dilemma and would be willing to poll the neighborhood to see how much support each might have. We would truly like to work out a compromise that would satisfy the needs of both the hospital and the community.

There is one additional topic that we, as representatives of this community, would like to address. Gathering information on this helipad proposal, both generally and as it pertains to the medical need issue, has been difficult. As you know, COH refused to complete a Certificate of Need application for helicopter service. As a result, important information which might have been provided through that procedure will not become available. Further, while many discussions have been held with COH personnel, it has been very difficult to get any hard data which would prove that there is a compelling need for the helipad. Over the past year we have been given much confusing and often contradictory information by COH. Some of this information has to do specifically with the utilization expectations of the helipad. Originally, we were told that we could expect 1-3 flights a month. Currently, Dr. Neff states that 15-20 might be a more realistic prediction. Other COH representatives have been quoted in the paper as anticipating 25-30 flights. When one stops to consider that each transport will require four flights over our community because of the different locations of the helicopter and flight team, any prediction becomes significant in terms of impacts on our community. Personal and professional connections have made it impossible for individual physicians to speak publicly about the complexities and uncertainties surrounding this issue. Many of the people who have expertise in emergency and neonatal medicine, and whom we have contacted recently, were not even aware of this medical need hearing. It is a sad

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

commentary that some of the best, unbiased, and disinterested but expert opinions on this issue are not being heard at all tonight. Although Dr. Nicola is no doubt acutely aware of this situation, it is unfortunate that a more open presentation of the numerous facets of these issues is not available for us all to hear.

In summary, we ask tonight, Dr. Nicola, the same thing that we have asked of the CQH administration and Board of Trustees--that the people associated with making this request and those associated with granting and denying such requests act thoughtfully and responsibly with regard to this issue and that a multi-county comprehensive plan for emergency medical transportation be developed that will address our questions and those of other consumers of EMS services. Such a plan should be developed in an open and participatory manner that will allow all points of view to be heard and balanced in rational ways. We hope our participation at this hearing will assist Seattle, King County, the Puget Sound Health Systems Agency, and other responsible parties move a step closer to the achievement of such a goal.

Thank you.

To: Hearing Officer, Heliport for Children's Orthopedic Hospital

From: P.A. Breysse, Associate Professor Emeritus

A group of citizens residing in the area adjacent to Children's Orhopedic Hospital are concerned about the effects of noise levels resulting from operation of the proposed heliport.

In the past I have conducted noise surveys associated with landings and take-offs of helicopters. Noise levels ranged from 95 dBA to over 110 dBA.

There is no doubt that exposure to noise (unwanted sound) can result in mental distress in some individuals. People do respond emotionally to noise. Mood music is intentionally utilized to elicit certain psychological responses during movies. Many are affected by military marches. On the other hand unintentional sounds also evoke responses. A dripping faucet, a sudden scream, a scratching piece of chalk all involve different yet characteristic emotional responses. Psychologic responses are related to intensity, frequency, intermittancy, as well as the unexpectedness, of the noise, the inappropriativeness f the stimulus, and interference with speech or communications.

One of the most significant and damaging effects of noise involves interference with sleep. Effects of noise on sleep disturbances has been accomplished by studying brain wave patterns utilyzing electro-encephalographs for monitoring subjects' stages of sleep.

Indications are that the quality and the quantity of sleep may be impaired by shifts from deeper stages of sleep to shallower stages, by interruption of dream sequences which are believed to be important for sleep and by premature awakening.

In a noise study conducted in schools located in close proximity to the Sea-Tac Airport, teachers often remarked that students in class who resided in homes located in the north and south ends of the runway would often fall asleep in class.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A series of sleep interference studies indicated that at:

70 dBA - most probable reaction, awaken.

50 dBA - probability that 50% of subjects will change to a lower level or awaken.

40-45 dBA - 10% of subjects will change depth of sleep or awaken.

J.D. Miller of the Central Institute for the Deaf concluded that, all facts considered, one must tentatively assume that sleep disturbance by excessive noise will reduce one's feeling of well being. Furthermore, when noise conditions are so severe as to disturb sleep in a regular unrelenting basis, then such sleep disturbance may constitute a hazard to one's physical and mental health.

The startle effect of helicopter operations, especially at night is an additional important noise effect and is undoubtly more disturbing than a steady state noise.

In summary, community noise is a serious problem having both a physical and mental aspect. As mentioned previously, sleep disturbance is critical and noise levels associated with heliport operations will certainly adversely affect the sleep of exposed individuals. Furthermore the startle also involves mental stress.

To Whom It May Concern:

I understand that Children's Orthopedic Hospital and Medical Center in Seattle, Washington is considering an off-site landing pad for the helicopter transport of infants and children into the Medical Center. Experience has accumulated over the last 5 - 10 years which clearly indicates that the ideal location for helicopter transport landing pads are either on the roof of the receiving childrens and general hospital or immediately adjacent to it so that there will be minimal exposure of the patient to the elements and the least possible distance for this secondary and dangerous transport. While this is not as critical in the newborn infant who is usually in a transport isolate and thus more protected; nevertheless, even with such small babies, the secondary transport adds additional dangers in the system of delivery. Especially for older children and young adults with multiple system injuries, protection of the airway during transport and management of skeletal fractures as well as exposure to possible hypothermia in bad weather strongly supports the concept that delivery directly to the hospital is far safer and medically advisable than to a remote landing site where secondary transport including a secondary transport team would be necessary. It is my opinion that in the planning phase, it would be unwise to consider an off-site landing pad for helicopter transport to the Children's Orthopedic and Medical Center if there is any option for transport directly to the Children's Center or immediately adjacent to it.

The Impact of a Rotorcraft Aeromedical Emergency Care Service on Trauma Mortality

William G. Baxt, MD, Peggy Moody, RN

• The mortality of 150 consecutive trauma patients treated at the site of injury and transported to a trauma center by standard land prehospital care services was compared with that of 150 consecutive trauma patients treated at the site of injury and transported to the same trauma center by a rotorcraft aeromedical service staffed by a physician and nurse. A statistical analysis designed to predict mortality based on injury severity revealed that the mortality of the land group was statistically no different from that of a large index trauma patient population treated at a major trauma center. There was a 52% reduction in predicted mortality of the aeromedical group, which was highly significant.

(*JAMA* 1983;249:3047-3051)

A REPORT in 1966 by the National Academy of Science termed accidental injury "the neglected disease of modern society."[1] This report led to a generalized realization that the medical care of trauma, both at the prehospital and hospital levels, was in need of change. The passage of the National Highway Safety Act and other federal legislation paved the way for the eventual upgrading of prehospital care by the funding of emergency medical technician (EMT) and paramedic training programs and the improvement of hospital trauma care by funding systematized and regionalized trauma care systems.

For editorial comment see p 3074.

In the ensuing years, most major population centers have obtained paramedic or EMT prehospital care services, and many areas have developed formalized regional trauma care systems. Today, however, trauma remains the third leading cause of death and the leading cause of death between the ages of 1 and 35 years. Because of these persisting, grim statistics, there have been recent attempts to upgrade the national approach to the treatment of trauma. To this end, there has been a reemphasis on improving prehospital care and extending organized regional hospital trauma care systems. One recent development has been the use of hospital-based rotorcraft staffed with advanced medical treatment crews that respond directly to the actual site of injured patients and provide major semidefinitive interventive care. This work is devoted to an analysis of the effect of such a system on patient mortality.

The first major use of rotorcraft as an adjunct to medical care took place during the Korean conflict. Although it has been said that the pronounced drop in mortality from 4.5 deaths per 100 casualties in World War II to 2.5 deaths per 100 casualties in the Korean conflict was partly due to the rapid treatment afforded casualties by use of rotorcraft,[2] this is difficult to confirm in view of the advancements in clinical expertise between these years and the important introduction of front-line surgical hospitals. The use of rotorcraft was further developed during the Vietnam War, when casualties were moved inside the craft and treated en route to definitive care. Mortality fell to less than one death per 100 casualties,[3] but again, with improved trauma care, it is impossible to totally attribute this to the utilization of rotorcraft. The use of rotorcraft for patient care in the civilian sector began in the late 1960s, when rotorcraft were utilized in dual-purpose law enforcement systems that had a limited commitment to medical response.[4] Although helicopters were first dedicated totally to patient care in Europe in the mid-1960s,[5,6] it was not until 1972 that rotorcraft were put into such service in the United States.[7,8] These craft were based at hospitals and responded within minutes with physician and/or nurse medical crews who were trained in advanced life support. They responded both to the scene of ill or injured patients and to other hospitals to transport patients rapidly to more advanced treatment centers. These services brought about several radical changes in prehospital care: (1) A higher level of medical expertise was rapidly brought to the patient at the site of injury or illness over a broad geographic area; the acute care crews were trained to place endotracheal tubes, central access intravenous catheters, and thoracostomy tubes. They were also certified to

administer all medications used in the hospital. None of these interventions had traditionally been practiced by existing prehospital care systems. (2) Critically ill and injured patients were transported at speeds two to three times faster than land ambulances. (3) The services could gain access to patients who either could not be reached at all by ground transportation or who would be forced to wait an inordinate amount of time for land emergency medical services (EMS) response.

Since the inception of rotorcraft services, numerous similar systems have emerged throughout the world. To date, only five studies have attempted to evaluate the impact of such service on patient mortality.[5-9,12] Since none of these studies statistically analyzed their data or compared the outcome of their patient group with a control group of patients treated by standard land care and transport services, the potential advantage of aeromedical care service could not be appreciated. Since these programs are extremely costly, it seems appropriate to examine this question.

Until recently, it has been virtually impossible to compare the outcome of injured patients treated at different medical facilities. With the development of a severity scoring system for acute head trauma by Teasdale and Jennett,[11] the mortality and morbidity of patients who suffered major head trauma could be compared among different medical centers. Although similar types of indexing systems for generalized trauma were developed, a statistically sound system was not derived until the development of the Trauma Score (TS).[13,14] The TS has been applied to a large number of patients and has been shown to be a reliable predictor of patient outcome.[15] In addition, the predictability of survival (P_s), derived from the TS by regression analysis of a large index population of trauma patients, provided a specific way in which patient outcome at one treatment facility could be compared with that at another center. Recently, Champion et al further refined this approach by using the Injury Severity Score (ISS)[16] and age as additional variables to compute the probability of survival.[17]

We used this methodology" to compare the mortality of 150 consecutive blunt trauma patients treated by land EMS systems and taken to a trauma center with the mortality of 150 consecutive blunt-trauma patients treated by a rotorcraft aeromedical emergency care system staffed by a physician and nurse and transported by air to the same center.

METHODS

The land EMS system was comprised of ambulances staffed by two EMTs and mobile intensive care units staffed by two paramedics. The rotorcraft system utilized a small cadre of acute-care physicians and nurses trained to perform oral or nasotracheal intubation and to administer a broad spectrum of medications. The medical teams were airborne in an average of four minutes after being requested and traveled at 100 mph to the site of injury. The medical interventions provided at the scene of injury by each of the three potential medical response services are listed in Table 1.

Two groups of patients were compared in this study: 150 consecutive patients who had sustained blunt trauma, were treated at the site of injury, and transported to the study trauma center by land EMS units and 150 consecutive patients who sustained blunt trauma, were treated at the site of injury, and taken to the same trauma unit by the rotorcraft aeromedical service. Only patients who had no spontaneous respiration and pulse at the site of injury and [illegible] whom no resuscitative measures we[illegible] were excluded from the study. T[illegible]re no patients in either group [illegible] cardiopulmonary resuscitation them at any time in course. Mortality was defined as death caused by the original injury or complication of that injury. All patients were followed up to discharge from the hospital. The data of the two patient groups were collected during the identical 30-month period. The rotorcraft aeromedical service could only be utilized if the first public safety unit responding to the patient requested its use. In general, first medical responder units would request the use of the service when patients were injured in rural areas, while patients injured in urban areas were usually treated and transported by the land EMS system.

Trauma Scores were developed blindly on initial physician contact as described previously.[13,14] The TS was developed on land patients in the trauma resuscitation area immediately on arrival and on aeromedical patients on initial contact by the rotorcraft physician. Injury Severity Scores[16] were developed from patient charts and autopsy records at the completion of admission.

The P_s was computed as outlined by Champion et al,[16,17] using the following computations:

$$P_s = 1/(1+e^{-b})$$

where

$$b = b_0 + b_1(TS) + b_2(ISS) + b_3(Age)$$

where b_{0-3} are weights for each variable derived through use of the Walker-Duncan regression analysis[18] of a large index population of trauma patients treated at a trauma center[16,17] assumed to be operating at the accepted standard of care.[19] Age was coded as 0 for age younger than 60 years and 1 for age 60 years or older.

The statistical significance of any observed variation in mortality of a study group from that predicted by the P_s was accomplished by using the method of Flora[20] with the following approach:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

$$Z=\frac{D-\Sigma Q_i}{\sqrt{\Sigma P_i Q_i}} \quad (3)$$

Where Z is the statistic of comparison of predicted to actual survival, P_i is the probability of survival as derived from Champion et al,[9] and $Q_i=1-P_i$. D equals the actual number of patients that died in the test study. The significance of the observed variation in mortality between treatment groups was determined by using the Mantel-Haenszel test.[10]

RESULTS

Table 2 summarizes the data of the 150 blunt trauma patients treated and transported to the trauma center by land and the 150 blunt trauma patients treated and transported to the center by aeromedical service. The mean age, sex, association with motor vehicle accidents, and presence of closed head trauma were statistically similar in the two groups. More land patients were injured in urban areas while more aeromedical patients were injured in rural areas. More land patients were initially treated by paramedic services, while more aeromedical patients were initially treated by EMT services.

The average medical response time to the two treatment groups is summarized in Table 3. The average response time to the land treated and transported patients was seven minutes. The average time spent at the scene was 18 minutes, and the average transport time to hospital was ten minutes.

The average response time of the rotorcraft to the aeromedically treated and transported patients was 24 minutes. The actual time from injury to activation of the service was longer than the response time since the rotorcraft service could not be activated only after a first response unit had examined the patient. The approximate response time of these units in this setting was fifteen minutes. The time interval between injury and initial contact with a physician when the TS was developed was, on the average, 35 minutes for the land patients and 34 minutes for the aeromedical patients.

Table 4 gives an arbitrary stratification of the continuous P_i distribution of the two groups, and Table 5 gives the P_i means of the two groups. The mean P_i for the land group was 0.902. Nineteen of the 150 patients died, whereas 15 patients were predicted to die. The mean P_i of the survivors was 0.965, and the mean P_i of the nonsurvivors was 0.508. The mean P_i for the aeromedical group was 0.865. Ten of the 150 patients died, whereas 21 patients were predicted to die. The mean P_i of the survivors was 0.898, and the mean P_i of the nonsurvivors was 0.360.

Table 5 summarizes the statistics. A 2×6 contingency table χ^2 analysis of the P_i strata of Table 4 revealed $P>.05$ when the land and aeromedical sets were either compared with the standard index trauma patient population or when the two sets were compared with each other. Therefore, there was no significant difference in the distribution of severity among the three data sets. The Z statistic (equation 3) for the land transport group had a $P>.05$. The Z statistic for the aeromedical group had a $P<.001$. The stratification of the P_i as given in Table 4 can also be viewed as multiple data levels as defined by Mantel and Haenszel[10] and subjected to the Mantel-Haenszel test. The statistic obtained by comparing the observed difference in mortality between the land and aeromedical groups by this methodology had a $P<.001$.

Time to initial physician contact	35 min	34 min
Time from injury to arrival at trauma center	35 min	58 min

COMMENT

Patients treated and transported to the study trauma center showed statistically similar injury severity distributions and mortality rates to patients treated at the index trauma center. Since the study trauma center was operating at the expected standard of trauma care, it is appropriate to compare the mortality of those patients brought to the center by the traditional land EMS system with those brought to the center by the aeromedical service.

Although it would be of interest to derive a direct numerical comparison between the mortality rates of the two treatment groups based on injury severity, such a contrast is fraught with problems because of the nature of this methodology. The most appropriate comparison is gained from reflection on the difference in the number of projected (ΣQ_i) and actual (D_i) deaths within each group. In the land set (Table 4), 15 patients were projected to die, while 19 patients died. In the aeromedical set (Table 4), 21 patients were expected to die, while ten patients died, which represents a 52% reduction in the predicted mortality. A more direct com-

parison would be statistically invalid, in that the distribution of the severity of injury among the two treatment groups was not identical.

The statistical significance of the differences observed in the mortality of the land and aeromedical treatment groups was established by two independent means. The Flora methodology (equation 3) tests the statistical significance of the difference in the observed mortality from the predicted mortality based on the P_s. The Mantel-Haenszel approach tests the statistical significance of the overall observed differences in mortality within the severity stratifications between the treatment groups. The difference between the observed and predicted mortality of the land treatment group was not significant (equation 3, $P>.05$), while the difference between the observed and predicted mortality of the aeromedical treatment group was highly significant (equation 3, $P<.001$). The observed difference in mortality within the [illegible] was

[illegible]el,

major improvement in the mortality of patients treated and transported by the rotorcraft aeromedical service was in those patients with a $P_s<0.95$ (ten of 42 patients dying when 18 patients were expected to die). Patients who have scores between 0.99 and 0.95 are probably not critical enough to require rotorcraft intervention, and such intervention had less impact on their survival (no deaths when three patients were expected to die).

In addition, Table 5 reveals that the actual nonsurvivors in the land group had a mean P_s of 0.508, whereas the actual nonsurvivors in the aeromedical group had a mean P_s of 0.360. This suggests that not only was survival more likely in aeromedical patients in the more severe injury classifications, but that the aeromedical patients in those classifications who died were dying of more severe injuries than the nonsurvivors in the land group.

The major improvement in survivability occurred in the more severe classification groups, which represent only a fraction of all trauma patients. If the standard population is utilized, these groups represent less than 10% of [illegible] injured patients

brought to that medical center. This suggests that the efficacy of this type of rotorcraft care is appropriate only to a small subset of all trauma patients.

Before any conclusions about the value of the use of rotorcraft in this setting can be made, there are a number of weaknesses in this study that must be taken into consideration. Although the age, sex, nature of trauma, and distribution of the severity of injury of the two patient groups were statistically similar, there were a number of major differences between the two groups: (1) the location of injury (urban *v* rural), (2) the initial care rendered victims (paramedic *v* EMT), (3) the care after initial medical intervention, and (4) the route to the trauma center (paramedic *v* physician), and (4) the possible difference of patient handlings after reaching the trauma center.

The difference in the location of injury may have had two effects. Patients injured in rural areas had to wait slightly longer for the arrival of a medical first-response unit. If both rural medical first-response units took an average of three minutes longer to reach aeromedical patients than those that took the urban medical first-response units to reach the land patients. Patients injured in rural settings also had a longer transit time. On the average, it took 23 minutes longer for the aeromedical patients to reach the trauma center and definitive intervention. Both of these factors could have had a negative impact on the aeromedical patient's outcome.

The difference in the initial level of care rendered to each group may have also been a major factor. As noted previously, land patients were usually injured in urban settings where initial treatment was administered by paramedics, while aeromedical patients were injured in rural settings where initial treatment was usually administered by an EMT service. Due to the higher level of care administered by paramedics, it is conceivable that by the time the land patient reached the trauma center, they may have had been improved by therapy. On the other hand, because of the lack of semidefinitive care given to the aeromedical group, the TS of these patients may have worsened before contact by the aeromedical crews.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the time of injury, the land patients may have been more severely injured and the aeromedical patients less severely injured than the actual TS indicated. This possible anomaly is partially mitigated by the inclusion of the ISS in the methdology and by the fact that the subset of the aeromedical patients who were treated initially by paramedic level service before contact by the aeromedical team were statistically indistinguishable from the patients treated initially by an EMT service (data not given).

The difference in the care after initial medical contact may also have affected these data. The land group was treated by a variable spectrum of different first responders, while the aeromedical group, after initial intervention, was treated by the same small group of flight nurses and physicians. It is conceivable that the improved mortality of the aeromedical group is not only a reflection of the more advanced modalities of treatment afforded by the aeromedical teams, but also a reflection of the continuity and standardization of care afforded by the highly trained physician-nurse teams. This may have also had a further effect on [illegible] ...ent after reaching the trauma center. Unlike the treatment teams on the rotorcraft service, the treatment teams in the trauma resuscitation area consisted of rotating physicians and nurses with a moderate turnover. Since the time it took patients in each group to be contacted by these two treatment teams was almost identical, a difference in the medical efficacy with which each respective team operated may also have accounted for the observed results. The aeromedical patients may have been better evaluated and more substantially stabilized, allowing for definitive treatment to have been provided more rapidly than to the land patients.

Due to the aforementioned factors, these data must be viewed with a great deal of caution. The conclusion cannot be made that the reduction in mortality observed in the aeromedical group was due strictly to the use of rotorcraft. It may be conceivable that placing the same physician-nurse teams on urban ambulances may afford similar or greater improvements in patient mortality. What rotorcraft do afford is the ability to move a highly skilled physician-nurse team rapidly over a far wider geographic area than possible by [illegible] transport, who can quickly sta... and transport patients to defi... care that can be prearranged by ra... before arrival. These results demonstrate that the use of rotorcraft staffed by a physician and nurse facilitate the provision of semidefinitive trauma care and improve patient mortality when compared with a patient population with similar injuries, at less distance and a longer time from definitive care, treated at the prehospital level by EMTs or paramedics.

In view of these data, it appears that physician-nurse staffed rotorcraft emergency care services may be a valuable adjunct to the prehospital care of patients who have sustained major blunt trauma. It seems warranted to study further the impact of such services.

The rotorcraft crews who made this work possible included James Dunford, MD, Lee Griffith, MD, Steven Guler, MD, David Guss, MD, Tom Neuman, MD; flight nurses Martha Bennett, RN, Mary Anne Bockman, RN, Janet Gill, RN, Catherine Kennedy, RN, Laurinda Martin, RN, Phillip Moomjean, RN; pilots Randall Mains, Joseph Hatley, and Howard Albecker. Charles Berry, PhD, and William Sacco, PhD, helped with the manuscript.

Dear Dr. Nicola,

Addressing the three points upon which the Council will base its decision for or against the COH helistop, I must say that

a. Not one life has been lost due to the present helistop in Graves Field. The time by private car from the field to COH, stopping at stop lights, is three minutes. The field surface could be improved inexpensively to meet all weather conditions. In addition, the director of Marybridge Hospital in Tacoma told me that an unstable patient should not be transported by helicopter in the first place.

b. The helistop is located in such a position that a crash could kill several people in the dense apartment area adjacent to the west, in the two grade schools adjacent to the east, and, most vulnerably, in the hospital itself. Unlike ambulances, which can turn off their sirens at the entrance drive to the hospital, the helicopters, with their considerable noise, would provide an unsettling, if not frightening, atmosphere for the children in the hospital.

c. There is no monitoring group in existence that would check the purpose of each flight. Even if there were such a group, they would be hard pressed to speak out against the COH authorities who would maintain the autonomy they have developed throughout this entire situation and against the marketing staffs of groups, such as Med-Flight of Boise, who encourage more flights by charging less for all flights over a minimum number.

Aside from the factual evidence above, I must say that, while I have four children of my own and fully support the care given to children <u>within</u> COH, I strongly believe that our cities are becoming unlivable because of projects such as the COH helistop. I further believe that COH feels that it must have the helistop in order to maintain its competitive edge against other Seattle hospitals, such as University, Swedish, and Harborview.

If, after the installation of a helistop at COH, it becomes obvious to all that it was a bad mistake, it will be very difficult, if not impossible, to get the helistop out.

I would say in closing that, not only is there no medical need for a helistop at COH, but that the establishment of such a helistop would provide a clear and present danger to the lives of people both in the hospital and in the homes and schools nearby.

Sincerely,

Joy Scott

Re: Helicopter-helipad, COH

Dear Dr. Nicola:

Please seriously consider the many other medical needs at COH (and throughout Seattle and King County) which need funding and will be either under-funded or un-funded if hundreds of thousands of dollars are spent on purchase and maintenance, operation, crew and insurance for a helicopter and helipad.

Please seriously reconsider the advisiability and justification claimed by COH for the helicopter-helipad in light of the multiple other medical needs at COH, including up-dated care units, on-going care, staff, new equipment, special programs, specific diseses, and research.

Thank you.

Sincerely,

Dr. Bud Nicola
Director, Health Department
7th Floor, Yesler Building
Seattle, WA 98104

Dear Dr. Nicola:

I wish to support the construction of a helipad at Children's Orthopedic Hospital very strenuously.

1. As a physician responsible for treating many of the children who could be transported by helicopter, I plead with you to give us the facility to most properly try to save lives. Without this proven advantage, our best efforts are reduced substantially. I do not participate in or initiate this transport, but am frequently the person called on to provide life preservation when it is no longer possible. The time and expertise provided by helicopter transport is essential to our mission as a tertiary care center.

2. As a Laurelhurst resident residing less than one mile from the Hospital, I refute charges of pollution and noise that were raised by neighbors residing further away. COHMC is a tertiary center. Airlift Northwest is an established entity. The supposed comfort of neighbors is not affected by these facts, and the city will be liable for the consequences if these considerations are placed ahead of the need to provide life support.

3. Denial of this otherwise available mode of care to children represents an attitude and behavior that shouts "descrimination" at its loudest.

I appreciate this opportunity to present my views. I hope that reason and good sense prevail.

Sincerely,

Eric B. Furman

October 24, 1985

TO: The Seattle City Council

My name is Eugene Turner and Iam a practicing Pediatrician in Port Angeles. I have practiced in that area for 15 years and am associated with three other full-time Pediatricians. We service the majority of the north Olympic Peninsula with a population of approximately 50,000. Being the regional referral center for our area, we deal with the majority of complicated pediatric problems. Our hospital is equiped and staffed only for primary and only for very temporary secondary critical care. Herein lies the problem with a relatively isolated rural area. The solution of this problem should be straight-forward. Childrens Orthopedic Hospital and Medical Center has been established as a tertiary care center for our larger region. This is rational, efficient, and economical, and, in fact, represents the ideal set-up for outlying areas such as ours. The comprehensive nature of their service is exemplified by such niceties as having a 24-hour toll free consultation access to anyone of the pediatric specialities. This allows us to make more rational and educated decisions relating to medical care in general, and especially in regards to the organization of our efforts in the transfer of our critically ill patients.

Throughout my 15 years as a contributor to this regional center, I can assure the service has been unfailingly consistent. The only flaw in the ointment, if you will, is the very inefficient transport system that is extant. We have three types of medical emergencies which require transport. First is the transport of premature and full term, newborn infants, who are in distress. This includes babies with hyaline membrane disease, neonatal seizures, apnea and the like. The second category is that group of patients with cardiopulmonary problems,such as congenital heart disease, heart failure and severe intractable asthma, as well as those children who have aspirated a foreign body into the pulmonary tree and are in need of urgent intervention. The above mentioned patients are usually in need of oxygen and oftentimes of assisted ventilation as well. The third category is the patient with a closed head injury, specifically one where there is active bleeding. I am sure that you can all appreciate there is nothing more delicate, more fragile and more stressful to all concerned than dealing with a two or three pound premature infant, hooked up to oxygen and IV and with a tube down the wind-pipe, requiring constant bagging for assistant ventilation during the transport.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Until Airlift Northwest came into existence a very few years ago, we had the onerous task of accompanying these patients in a Coast Guard Helicopter to Graves Field, where a transfer to an ambulance took place. More often than not, the field was wet, muddy and this simply made the transfer a risky and sometimes dangerous undertaking. On one occasion a transport incubator was damaged beyond repair when dropped on the ground during this transport. Fortunately, the baby had been removed before this occurance. The most important point to emphasize here, however, is the critical time-loss due to this unnecessary transfer undertaking. It is virtually impossible to adequately monitor these sick children during this interval. This is especially true in the case of a closed head injury or the young premature infant with apnea, where active intervention could become necessary at any moment. Each minute lost can literally make the difference between life and death or, at least, allowing for a good versus poor quality outcome.

We are talking about anywhere from 20 minutes to an hour or more difference depending on weather and field conditions.

My partners and I have, indeed, lost patients due to this phase of the transport process. Even with the advent of the fully trained medical team that accompanies all of the Airlift Northwest evacuations in our case, these same transfer delays prevail. I would further stress that with the potential for direct helicoptor transfer to the medical building at COH that the above delays are nothing short of ludicrous.

In summary, we at the Peninsula Children's Clinic and in the area of Port Angeles, submit to you that transport directly to COH from the patient's point of origin, without a time consuming intermediate delay, almost always adding to the morbidity of the patient, is of critical importance. In fact, the decrease in morbidity and mortality that would be accomplished therein, should certainly outweigh the relatively minor inconvenience experienced by the relatively small number of persons affected by this proposal. I would very much like to see the efforts put forth by those opposed to the Helipad, shifted to more worthwhile public health problems which affect thousands of our youth daily - a prime example being the exposure of their youths to the uncontrolled noise pollution that occurs at rock concerts in every high school gym and/or auditorium and public places. The epidemic of permanent hearing nerve damage leading to permanent hearing loss is criminal in its present malignant form and could so easily be controlled with adequate citizen input and subsequent health legislation.

Thank you.

Gene Turner

To whom it may concern:

Re: Helipad at Children's Orthopedic Hospital, medical need.

I am a pediatrician in private practice in Bellingham, Washington, and am the Medical Director of the Nursery and Pediatrics at St Joseph Hospital. We are a Level II facility and deliver 1500 babies each year. We take care of a number of sick neonates, from fullterm infants with pneumo to prematures with respiratory distress. Our hospital policies reflect the directives of the regional perinatal referral system in that we rely on maternal transports (15 per year) for those who are extremely high risk: gestations less than 34 weeks, complicated medical conditions like advanced diabetes, etc. We average about 22 neonatal transports each year for a variety of life threatening conditions: severe prematurity, respiratory distress syndrome, overwhelming sepsis, cardiac and surgical emergencies, need for mechanical ventilation, etc. From our pediatric department we can plan on about 10 transports annually. Thus total transports easily can approach 50 per year - half of these being extremely critical.

These numbers speak for themselves. Bellingham, 90 miles away from Level III care, needs, shall we say, demands, an organized, efficient transport service. Up to three years ago we relied upon our own ground based transport system. Our ambulance. Our staff of respiratory therapists and nurses. Our equipment. We felt pretty good; no obvious disesters. There was

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

no alternative. It was clearly inadequate – precarious. There was no formal training program for transport personnel. No one team transported frequently. There were no backup protocols to rely on if something went wrong (pneumothorax). No physician attended the patient. 90 miles. At times heavy traffic delays. One mother ended up delivering in Everett. Another mother almost delivered her breech baby in the entrance way of the University as they unloaded her from the ambulance. Another baby arrived cold with low blood sugars. There are other cases. We were lucky.

Over the last 2 years Airlift Northwest, with their intensive care team of nurses and physicians, has greatly enhanced our abilities to give secure, high quality care to patients in transport. The standards of transporting sick babies in this state are finally catching up with those of other western states (Colorado, Utah, Arizona) who have had a highly skilled and efficient transport system for 8-10 years.

More to the point of the helipad issue. From our perspective in Bellingham, it is simple and logical. For those newborns and children who are critically ill, who have a stormy and deteriorating clinical course, they must be transported by an intensivist team AS FAST AS POSSIBLE AND WITH A MINIMUM of physical disturbance. A helipad at COH would accomplish this efficiency. The team could load the patient and equipment onto the helicopter at ST. Joseph Hospital and unload at COH's doorstep, accomplishing this in 2 patient moves. Without the helipad an extra, cumbersome, and time consuming transfer to a second vehicle is necessary for the patient and required equipment. Now, let's talk about this equipment for a moment. Equipment accompanying a critically ill child might include a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

respirator connected by ½" tubing to the child's windpipe, a plastic catheter that connects the transcutaneous monitor (for oxygen monitoring) to the patient's chest wall, an intravenous line that connects the IV pump to the patient's right arm (for fluids), a second IV line connected to the left arm (for medication), a third line that runs from a pomp to the child's left wrist artery (for blood gas analysis), ½" tubing connecting an air suction unit to the chest tube inserted between the ribs (to expand a collapsed lung), a line for temperature regulation, a foley catheter connecting a urine collecting bag to the baby's bladder (for urine volume measurement) the electrical wires that connect the cardiac monitor to the chest leads, and other items: Blood pressure equipment, medication boxes, respiratory equipment, attendant's ~~coat~~, jackets, etc

I think I've made my point. Transfer of a patient into and from a transport vehicle is clumsy, time consuming, ~~and time~~ hazardous to the patient. With a bit of dark humor one might imagine that this can be done easily and safely on a poorly lit, perhaps wet and muddy soccer field. Sound medical judgement mandates a well lit, reliably surfaced helipad that lies adjacent to intensive facilities at COTH.

As far as the question: Are we quibbling when we talk of shaving off 10, 20 or 30 minutes of time of transport? For the stable, moderately sick child, the answer is probably yes. But for the truly critically ill child the answer is NO; TIME makes a difference

As far as noise, neighborhood, or nuisance issues, for me, for my community of Bellingham, these are very secondary to the priority of having of having an excellent regional emergency transport service. I support a helipad at the COTH facility

Sincerely.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WRITTEN TESTIMONY BY DR. WILLIAM A. MADDEN REGARDING THE IMPORTANCE OF HELICOPTER EVACUATION IN THE TREATMENT OF CRITICALLY ILL OR INJURED INFANTS AND CHILDREN.

My name is Dr. William A. Madden. I am a physician in the U.S. Army assigned to the Department of Pediatrics at Madigan Army Medical Center. I am Assistant Chief of the Department of Pediatrics, and Chief of Pediatric Intensive Care within the Department of Intensive Care Medicine at Madigan. My medical training includes a fellowship in both neonatology and pediatric pulmonary medicine. I have served in various capacities at military hospitals in Honolulu, Hawaii, Anchorage, Alaska, and Denver, Colorado. In addition, I was in private pediatric practice in Klamath Falls, Oregon.

During my fifteen years as a pediatrician I have practiced critical care medicine on neonates, infants, and children. During this time I have medically evacuated my patients by both ground and air transport. I have personally managed the transport of patients in the C-141, C-130, C-12, and Cessna 421 aircrafts, and in the UH-1, CH-53, and Dassault single turbine helicopters. These flights have varied in length from 30 miles to more than 2800 miles.

For the safe and rapid transport of critically ill infants and children, I believe it is essential that a helipad be placed at Children's Orthopedic Hospital (COH) in Seattle, Washington. COH is the pediatric referral center for much of Western Washington. Because of distance, ground transportation greatly increases travel time, particularly during peak traffic hours (0600-0900 and 1600-1900 hours) on weekdays, and on weekends during football games in fall and winter. This extra time could be significant in the transport of certain critically ill infants and children.

The importance of rapid transport for all ages of patients is demonstrated by the presence of a helipad at Harborview Hospital, the principle receiving hospital for critically injured or ill adults in King County; however, this helipad would not be suitable for COH. It would require both transfer to another vehicle (ambulance) and then a ride across town before the child could be brought to the hospital. As an example, I recently took a child with a critical, life-threatening condition to COH. Because of a football game at the University of Washington, we were forced to land at Harborview. After waiting for an ambulance we transferred the child to the ambulance, with the associated risks of dislodging the oxygen supply or the intravenous lines. Our trip to COH was delayed approximately 30 minutes, and was made more hazardous by traffic trying to enter the University District for the football game.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The current landing area for COH, a playing field at the University of Washington, increases the danger to the patient and increases the transport time. Every time a critically ill patient is moved to a new conveyance, there is significant risk that intravenous lines, intra-arterial lines, urine catheters, endotracheal tubes, or monitoring equipment will be dislodged. The patient is exposed to the elements during the transfer when a transport isolette cannot be utilized because of the size of the patient. During the transfer to each vehicle there is no possibility of treating the patient should a life-threatening complication occur and, because of the complexity of the transfer from one vehicle to another, there is further delay in the movement of the child. The landing field is a playing field used by all age groups. The helicopter crews must depend upon these individuals utilizing the field to clear the area. A designated helipad would eliminate this hazard.

The views expressed above are my own views and are not to be construed as representing the views of Madigan Army Medical Center or the United States Government.

WILLIAM A. MADDEN, M.D.
Colonel, Medical Corps
Chief, Pediatric Pulmonology
Assistant Chief, Department of Pediatrics

Dr. Bud Nicola
Director, Health Department
7th floor
Yesler Building
Seattle, Washington 98104

Dear Dr. Nicola:

I am writing this letter in response to an inquiry from Children's Orthopaedic hospital concerning my professional judgement as to the placing of helipads near selected and designated institutions for the management of the critically ill.

By way of background I am a Board Certified General Surgeon who had been working in trauma for approximately five years. My previous employment was within the state of Maryland as the state medical Director for Emergency Medical Services and as such coordinated the response of the Maryland State Police Helicopter Program which transferred approximately 2,700 critical patients last year. They transported these victims to designated centers for trauma, neonates, pediatric trauma, burns, spinal cord injuries, penetrating eye injuries and replantation centers. During my tenure in Maryland the majority of hospitals upgraded helipads to enable them to access this rapid air transport service.

At this time I am the Medical Director and Chief Executive Officer of Boston Med Flight - a helicopter program, originating in Boston and serving the New England region. This hospital consortium represents Boston University Hospital, New England Medical Center (to include the Kiwanis Pediatric Trauma Institute), Massachusetts General Hospital, the Massachusetts Eye and Ear Infirmary, Boston City Hospital, Beth Israel Hospital, Brigham and Women's Hospital and Children's Hospital Boston. Within Boston there are concerns from various agencies as to the need for the receiving centers to have adequate helicopter landing areas.

Following the designation process hospitals begin to receive not only inter-hospital referrals but also patients directly from scenes of accidents. Patients who previously would have succumbed in the prehospital phase now, because of the emergence of E.M.S. systems and helicopter availability, survive to reach hospital. For many institutions there is a learning process to be able to manage these injuries. There is no doubt that the time from accident to definitive care is at a premium in managing these types of patients and that any increase in time from scene to trauma center may translate out to an increase in mortality or morbidity. Many agencies in their R.F.P.'s for specialty center designation mandate the close proximity of a helipad to decrease transit time to a minimum.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There are concerns other than that of time which may be of critical importance. An unstable patient should not be handled unnecessarily or transferred from one vehicle to another in their critical state. The experience with pediatric trauma in Baltimore may illustrate this point. At the time of implementation of the program Johns Hopkins did not have a well-equipped helipad and indeed the state police helicopters used to land a few blocks away from the hospital and rely on surface ambulance to complete the transfer. The physicians working within the pediatric trauma center recognized this deficiency and collaborated with community groups, architects and health planners and built a helipad directly on the roof of the hospital. This is served by a dedicated elevator which now takes patients from the helipad directly into the pediatric rescusitation area. Within this area all pertinent expertise immediately is available so that the patient has immediate access to the radiology suite, the CAT scanner or the operating room.

Although no community polls were conducted during the implementation of this program, during my stay in Maryland I received no complaints from community groups concerning the helicopter program. They were made aware that air transport was reserved only for those critical patients in direst need. Even with a busy day at the pediatric trauma center in Baltimore only five or six helicopter transports would be flown during a 24 hour period; this did not seem to cause community concern.

I hope that this brief letter addresses some of the points that will be raised at the public hearing on Thurday. If I can provide any further information please don't hesitate to let me know.

Thank you.

Sincerely,

Alasdair Conn, MD
Medical/Executive Director

Seattle Department of Construction and Land Use
400 Municipal Building
Seattle, Washington
98104

Re: NOTICE OF PUBLIC HEARING File No. 84-022 (Master Use Permit No. 8402935)

I would like to make the following statements with regards to the proposed construction of a "Helistop" at the Childrens' Orthopedic Hospital.

I am a noise control engineer and a professor of .echanical engineering at the University of Washington. As such, I am concerned about the noise environment in the city in which I live. I, also, have served on the Mayor's (Seattle) Noise Task Force, which drafted the present Seattle Noise Ordinance. For these reasons, I have followed with interest the proposal to establish a heliport ("Helistop") at the Childrens' Orthopedic Hospital.

I am not a resident of the immediate neighborhood of COH, but I would like to voice my opposition to the proposal because I think that this action will have a detrimental effect on the quality of life for those neighbors, and this ultimately reflects on the quality of life in the greater Seattle community.

Noise directly affects more people in this country than any of the other form of pollution. For many years, noise has been the item identified by Americans in the U. S. Census as the most serious environmental pollutant. Are the neighbors of COH any different than the millions of other Americans who have raised their voices against this "Tyranical" pollutant? I think not.

Proponants of the proposed action claim that it will save lifes, but they give little consideration to the fact that it might destroy the life styles of the entire community, and could lead to serious health problems, even death, for neighbors of the hospital. Can you imagine being startled in the midst of a sound sleep by a thundering, thumping, whirring machine decending from the sky, shaking the very foundations of your home? This would happen to those unfortunate residents who live near the hospital, and the effects would be felt further away.

If you would like to get some idea of the problem that helicopter overflights create, I suggest that you talk to the Seattle Police Department and ask them about their experiences with their helicopter experiment. The complaints were numerous and continuous, and the aircraft that they used were small helicopters, not the large military type, that are expected at COH.

Laurelhurst is a quiet neighborhood as city neighborhoods go. The only major arterial in the area is Sand Point Way, which is a relatively underutilized street, and there are no major businesses or industries nearby. Nighttime noise levels in the community will be found to be on the order of 35 dBA, or lower. The introduction

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of a heliport at COH would introduce a new noise source to this quiet community that could range up to 105 dBA. The effects of such an increase in noise level would be astounding and far reaching. Because the helicopters would approach from the sky, the noise from these hidious machines would be heard and felt over the entire Laurelhurst Community.

Noise will affect the adjoining neighborhoods, as well, but to a lesser degree, but it is my contention that any unnecessary increase in community noise deteriorates the quality of life in that neighborhood, and should be avoided if at all possible.

Respectfully,

James D. Chalupnik

Testimony of the Laurelhurst Community Club at the DCLU Medical Need Hearing, Municipal Building, October 24, 1985

My name is Liz Anderson. I live at 4746 45th N.E. I am here tonight to represent the Laurelhurst Community Club Board.

First, we would like to clarify that we are not opposed to air transport for emergency cases nor to Childrens Orthopedic Hospital. Our community supports the hospital and the good work which it does;many in this community are volunteers, employees, and Guild members, and we are grateful for the fine work done in the hospital. We have difficulty taking an adversarial position against the hospital but feel that the helipad proposal is one that requires, at the least,open, careful, and honest scrutiny.

The goal of the LCC Board and many in the community has been to secure answers to a number of questions which should be addressed before approval for a helipad on the COH premises is granted. Tonight, we will just focus on questions concerning medical need. They are as follows:

1. Helicopter transport is relatively new. What data, prior to 1984 are available that indicate there are problems with the existing system of emergency ground transport? If local data are unavailable, what evidence is available from other comparable metropolitan areas?

2. Is there evidence that there are portions of the population that are currently not receiving satisfactory emergency medical treatment? We are certainly aware that the geography of this state makes ground transport difficult and we would understand that helicopter service could provide a useful adjunct to emergency care transport service in these areas. However. it is also clear that there are many areas that contain large populations that are well-served by ground transport and do not need helicopter service. It is very important that the ground transport system not be allowed to deteriorate because of competition from Airlift Northwest.

3. If emergency medical need can be defined, how many cases would meet the criteria for emergency delivery to the door of COH? Given the predominantly residential character of the COH location, what restrictions could be put upon helicopter landings at COH?

4. If a helipad is sited at COH, how will the service be integrated into a comprehensive regional plan based on a credible projection of need and standards of use and accountability?

5. How can a balance be found between the health needs of the community's residents (Laurelon Terrace, students in the elementary school) and the emergency medical needs of the hospital?

6. Can the emergency medical needs of patients be met by alternative

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

landing sites? Some possible alternatives are:

a) one helipad at the UW Soccer Field shared by UW and COH

b) one helipad at COH for extreme emergencies and another helipad at UW Soccer Field that both hospitals can share for non-emergency, stable interhospital transfers.

c) one helipad at COH and another helipad at the Sand Point Naval Air Station.

Our preferred alternative is to have all emergency cases that require helicopter transport sent initially to Harborview for evaluation and stabilization. There is simply no clear reason why patients cannot be taken to this region's acknowledged regional trauma unit, Harborview Hospital. Some of these patients would then be transferred to other adjacent hospitals by ground transport as indicated by theirk particular requirements. If Harborview's current staff, equipment and space is not wholly adequate for this role, it should be upgraded appropriately with the assistance and cooperation of both University and Children's Hospitals. This might involve the development of some joint practice agreements between University, Children's and Harborview to make such an arrangementk fully workable. We feel confident that such a mutually satisfactory arrangement can be developed by the three hospitals if they are required to do so. Perhaps financial support from King County would be appropriate to make this concept a reality and to ensure that the helicopter service is integrated into the county-wide EMS system.

We on the LCC Board have discussed these alternatives as solutions to this dilemma and would be willing to poll the neighborhood to see how much support each might have. We would truly like to work out a compromise that would satisfy the needs of both the hospital and the community.

There is one additional topic that we, as representatives of this community, would like to address. Gathering information on this helipad proposal, both generally and as it pertains to the medical need issue, has been difficult. As you know, COH refused to complete a Certificate of Need application for helicopter service. As a result, important information which might have been provided through that procedure will not become available. Further, while many discussions have been held with COH personnel, it has been very difficult to get any hard data which would prove that there is a compelling need for the helipad. Over the past year we have been given much confusing and often contradictory information by COH. Some of this information has to do specifically with the utilization expectations of the helipad. Originally, we were told that we could expect 1-3 flights a month. Currently, Dr. Neff states that 15-20 might be a more realistic prediction. Other COH representatives have been quoted in the paper as anticipating 25-30 flights. When one stops to consider that each transport will require four flights over our community because of the different locations of the helicopter and flight team, any prediction becomes significant in terms of impacts on our community. Personal and professional connections have made it impossible for individual physicians to speak publically about the complexities and uncertainties surrounding this issue. Many of the people who have expertise in emergency and neonatal medicine, and whom we have contacted recently, were not even aware of this medical need hearing. It is a sad

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

commentary that some of the best, unbiased, and disinterested but expert opinions on this issue are not being heard at all tonight. Although Dr. Nicola is no doubt acutely aware of this situation, it is unfortunate that a more open presentation of the numerous facets of these issues is not available for us all to hear.

In summary, we ask tonight, Dr. Nicola, the same thing that we have asked of the COH administration and Board of Trustees--that the people associated with making this request and those associated with granting and denying such requests act thoughtfully and responsibly with regard to this issue and that a multi-county comprehensive plan for emergency medical transportation be developed that will address our questions and those of other consumers of EMS services. Such a plan should be developed in an open and participatory manner that will allow all points of view to be heard and balanced in rational ways. We hope our participation at this hearing will assist Seattle, King County, the Puget Sound Health Systems Agency, and other responsible parties move a step closer to the achievement of such a goal.

Thank you.

DR Nicola

Testimony of the Citizens Concerned About Helicopter Transport at the DCLU Medical Need Hearing, Municipal Building, Oct. 24, 1985

My name is Anita Francis. I have a Ph.D. in medical sociology and health services research and am a graduate nurse. I reside at 5003 45th N.E. and speak for the organization: Citizens Concerned About Helicopter Transport.

We have been concerned about the issue of hospital use of helicopters and have been investigating the successes and problems associated with this use for over a year. We have interviewed 20 to 30 physicians and about 10 nurses from this area, most of whom have had experience in neonatal transport and/or pediatric emergency care. We have also interviewed experts in emergency medicine around the U.S. Our library work has involved reviewing professional journals and various other research literature concerning emergency transport and related issues.

Based on this effort, we strongly recommend that a careful study of the role of the helicopter be required. Although the problem currently before us is whether Childrens Orthopedic Hospital should have a helipad, we cannot separate this question from the larger question of what is appropriate for the system as a whole. Giving COH permission to have a helipad without requiring them to do a careful study will set a precedent that other hospitals will eagerly follow. Thus, both the question of COH permission and permission for University Hospital and other hospitals must be addressed now.

It is of critical importance that the role of the helicopter in the existing emergency medical services (EMS) system and neonatal care system be well-defined. The helicopter's role must be carefully planned, well-conceived, and, if allowed to proceed, should be continually monitored. To do this, a justification study should be done. This type of study has been asked for by numerous individuals--local and community physicians and nurses, experts in EMS throughout the U.S., and others concerned that our current, excellent ground transportation system not deteriorate and that issues of cost containment and cost-effectiveness be considered.

Some suggested objectives for such a study are as follows:
1. Determine an optimal allocation of emergency transportation resources.
2. Avoid disruption of the current nationally-recognized EMS system in the Central Puget Sound Region, which includes Medic One, Fire Department Aid Units, private ground ambulance companies, MAST military helicopters, Airlift Northwest's fixed-wing airplane service and also includes emergency care which is available at many of the region's community hospitals.
3. Forecast, as accurately as possible, the economic feasibility of the helicopter service, so that overuse in order to increase revenue is less likely to occur. It is possible that, as Dr. John Neff from COH has suggested, this helicopter service is so vital that there should be public subsidies of the service. A careful projection of its expected utility is needed in order to justify that claim.
4. Explore the concerns expressed by local and community physicians, nurses, and other residents of the Seattle area toward helicopter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

service and its secondary impacts in order to elicit their support, trust, and cooperation. There should be a full range of participants involved in the study, so that both the public and private sector providers and a wide range of consumers are represented.
5. Show whether the proposed plan of increased helicopter usage will have tangible benefits, with specific numbers to indicate that the proposed plan represents a worthwhile addition to the already well-developed current system.

Some specific recommendations as to scope and content are as follows:

1. Describe the current EMS and neonatal transport systems. Include findings on patterns of usage, capabilities and deficiencies, referral patterns, and the components of the system including existing prehospital care transport, caregivers. and institutions. Distinguish between getting care to the patient and transporting the stabilized patient to a hospital for treatment.

2. Include in a geographical framework a description of the current and projected population to be served, its demographic characteristics, and the transportation problems unique to certain parts of the Puget Sound region.

3. Estimate the optimal role and level for each mode of transport. One method of doing this is described by Rhee, et al., Annals of Emergency Medicine, 13:10, October, 1984, as follows:

a. Define which medical conditions are appropriate for each transport mode, e.g., for which medical conditions would patients benefit significantly from helicopter transport to a referral center? These findings can become guidelines for use in deciding on transport if and as the system evolves.
b. Determine the incidence of each of the medical conditions
c. Define the population to be served.
d. Calculate the need for service by multiplying the population to be served by the incidence and by the fraction of the population that will require the transfer. Do this for each of the transport modes.
e. Estimate the fraction of patients with demonstrated need who will actually use the service.

In estimating the need for each mode of transport, it is particularly important to identify in what situations and for what types of cases the helicopter is preferable and when it is not. A comparison of patients who were transported by helicopter and their outcomes with similar cases moved in other ways is very important to do. About 30 cases would be sufficient to allow some useful estimates to be made.

Ideally, the role of the helicopter in the EMS system should be examined in 2 situations. One should determine how the existing system works, and then what changes the availability of a helicopter service would make, especially its possible impact on ground ambulance capability. Estimates should be made for 5 and 10 years time horizons, at a minimum. From such results, credible estimates of the expected number of flights, based on specific criteria, can be made.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Introduce cost factors. How much do these services cost and how will they be paid for? As is well known, the economics of helicopter transport are weak and results from this component may have a profound impact on the current perceptions and the future evolution of our EMS sytem.

Once this justification study has been conducted, and if use of the helicopter is shown to be warranted, and its role in the overall EMS system as been carefully defined, a set of rules for monitoring its use should be adopted. These rules would need to be agreed upon by all participants, and would include information as to who will be transported, who will make transport mode deicisions, methods for identifying and assessing penalties for misuse of the helicopter, and who has legal responsibility for the care of the patient during each part of the transport.

In contrast to the kind of careful study I have just outlined, is the case study approach, relied upon by CDH, at least in its public presentations. A case study approach is of questionable value. I know from personal experience in my research that generalizations based on a few observations are not often true. As the methodologists Campbell and Stanley point out, "Any appearance of absolute knowledge, or intrinsic knowledge, about singular, isolated events, is found to be illusory upon analysis." Only by making carefully measured comparisons is knowledge reliable. And that is what we are asking for here.

A study such as we have suggested here would produce the kind of knowledge base needed to determine where and how the greatest impact on life-saving can be accomplished. Helter-skelter, piecemeal approaches are simply not adequate.

Thank you for giving us this opportunity to speak.

To: Hearing Officer, Heliport for Children's Orthopedic Hospital

From: P.A. Breysse, Associate Professor Emeritus

A group of citizens residing in the area adjacent to Children's Orhopedic Hospital are concerned about the effects of noise levels resulting from operation of the proposed heliport.

In the past I have conducted noise surveys associated with landings and take-offs of helicopters. Noise levels ranged from 95 dBA to over 110 dBA.

There is no doubt that exposure to noise (unwanted sound) can result in mental distress in some individuals. People do respond emotionally to noise. Mood music is intentionally utilized to elicit certain psychological responses during movies. Many are affected by military marches. On the other hand unintentional sounds also evoke responses. A dripping faucet, a sudden scream, a scratching piece of chalk all involve different yet characteristic emotional responses. Psychologic responses are related to intensity, frequency, intermittancy, as well as the unexpectedness, of the noise, the inappropriativeness of the stimulus, and interference with speech or communications.

One of the most significant and damaging effects of noise involves interference with sleep. Effects of noise on sleep disturbances has been accomplished by studying brain wave patterns utilyzing electro-encephalographs for monitoring subjects' stages of sleep.

Indications are that the quality and the quantity of sleep may be impaired by shifts from deeper stages of sleep to shallower stages, by interruption of dream sequences which are believed to be important for sleep and by premature awakening.

In a noise study conducted in schools located in close proximity to the Sea-Tac Airport, teachers often remarked that students in class who resided in homes located in the north and south ends of the runway would often fall asleep in class.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A series of sleep interference studies indicated that at:

70 dBA - most probable reaction, awaken.

50 dBA - probability that 50% of subjects will change to a lower level or awaken.

40-45 dBA - 10% of subjects will change depth of sleep or awaken.

J.D. Miller of the Central Institute for the Deaf concluded that, all facts considered, one must tentatively assume that sleep disturbance by excessive noise will reduce one's feeling of well being. Furthermore, when noise conditions are so severe as to disturb sleep in a regular unrelenting basis, then such sleep disturbance may constitute a hazard to one's physical and mental health.

The startle effect of helicopter operations, especially at night is an additional important noise effect and is undoubtly more disturbing than a steady state noise.

In summary, community noise is a serious problem having both a physical and mental aspect. As mentioned previously, sleep disturbance is critical and noise levels associated with heliport operations will certainly adversely affect the sleep of exposed individuals. Furthermore the startle also involves mental stress.

Re: NOTICE OF PUBLIC HEARING File No. 84-022 (Mas' Use
Permit No. 8402935)

I would like to make the following statements with regards to the proposed construction of a "Helistop" at the Childrens' Orthopedic Hospital.

I am a noise control engineer and a professor of mechanical engineering at the University of Washington. As such, I am concerned about the noise environment in the city in which I live. I, also, have served on the Mayor's (Seattle) Noise Task Force, which drafted the present Seattle Noise Ordinance. For these reasons, I have followed with interest the proposal to establish a heliport ("Helistop") at the Childrens' Orthopedic Hospital.

I am not a resident of the immediate neighborhood of COH, but I would like to voice my opposition to the proposal because I think that this action will have a detrimental effect on the quality of life for those neighbors, and this ultimately reflects on the quality of life in the greater Seattle community.

Noise directly affects more people in this country than any of the other form of pollution. For many years, noise has been the item identified by Americans in the U. S. Census as the most serious environmental pollutant. Are the neighbors of COH any different than the millions of other Americans who have raised their voices against this "Tyranical" pollutant? I think not.

Proponants of the proposed action claim that it will save lifes, but they give little consideration to the fact that it might destroy the life styles of the entire community, and could lead to serious health problems, even death, for neighbors of the hospital. Can you imagine being startled in the midst of a sound sleep by a thundering, thumping, whirring machine decending from the sky, shaking the very foundations of your home? This would happen to those unfortunate residents who live near the hospital, and the effects would be felt further away.

If you would like to get some idea of the problem that helicopter overflights create, I suggest that you talk to the Seattle Police Department and ask them about their experiences with their helicopter experiment. The complaints were numerous and continuous, and the aircraft that they used were small helicopters, not the large military type, that are expected at COH.

Laurelhurst is a quiet neighborhood as city neighborhoods go. The only major arterial in the area is Sand Point Way, which is a relatively underutilized street, and there are no major businesses or industries nearby. Nighttime noise levels in the community will be found to be on the order of 35 dBA, or lower. The introduction

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of a heliport at COH would introduce a new noise source to this quiet community that could range up to 105 dBA. The effects of such an increase in noise level would be astounding and far reaching. Because the helicopters would approach from the sky, the noise from these hidious machines would be heard and felt over the entire Laurelhurst Community.

Noise will affect the adjoining neighborhoods, as well, but to a lesser degree, but it is my contention that any unnecessary increase in community noise deteriorates the quality of life in that neighborhood, and should be avoided if at all possible.

Respectfully,

James D. Chalupnik

Seattle, WA. 98104

Dear Dr. Nicola:

Please register my support of a helipad at Children's Orthopedic Hospital. After caring for neonates for many years, I feel very strongly that the present system of landing elsewhere does take a terrific toll on these fragile babies and may make the difference between life and death.

As we treat younger and more delicate newborns, we have to make provisions for minimizing the stress, temperature changes, noise, and other factors that are tolerated poorly by these babies.

Life saving equipment--IV lines, endotracheal tubes, etc.-- are in place before the infant leaves the hospital where he/she was born. Making two transfers could very easily dislodge or cause misplacement of a tube or line which would greatly jeopardize the life of the baby. A single transfer at the door of COH would eliminate this threat as the damage could be repaired immediately.

In my opinion, the residents of the surrouding area have not presented any compelling reasons to restrict helicopter access to the hospital. I am proud of Childrens and the care available there. It definitely means the difference between life and death for children born in rural areas. Let's take the next step in providing the best care humanly possible.

Sincerely,

To Whom it may concern:

I am writing in support of the helipad for Childrens Orthopedic Hospital. I am the mother of a child with hydrocephalus and a severe seizure disorder. We live 5 hours from Seattle in Forks Wa. and our son has had 8 brain surgeries, 3 of them emergencies. We have also had numerous hospitalizations for seizure controll, one of these emergency.

When I look at my son and know that without the expert help and services of Childrens Orthopedic he would not be alive I grieve for those parents that have been less fortunate. I cannot imagine life without him. I cannot understand the comparrison between a childs life and well being and the occasional interuption of peace that wouldcome with the helipad.

Our lives have been interupted many times with long tiresome, and stressful trips to Seattle. We have many more such interuptions to look forward to and a lifetime of dealing with a child with severe handicaps and all the restrictions that carries with it.

When a child with medical problems is born it is born without choise to the parents, you have a choice, to help those less fortunate than yourselves. Please make that choice, isn't it a small price to pay for such a great reward.

Sincerely:

Linda Middleton

Dear Mr. Justin:

I noted with horror the Notice of COH's plans to construct a heliport on the grounds of the hospital. I urge you to require them to file an environmental impact statement. Their total disregard for the surrounding neighborhood is appalling -- it will clearly affect all of us with increased noise pollution and the possibility of property damage and destruction of life if one of the helicopters crashes.

Sincerely yours,

Carolyn Margon

Re: COH Helipad

Dear Sir:

It would be a travesty if Children's Orthopedic Hospital were not required to file an environmental impact statement for its proposed helipad.

The Hospital has more than once proved itself an untrustworthy neighbor. It uses the obvious appeal "for our children" to continually expand to satisfy its ego and build its prestige. It should be obvious that a helipad is unnecessary. Hospitals are installing them to increase the area they serve and to compete with each other by kidnaping patients from one another's traditional geographical areas.

As we all know, duplication of facilities and technological competition are major causes of rising hospital costs. Why should the city not require the most stringent environmental impact statement for something which is so unnecessary and which damages our neighborhood?

Please remember that the most important things to protect in Seattle are our neighborhoods and the people who live in them.

Sincerely,

John M. Maloof, Jr.

January 6, 1984

Dear Guild Members,

As many of you may already know, this fall Children's Orthopedic Hosipital announced plans to build a helipad on their hospital grounds. There is much public concern over this issue not just in Laurelhurst, but throughout the city as well and justifiably so.

The media and C.O.H. would have you believe that those who oppose the helipad are selfish, affluent people who would have children and infants die rather than suffer a little excess noise in their neighborhood. This simply is not the case. The group of people who oppose the building of the helipad is comprised of people from all over the city, most of whom have a modest income and lifestyle. Many of us are members of Orthop ic guilds like yourselves and have spent years actively fundraising for an institution that we believe enhances the quality of our lives in this region. Most importantly, the majority of us are parents as well, who have at one time or another engaged the services of C.O.H. and have appreciated and been thankful for the exceptional care our children have received. In spite of this, the building of a helipad at the proposed site is something that we cannot support because so many of our questions concerning the helipad and its service remain unanswered and our concerns, which go far beyond the issue of noise, have not been addressed.

C.O.H. has written a form letter entitled <u>COHMC Helipad Justification</u> in which they describe the two main advantages to having a helicopter transport system as 1. <u>Critical Time Saved</u> and 2. <u>Decreased Patient Manipulation</u>. C.O.H. proposes that time lost between diagnosing and initiating treatment of critically ill patients may result in death. They also suggest that various other medical emergencies require immediate intervention. We certainly do not dispute these facts, but two things are overlooked. Seattle already has a trauma facility, that being Harborview Medical Center, and they already have a helipad and provide helicopter service to emergency victims. Secondly, it is usually the ground ambulance that will arrive at these emergency sites first. It is only after stabilizing a patient and assessing a situation that a helicopter is called. With two or most likely more helicopter services available, which will be called? This will result in increased competition for patients between hospitals, crowded skies as more and more hospitals purchase or lease the helicopters, and a greater potential for mid-air collisions and loss of lives. Since 1980 the number of hospitals offering helicopter services has tripled in this country. What is to prevent physicians and medic teams alike from abusing the system and calling for helicopters to expedite transfer of even the most local and routine injury? How does one determine which patients will benefit most from an airlift? Who will feel comfortable with making these judgements? With the costs involved

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in operating a service such as this you can be sure that a helicopter will never leave an emergency site empty. With malpractice insurance rates continuing to skyrocket, what physician in his right mind wouldn't call for the aid of a helicopter if it were available to him- just to protect himself from the possibility of a lawsuit?

C.O.H. compared time involved in aiding a patient in Enumclaw by helicopter to that of one assisted only by ground ambulance. They showed that they could save on hour and six minutes usir the proposed helicopter service, a significant amount of time if the comparison were a valid one. We are not insisting or even encouraging C.O.H. to rely on ground transportation to outlying areas, only that they land the helicopters at an improved current site, the IMA field. Had C.O.H. done a "time saved" comparison between a helicopter landing on their property versus one landing at the IMA field, which is the only comparison that would be valid, the time saved would indeed be quite minimal.

The other major concern that C.O.H. expresses in its justification letter is that of Patient Manipulation. They say that each time a patient is loaded or unloaded from and emergency vehicle they risk the possibility of losing life support tubes. If these systems are so delicately placed and vulnerable it would seem that the turbulent ride in a helicopter is certainly not the best mode of transportation for these tiny patients. Dr. Paul Herndon, a C.O.H. staff physician, along with other colleagues, support this premise. Dr. Herndon feels that quality care can best be administered in a ground ambulance where at least one would have the option of pulling off of the road to tend to developments in a patient's condition as they occur. C.O.H. also discussed the possibilities of an infant's condition being compromised by opening the isolette to replace a tube. They explain in detail how a change in temperature in an isolette can result in hypothermia and other complications that can ultimately result in death. What they fail to tell you is that if the helipad is built on its proposed site, the Kitchen Gardens, these delicate isolettes will still have to be transferred from chopper to gurney and then be pushed or carried a distance of at least seventy yards down a sloping grade and ultimately into the emergency room. It seems that their present plan for the helicopter site does not eliminate the particular risks for which they have declared their current landing site unacceptable. Poor lighting and bad field conditions are obstacles that are easily and inexpensively overcome by upgrading the soccer field.

Please don't dismiss this as a Laurelhurst problem or even as a Seattle problem. If C.O.H. is successful in obtaining permits to build this helistop it will only be the first of many in our area to be built. There won't be a city or town in the State that will not eventually feel the adverse impact of this move toward patient transport by helicopter. The U.W. Plans on building a helipad on the top of its new wing just three to four minutes from C.O.H. Then it is suggested that the two hospitals work together and share

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a helipad, they insist that they each need their own. Virginia Mason Clinic already has a helipad on top of their facility. Providence and Swedish have plans to expand and no doubt will apply for helipad permits also. Harborview, as mentioned earlier, currently operates their own helicopter service. Can you think of a hospital that is not growing and expanding their services and that will be complacent to standby and watch other hospitals surpass them in resources and technology? We fear, and with good reason that this is only the tip of the iceberg.

The costs in establishing and operating a helipad for one year have been estimated by the A.M.A News to be in excess of a million dollars. One can only surmise that these costs will be passed along to the patients. Health care costs rose twenty per cent in Washington State alone this past year. It seems that this money could be better spent improving the existing quality of care given patients rather than providing a new mode of transportation to the hospital.

We have no idea of how frequently the helipad at C.O.H. will be used. Each time the question is asked of them the figure changes and the projections are only increasing. On their application to the F.A.A. for air space clearance they estimated there would be one or two trips per month. The current figures quoted in the University Herald (Dec. 12, 1984), were estimated at between twenty and twenty-five flights per month. Each of these cases would involve two trips to the hospital by helicopter, one to pick up the emergency equipment and team and a return flight with the patient. If the hospital cannot even project figures for its immediate usuage we can only assume that these figures will escalate dramatically over the next five to ten years.

With the increase in its use we can also expect an increase in the frequency of crashes. Those who would insist on the safety of helicopters should be reminded that the KIRO chopper crashed three times last year alone. According to the A.M.A News (Sept. 21,1984), "there is a serious helicopter crash every year." C.O.H. chose to locate its hospital in the midst of a residential neighborhood only blocks from two elementary schools and yet they seem indignant that we are concerned for our safety and the well being of our children. Who will be liable if one of these choppers crashes into a home or on the school playground? In addition to flying over our homes and schools these helicopters will hover over a group of apartments that happen to lie in its flight path. Eighty per-cent of Laurelon Terrace is occupied by elderly residents. Their sleep has already been disrupted by the flood lights of C.O.H.'s parking garage which shine directly into their apartments. As if to add insult to injury, C.O.H. now proposes to land helicopters barely 200 ft. from their units at all hours of the night and day. C.O.H. has refused to acknowledge that the noise generated by these helicopters will be of a significant health concern to surrounding residents. Because they are members of the health care profession they know better than most that dozens of studies have shown there to be a direct link between noise and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

physical and psychological stress. We even have a city ordinance set up to deal with the noise created by that of a barking dog. Everyone is aware that stress is directly linked with many common health problems and diseases such as heart disease, high blood pressure, headache, fatigue, and irritability. We are concerned for the health of the elderly residents in Laurelon Terrace and for the sick children at C.O.H. who will be sensitive to the disruptive and frightening sounds of helicopters landing and taking off. We question the sincerity and motives of hospital administrators who would work energetically to enhance the quality of care given premature babies, while at the same totally disregarding other factions of the population such as the sick and the elderly. We can only conclude that when one takes the time to think about this issue, and look beyond the seductive premise of saving lives, one would realize that C.O.H.'s motives for wanting a helipad may have more to do with revenue and promotion of their image in surrounding regions.

Finally we feel that there are many effective alternatives to locating a helipad a C.O.H. As we mentioned earlier, we feel that the IMA field can be easily upgraded to host a helipad that would serve both the U.W. and C.O.H. Sandpoint Naval Air Station is only six minutes away and is another feasible location for an area helipad. There could be one helipad located at Harvorview to serve all area hospitals or there could be two helipads in the city, one to serve Harvorview, Virginia Mason, and Swedish located at one of those hospitals and a second located at the I.M.A. field to serve both the U.W. and C.O.H.

In conclusion, we should consider it a privilege to be raising funds for an institution such as C.O.H. It is certainly worthy of our efforts, but let's not underestimate the amount of influence we have on decisions made by the hospital's administration. We should also be aware of the responsibility we have assumed in accepting financial contributions on behalf of the hospital. Can we assure our benefactors that their donations are not being used inappropriately by the hospital in acquiring a costly transport service that may not be necessary and may or may not improve the care emergency patients presently receive at C.O.H. At the same time C.O.H. will dramatically increase the cost of care to patients, jeopardize the health and well-being of neighboring residents and promote the deterioration of the quality of life in Washington State.

Enclosed you will find two recent articles on this topic that are very informative. Please take the time to read them and discuss this issue among yourselves. If you support our position as other guilds have done, then we urge you to follow their course of action. Please sign and return the enclosed petitions and send letters expressing your concerns about this helipad to the following people.

Dear Councilpeople,

I would like to urge you to approve the permit for Children's Orthopedic Hospital to install their emergency heleport.

DEC 1984
JIM STREET
SEATTLE CITY COUNCIL MEMBER

My niece has been in this fine facility many times in the last 2 years and I have spent countless hours in the Emergency Room & hospital. I have met hundreds of parents from all over the Northwest United States who had children there. I have never heard anything but the most appreciative comments about an lifesaving community institution.

I am sure the neighbors can believe their airspace would only be used in the most critical cases as the hospital promises. They should join the rest of us thanking God COH is here.

Thank you.

Dupl.

Ms. Nancy Lawrence
10660 Lakeside Avenue N.E.
Seattle, Washington 98125

Dear Ms. Lawrence:

Thank you for your recent letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. I agree that providing emergency care for children is a City-wide concern, but there have been numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

William Justen, Director of the Department of Construction and Land Use (DCLU), tells me that before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by City Council. DCLU has required the COH to put up a large sign to alert the community about the proposal and to submit a checklist on potential environmental impacts of the project. Your letter and letters of other citizens of the community are included in the official file (CC 84-002), and you will be notified of future public hearing schedules and decisions.

I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Sincerely,

Charles Royer

Dear Major Royer:

I would very much appreciate it if you would write a letter to the Group living in the Laurelhurst Area trying to prevent the construction of a Helicopter Pad at Children's Orthopedic Hospital on the basis of noise caused by helicopters. Is it more important to have Laurelhurst quiet and thus prevent a helicopter from landing at the Hospital when it is carrying a child dying from poison?

I live north of the Sandpoint Naval Air Station. For all the years when it was an active Base, Air planes took off and landed one after another on Lake Washington every Friday and Saturday night - all night. The Navy never asked us whether the planes kept us awake. They did. A helicopter carrying a sick child may fly

Re: Childrens Orthopedic
Hospital Heliport
CUP Application

To Whom it May Concern:

We have been advised that COH has submitted an application for development of a heliport adjacent to a high density residential neighborhood. We are concerned with this proposal and request DCLU examine the proposal with great care prior to acting on the application.

We recognize, of course, that Childrens Orthopedic Hospital offers a great service to the community. However, like every good community neighbor, COH must not act in a manner which unreasonably interferes with the residential character of the surrounding neighborhood.

We are particularly concerned with the proposal for a heliport because it is not at all clear that there is a great need for this use. Landing facilities are already available in close proximity to COH. The University of Washington Hospital and the University of Washington Intramural fields both provide the same capacity which COH now wishes to duplicate a few minutes away.

Given the inappropriateness of daily helicopter landings in this residential neighborhood and the close proximity of existing landing facilities, a preliminary analysis indicates that the proposed heliport would be an unreasonable use.

We appreciate your consideration of our comments and request that we be provided with notice of any future hear-

Dear Sir's

I am Beverly Morris, located at 4720-44th N.E., Seattle 98105, directly across from the parking lot of the Orthopedic Hospital, I have been in my home for over 33 years.

I am very much against this helicopter trip some head nurse is going through-, over at the hospital. Yes, I have raised 2 kids, so I know what it is to have children.

Because of the pad for the helicopter being at the present location, they have Not , let me repeat myself, they have Not lost a child yet.

Please do not let this happen.

Re: Helipad plan, COH

Dear Mr. Justen:

You have my memo to you attached to copy of my letter to Mrs. Habegger of Children's Orthopedic Hospital dated November 15, 1984.

You know my reasons for objection to the ill-conceived plan for a helipad at Children's Orthopedic Hospital in a densely populated residential area. To summarize briefly:

1. Helipad is not needed. Present landing at nearby soccer field, corner of Union Bay, is completely workable, and safe--no lives have been lost; it is a three-minute distance to COH.

2. Environmental impact. Pollution from helicopter, and noise would be great.

3. Endangerment of the lives of thousands of individuals--patients and personnel at hospital, children at elementary school, senior citizens at Burke-Gilman Village, junior and senior citizens in Laurelon Terrace Condominiums, Laurel Crest Condominiums, Laurelhurst West Condominiums, as well as those in individual homes and other apartments nearby and in path of flight pattern.

4. Excessive duplication of expenditures of money with a helipad also being built at nearby University Hospital, within five minutes of COH. Landing facilities already available, too, at nearby Sand Point Naval Station within six minutes from COH make helipad unnecessary.

With this letter I state in writing my request to be notified of date, time, place of public hearing for this plan.

Thank you.

Sincerely,
Maryann E. Spangler

Councilmember Jeanette Williams
City Council
City of Seattle

Dear Councilmember Williams:

Thank you for your letter concerning the Children's Orthopedic Hospital (COH) application for a permit to install a helistop within the hospital grounds.

Before a permit can be issued, there must be an environmental review and Council Conditional Use approval. The first notice to the public will be of the environmental review. It will be published in the Land Use Bulletin that we mail twice a week to subscribers, and a large sign describing the project will be posted in a prominent place on the proposed site. At least fourteen days after the large sign has been posted (to allow time for citizen comment), we will determine if an environmental impact statement (EIS) is required. If we determine that an EIS is not needed and issue a declaration of non-significance, citizens may appeal that decision to the Hearing Examiner. If an EIS is required, citizens will have an opportunity to tell us what they think should be covered in the EIS.

When the environmental determination has been made, this Department will issue to the Council a report and recommendation on the helistop, and the Hearing Examiner will schedule a public hearing on the recommendation. Notices of that hearing will be mailed to all occupants and owners of property within a 300 foot radius of hospital boundaries, posted on placards around the site, and published in the Land Use Bulletin. Following the hearing, the Hearing Examiner will forward a recommendation to the Council for consideration.

We are aware of the controversy over the proposal, and have received numerous phone calls from Laurelhurst residents regarding the project and the applicable laws and regulations. Prior to making application, COH representatives met with my staff, and, at that time, noise was identified as a major impact.

I appreciate your interest, and if you have any other questions about the project, please call Ann Ormsby at extension 4509.

Very truly yours,

William J. Justen

City of Seattle

Dear William:

The Laurelhurst Community Club alerted me to the fact that Children's Orthopedic Hospital (COH) has applied to DCLU for a permit to site a helicopter landing pad on their grounds off Sand Point Way.

This is to inquire as to the status of that application, what City laws and regulations apply, and what process will be followed.

The issue is not a new one. It has been under discussion and hotly debated for several years because of the negative impact this facility would have on the immediate and surrounding residential neighborhoods.

A meeting was held last evening at the Laurelhurst Community Center. The attendance was large and the opposition very vocal.

I would appreciate a prompt response to my inquiry.

Sincerely,

Jeanette Williams

Ms. Claire A. Marston
4250 N.E. 50th Street
Seattle, Washington 98105

Dear Ms. Marston:

Thank you for your letter to Mr. Kraabel regarding the proposal to build a helipad at Children's Orthopedic Hospital.

I am told that the application is for a Council Conditional Use permit which will ultimately require a decision by the City Council. Such applications are governed by the "Appearance of Fairness" Doctrine whose purpose is to prevent people representing one side or the other in a disputed case from gaining favor through special access to Councilmembers. No one should attempt to communicate directly with Councilmembers concerning the merits of the case outside open public hearings where all sides have an opportunity to present their views. Violation of the doctrine can result in the courts overturning Council decisions which are appealed.

So that your comments will be placed in the official record for consideration by the Councilmembers when the application comes before them, I am forwarding your letter to the Director of the Department of Construction and Land Use. The decision on the proposal will be made on the merits of the case contained in the official record.

If you have any questions regarding the above, do not hesitate to call me at 625-2447.

Respectfully,

Claire McKechnie

Council Member Paul Kraabel
Seattle City Council
600 4th Ave.
Seattle 98104

Dear Mr Kraabel,

I wish to tell you of my concern over the building of a helipad at Childrens Orthopedic Hospital. I think the hospital does a magnificant job in caring for sick children and their families. So does the whole of Seattle. I see it at first hand every week as I volunteer my services there But the necessity for helicopter service on the grounds escapes me, when the present service from Groves Field is available and more than adequate, and the helipad at U of W Hospital will soon be available.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It seems very unfair to a residential neighborhood, that the Hospital chose to move into. You and I both know that the service will expand once it is established. Therefore the noise factor and the safety risks will as well. Night flights and extra lighting will become a necessity.

This is very troublesome to nearby residents, especially. We all care about sick children. I hope that you will also have some care for this neighborhood.

Sincerely yours,

Claire Marston

Dear Mr. Justen:

I am writing to let you know of my opposition to the proposed helipad at the Children's Orthopedic Hospital. I can't believe the administration of this hospital is asking our community to be subjected to such an unjust ordeal.

I feel there are other aternatives that are satisfactory. There are homes not more than 200 feet from the proposed landing site to the east, and a large group of condominiums one block west. These condominiums are occupied by a majority of senior citizens. I have enclosed a copy of a booklet published by the Environmental Protection Agency which states the health hazard noise can be to the elderly.

I have seen all of COH's slides of these tiny infants and have heard their same, rehearsed speeches. I find this an insult. As if one of our community would not want those children to live. I myself have suffered the loss of my seven day old daughter. To say I am not sympathetic and understanding of these babies and their families is ridiculous. But, because of money and politics this hospital is determined to disrupt our lives, destroy the character of our neighborhood, inflict possible health hazards to the elderly, and cause unknown havoc to the residents of Laurelhurst. Children's made a promise in the 1940's to be a small cottage hospital, with lots of lawn and flowering cherry trees. They have continuously lied to the community of their intentions of growth and will continue to do so.

I can only hope that you will see your way clear to deny them the helipad. I can't believe COH is asking this of the community. There are viable options that they refuse to even consider. I also find it interesting the Mr. Katz, Dr. Coppas, and the other proponents of the helipad are neatly tucked away as residents of Mercer Island and the like.

Please read the enclosed literature. It contains only a small portion of the booklet put out by the EPA. I did not include the portions of the booklet detailing the effects noise has on the unborn, learning in young children, and the effects disrupted sleep has on the physical and emotional well being of all age groups. This helipad is definately not meant for a neighborhood surrounded by homes, filled with aged, sick, young, and so varied residents.

Sincerely,

Ramy Hardwick Dept.

"It is truly a serious problem to escape from noise."
William Dean Howells, American Author

A Final Word

When unwanted sounds intrude into our environment, noise exists. We have all experienced to varying degrees the annoyance and irritation caused by noise. Sometimes this annoyance is brought about by disruption of our sleep or difficulty in falling asleep. At other times, it may be because we have to raise our voices over background noise to be heard or because we are distracted from our activities.

Except for the serious problem of hearing loss, there is no human illness known to be directly caused by noise. But throughout dozens of studies, noise has been clearly identified as an important cause of physical and psychological stress, and stress has been directly linked with many of our most common health problems. Thus, noise can be associated with many of these disabilities and diseases, which include heart disease, high blood pressure, headaches, fatigue and irritability.

Noise is also suspected to interfere with children's learning and with normal development of the unborn child. Noise is reported to have triggered extremely hostile behavior among persons presumably suffering from emotional illness. It is suspected to lower our resistance, in some cases, to the onset of infection and disease.

However, most Americans are largely unaware that noise poses such significant dangers to their health and welfare. The reasons for this lack of awareness are clear. Noise is one of many environmental causes of stress and cannot easily be identified as the source of a particular physical or mental ailment by the layman. Another reason is that biomedical and behavioral research is only now at the point where health hazards stemming from noise can actually be named, even though some specific links have yet to be found.

Dr. William H. Stewart, former Surgeon General, in his keynote address to the 1969 Conference on Noise as a Public Health Hazard, made the following point: "Must we wait until we prove every link in the chain of causation? I stand firmly with (Surgeon General) Burney's statement of 10 years ago. In protecting health, absolute proof comes late. To wait for it is to invite disaster or to prolong suffering unnecessarily. I submit that those things within man's power to control which impact upon the individual in a negative way, which infringe upon his sense of integrity, and interrupt his pursuit of fulfillment, are hazards to public health."

It is finally clear that noise is a significant hazard to public health. Truly, noise is more than just an annoyance.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"The din of the modern city [includes] noises far above levels for optimum sleeping. Result: insomnia and instability."
Dr. Edward F. Crippen, Former Deputy Health Commissioner of Detroit

Sleep Disruption

Sleep is a restorative time of life, and a good night's sleep is probably crucial to good health. But everyday experience suggests that noise interferes with our sleep — in a number of ways. Noise can make it difficult to fall asleep, it can wake us, and it can cause shifts from deeper to lighter sleep stages. If the noise interference with sleep becomes a chronic problem, it may take its toll on health.

Human response to noise before and during sleep varies widely among age groups. The elderly and the sick are particularly sensitive to disruptive noise. Compared to young people, the elderly are more easily awakened by noise and, once awake, have more difficulty returning to sleep. As a group, the elderly require special protection from the noises that interfere with their sleep.

Other age groups seem to be less affected by noise at bedtime and while asleep. But their apparent adjustment may simply be the result of failing to remember having awakened during the night. Sleep researchers have observed that their subjects often forget and underestimate the number of times they awaken during sleep. It may be that loud noises during the night continue to wake or rouse us when we sleep, but that as we become familiar with the sounds, we return to sleep more rapidly.

Factors other than age can influence our sleep. Studies suggest that the more frequent noise is, the less likely a sleeper is to respond. Certain kinds of noises can cause almost certain responses, however. A mother may wake immediately at the sound of a crying baby, but may tune out much louder traffic noise outside.

Disruption of sleep does not necessarily include awakening. Shifting in depths of sleep may be more frequent than awakening. For instance, recent studies have shown that shifts from deep to light sleep were more numerous because of noise, and that light sleep became lengthened at the expense of deep sleep.

Studies have also been made of noise complaints and what kinds of annoyance led people to file them. Surveys taken in communities significantly affected by noise indicated that the interruption of rest, relaxation, and sleep was the underlying cause of many people's complaints.

When noise interferes with our sleep— whether by waking us or changing the depth of sleep — it makes demands on our bodies to adapt. The implications of these demands for our general health and performance are not well understood. Nonetheless, we need restful sleep and many of us are not getting it. As a result, for millions of Americans, trying to get a good night's sleep still means reaching for sleeping pills.

Noise affects the quantity and quality of sleep

The elderly and sick are more sensitive to disruptive noise

When sleep is disturbed by noise, work efficiency and health may suffer

Seattle, Washington 98104

Dear Councilmember Sibonga,

Please add the following letter to the comments you have received reccommending further study, analysis, and consideration of alternate options for the Helipad requested by Children's Orthopedic Hospital. Since COH is such a vital and commendable institution in our community I want to acknowledge my respect for the services they deliver, but I am also anxious to urge you as a councilmember to remember that any strong, viable community is the result of more than one institution. To you goes the unenviable task of keeping a harmonious balance between all the elements that make Seattle the desirous community it is at present, and I plead with you to keep that balance in mind as you consider this request from COH.

When you make your decision on this helipad, I ask for analysis of its impact in four different categories: will this facility significantly improve the life-saving emergency care over the current procedure; will its influence on the surrounding residential neighborhood be acceptable; will the logistics, safety, and coordination of several helipads within one and a half miles of one another (one projected at the University Hospital and one at Sandpoint) be in conflict with the city's published desire to limit congestion in the University/Northend areas, as well as the desire to promote balanced growth in other parts of the city; and will the installation of a helipad at COH further concentrate care at that hospital to the exclusion and detriment of other hospitals whose facillities would be that much less than COH and less capable of attracting research monies and staff?

As an amateur in all these categories, I can do nothing more than speculate that the answers will corroborate the feeling I have that the request for the helipad is more a luxury than a necessity. No doubt each of us would like all the latest conveniences at our doorsteps, but would forego those for which the pricetag comes in irreversible, environmental damage. The challenge that tests all of us is striking the "quality of life" balance that will preserve our community.

Sincerely,

Elizabeth L. Morrison

Dear Mr. Justen:

I urge you to reject the application by COH for a helicopter pad on the hospital grounds for the following reasons:

1. COH has been successfully using an air transport system with an army helicopter which lands on an open field only 3 minutes from the hospital grounds.

2. The landing of the helicopter on the hospital grounds will force the vehicle to fly over a heavily residential neighoorhood.

3. The noise from the helicopter will frighten the children who are patients in the hospital.

4. There are 3 other sites within 6 minutes of COH where a helicopter can land safely.

Thank you for your consideration.

Sincerely,

Carolyn Margon

Dear Ms. Justen;

I wish to question as to whether there is really a need to build a Helipad at Childrens Orthopedic Hospital? I live on 43rd DR two blocks from the hospital and understand from what in the landing pattern of the helicopter if the pad is installed. Therefore I am also concerned about the noise level.

It seems to me the hospital has done fine using the University playfield to pick up transfer patients. Using the field does not increase costs as the Helipad would, nor is much extra time lost. I would rather see that money go for new equipment.

You must remember Laurelhurst is primarily a residential neighborhood and the residents need it

Children's Orthopedic Hospital
3402 N. E. 45th Place
Seattle, Washington 98105

Dear Mrs. Boose:

Thank you for your recent letter to Councilmember Williams in opposition to the Children's Orthopedic Hospital (COH) proposed helipad.

The City Council will be the final decision maker on this application for a helipad. When considering specific land use issues, the Councilmembers sit as a quasi-judicial body. They are required to maintain an appearance of fairness to all parties and must limit their review of the issue to the official record and testimony received at an open, public hearing. For this reason, Councilmember Williams is unable to read your letter at this time.

Once the initial environmental review is completed by the City's Department of Construction and Land Use, a public hearing will be scheduled before the City's Hearing Examiner. A sign will be placed at the proposed helipad site, and notice will be sent to those who reside 300 feet from the Hospital boundaries 30 days prior to the public hearing. The community is encouraged to participate in the hearing because the testimony received will comprise a portion of the official record. I am forwarding a copy of your letter to Mr. William Justen, Director of the Department of Construction and Land Use to ensure it is included in the record and a hearing notice is sent to you.

The Hearing Examiner will recommend to the City Council whether or not the helipad should be approved, with the Council making the final decision. Even though Councilmember Williams is unable to read your letter at this time, thank you again for forwarding the opposition of the Minna Parks Guild.

Sincerely,

Lori Mayfield

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Please do not allow Children's Orthopedic Hospital to build a helicopter landing pad near their emergency entrance. COH has impacted Laurelhurst far more than was their avowed original intention. Their present landing site, 3 minutes away, is adequate. The noise & danger of helicopters is too much! We residents protest the proposed landing pad very strongly. Our community is fast becoming a commercial development. Please help. Thank you. Mrs. Wayne J. Vath NO. 11-27-84 (Christy M.) Timberlake

Re: Proposed helipad COH

Dear Mrs. Habegger:

Please bear in mind as you read the following that I write to you as a concerned citizen and that I love children for whom I want the best possible care.

Are you aware of the extreme enmity and disapproval created by the COH and deeply felt by neighbors of COH relative to the proposed plans for a helipad and the method in which these plans have been handled? This is undesirable and unnecessary. Neither you nor I want this.

A helipad at COH in the heart of a residential, densely populated neighborhood is neither wise nor safe. This is true not only for the residents of the neighborhood but also for the hospital patients and personnel, the children at the nearby elementary school, the senior citizens of the future retirement home at the Villa, the residents of condominiums on both sides of Sand Point Way and nearby apartment buildings, residents of Ronald Macdonald House, and the city housing complex near it.

Environmental impact of noise is only one detrimental factor. Safety of landing and take-off of a helicopter in a high-density population area is a second factor to be taken very seriously. Lowering of property values is yet another factor to be considered. Environmental impact created by COH already is felt via ambulance and traffic generated in the residential neighborhood. This is further institutional encroachment in our neighborhood.

Emergencies to which a helicopter would respond could occur anytime during day or night hours. We in this neighborhood (as in others) experienced the low-flying helicopter during the gypsy moth spraying and know the uneasy feeling and noise factor first hand. To have a helicopter land in one's front yard or atop one's roof, so to speak, would be unbearable. It would create unnecessary upset to the patients at COH and to the children at the elementary school, to senior citizens, and to families nearby.

My request is that you and the Board take the necessary steps immediately to cancel the proposed plans for the helipad. I further request that COH and the University of Washington work in cooperation not competition for a helipad at University Hospital rather than at COH. Two helipads located so close together are not needed and constitute duplication of huge and unnecessary expenditures.

In addition, I request that you honestly pursue the following:

1. Research the difference between present helicopter landing in soccer field, UW, and ambulance taking patient to COH (reportedly three-minute run) vs helicopter landing atop roof, transfer to stretcher and down ramp to emergency entrance. Would three minutes really be saved? No, not really. Would handling of and moving of patient be minimized? No, not really.

   Further question here: How many, if any, patients have been injured or died as a result of present arrangement?

   It is the quality of care in ambulance or helicopter not the mode of transport, not the three-minute time differential that spells the difference between life or death outcome. The quality of care given by Seattle's ambulance service(s) is second to none.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Examine the records of COH. You will find that initially in the building program COH stated there would be no further expansion. This has not been adhered to. In addition, at one time, COH stated that it would not build a helipad. This is now being ignored.

   The application for helipad construction contains incorrect and incomplete data. Also, no certification of need is on record. What is the perceived need?

   Credibility of the COH Board of Trustees is diminished and is at stake. Likewise, citizen support for COH will diminish and be at stake. Thus, even now the projected number of "approximately 15 flights a month" is not believed. Furthermore, the number of flights cannot be controlled once a service is offered, as you know.

3. Consider building an emergency unit on UW soccer field <u>if</u> this is needed to meet helicopter upon landing and before drive to COH by ambulance. There patient could be placed on stretcher, emergency measures administered, then taken to emergency entrance at COH with minimal moving. (Although this is an alternative possibility, this construction is very likely not needed.)

Do you care about what the neighbors of COH think? Do you care about alternatives to helipad at COH? Do you care about saving money by COH working cooperatively with the UW and University Hospital? Do you care that many citizens' rights are being abridged and disregarded?

To reiterate, please know that I am a concerned citizen and a person who loves children and cares about them. I also am concerned and care about the quality of environment and quality of life for the senior citizens as well as the young couples with children who live in close proximity to COH.

Please consider carefully these ideas, these opinions (held by me and many, many others). Please take necessary and positive action. Please contact me. Thank you.

Sincerely,

Maryann E. Spangler

Marjorie Kresge
4014 N. E. 46th Street
Seattle, Washington 98105

Dear Ms. Kresge:

Thank you for your letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. I believe that providing emergency care for children is a City-wide concern, but there have been numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

My staff is currently reviewing the merits of the proposal, and we have required the COH to put up a large sign to alert the community about the proposal and to submit a checklist on potential environmental impacts of the project. Before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by City Council. Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and you will be notified of future public hearing schedules and decisions.

I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

Katy Chaney

600 4th Avenue
Seattle, Washington 98104

Dear Mr. Justen:

Yesterday evening I attended a meeting of the Laurelhurst Community concerning the introduction of a helipad at Children's Orthopedic Hospital.

I wish to add my objection to those of my neighbors against a helicopter pad in this all-residential neighborhood. From what I understand of the situation, in this time of surplus hospital beds, there is great competition among hospitals for patients and this is becoming true between COH and University Hospital. University Hospital will very shortly have a helipad on its roof and is capable of handling emergency care for children. The University Hospital has an entirely different neighborhood structure than COH and helicopter traffic should not be so disturbing to its neighbors. Children's Orthopedic Hospital, on the other hand, is entirely surrounded by residences whose owners should not be discomfitted so that COH can better compete with University Hospital for patients.

If this helipad is approved I can only foresee a future for Laurelhurst similar to that of the residents of SeaTac. For at least the past 20 years there has been intermittent disputation between the airport and the nearby residents: Agreements are reached only to be disregarded by the airport when the heat is off. The residents then go through the old petition, meetings, etc., routine to get only temporary reprieve. This should not be the fate of Laurelhurst residents, many of whom, I understand, were here before COH and since there are alternative emergency care facilities available at University Hospital.

Sincerely,

Marjorie Kresge

Councilmember Jeanette Williams
City Council
City of Seattle

Dear Councilmember Williams:

Thank you for your letter concerning the Children's Orthopedic Hospital (COH) application for a permit to install a helistop within the hospital grounds.

Before a permit can be issued, there must be an environmental review and Council Conditional Use approval. The first notice to the public will be of the environmental review. It will be published in the Land Use Bulletin that we mail twice a week to subscribers, and a large sign describing the project will be posted in a prominent place on the proposed site. At least fourteen days after the large sign has been posted (to allow time for citizen comment), we will determine if an environmental impact statement (EIS) is required. If we determine that an EIS is not needed and issue a declaration of non-significance, citizens may appeal that decision to the Hearing Examiner. If an EIS is required, citizens will have an opportunity to tell us what they think should be covered in the EIS.

When the environmental determination has been made, this Department will issue to the Council a report and recommendation on the helistop, and the Hearing Examiner will schedule a public hearing on the recommendation. Notices of that hearing will be mailed to all occupants and owners of property within a 300 foot radius of hospital boundaries, posted on placards around the site, and published in the Land Use Bulletin. Following the hearing, the Hearing Examiner will forward a recommendation to the Council for consideration.

We are aware of the controversy over the proposal, and have received numerous phone calls from Laurelhurst residents regarding the project and the applicable laws and regulations. Prior to making application, COH representatives met with my staff, and, at that time, noise was identified as a major impact.

I appreciate your interest, and if you have any other questions about the project, please call Ann Ormsby at extension 4509.

Very truly yours,

WILLIAM J. JUSTEN, P. E.

December 5, 1984

Mr. William Justen Director,
Department of Construction and Land Use,
600 4th Avenue,
Seattle, Washington 98104

Dear Mr. Justen:

The Childrens' Orthopedic Hospital is doing untold good for the people of our state; and the nighborhood residents are grateful to it. However, a time comes when the disturbing noises caused by the wailing ambulances and the prospect of helicopter rotors seem too much.

Since the alternatives for a helipad on the grounds are not harmful to the patients, it is time for us to object to the continuing encroachments, to which the hospital people feel they have a perfect right. The University intramural field has been a handy three-minute-away-pad,serv- the hospital for years. And the up-coming helipad at the University hospital will be five minutes away.

Once a helipad is built, there is no way to control the increasing noise of more and larger helicopters, day and night. This also increases the chance of accidents in a highly populated area.

So I am requesting that you do not give the COH permission to build a helipad on their grounds.

Sincerely yours,

Emergencies to which a helicopter would respond could occur anytime during day or night hours. We in this neighborhood (as in others) experienced the low-flying helicopter during the gypsy moth spraying and know the uneasy feeling and noise factor first hand. To have a helicopter land in one's front yard or atop one's roof, so to speak, would be unbearable. It would create unnecessary upset to the patients at COH and to the children at the elementary school, to senior citizens, and to families nearby.

My request is that you and the Board take the necessary steps immediately to cancel the proposed plans for the helipad. I further request that COH and the University of Washington work in cooperation not competition for a helipad at University Hospital rather than at COH. Two helipads located so close together are not needed and constitute duplication of huge and unnecessary expenditures.

In addition, I request that you honestly pursue the following:

1. Research the difference between present helicopter landing in soccer field, UW, and ambulance taking patient to COH (reportedly three-minute run) vs helicopter landing atop roof, transfer to stretcher and down ramp to emergency entrance. Would three minutes really be saved? No, not really. Would handling of and moving of patient be minimized? No, not really.

   Further question here: How many, if any, patients have been injured or died as a result of present arrangement?

   It is the quality of care in ambulance or helicopter not the mode of transport, not the three-minute time differential that spells the difference between life or death outcome. The quality of care given by Seattle's ambulance service(s) is second to none.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Examine the records of COH. You will find that initially in the building program COH stated there would be no further expansion. This has not been adhered to. In addition, at one time, COH stated that it would not build a helipad. This is now being ignored.

   The application for helipad construction contains incorrect and incomplete data. Also, no certification of need is on record. What is the perceived need?

   Credibility of the COH Board of Trustees is diminished and is at stake. Likewise, citizen support for COH will diminish and be at stake. Thus, even now the projected number of "approximately 15 flights a month" is not believed. Furthermore, the number of flights cannot be controlled once a service is offered, as you know.

3. Consider building an emergency unit on UW soccer field if this is needed to meet helicopter upon landing and before drive to COH by ambulance. There patient could be placed on stretcher, emergency measures administered, then taken to emergency entrance at COH with minimal moving. (Although this is an alternative possibility, this construction is very likely not needed.)

Do you care about what the neighbors of COH think? Do you care about alternatives to helipad at COH? Do you care about saving money by COH working cooperatively with the UW and University Hospital? Do you care that many citizens' rights are being abridged and disregarded?

To reiterate, please know that I am a concerned citizen and a person who loves children and cares about them. I also am concerned and care about the quality of environment and quality of life for the senior citizens as well as the young couples with children who live in close proximity to COH.

Please consider carefully these ideas, these opinions (held by me and many, many others). Please take necessary and positive action. Please contact me. Thank you.

Sincerely,

Maryann E. Spangler

Seattle, WA 98105

Dear Ms. Margon:

Thank you for your letter regarding the helipad at Chi'dren's Orthopedic Hospital.

As this matter will eventually come before the Council and Councilmember Jim Street's committee as a Council Conditional Use, he is not able to see your letter at this time due to the "Appearance of Fairness" doctrine which governs such matters. The doctrine's purpose is to prevent people representing one side or the other in a disputed case from gaining favor through special access to Councilmembers. No one should attempt to communicate directly with Councilmembers concerning the merits of the case outside open public hearings where all sides have an opportunity to present their views. Violation of the doctrine can result in the courts overturning Council decisions which are appealed.

When the matter comes before the Council for review, the decision will be made on the merits contained in the official record.

I will forward your letter to the Department of Construction and Land Use and ask that it be placed in the file.

Thank you for taking the time to write. If you have any questions regarding the above, do not hesitate to call me.

Sincerely,

Karen L. Campbell

NOV 2 7 1984

Dear Mr. Street:

I am a friend of Kate and Charles Nelson's and met you at a coffee at their house last year when you were running for office. I am writing on behalf of most of my neighbors regarding the application by COH for a helicopter pad on the hospital grounds for the following reasons:

1. COH has been successfully using an air transport system with an army helicopter which lands on an open field only 3 minutes from the hospital grounds.

2. The landing of the helicopter on the grounds will force the vehicle to fly over a heavily residential neighborhood.

3. The noise from the helicopter will frighten the children who are patients in the hospital.

4. There are 3 other sites within 6 minutes of the helipad where a helicopter can land safely. Therefore, I urge you to reject their application. Thank you.

Sincerely,

Carolyn Margon

Dear Ms. Wood:

Thank you for forwarding a copy of your letter to Mrs. Habegger to Councilmember Paul Kraabel regarding the proposal to build a helipad at Children's Orthopedic Hospital.

I am told that the application is for a Council Conditional Use.permit which will require a decision by the City Council. Such applications are governed by the "Appearance of Fairness" Doctrine whose purpose is to prevent people representing one side or the other in a disputed case from gaining favor through special access to Councilmembers. No one should attempt to communicate directly with Councilmembers concerning the merits of the case outside open public hearings where all sides have an opportunity topresent their views. Violation of the doctrine can result in the courts overturning Council decisions which are appealed.

I am forwarding your letter to the Director of the Department of Construction and Land Use so that it will be placed in the official record for consideration by the Council when the application comes before it. The decision on the proposal will be made on the merits of the case contained in the official record.

If you have any questions regarding the above, do not hesitate to call me at 625-2447.

Respectfully,

Claire McKechnie

Mrs. Robert J. (Peggy) Habegger
President, Board of Trustees
Children's Orthopedic Hospital
4530 52nd. N.E.
Seattle, Washington 98105

Dear Mrs. Habegger,

I am writing to you about a deep concern I share with many other COH neighbors---the apparent decision of Children's Orthopedic Hospital to install a helipad.

As a resident of Laurelon Terrace since 1955, as a present condominium owner, the immediate past-president of the Laurelon Terrace Homeowner's Board of Directors, and as an individual, I have been aware of the history, mission and growth of the hospital since it moved into our area. During some of the heavy construction phases, which had significant impact on our lives, I felt that the hospital tried to be a good neighbor, to keep us informed of plans and developments. As recently as the June '84 meeting to inform the community of the latest expansion plans (which recently, I hear, have been at least temporarily abandoned) I was impressed with your personal interest in complaints of noise on the walkway just to the west of the hospital. I felt that you were responsive to reasonable requests.

At the same meeting, however, I asked publicly for Mr. Truman Katz to tell us what further plans they had for a helipad which we had first heard mentioned several years ago. Mr. Katz stated at that public meeting that they had no plans for a helipad at the moment. Such answers to direct questions in June----and the imminence of a helipad in mid-November-does not build cred bility. I feel betrayed!

If you have looked at the map showing the plans for the helipad, you will note that Laurelon Terrace---three blocks and 136 residences---will be the most severely impacted by both approach and return of helicopters whose noise level is only 3 decibels below that of a Huey.

We feel that 15 trips (which will be 30 'single' trips) a month---in the beginning----is totally unacceptable. Once the helipad is in place it will undoubtedly be used for emergency and non-emergency alike. Those of us who live in the area will pay for it in noise pollution, lack of safety, lowering of property values, erosion of our living climate. This is a residential area---it was a totally residential area when Children's Orthopedic elected to relocate here.

I have worked at the University of Washington for 35 years, both in medical research and, most recently, as a supervisor in the clinical laboratory. I do not believe that COH has proven the need for this helipad. At present, truly emergency flights can(and do) land in the University of Washington playfield at "5 Corners". The patient can be transported from helicopter to emergency entrance in less than 5 minutes. (I have seen this happen!) I do not believe the patient would be transferred from helicopter to emergency room from the helipad significantly faster.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It is hard to address this subject because we not only love children, we're proud of the total facility and the wonderful care that COH provides. We want to be good neighbors. But we think the hospital should seriously consider the impact this request will have on all its neighbors and ask themselves "Is it worth the trip?"

I am well aware of the turmoil currently going on in [illegible]al centers in response to DRG's, the Deficit Reduction Act of 198[illegible] and the real struggle of hospitals to survive as we know them. I attended a meeting in September in Nashville with 800 other clinical laboratory directors and I know there are tough times ahead that call for creative strategies. But a helipad should not be used as a marketing tool.

To summarize:

1. COH chose to relocate in a residential area. They should abide with compatible use of our common space.
2. COH's neighbors have been very supportive of the hospital and its mission.
3. We are concerned about the number of trips, the noise pollution, the hazards and the undoubted proliferation of use.
4. Who is going to assume responsibility and reimbursement for property damage? (They do crash!)
5. Who will compensate Laurelon Terrace and other close neighbors for diminished property value? You should be aware that Laurelon has many owners who are not affluent, who would be seriously affected if they lost their investment. Many have worked all their lives to acquire their modest home and do not have the luxury to walk away and relocate.
6. We do not feel that the hospital has proven that a helipad is necessary to survival of any type of patient.
7. There will be a helipad at the University Hospital on its new building which will be finished next spring. We don't need helipads a mile apart.
8. COH has access to a "helipad" within 5 minutes of its door.

I invite your comments on my concerns and would be happy to discuss any of these points with you in depth. Laurelon is my home, which I have worked for many years to secure. I don't want to see its peaceful, liveable climate vanish through unnecessary "progress".

Sincerely

Patricia Ann Wood

Seattle. Washington 98105

Re: Proposed helipad COH

Dear Mrs. Habegger:

Please bear in mind as you read the following that I write to you as a concerned citizen and that I love children for whom I want the best possible care.

Are you aware of the extreme enmity and disapproval created by the COH and deeply felt by neighbors of COH relative to the proposed plans for a helipad and the method in which these plans have been handled? This is undesirable and unnecessary. Neither you nor I want this.

A helipad at COH in the heart of a residential, densely populated neighborhood is neither wise nor safe. This is true not only for the residents of the neighborhood but also for the hospital patients and personnel, the children at the nearby elementary school, the senior citizens of the future retirement home at the Villa, the residents of condominiums on both sides of Sand Point Way and nearby apartment buildings, residents of Ronald Macdonald House, and the city housing complex near it.

Environmental impact of noise is only one detrimental factor. Safety of landing and take-of of a helicopter in a high-density population area is a second factor to be taken very seriously. Lowering of property values is yet another factor to be considered. Environmental impact created by COH already is felt via ambulance and traffic generated in the residential neighborhood. This is further institutional encroachment in our neighborhood.

Emergencies to which a helicopter would respond could occur anytime during day or night hours. We in this neighborhood (as in others) experienced the low-flying helicopter during the gypsy moth spraying and know the uneasy feeling and noise factor first hand. To have a helicopter land in one's front yard or atop one's roof, so to speak, would be unbearable. It would create unnecessary upset to the patients at COH and to the children at the elementary school, to senior citizens, and to families nearby.

My request is that you and the Board take the necessary steps immediately to cancel the proposed plans for the helipad. I further request that COH and the University of Washington work in cooperation not competition for a helipad at University Hospital rather than at COH. Two helipads located so close together are not needed and constitute duplication of huge and unnecessary expenditures.

In addition, I request that you honestly pursue the following:

1. Research the difference between present helicopter landing in soccer field, UW, and ambulance taking patient to COH (reportedly three-minute run) vs helicopter landing atop roof, transfer to stretcher and down ramp to emergency entrance. Would three minutes really be saved? No, not really. Would handling of and moving of patient be minimized? No, not really.

Further question here: How many, if any, patients have been injured or died as a result of present arrangement?

It is the quality of care in ambulance or helicopter not the mode of transport, not the three-minute time differential that spells the difference between life or death outcome. The quality of care given by Seattle's ambulance service(s) is second to none.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Examine the records of COH. You will find that initially in the building program COH stated there would be no further expansion. This has not been adhered to. In addition, at one time, COH stated that it would not build a helipad. This is now being ignored.

   The application for helipad construction contains incorrect and incomplete data. Also, no certification of need is on record. What is the perceived need?

   Credibility of the COH Board of Trustees is diminished and is at stake. Likewise, citizen support for COH will diminish and be at stake. Thus, even now the projected number of "approximately 15 flights a month" is not believed. Furthermore, the number of flights cannot be controlled once a service is offered, as you know.

3. Consider building an emergency unit on UW soccer field if this is needed to meet helicopter upon landing and before drive to COH by ambulance. There patient could be placed on stretcher, emergency measures administered, then taken to emergency entrance at COH with minimal moving. (Although this is an alternative possibility, this construction is very likely not needed.)

Do you care about what the neighbors of COH think? Do you care about alternatives to helipad at COH? Do you care about saving money by COH working cooperatively with the UW and University Hospital? Do you care that many citizens' rights are being abridged and disregarded?

To reiterate, please know that I am a concerned citizen and a person who loves children and cares about them. I also am concerned and care about the quality of environment and quality of life for the senior citizens as well as the young couples with children who live in close proximity to COH.

Please consider carefully these ideas, these opinions (held by me and many, many others). Please take necessary and positive action. Please contact me. Thank you.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

December 3, 1984

Councilmember ----------
Seattle City Council
600 4th Avenue
Seattle, Washington 98104

Dear Councilmember ----------,

Please add the following letter to the comments you have received reccommending further study, analysis, and consideration of alternate options for the Helipad requested by Children's Orthopedic Hospital. Since COH is such a vital and commendable institution in our community I want to acknowledge my respect for the services they deliver, but I am also anxious to urge you as a councilmember to remember that any strong, viable community is the result of more than one institution. To you goes the unenviable task of keeping a harmonious balance between all the elements that make Seattle the desirous community it is at present, and I plead with you to keep that balance in mind as you consider this request from COH.

When you make your decision on this helipad, I ask for analysis of its impact in four different categories: will this facility significantly improve the life-saving emergency care over the current procedure; will its influence on the surrounding residential neighborhood be acceptable; will the logistics, safety, and coordination of several helipads within one and a half miles of one another (one projected at the University Hospital and one at Sandpoint) be in conflict with the city's published desire to limit congestion in the University/Northend areas, as well as the desire to promote balanced growth in other parts of the city; and will the installation of a helipad at COH further concentrate care at that hospital to the exclusion and detriment of other hospitals whose facillities would be that much less than COH and less capable of attracting research monies and staff?

As an amateur in all these categories, I can do nothing more than speculate that the answers will corroborate the feeling I have that the request for the helipad is more a luxury than a necessity. No doubt each of us would like all the latest conveniences at our doorsteps, but would forego those for which the pricetag comes in irreversible, environmental damage. The challenge that tests all of us is striking the "quality of life" balance that will preserve our community.

Sincerely,

Elizabeth L. Morrison

RECEIVED
DEC 3 - 1984
DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Mr. William Justen, Director
Dept. of Construction and Land Use
600 4th Avenue
Seattle, WA 98104

Dear Mr. Justen,

As a parent of four children and as a neighbor of the Children's Orthopedic Hospital for more than twenty years, I am writing to protest the hospital's application for permission to build a helipad.

My reasons for this protest are

1. There is no need for the helipad at the hospital because
   a. there is already a helipad only three minutes (by private car, stopping at stop lights) or 8/10 mile away from the hospital on 45 Street

   b. Dr. Copass, the director of medical flight service, has admitted that transfer by ambulance from the 45 Street pad does <u>not</u> present undue risk to the patient.

2. There is potential harm, both to the children in the hospital and to the children and adults living in the surrounding communities because of
   a. the ever present and high potential for a copter crash

   b. the frightening and constantly increasing noise of the copter itself, which is counter to any hospital rules. The ambulance driver can turn off the siren, once he nears the hospital, but the copter blades can't stop just because there are many other sick children just a few yards away.

3. Once the pad is in, there would be no control over the flights. Who knows who's flying in or out? A sick child or an administrator on an errand?

4. Granted: a helicopter is an impressive marketing device in these days of increasing competition between hospitals, but the one to 1.5 million dollars that COH will have to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

spend annually to install and maintain a copter service could be better and more effectively spent for the care of low income children.

No one in our community has anything but praise and support for the fine care that children receive in the hospital, but we firmly believe that the installation of a helicopter service will not only fail to improve the care that the hospital gives but will cause irreparable damage to the hospital itself and to the surrounding communities.

Sincerely,

Joy Scott Dupl.

Mrs. Maryann E. Spangler
4013 N. E. 46th Street
Seattle, Washington 98105

Dear Mrs. Spangler:

Thank you for your recent letter to Councilmember Williams and the accompanying letter you sent to Mrs. Robert J. Habegger concerning a proposed Children's Orthopedic Hospital (COH) helipad.

Since the meeting of the Laurelhurst Community Club, we have been informed the City Council will be the final decision maker on this application for a helipad. When considering specific land use issues, the City Councilmembers sit as a quasi-judicial body. They are required to maintain an appearance of fairness to all parties and must limit their review of the issue to the official record and testimony received at an open, public hearing. For this reason, Councilmember Williams is unable to read your letters at this time.

Once the initial environmental review is completed by the City's Department of Construction and Land Use, a public hearing will be scheduled before the City's Hearing Examiner. A sign will be placed at the proposed helipad site, and notice will be sent to those who reside 300 feet from the Hospital boundaries 30 days prior to the public hearing. The community is encouraged to participate in the hearing because the testimony received will comprise a portion of the official record. I am forwarding a copy of your letter to Mr. William Justen, Director of the Department of Construction and Land Use to ensure it is included in the record and a hearing notice is sent to you.

The Hearing Examiner will recommend to the City Council whether or not the helipad should be approved, with the Council making the final decision. Even though Councilmember Williams is unable to read your letter at this time, thank you again for forwarding your position.

Sincerely,

Lori Mayfield

Re: Proposed helipad COH

Dear Mrs. Habegger:

Please bear in mind as you read the following that I write to you as a concerned citizen and that I love children for whom I want the best possible care.

Are you aware of the extreme enmity and disapproval created by the COH and deeply felt by neighbors of COH relative to the proposed plans for a helipad and the method in which these plans have been handled? This is undesirable and unnecessary. Neither you nor I want this.

A helipad at COH in the heart of a residential, densely populated neighborhood is neither wise nor safe. This is true not only for the residents of the neighborhood but also for the hospital patients and personnel, the children at the nearby elementary school, the senior citizens of the future retirement home at the Villa, the residents of condominiums on both sides of Sand Point Way and nearby apartment buildings, residents of Ronald Macdonald House, and the city housing complex near it.

Environmental impact of noise is only one detrimental factor. Safety of landing and take-off of a helicopter in a high-density population area is a second factor to be taken very seriously. Lowering of property values is yet another factor to be considered. Environmental impact created by COH already is felt via ambulance and traffic generated in the residential neighborhood. This is further institutional encroachment in our neighborhood.

Emergencies to which a helicopter would respond could occur anytime during day or night hours. We in this neighborhood (as in others) experienced the low-flying helicopter during the gypsy moth spraying and know the uneasy feeling and noise factor first hand. To have a helicopter land in one's front yard or atop one's roof, so to speak, would be unbearable. It would create unnecessary upset to the patients at COH and to the children at the elementary school, to senior citizens, and to families nearby.

My request is that you and the Board take the necessary steps immediately to cancel the proposed plans for the helipad. I further request that COH and the University of Washington work in cooperation not competition for a helipad at University Hospital rather than at COH. Two helipads located so close together are not needed and constitute duplication of huge and unnecessary expenditures.

In addition, I request that you honestly pursue the following:

1. Research the difference between present helicopter landing in soccer field, UW, and ambulance taking patient to COH (reportedly three-minute run) vs helicopter landing atop roof, transfer to stretcher and down ramp to emergency entrance. Would three minutes really be saved? No, not really. Would handling of and moving of patient be minimized? No, not really.

Further question here: How many, if any, patients have been injured or died as a result of present arrangement?

It is the quality of care in ambulance or helicopter not the mode of transport, not the three-minute time differential that spells the difference between life or death outcome. The quality of care given by Seattle's ambulance service(s) is second to none.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Examine the records of COH. You will find that initially in the building program COH stated there would be no further expansion. This has not been adhered to. In addition, at one time, COH stated that it would not build a helipad. This is now being ignored.

   The application for helipad construction contains incorrect and incomplete data. Aiso, no certification of need is on record. What is the perceived need?

   Credibility of the COH Board of Trustees is diminished and is at stake. Likewise, citizen support for COH will diminish and be at stake. Thus, even now the projected number of "approximately 15 flights a month" is not believed. Furthermore, the number of flights cannot be controlled once a service is offered, as you know.

3. Consider building an emergency unit on UW soccer field if this is needed to meet helicopter upon landing and before drive to COH by ambulance. There patient could be placed on stretcher, emergency measures administered, then taken to emergency entrance at COH with minimal moving. (Although this is an alternative possibility, this construction is very likely not needed.)

Do you care about what the neighbors of COH think? Do you care about alternatives to helipad at COH? Do you care about saving money by COH working cooperatively with the UW and University Hospital? Do you care that many citizens' rights are being abridged and disregarded?

To reiterate, please know that I am a concerned citizen and a person who loves children and cares about them. I also am concerned and care about the quality of environment and quality of life for the senior citizens as well as the young couples with children who live in close proximity to COH.

Please consider carefully these ideas, these opinions (held by me and many, many others). Please take necessary and positive action. Please contact me. Thank you.

Sincerely,

Maryann E. Spangler

Dear Ms. Spangler:

Thank you for your note to Councilmember Hildt expressing your concern about the proposal by Children's Orthopedic Hospital to install a helipad.

As you may know, this request under the zoning code is for a Council Conditional Use permit. The courts have ruled that in site-specific zoning decisions of this type, the City Council sits in a "quasi-judicial" capacity and may not prejudice their decision on the merits of the case by having contact with individuals outside the open, public decision process. To do so could jeopardize the decision in a court challenge. It is for this reason that I am responding on Mr. Hildt's behalf.

I am taking the liberty of forwarding your letter to Nanette Mozeika, the land use analyst working on the COH application, and asking that it be included in the official record on the case. I am also asking Ms. Mozeika to add your name to the mailing list so that you may be notified of the date and time of the Public Hearing before the Hearing Examiner.

Thank you again for taking the time to write.

Sincerely,

Dewey Potter, Assistant to
Michael Hildt, Member
Seattle City Council

Mrs. Robert J. (Peggy) Habegger
President, Board of Trustees
Children's Orthopedic Hospital
4530 52nd. N.E.
Seattle, Washington 98105

Dear Mrs. Habegger,

I am writing to you about a deep concern I share with many other COH neighbors---the apparent decision of Children's Orthopedic Hospital to install a helipad.

As a resident of Laurelon Terrace since 1955, as a present condominium owner, the immediate past-president of the Laurelon Terrace Homeowner's Board of Directors, and as an individual, I have been aware of the history, mission and growth of the hospital since it moved into our area. During some of the heavy construction phases, which had significant impact on our lives, I felt that the hospital tried to be a good neighbor, to keep us informed of plans and developments. As recently as the June '84 meeting to inform the community of the latest expansion plans (which recently, I hear, have been at least temporarily abandoned) I was impressed with your personal interest in complaints of noise on the walkway just to the west of the hospital. I felt that you were responsive to reasonable requests.

At the same meeting, however, I asked publicly for Mr. Truman Katz to tell us what further plans they had for a helipad which we had first heard mentioned several years ago. Mr. Katz stated at that public meeting that they had no plans for a helipad at the moment. Such answers to direct questions in June----and the imminence of a helipad in mid-November-does not build cred bility. I feel betrayed!

If you have looked at the map showing the plans for the helipad, you will note that Laurelon Terrace---three blocks and 136 residences---will be the most severely impacted by both approach and return of helicopters whose noise level is only 3 decibels below that of a Huey.

We feel that 15 trips (which will be 30 'single' trips) a month---in the beginning----is totally unacceptable. Once the helipad is in place it will undoubtedly be used for emergency and non-emergency alike. Those of us who live in the area will pay for it in noise pollution, lack of safety, lowering of property values, erosion of our living climate. This is a residential area---it was a totally residential area when Children's Orthopedic elected to relocate here.

I have worked at the University of Washington for 35 years, both in medical research and, most recently, as a supervisor in the clinical laboratory. I do not believe that COH has proven the need for this helipad. At present, truly emergency flights can(and do) land in the University of Washington playfield at "5 Corners". The patient can be transported from helicopter to emergency entrance in less than 5 minutes. (I have seen this happen!) I do not believe the patient would be transferred from helicopter to emergency room from the helipad significantly faster.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It is hard to address this subject because we not only love children, we're proud of the total facility and the wonderful care that COH provides. We want to be good neighbors. But we think the hospital should seriously consider the impact this request will have on all its neighbors and ask themselves "Is it worth the trip?"

I am well aware of the turmoil currently going on in medical centers in response to DRG's, the Deficit Reduction Act of 1984 and the real struggle of hospitals to survive as we know them. I attended a meeting in September in Nashville with 800 other clinical laboratory directors and I know there are tough times ahead that call for creative strategies. But a helipad should not be used as a marketing tool.

To summarize:

1. COH chose to relocate in a residential area. They should abide with compatible use of our common space.
2. COH's neighbors have been very supportive of the hospital and its mission.
3. We are concerned about the number of trips, the noise pollution, the hazards and the undoubted proliferation of use.
4. Who is going to assume responsibility and reimbursement for property damage? (They do crash!)
5. Who will compensate Laurelon Terrace and other close neighbors for diminished property value? You should be aware that Laurelon has many owners who are not affluent, who would be seriously affected if they lost their investment. Many have worked all their lives to acquire their modest home and do not have the luxury to walk away and relocate.
6. We do not feel that the hospital has proven that a helipad is necessary to survival of any type of patient.
7. There will be a helipad at the University Hospital on its new building which will be finished next spring. We don't need helipads a mile apart.
8. COH has access to a "helipad" within 5 minutes of its door.

I invite your comments on my concerns and would be happy to discuss any of these points with you in depth. Laurelon is my home, which I have worked for many years to secure. I don't want to see its peaceful, liveable climate vanish through unnecessary "progress".

Sincerely

Patricia Ann Wood

Dear Mr. Benson:

I am writing to let you know of my opposition to the proposed helipad at the Children's Orthopedic Hospital. I can't believe the administration of this hospital is asking our community to be subjected to such an unjust ordeal.

I feel there are other aternatives that are satisfactory. There are homes not more than 200 feet from the proposed landing site to the east, and a large group of condominiums one block west. These condominiums are occupied by a majority of senior citizens. I have enclosed a copy of a booklet published by the Environmental Protection Agency which states the health hazard noise can be to the elderly.

I have seen all of COH's slides of these tiny infants and have heard their same, rehearsed speeches. I find this an insult. As if one of our community would not want those children to live. I myself have suffered the loss of my seven day old daughter. To say I am not sympathetic and understanding of these babies and their families is ridiculous. But, because of money and politics this hospital is determined to disrupt our lives, destroy the character of our neighborhood, inflict possible health hazards to the elderly, and cause unknown havoc to the residents of Laurelhurst. Children's made a promise in the 1940's to be a small cottage hospital, with lots of lawn and flowering cherry trees. They have continuously lied to the community of their intentions of growth and will continue to do so.

I can only hope that you will see your way clear to deny them the helipad. I can't believe COH is asking this of the community. There are viable options that they refuse to even consider. I also find it interesting the Mr. Katz, Dr. Coppas, and the other proponents of the helipad are neatly tucked away as residents of Mercer Island and the like.

Please read the enclosed literature. It contains only a small portion of the booklet put out by the EPA. I did not include the portions of the booklet detailing the effects noise has on the unborn, learning in young children, and the effects disrupted sleep has on the physical and emotional well being of all age groups. This helipad is definately not meant for a neighborhood surrounded by homes, filled with aged, sick, young, and so varied residents.

Sincerely,

Ramy Hardwick

Dear Ms. Hardwick:

Thank you for your recent letter addressed to Councilmember Williams in opposition to Children's Orthopedic Hospital's (COH) proposed helicopter landing pad.

The City Council has learned that it will be the final decision maker on COH's application for a helipad. When considering specific land use issues, the Councilmembers sit as a quasi-judicial body. They are required to maintain an appearance of fairness to all parties and must limit their review of the issue to the official record and testimony received at an open, public hearing. For this reason, Councilmember Williams is unable to read your letter at this time.

Once the initial environmental review is completed by the City's Department of Construction and Land Use, a public hearing will be scheduled on the helipad application before the City's Hearing Examiner. A sign will be placed at the proposed helipad site, and notice will be sent to those who reside 300 feet from the Hospital boundaries 30 days prior to the public hearing. The community is encouraged to participate in the hearing because the testimony received will comprise a portion of the official record. I am forwarding a copy of your letter to Mr. William Justen, Director of the Department of Construction and Land Use to ensure it is included in the record and a hearing notice is sent to you.

The Hearing Examiner will recommend to the City Council whether or not the helipad should be approved, with the Council making the final decision. Even though Councilmember Williams is unable to read your letter at this time, thank you again for forwarding your views.

Sincerely,

Tom Rasmussen

Seattle, Washington 98104

Dear Councilmember Williams,

Please add the following letter to the comments you have received reccommending further study, analysis, and consideration of alternate options for the Helipad requested by Children's Orthopedic Hospital. Since COH is such a vital and commendable institution in our community I want to acknowledge my respect for the services they deliver, but I am also anxious to urge you as a councilmember to remember that any strong, viable community is the result of more than one institution. To you goes the unenviable task of keeping a harmonious balance between all the elements that make Seattle the desirous community it is at present, and I plead with you to keep that balance in mind as you consider this request from COH.

When you make your decision on this helipad, I ask for analysis of its impact in four different categories: will this facility significantly improve the life-saving emergency care over the current procedure; will its influence on the surrounding residential neighborhood be acceptable; will the logistics, safety, and coordination of several helipads within one and a half miles of one another (one projected at the University Hospital and one at Sandpoint) be in conflict with the city's published desire to limit congestion in the University/Northend areas, as well as the desire to promote balanced growth in other parts of the city; and will the installation of a helipad at COH further concentrate care at that hospital to the exclusion and detriment of other hospitals whose facillities would be that much less than COH and less capable of attracting research monies and staff?

As an amateur in all these categories, I can do nothing more than speculate that the answers will corroborate the feeling I have that the request for the helipad is more a luxury than a necessity. No doubt each of us would like all the latest conveniences at our doorsteps, but would forego those for which the pricetag comes in irreversible, environmental damage. The challenge that tests all of us is striking the "quality of life" balance that will preserve our community.

Sincerely,

Elizabeth L. Morrison

Elizabeth L. Morrison
3643 - 42nd Avenue Northeast
Seattle, Washington 98105

Dear Ms. Morrison:

Thank you for your letter to Councilmember Hildt expressing your concern about the proposal by the Children's Orthopedic Hospital to install a helipad, and suggesting further analysis.

As you may know, this request under the zoning code is for a Council Conditional Use permit. The courts have ruled that in site-specific zoning decisions ofthis type, the City Council sits in a "quasi-judicial" capacity and may not prejudice their decision on the merits of the case by having contact with individuals outside the open, public decision process. To do so could jeopardize the decision in a court challenge. It is for this reason that I am responding on Mr. Hildt's behalf.

I am taking the liberty of forwarding your letter to Nanette Mozeika, the land use analyst working on the COH application, and asking that it be included in the official record on the case. I am also asking Ms. Mozeika to add your name to the mailing list so that you may be notified of the time and date of the public hearing before the Hearing Examiner.

Thank you again for taking the time to write.

Sincerely,

DEWEY POTTER, Assistant to
Michael Hildt, Member
Seattle City Council

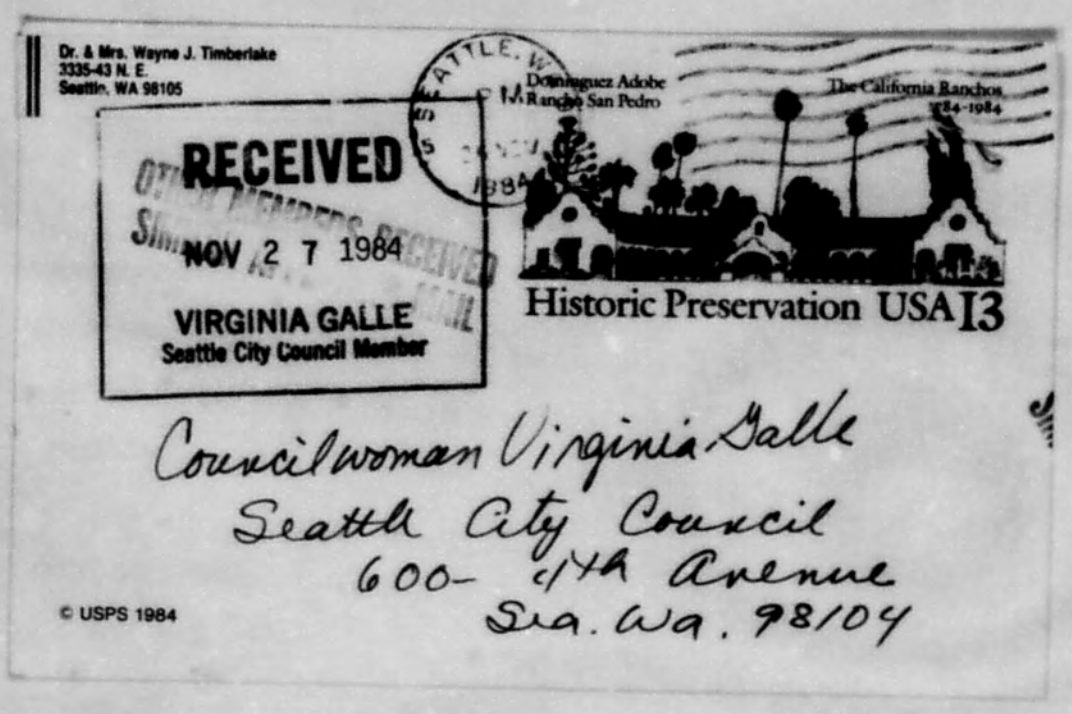
Please do not allow Children's Orthopedic Hospital to build a helicopter landing pad near their entrance. The existing site, 3 minutes away, is adequate!! COH has already impacted Laurelhurst greatly. The noise & potential danger of landing helicopters is just too much! We ask you to share our community & neighborhood concerns & to vote against the landing pad.



Thank you.

Ms. Elizabeth L. Morrison
3643 42nd Ave. N.E.
Seattle, Wa. 98105

Dear Ms. Morrison:

Thank you for your letter to Mr. Kraabel regarding the proposal to build a helipad at Children's Orthopedic Hospital.

I am told that the application is for a Council Conditional Use permit which will ultimately require a decision by the City Council. Such applications are governed by the "Appearance of Fairness" Doctrine whose purpose is to prevent people representing one side or the other in a disputed case from gaining favor through special access to Councilmembers. No one should attempt to communicate directly with Councilmembers concerning the merits of the case outside open public hearings where all sides have an opportunity to present their views. Violation of the doctrine can result in the courts overturning Council decisions which are appealed.

So that your comments will be placed in the official record for consideration by the Councilmembers when the application comes before them, I am forwarding your letter to the Director of the Department of Construction and Land Use. The decision on the proposal will be made on the merits of the case contained in the official record.

If you have any questions regarding the above, do not hesitate to call be at 625-2447.

Respectfully,

Claire McKechnie

Dear Councilmember Kraabel,

Please add the following letter to the comments you have received reccommending further study, analysis, and consideration of alternate options for the Helipad requested by Children's Orthopedic Hospital. Since COH is such a vital and commendable institution in our community I want to acknowledge my respect for the services they deliver, but I am also anxious to urge you as a councilmember to remember that any strong, viable community is the result of more than one institution. To you goes the u..enviable task of keeping a harmonious balance between all the elements that make Seattle the desirous community it is at present, and I plead with you to keep that balance in mind as you consider this request from COH.

When you make your decision on this helipad, I ask for analysis of its impact in four different categories: will this facility significantly improve the life-saving emergency care over the current procedure; will its influence on the surrounding residential neighborhood be acceptable; will the logistics, safety, and coordination of several helipads within one and a half miles of one another (one projected at the University Hospital and one at Sandpoint) be in conflict with the city's published desire to limit congestion in the University/Northend areas, as well as the desire to promote balanced growth in other parts of the city; and will the installation of a helipad at COH further concentrate care at that hospital to the exclusion and detriment of other hospitals whose facillities would be that much less than COH and less capable of attracting research monies and staff?

As an amateur in all these categories, I can do nothing more than speculate that the answers will corroborate the feeling I have that the request for the helipad is more a luxury than a necessity. No doubt each of us would like all the latest conveniences at our doorsteps, but would forego those for which the pricetag comes in irreversible, environmental damage. The challenge that tests all of us is striking the "quality of life" balance that will preserve our community.

Sincerely,

Elizabeth L. Morrison

December 3, 1984

Councilmember Paul Kraabel
Seattle City Council
400 - 4th Avenue
Seattle, Washington 98104

Dear Mr. Kraabel:

I am writing to let you know of my opposition to the proposed helipad at the Children's Orthopedic Hospital. I can't believe the administration of this hospital is asking our community to be subjected to such an unjust ordeal.

I feel there are other aternatives that are satisfactory. There are homes not more than 200 feet from the proposed landing site to the east, and a large group of condominiums one block west. These condominiums are occupied by a majority of senior citizens. I have enclosed a copy of a booklet published by the Environmental Protection Agency which states the health hazard noise can be to the elderly.

I have seen all of COH's slides of these tiny infants and have heard their same, rehearsed speeches. I find this an insult. As if one of our community would not want those children to live. I myself have suffered the loss of my seven day old daughter. To say I am not sympathetic and understanding of these babies and their families is ridiculous. But, because of money and politics this hospital is determined to disrupt our lives, destroy the character of our neighborhood, inflict possible health hazards to the elderly, and cause unknown havoc to the residents of Laurelhurst. Children's made a promise in the 1940's to be a small cottage hospital, with lots of lawn and flowering cherry trees. They have continuously lied to the community of their intentions of growth and will continue to do so.

I can only hope that you will see your way clear to deny them the helipad. I can't believe COH is asking this of the community. There are viable options that they refuse to even consider. I also find it interesting the Mr. Katz, Dr. Coppas, and the other proponents of the helipad are neatly tucked away as residents of Mercer Island and the like.

Please read the enclosed literature. It contains only a small portion of the booklet put out by the EPA. I did not include the portions of the booklet detailing the effects noise has on the unborn, learning in young children, and the effects disrupted sleep has on the physical and emotional well being of all age groups. This helipad is definately not meant for a neighborhood surrounded by homes, filled with aged, sick, young, and so varied residents.

Sincerely,

Ramy Hardwick

Seattle, Washington 98105

Dear Ms. Hardwick:

Thank you for your letter to Councilmember Hildt expressing your concern about the proposal by Children's Orthopedic Hospital to install a helipad.

As you may know, this request under the zoning code is for a Council Conditional Use permit. The courts have ruled that in site-specific zoning decisions of this type, the City Council sits in a "quasi-judicial" capacity and may not prejudice their decision on the merits of a case by having contact with individuals outside the open, public decision process. To do so could jeopardize the decision in a court challenge. It is for this reason that I am responding on Mr. Hildt's behalf.

I am taking the liberty of forwarding your letter to Nanette Mozeika, the land use analyst working on the COH application, and asking that it be included in the official record on the case. I am also asking Ms. Mozeika to add your name to the mailing list so that you may be notified of the date and time of the public hearing before the Hearing Examiner.

Thank you again for taking the time to write.

Dear Dr. and Mrs. Timberlake:

Thank you for your postcard to Mr. Kraabel regarding the proposal to build a helipad at Children's Orthopedic Hospital.

I am told that the application is for a Council Conditional Use permit which will require a decision by the City Council. Such applications are governed by the "Appearance of Fairness" Doctrine whose purpose is to prevent people representing one side or the other in a disputed case from gaining favor through special access to Councilmembers. No one should attempt to communicate directly with Councilmembers concerning the merits of the case outside open public hearings where all sides have an opportunity to present their views. Violation of the doctrine can result in the courts overturning Council decisions which are appealed.

I am forwarding your letter to the Director of the Department of Construction and Land Use so that it will be placed in the official record for consideration by the Council when the application comes before it. The decision on the proposal will be made on the merits of the case contained in the official record.

If you have any questions regarding the above, do not hesitate to call me at 625-2447.

Respectfully,

Claire McKechnie

Patricia Ann Wood
4036 N. E. 45th Street
Seattle, Washington 98105

Dear Ms. Wood:

Thank you for your letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. I believe that providing emergency care for children is a City-wide concern, but there have been numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

My staff is currently reviewing the merits of the proposal, and we have required the COH to put up a large sign to alert the community about the proposal and to submit a checklist on potential environmental impacts of the project. Before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by City Council. Your letter and letters of other citizens of the community are included in the official file (CC 84-022), and you will be notified of future hearing schedules and decisions.

I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Very truly yours,

Katy Chaney

Seattle, Washington 98105

Dear Mrs. Habegger,

I am writing to you about a deep concern I share with many other COH neighbors---the apparent decision of Children's Orthopedic Hospital to install a helipad.

As a resident of Laurelon Terrace since 1955, as a present condominium owner, the immediate past-president of the Laurelon Terrace Homeowner's Board of Directors, and as an individual, I have been aware of the history, mission and growth of the hospital since it moved into our area. During some of the heavy construction phases, which had significant impact on our lives, I felt that the hospital tried to be a good neighbor, to keep us informed of plans and developments. As recently as the June '84 meeting to inform the community of the latest expansion plans (which recently, I hear, have been at least temporarily abandoned) I was impressed with your personal interest in complaints of noise on the walkway just to the west of the hospital. I felt that you were responsive to reasonable requests.

At the same meeting, however, I asked publicly for Mr. Truman Katz to tell us what further plans they had for a helipad which we had first heard mentioned several years ago. Mr. Katz stated at that public meeting that they had no plans for a helipad at the moment. Such answers to direct questions in June----and the imminence of a helipad in mid-November-does not build cred bility. I feel betrayed!

If you have looked at the map showing the plans for the helipad, you will note that Laurelon Terrace---three blocks and 136 residences---will be the most severely impacted by both approach and return of helicopters whose noise level is only 3 decibels below that of a Huey.

We feel that 15 trips (which will be 30 'single' trips) a month---in the beginning----is totally unacceptable. Once the helipad is in place it will undoubtedly be used for emergency and non-emergency alike. Those of us who live in the area will pay for it in noise pollution, lack of safety, lowering of property values, erosion of our living climate. This is a residential area---it was a totally residential area when Children's Orthopedic elected to relocate here.

I have worked at the University of Washington for 35 years, both in medical research and, most recently, as a supervisor in the clinical laboratory. I do not believe that COH has proven the need for this helipad. At present, truly emergency flights can(and do) land in the University of Washington playfield at "5 Corners". The patient can be transported from helicopter to emergency entrance in less than 5 minutes. (I have seen this happen!) I do not believe the patient would be transferred from helicopter to emergency room from the helipad significantly faster.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It is hard to address this subject because we not only love children, we're proud of the total facility and the wonderful care that COH provides. We want to be good neighbors. But we think the hospital should seriously consider the impact this request will have on all its neighbors and ask themselves "Is it worth the trip?"

I am well aware of the turmoil currently going on in medical centers in response to DRG's, the Deficit Reduction Act of 1984 and the real struggle of hospitals to survive as we know them. I attended a meeting in September in Nashville with 800 other clinical laboratory directors and I know there are tough times ahead that call for creative strategies. But a helipad should not be used as a marketing tool.

To summarize:

1. COH chose to relocate in a residential area. They should abide with compatible use of our common space.
2. COH's neighbors have been very supportive of the hospital and its mission.
3. We are concerned about the number of trips, the noise pollution, the hazards and the undoubted proliferation of use.
4. Who is going to assume responsibility and reimbursement for property damage? (They do crash!)
5. Who will compensate Laurelon Terrace and other close neighbors for diminished property value? You should be aware that Laurelon has many owners who are not affluent, who would be seriously affected if they lost their investment. Many have worked all their lives to acquire their modest home and do not have the luxury to walk away and relocate.
6. We do not feel that the hospital has proven that a helipad is necessary to survival of any type of patient.
7. There will be a helipad at the University Hospital on its new building which will be finished next spring. We don't need helipads a mile apart.
8. COH has access to a "helipad" within 5 minutes of its door.

I invite your comments on my concerns and would be happy to discuss any of these points with you in depth. Laurelon is my home, which I have worked for many years to secure. I don't want to see its peaceful, liveable climate vanish through unnecessary "progress".

Sincerely

Patricia Ann Wood

Dear Mrs. Timberlake:

Thank you for your letter regarding the helipad at Children's Orthopedic Hospital.

As this matter will eventually come before the Council and Councilmember Jim Street's committee as a Council Conditional Use, he is not able to see your letter at this time due to the "Appearance of Fairness" doctrine which governs such matters. The doctrine's purpose is to prevent people representing one side or the other in a disputed case from gaining favor through special access to Councilmembers. No one should attempt to communicate directly with Councilmembers concerning the merits of the case outside open public hearings where all sides have an opportunity to present their views. Violation of the doctrine can result in the courts overturning Council decisions which are appealed.

When the matter comes before the Council for review, the decision will be made on the merits contained in the official record.

I will forward your letter to the Department of Construction and Land Use and ask that it be placed in the file.

Thank you for taking the time to write. If you have any questions regarding the above, do not hesitate to call me.

Sincerely,

Karen L. Campbell

Dear Ms. Timberlake:

Thank you for your note to Councilmember Hildt expressing your concern about the proposal by Children's Orthopedic Hospital to install a helipad.

As you may know, this request under the zoning code is for a Council Conditional Use permit. The courts have ruled that in site-specific zoning decisions of this type, the City Council sits in a "quasi-judicial" capacity and may not prejudice their decision on the merits of the case by having contact with individuals outside the open, public decision process. To do so could jeopardize the decision in a court challenge. It is for this reason that I am responding on Mr. Hildt's behalf.

I am taking the liberty of forwarding your letter to Nanette Mozeika, the land use analyst working on the COH application, and asking that it be included in the official record on the case. I am also asking Ms. Mozeika to add your name to the mailing list so that you may be notified of the date and time of the Public Hearing before the Hearing Examiner.

Thank you again for taking the time to write.

Sincerely,

Dewey Potter, Assistant to

Dear Mr. Juster,

I vehemently oppose the establishment of a helipad at C.O.H. for several reasons; the noise is deafening for those of us who live near the hospital in a residential neighborhood, there may be night-time landings, interrupting sleep and there is a danger of crashing into our heavily populated area. The VA field is already in use - continue it.

Thank you,

Seattle, Wa. 98104

Dear Mr. Justen,

Re: Helipad proposed for Childrens' Orthopedic Hospital

As a resident of the area near the hospital I wish to express my concern regarding the placing of a helipad at the hospital. It will be noisy and dangerous. This is a residential neighborhood. The hospital chose to locate here, and must not continue to encroach on the rights of the citizens and property owners.

The present arrangement of landing on the intramural field with an aid car standing by has proven very successful, and should be continued. The University Hospital will have a helipad on its roof in the near future and is only 5 minutes from Childrens Orthopedic.

Once built flights are apt to become more frequent with larger and noisier helicopters used. A crash on a densely populated neighborhood is a distinct possibility of this is allowed to go through.

Please give this matter very careful consideration, and help preserve our residential neighborhood.

Sincerely,

Lillian J. Mills

Ms. Nancy Lawrence
10660 Lakeside Avenue N.E.
Seattle, Washington 98125

Dear Ms. Lawrence:

Thank you for your recent letter regarding the Children's Orthopedic Hospital (COH) application for a permit to install a helistop on the hospital grounds. I agree that providing emergency care for children is a City-wide concern, but there have been numerous phone calls and letters from COH neighbors who are concerned about the particular location of the helistop, which they feel may adversely affect their neighborhood.

William Justen, Director of the Department of Construction and Land Use (DCLU), tells me that before a permit can be issued, there must be an environmental review, a public hearing conducted by the Hearing Examiner, and a Conditional Use approval by City Council. DCLU has required the COH to put up a large sign to alert the community about the proposal and to submit a checklist on potential environmental impacts of the project. Your letter and letters of other citizens of the community are included in the official file (CC 84-002), and you will be notified of future public hearing schedules and decisions.

I appreciate your interest, and I am glad you took the time to write. If you have any other questions, please call Mrs. Hermia Ip, the Land Use Specialist assigned to this project, at 625-4509. She will be glad to help you.

Sincerely,

Mrs. Robert J. Habegger
President, Board of Trustees
The Children's Orthopedic Hospital
4530 52nd N.E.
Seattle. Washington 98105

Re: Proposed helipad COH

Dear Mrs. Habegger:

Please bear in mind as you read the following that I write to you as a concerned citizen and that I love children for whom I want the best possible care.

Are you aware of the extreme enmity and disapproval created by the COH and deeply felt by neighbors of COH relative to the proposed plans for a helipad and the method in which these plans have been handled? This is undesirable and unnecessary. Neither you nor I want this.

A helipad at COH in the heart of a residential, densely populated neighborhood is neither wise nor safe. This is true not only for the residents of the neighborhood but also for the hospital patients and personnel, the children at the nearby elementary school, the senior citizens of the future retirement home at the Villa, the residents of condominiums on both sides of Sand Point Way and nearby apartment buildings, residents of Ronald Macdonald House, and the city housing complex near it.

Environmental impact of noise is only one detrimental factor. Safety of landing and take-off of a helicopter in a high-density population area is a second factor to be taken very seriously. Lowering of property values is yet another factor to be considered. Environmental impact created by COH already is felt via ambulance and traffic generated in the residential neighborhood. This is further institutional encroachment in our neighborhood.

Emergencies to which a helicopter would respond could occur anytime during day or night hours. We in this neighborhood (as in others) experienced the low-flying helicopter during the gypsy moth spraying and know the uneasy feeling and noise factor first hand. To have a helicopter land in one's front yard or atop one's roof, so to speak, would be unbearable. It would create unnecessary upset to the patients at COH and to the children at the elementary school, to senior citizens, and to families nearby.

My request is that you and the Board take the necessary steps immediately to cancel the proposed plans for the helipad. I further request that COH and the University of Washington work in cooperation not competition for a helipad at University Hospital rather than at COH. Two helipads located so close together are not needed and constitute duplication of huge and unnecessary expenditures.

In addition, I request that you honestly pursue the following:

1. Research the difference between present helicopter landing in soccer field, UW, and ambulance taking patient to COH (reportedly three-minute run) vs helicopter landing atop roof, transfer to stretcher and down ramp to emergency entrance. Would three minutes really be saved? No, not really. Would handling of and moving of patient be minimized? No, not really.

Further question here: How many, if any, patients have been injured or died as a result of present arrangement?

It is the quality of care in ambulance or helicopter not the mode of transport. not the three-minute time differential that spells the difference between life or death outcome. The quality of care given by Seattle's ambulance service(s) is second to none.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Examine the records of COH. You will find that initially in the building program COH stated there would be no further expansion. This has not been adhered to. In addition, at one time, COH stated that it would not build a helipad. This is now being ignored.

   The application for helipad construction contains incorrect and incomplete data. Also, no certification of need is on record. What is the perceived need?

   Credibility of the COH Board of Trustees is diminished and is at stake. Likewise, citizen support for COH will diminish and be at stake. Thus, even now the projected number of "approximately 15 flights a month" is not believed. Furthermore, the number of flights cannot be controlled once a service is offered, as you know.

3. Consider building an emergency unit on UW soccer field <u>if</u> this is needed to meet helicopter upon landing and before drive to COH by ambulance. There patient could be placed on stretcher, emergency measures administered, then taken to emergency entrance at COH with minimal moving. (Although this is an alternative possibility, this construction is very likely not needed.)

Do you care about what the neighbors of COH think? Do you care about alternatives to helipad at COH? Do you care about saving money by COH working cooperatively with the UW and University Hospital? Do you care that many citizens' rights are being abridged and disregarded?

To reiterate, please know that I am a concerned citizen and a person who loves children and cares about them. I also am concerned and care about the quality of environment and quality of life for the senior citizens as well as the young couples with children who live in close proximity to COH.

Please consider carefully these ideas, these opinions (held by me and many, many others). Please take necessary and positive action. Please contact me. Thank you.

Sincerely,

Maryann E. Spangler

P. O. Box 689
Allentown, PA 18105

Dear Mr. Spiker:

On Wednesday, November 18, 1981, the Board of Directors of the Eastern Pennsylvania EMS Council accepted the enclosed document and conditions as presented by the EMS Council Staff and Committee Chairmen for the approval of the Pre-Hospital Medevac Helicopter Proposal of the Allentown and Sacred Heart Hospital Center.

A twenty-eighth condition was added by the Board of Directors along with the approval of the review document. This twenty-eighth condition was that "the EMS Council's conditional approval of the helicopter madevac proposal would become effective upon Allentown and Sacred Heart Hospital Center's acceptance of conditions set forth by the Pennsylvania Department of Health for provisional designation of the Allentown and Sacred Heart Hospital Center as a trauma center". I have received a copy of your facility's December 10th letter to the Department of Health, formally assuring the Department of Health that the Hospital Center will meet all conditions in the designated time frames. Therefore, I assume that the Hospital Center will soon receive trauma center designation from the Department of Health.

The purpose of the EMS Council's review of your proposal was to insure this program's compatability with the Eastern Pennsylvania EMS System being developed within the counties of Berks, Carbon, Lehigh, Monroe, Northampton, and Schuylkill.

The EMS Council's approval of the Allentown and Sacred Heart Hospital Center Pre-Hospital Medevac Program is conditional upon our receipt of a written assurance from you, as the Chief Administrator of Allentown and Sacred

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Heart Hospital Center, that the hospital center will meet all twenty-eight conditions specified.

I realize that some of the conditions set forth will take some time to implement and some may need further clarification to be acceptable to, and implemented by, your institution. I am available to meet with you and any members of your staff to further discuss any of the conditons specified in the EMS Council's approval of the medevac program.

I await your reply.

Sincerely,

A. J. Heightman
Executive Director

Allentown, PA 18104

Dear Mr. Heightman:

I am in receipt of your letter of December 17, 1981, with attachments including the document "Eastern Pennsylvania Emergency Medical Services Council Review of Allentown and Sacred Heart Hospital Center Pre-Hospital Helicopter Proposal", with a revision date of December 17, 1981. The later document lists the twenty-eight conditions specified for EMS Council approval.

As Chief Executive Officer of the Allentown and Sacred Heart Hospital Center, I give you my assurance that the Hospital Center will meet all the conditions specified. It is understood that some of the conditions set forth will take some time to implement and some may need further clarification to be acceptable to the Hospital Center. We accept your invitation to meet with you and your staff to further discuss the conditions specified.

Mr. Gary Steinberg will coordinate this activity for the Hospital Center.

Sincerely yours,

Ellwyn D. Spiker
Administrator

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EASTERN PENNSYLVANIA EMERGENCY MEDICAL SERVICES COUNCIL
REVIEW OF ALLENTOWN AND SACRED HEART HOSPITAL CENTER
PRE-HOSPITAL HELICOPTER PROPOSAL

The following committees of the Eastern Pennsylvania EMS Council have reviewed the Allentown and Sacred Heart Hospital Center proposal which was submitted to the Eastern Pennsylvania Health Systems Council for establishment and operation of a pre-hospital helicopter medevac program:

Pre-Hospital Care and Transportation Committee
EMT Training Subcommittee
Communications Technical Advisory Subcommittee
Categorization Committee
Medical Command Subcommittee
Special Chairman's Ad-Hoc Committee

The main intent in the EMS Council's review and comment on this proposal was to insure that the pre-hospital phase of the program was developed, or would be modified, to be compatible with the Eastern Pennsylvania EMS System being developed with the Counties of Berks, Carbon, Lehigh, Monroe, Northampton, and Schuylkill. Although considered important, it was not the EMS Council's intent to review the cost effectiveness of this program, since it was realized that this would be carried out by the Eastern Pennsylvania Health Systems Council during its review of the Allentown and Sacred Heart Hospital Center CON Application.

The Eastern Pennsylvania EMS Council has been charged by the State and Federal Government with developing a total Emergency Care System within Eastern Pennsylvania. During the development of such a system, the EMS Council must follow State and Federal guidelines. The guidelines established for the development of an EMS System require that primary and secondary modes of transportation be developed and available for use within the system. Secondary transportation includes mobile intensive care units, water vehicles, snowmobiles, helicopters, fixed wing aircraft, etc. Therefore, the EMS Council review of proposals for development and implementation of secondary transportation systems which will impact a large portion of the Eastern Pennsylvania EMS Region is appropriate.

Each committee, and the EMS Council Staff, following their review of this project, has recommended conditional approval of this project.

EMS Council approval of the Allentown and Sacred Heart Hospital Center Pre-Hospital Helicopter Medevac is conditional upon the Council's receipt of a written assurance from the Chief Administrator of the Allentown and Sacred Heart Hospital Center that the hospital center will meet all conditions specified.

The EMS Council's Categorization Committee, on October 7, 1981, approved a motion (11 to 3) to support the medevac program with all concerns which had been expressed by the committee forwarded to the EMS Council Board of Directors along with the recommendation for support. The concerns of the Categorization Committee were included in detailed minutes of the October 7th

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Categorization Committee Meeting. Principle concerns expressed at the Categorization Committee level have been: the service area for the proposed medevac service; impact of this service on the Reading Hospital and Medical Center when this facility is designated as a trauma center; the feeling that all Category 1 trauma patients do not have to be transported directly to a trauma center; and possible delays in patient care if helicopter transport is selected in cases where ground transport resources are readily available to transport the patient to a trauma facility more rapidly.

It is important to note that in 1980, the Categorization Committee, EMS Council Board of Directors and the region's hospitals approved the EMS Council's "Patient Triage and Hospital Classification Guidelines" which recommend the transport of severe multiple systems injury patients directly to one of two facilities classified within Eastern Pennsylvania as Advanced in the area of trauma care if the pre-hospital emergency services can reach either facility within twenty minutes after leaving the scene off an incident. It is understood that, as one of the two facilities recognized as advanced in the area of trauma care, the Allentown and Sacred Heart Hospital Center proposes to utilize the medevac helicopter to assist in getting severe multiple system trauma patients to their facility within twenty minutes after leaving the scene of an incident.

These triage guidelines further recommend that if a pre-hospital emergency service cannot get the patient to one of these facilities within twenty minutes, the patient should be taken to the closest most appropriate hospital facility that can provide care for the patient. It is at this point that arrangements for transfer to a higher level facility are to be made according to other EMS Council and hospital approved guidelines.

The Categorization Committee's revised (May 1981) Acute Trauma Transfer and Treatment Protocols are recommended for use "if the physician performing the initial patient assessment determines a transfer to a more advanced facility or trauma center is necessary". These guidelines further recommend that:

1. If feasible, transfers should occur within the first hour following injury.

2. Land transfers should utilize, if possible, a Mobile Intensive Care Unit with personnel capable of providing ALS care during transport.

3. Air transfer may be considered by the receiving physician.

4. The trauma center may assist with providing transportation.

With these facts presented, and to keep the helicopter program within the framework of the existing Eastern Pennsylvania EMS System, the conditions given for EMS approval of the Allentown and Sacred Heart Hospital Center Project are:

1. The Allentown and Sacred Heart Hospital Center Medevac Helicopter be utilized to transport serious multiple system injury patients directly from the scene of an incident within the response zones presented by the Allentown and Sacred Heart Hospital Center to the closest designated Trauma Center, unless a specific Trauma Center

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

is requested by the patient/family or a ground transportation unit can transport the patient to a trauma center in less time than it would take to mobilize the Allentown and Sacred Heart Hospital Center Helicopter and have the patient airlifted to a trauma center.

2. The Allentown and Sacred Heart Hospital Center Medevac Helicopter be made available to transfer serious multiple systems injury trauma victims from Schuylkill County hospital facilities to the Reading Hospital and Medical Center, when that facility is designated as a Trauma Center, utilizing the same rate plan as will be used for patients transferred to the Allentown and Sacred Heart Hospital Center Trauma Unit via helicopter.

3. The Allentown and Sacred Heart Hospital Center Medevac Helicopter respond (if available) and transport Class 1 trauma patients directly from a pre-hospital setting when:

   Requested by a field unit for a patient which is to be transported to the Allentown and Sacred Heart Hospital Center, the transport time (air time) from a scene or rendezvous area to the Allentown and Sacred Heart Hospital Center will not exceed 20 minutes and a ground transportation unit cannot transport the patient to the Allentown and Sacred Heart Hospital Center in less time than it will take to mobilize the helicopter and have the patient transported to that facility.

4. Allentown and Sacred Heart Hospital Center develop a written procedure in conjunction with the Eastern Pennsylvania EMS Council for helicopter rendezvous at hospitals and at locations convenient for ambulances already enroute to the Allentown and Sacred Heart Hospital Center, whenever the helicopter has been requested and it is known that:

   a. The patient is ready for transport and the helicopter will be delayed in arriving at the scene.

   b. The ambulance unit, with the patient stabilized as much as possible, can transport the patient to a nearby hospital facility in a shorter amount of time than it will take for the helicopter to meet that unit.

   (This will insure that unnecessary delays in patient care or transport do not occur due to field units waiting for the helicopter's arrival, and will, in many cases, allow the closest hospital to provide additional patient care, such as IV therapy, prior to the arrival of the helicopter.)

5. Allentown and Sacred Heart Hospital Center agree to enter into written agreements with specialty centers developed within the Eastern Pennsylvania EMS Region, if and when these centers request to have helicopter transfer capabilities available to them.

6. Allentown and Sacred Heart Hospital Center develop a "fly-by" policy with the Reading Hospital and Medical Center, when that facility is designated as a Trauma Center, to insure that multiple systems injury trauma patients normally transported to the Allen-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

town and Sacred Heart Hospital Center would be airlifted to Reading Hospital whenever the critical care capabilities at the Allentown and Sacred Heart Hospital Center are over-taxed.

7. Allentown and Sacred Heart Hospital Center agree to develop a procedure to be utilized for the transport of blood or blood components to any Eastern Pennsylvania Hospital or disaster scene in critical need of these supplies.

8. Allentown and Sacred Heart Hospital Center agree to prepare quarterly reports which will provide the following information on all trauma patients transported to the Allentown and Sacred Heart Hospital Center:

   a. Patient Origin Information

   b. Method of transport to Allentown and Sacred Heart Hospital Center (name of ambulance service or helicopter).

   c. Helicopter flight times to scene, time spent at scene, and flight time to hospital facility.

   d. Patient diagnosis

   e. Type of surgical interventions performed.

   f. Patient outcome and length of stay.

   These quarterly reports will maintain patient confidentiality and be made available for review by a review committee designated by the Eastern Pennsylvania EMS Council.

9. Allentown and Sacred Heart Hospital Center develop an educational program for pre-hospital care providers concerning how to:

   a. Properly utilize the helicopter in conjunction with the region's Patient Triage and Hospital Classification Guidelines.

   b. Mobilize the helicopter.

   c. Function safely near the helicopter.

   d. Set-up proper landing areas for the helicopter.

   e. Obtain patient information and any equipment airlifted with the patient.

10. Allentown and Sacred Heart Hospital Center utilize a name other than "Paramedic" to designate the pre-hospital technicians employed on the medevac helicopter since these technicians are reportedly going to act as agents of the Allentown and Sacred Heart Hospital Center and not be functioning within the existing Eastern Pennsylvania Medical Command and Control System for Paramedics.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. Allentown and Sacred Heart Hospital Center work with the region's Advanced Life Support Medical Control Officer to develop a mechanism whereby personnel employed by the Allentown and Sacred Heart Hospital Center Medevac Program and holding Pennsylvania State Paramedic certification within Eastern Pennsylvania could maintain their State certification through involvement with other volunteer or paid Paramedic units operating within the Eastern Pennsylvania Medical Command/Control System, if they so desire.

12. Allentown and Sacred Heart Hospital Center develop a mechanism acceptable to the EMS Council which will allow for the quick return or replacement of equipment and/or supplies utilized by field crews on a medevac case or transported along with the patient via helicopter to a Trauma Center. This includes the return of items such as backboards, as well as arrangements to replace items such as endotracheal tubes and intravenous supplies used by ALS units prior to the transport of the patient by helicoptar.

13. Allentown and Sacred Heart Hospital Center Medevac Program have each county's central dispatch center serve as the activation agency for the helicopter whenever it is requested by a field unit.

14. Allentown and Sacred Heart Hospital Center Helicopter operate through each county's communications network in a manner identical to other existing EMS response units. The helicopter will sign-in service with the county communications center in the county where the mission is located; sign-off at the scene; sign enroute to its hospital destination; sign-off when at the destination hospital and notify the communications center when the helicopter is ready for another mission.

15. If it is decided in the future that the Allentown and Sacred Heart Hospital Center pre-hospital technicians will work within the region's Paramedic Medical Command/Control System, the Allentown and Sacred Heart Hospital Center will work in conjunction with the EMS Council and the Region's Medical Control Officer to insure conformance to the ALS system policies, procedures, and protocols.

16. A cardiac defibrillator be added to the capabilities of the helicopter.

17. The medevac helicopter, serving as a pre-hospital EMS patient transportation vehicle, participate in the Eastern Pennsylvania regional standard recordkeeping system, with a reportform completed by the crew following each mission. These forms are to be returned to EMS through currently established procedures.

18. All nurses assigned to the medevac helicopter become certified to the Pennsylvania Department of Health Emergency Medical Technician (EMT) I level within one year after the start of the pre-hospital helicopter program. Additionally, all new nurses entering the medevac program will hold current EMT-I certification.

19. Allentown and Sacred Heart Hospital Center develop a more acceptable method which will allow pre-hospital personnel who have had an at-scene/helicopter interface and whose patient was transported via the Allentown and Sacred Heart Hospital Center Medevac Helicopter, to obtain necessary patient information . it cannot be obtained prior to the helicopter transport of the patient.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

20. Allentown and Sacred Heart Hospital Center attempt to have hoist capabilities on the helicopter to assist in removing victims from inaccessible locations.

21. The medevac helicopter will only respond to emergency scenes when requested and will return to service when cancelled by at-scene personnel.

22. Allentown and Sacred Heart Hospital Center will work with each Eastern Pennsylvania hospital facility to insure that predetermined, easily accessible and safe helicopter landing facilities are available within close proximity to each hospital on a 24-hour basis.

23. The Allentown and Sacred Heart Hosptial Medevac Helicopter carry a set of Adult and Child Size Jobst Three-Section Medical Anti-Shock Trousers, with single control gauges, for exchange with pre-hospital crews that apply MAST prior to the arrival of the helicopter. The emergency crews' own pair of MAST, if utilized on a patient that is airlifted, shall be returned in a timely fashion to that crew following their removal from the patient.

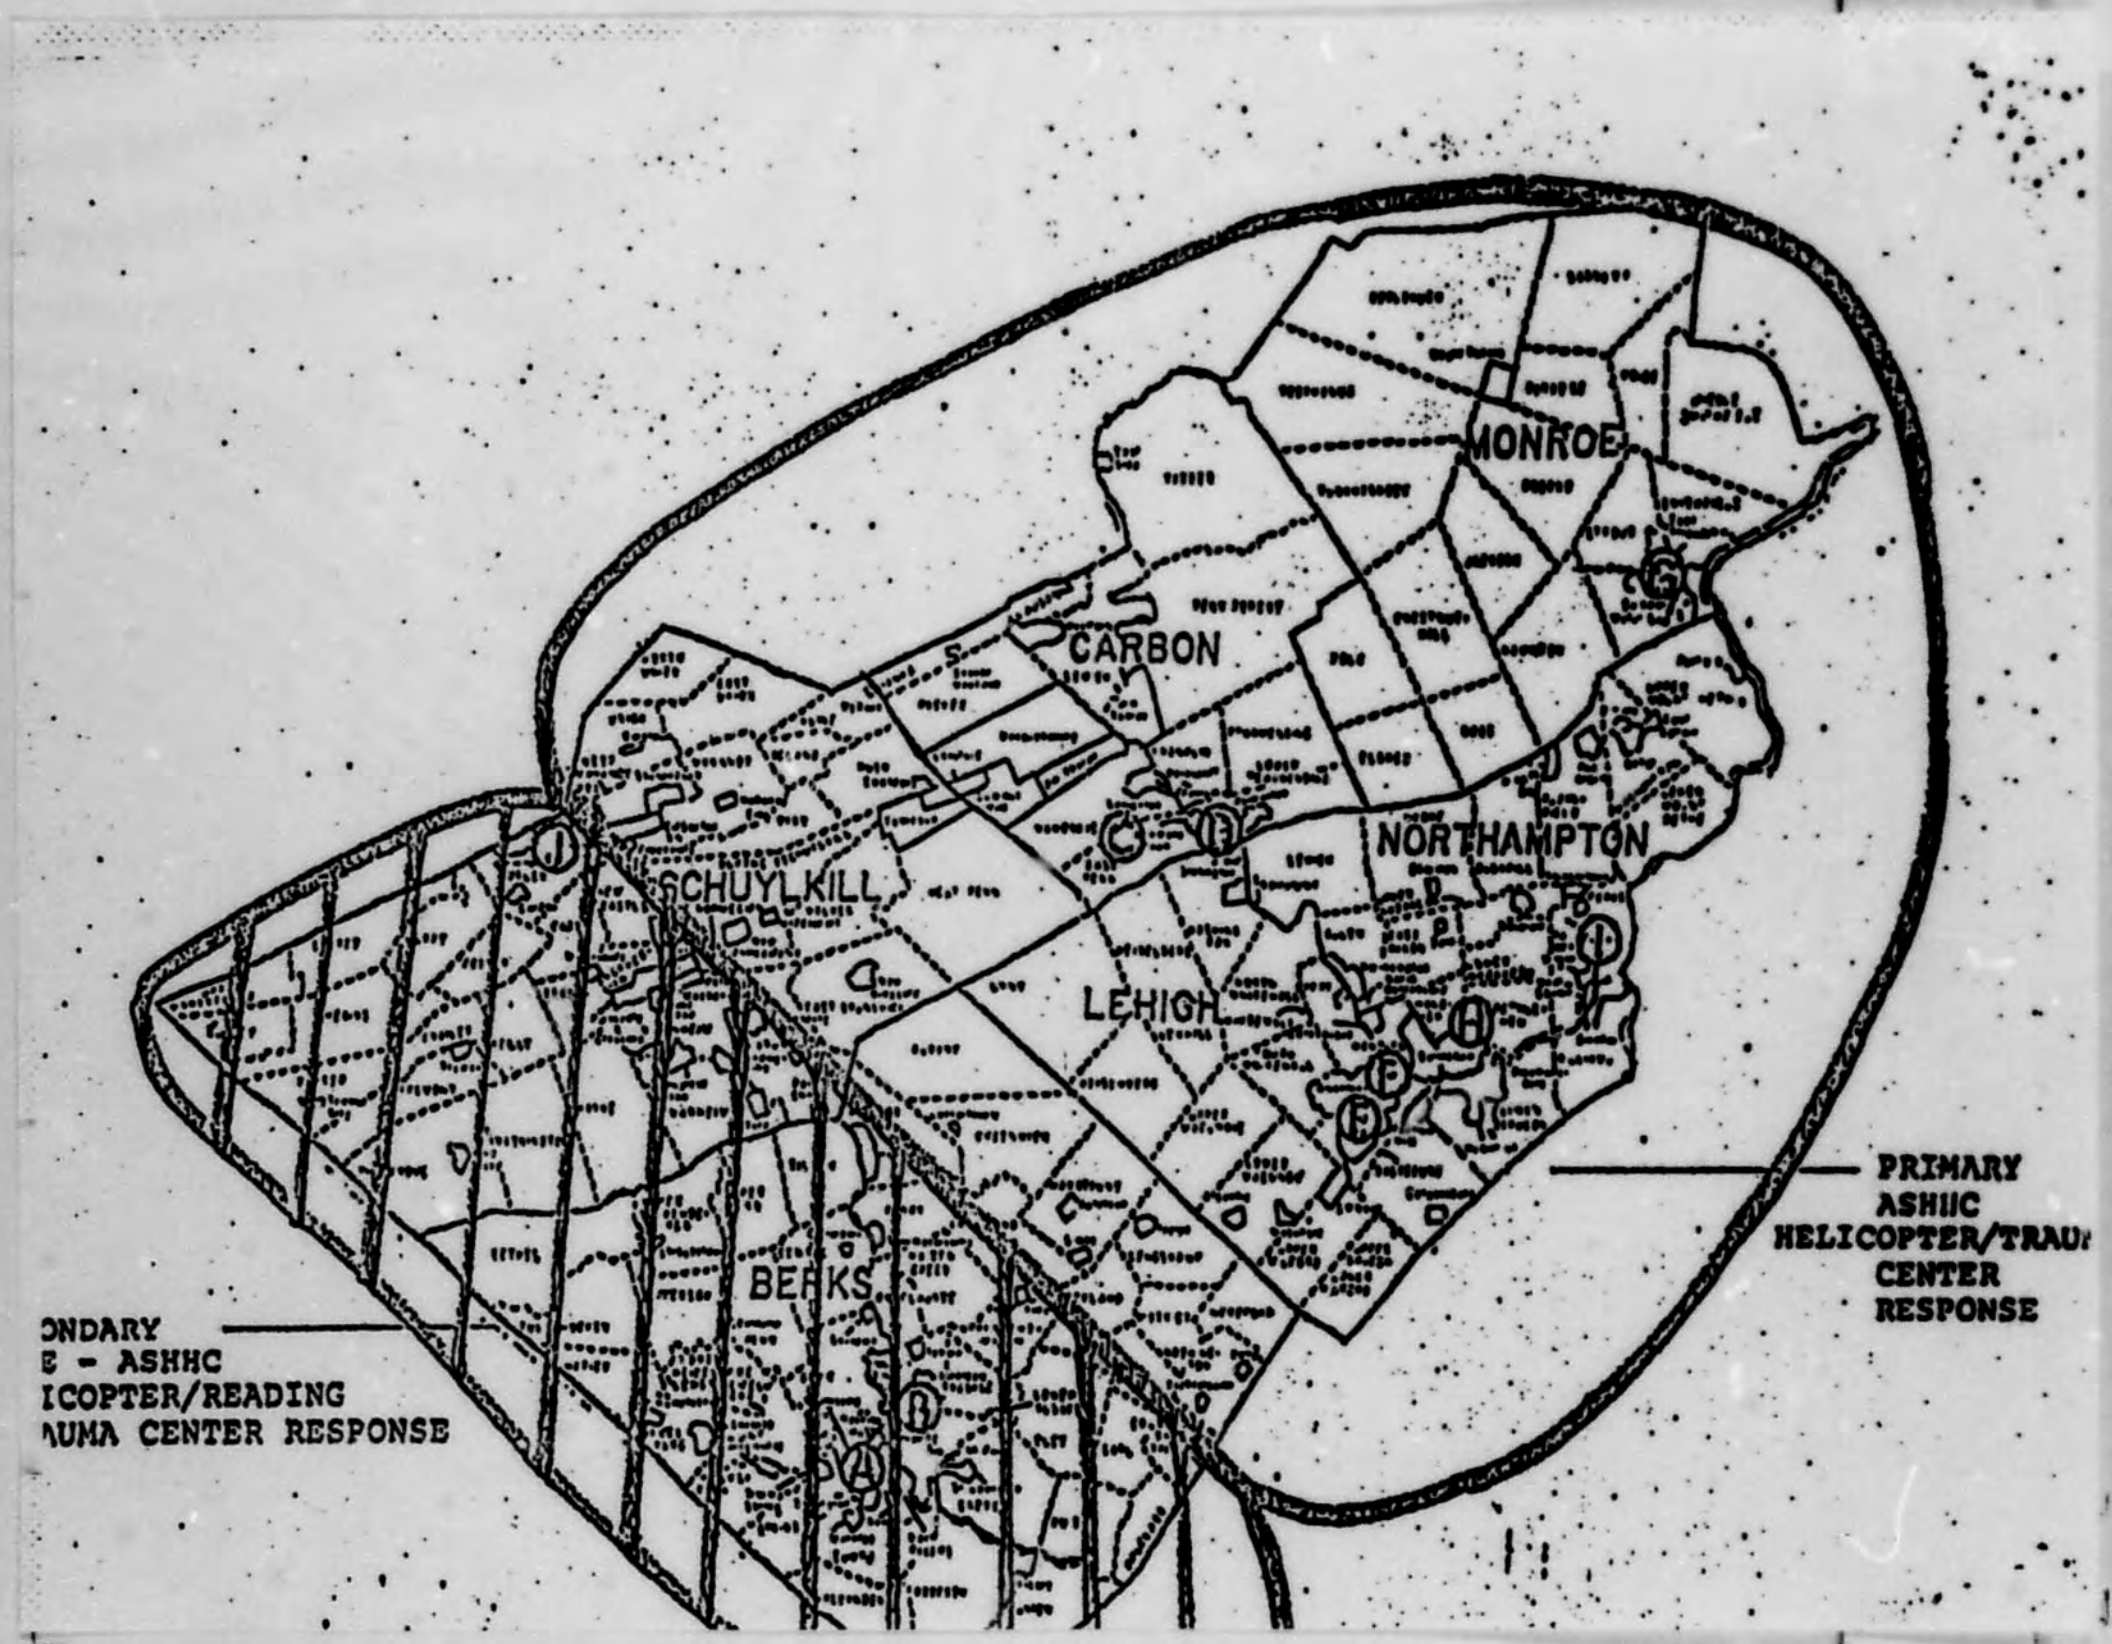
24. If the helicopter medevac service is cancelled while enroute to a scene due to a reassessment which indicates that helicopter transport of a patient is not necessary and the mission is terminated, neither the patient or the emergency crews at that scene shall be billed for use of the helicopter.

25. Allentown and Sacred Heart Hospital Center shall work in conjunction with the EMS Council to attempt to have Pennsylvania Turnpike helicopter coverage areas (ie., between the Lehigh Tunnel area and the Pocono Exit of the Northeast Extension) re-evaluated and reassigned to the closest available helicopter and/or Paramedic response service so that unnecessary delays in the delivery of advanced emergency medical care and transport are avoided.

26. The geographic boundaries for helicopter coverage of the Eastern Pennsylvania EMS Region are recognized as those exhibited (Primary and Secondary Zones) on the attached map provided by Allentown and Sacred Heart Hospital Center, with it understood that medevac service to all parts of the Eastern Pennsylvania EMS Region would be available upon the request of Eastern Pennsylvania pre-hospital units and hospital facilities. It is to be understood that patients picked up in the secondary zone area of the map will be transported to the Reading Hospital and Medical Center when that facility is designated as a trauma center by the Pennsylvania Department of Health.

27. Special educational programs be developed and implemented by Allentown and Sacred Heart Hospital Center for Eastern Pennsylvania police departments, particularly the Pennsylvania State Police, to orient them about the medevac program and the need for proper scene control during medevac missions.

28. The EMS Council conditional approval of the helicopter medevac proposal would become effective upon Allentown and Sacred Heart Hospital Center's acceptance of conditions set forth by the



NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pennsylvania Department of Health for provisional designation of the Allentown and Sacred Heart Hospital Center as a trauma center.

Prepared in compliance with recommendation made by the EMS Council Staff, Eastern Pennsylvania EMS Council Committees, and EMS Council Committee Chairmen.

A. J. Heightman
Executive Director

EASTERN PE... EMS COUNCIL

Dear Doctor Reid:

Let me express my appreciation to you and your staff for assisting the Allentown and Sacred Heart Hospital Center in its efforts to achieve designation as a trauma center.

The Allentown and Sacred Heart Hospital Center formally accepts the Department of Health's designation as an areawide trauma center. In accordance with your recommendation that the Hospital Center define its area of service, the Hospital Center is prepared to provide this important service to residents of the ten-county area delineated in our response to the request for proposal.

With respect to the specific conditions attached to the offer of designation, we are providing formal assurance that the Hospital Center will meet all conditions in the designated time frames. As you may know, we have received approval of our project from the Emergency Medical Services Council subject to clarification of some operational details. These operating details will be worked out in the next few months.

Our understanding based on our discussion with you is that the only item that limits the Allentown and Sacred Heart Hospital Center from achieving designation as a regional trauma center at this time is lack of a formal active research program. Within the next year our trauma program, under the direction of Donald Gaylor M.D., Chief of Surgery, and Michael Rhodes, M.D., traumatologist, will be expanded to increase the amount of research performed at the Hospital Center. As a result, we will seek designation as a regional center within a year.

Finally, as you may be aware, the Hospital Center has submitted a Certificate of Need Application for a 16-bed shock trauma unit and the purchase of a helicopter to carry out this responsibility to our ten-county area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Again, let me express my thanks for your assistance and cooperation in this process.

Sincerely yours,

Gary Steinberg

Annamarie T. Robertone, EMS Representative

GUEST

Mr. Charles Hafer

The meeting was called to order at 1:10 P.M. by Dr. Evan Reese, Committee Chairman. Minutes from the May 17, 1985 meeting were discussed. No addition or corrections were made. A motion was made by Dr. Stella, seconded by Dr. Moerkirk to approve the minutes as read.

Dr. Reese informed this committee that the Pre-Hospital Care and Transportation Committee was charged by the Council's Executive Committee with reviewing the current MedEvac Dispatch procedures. The committee addressed the MedEvac Dispatch Procedures at their August 5, 1985 meeting and made the following recommendations.

> "To recommend to the EMS Executive Committee and Board of Directors that the Eastern Pennsylvania Region return to the original dispatch system for MedEvac".

In addition, the following additional recommendations were unanimously recommended by the committee.

1. EMS work with MedEvac Administrative staff to create a reminder checklist similar to the Bally example, to be provided to services interested in utilising it.

2. Whenever possible, physician input be maintained by at-scene personnel after MedEvac has been dispatched.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. A brief checklist or decal be prepared by EMS and MedEvac for use by communication center personnel to encourage presentation of all necessary information when using MedEvac.

   a. Is oxygen being administered?
   b. Are MAST applied on the patient?
   c. Will MAST command be utilized?
   d. Will the patient be packaged and ready for airlift when MedEvac lands?

4. The Trauma Review Committee set parameters for cases valid false positive, non-valid and valid trauma/non-valid means of transportation which the system should not exceed. Also, have letters sent to services whose cases are declared non-valid trauma/non-valid means of transportation by the Trauma Review Committee.

5. The existing command physician MedEvac cancellation reporting system be maintained and followed up on whenever MedEvac reports a flight which was cancelled by a command physician.

The committee also recommended that Geisinger Medical Center be contacted and asked to participate in our Trauma Review Process for all cases they handle in the Eastern Pennsylvania EMS Region.

Dr. Reese informed the committee he would contact Life Flights' director and ask for their participation in the review. Dr. Reese also informed the committee that the Council's Executive Committee approved these recommendations pending the Trauma Review Committee's approval.

Discussion was called for. Being none, a motion was made by Dr. Moerkirk and seconded by Lois Altemose to accept the Pre-Hospital Care and Transportation Committee's recommendations as read. The motion was unanimously approved with Charlotte Yeager abstaining.

Mr. Heightman commented that in reviewing past MedEvac cases, the staff questioned if the patient needed to be transported to the landing site, how it was being shown on the sheet? Rick Frazier informed Mr. heightman that if the "Ambulance Depart Scene" section is filled in, then the patient was loaded and transported to the helicopter.

Mr. Heightman also commented that a problem exists with the patient not being ready for flight when the helicopter arrives. A copy of the MedEvac Alert - Summer 1985 newsletter addressing this issue was distributed to the committee members.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

MEDEVAC REVIEW 10/05/84 THROUGH 03/31/85:

CASE NO. 1012:

This case was not classified by the EMS Council staff. The staff felt not enough information was presented to determine the validity of this flight. Dr. Moerkirk informed the committee this was an accident at Pocono Raceway and he felt it should not be reviewed. Dr. Moerkirk felt the flight should be classified as an inter-hospital transfer.

CASE NO. 1014:

The EMS Council staff classified this case as valid false positive due to entrapment, hypotension and alcohol level of 251. The committee concurred with the staff classification of this case of VALID FALSE POSITIVE.

CASE NO. 1021:

The EMS Council staff classified this case as a Valid flight for MedEvac. However, because there was no entrapment, BLS waited 19 minutes for ALS to arrive, 26 minutes before requesting MedEvac and MedEvac's on-scene time of 34 minutes that BLS should have called for MedEvac sooner and had the patient ready for flight when MedEvac arrived. The committee concurred with the staff comments of this case.

CASE NO. 1031:

The EMS Council staff classified Patient A as being Non-Valid Transport and Patient B as Valid False Positive because of entrapment, unconsciousness and an alcohol level of 205.

Dr. Reese asked if we knew that Patient A was absolutely entrapped for 45 minutes. Dr. Moerkirk informed him, yes Patient A was entrapped for that length of time. He also commented medical records were giving only Patient B's chart, that attributed to the fact that Patient A's sheet was without information.

Dr. Reese recommended that Patient A be classified as Valid False Positive and Patient B as Valid.

Dr. Moerkirk felt if the patient's transport was not delayed he saw no problem in transporting both patients.

The committee changed Patient A's classification to VALID FALSE POSITIVE and Patient B to VALID.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1038:

This case was classified by the EMS Council staff as Valid False Positive. Due to the BLS on-scene blood pressure of 70/40 and entrapment, the committee concurred with this classification of Valid False Positive.

CASE NO. 1043:

The EMS Council staff classified this case as Valid Trauma/Non-Valid Means of Transportation because there was no entrapment, BLS/ALS waited 13 minutes before calling MedEvac and the 14 minute MedEvac at-scene time. The staff also felt that a total of 47 minutes by using MedEvac was too long when the patient could have been transported by ground to Lehigh Valley Hospital Center in less than 20 minutes. The staff also felt that patient could have been managed at St. Luke's Hospital. Dr. Reese also felt the patient could have been transported by ground faster.

Rick Frazier stated the crew waited approximately 5 minutes for the patient to arrive by ground transport to the landing site. The committee's concurrence with classification of VALID TRAUMA/NON VALID MEANS OF TRANSPORTATION.

CASE NO. 1047:

This case was classified by the EMS Council staff as Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1062:

This case was classified by the EMS Council staff as Valid False Positive due to initial BP 90/60 and injuries reported. Dr. Reese classified the flight as Non-Valid. A.J. asked if the patient had been struck by a car. Rick Frazier stated there were two (2) victims found in the road. He also commented that the patient was ready for flight upon MedEvac's arrival. The committee concurred with this classification of VALID FALSE POSITIVE.

CASE NO. 1065:

This case was classified by the EMS Council staff as Valid False Positive due to long entrapment, BP of 80/palpation and suspected chest trauma. The committee concurred with this classification of VALID FALSE POSITIVE.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1067:

The EMS Council staff classified this case as a Valid Trauma/Non-Valid Means Of Transportation. The staff felt the patient could have been moved rapidly to Lehigh Valley Hospital Center by ground ambulance. The committee concurred with this classification of VALID TRAUMA/NON VALID MEANS OF TRANSPORTATION.

CASE NO. 1069:

The EMS Council staff classified this case as Valid False Positive due to the fact that the patient was entrapped 38 minutes and had been unconscious. A.J. commented it was probably poor assessment on the part of the BLS crew. Mike Emery and Dr. Reese had no problem with this flight. Mr. Emery commented he felt Lehigh Valley Hospital Center was the closest facility considering the location and ground transport time. After the review of this case, the committee reclassified this case as VALID.

CASE NO. 1072:

The EMS Council staff classified this case as Non-Valid. There was no entrapment, E.T.A. by ground to Lehigh Valley Hospital Center 10-12 minutes. There appeared to be no special circumstances, the fact that 25 minutes lapsed from the time MedEvac was requested to the time MedEvac arrived at Lehigh Valley Hospital center and minor injuries sustained by the patient. Dr. Reese and Mike Emery commented they agreed with the staff's classification, that the only justification for calling MedEvac was the unconsciousness of the patient. The committee concurred with this classification of NON-VALID.

CASE NO. 1075:

The EMS Council staff classified this case as Valid False Positive because of prolonged entrapment (56 minutes) and multiple injuries. Dr. Reese felt only patient B was justified. Mike Emery if the EMS Council staff had classified the case as valid-false positive because of the entrapment and A.J. informed him the staff had. After the review of this case, the committee concurred with this classification of VALID FALSE POSITIVE.

CASE NO. 1086:

The EMS Council staff classified this case as Valid, but felt the patient should have been taken to Coaldale Hospital then transferred via MedEvac to Lehigh Valley Hospital Center. Mike Emery commented he found the flight as being non-valid means of transportation. Dr. Moerkirk felt the flight was valid. After the review of this case, the committee concurred with this classification of VALID.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1088

The EMS Council staff classified this case as Valid. The staff commented the trauma code was witnessed and medEvac times were good. The committee concurred with this classification of VALID.

CASE NO. 1091:

The EMS Council staff classified this case as Valid False Positive. The patient was entrapped and the initial BP was 86/palpation. The staff also noted the 23 minute delay in calling for MedEvac. Rick Frazier asked if Dr. Henriques requesting the helicopter to fly would make a difference in the classification of valid false positive and valid? A.J. and Dr. Reese explained that the end result still fooled everyone. After the review of this case, the committee concurred with this classification of VALID FALSE POSITIVE.

CASE NO. 1098:

The EMS Council staff classified this case as valid, but noted the 23 minute delay in calling for MedEvac was too long. Dr. Moerkirk noted that ALS requested the helicopter upon arrival to the scene, where BLS on the scene first felt the helicopter was not needed. After the review of this case, the committee concurred with this classification of VALID.

CASE NO. 1099:

The EMS Council staff classified this case as Non-Valid due to the fact there was no entrapment and 20 minutes land travel to Lehigh Valley Hospital Center which the staff felt would have been a faster mode of transporting these patients. A.J. asked if there was entrapment. Dr. Moerkirk read the flight report to the committee. After the review of this case, the committee concurred with this classification of NON-VALID.

CASE NO. 1104:

The EMS Council staff classified this case as valid, but commented that BLS waited too long (27 minutes) to call for MedEvac. The committee concurred with the classification of VALID.

CASE NO. 1121:

The EMS Council staff classified this case as Non-Valid. The staff commented that despite a physician being at the scene, there was no real indication for the helicopter except entrapment. Mike Emery stated that just because a physician says it is okay to fly, doesn't necessarily mean it is okay to fly. The committee concurred with the classification of NON-VALID.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1123:

The EMS Council staff classified this case as Non-Valid/Dead-At-Scene. A.J. asked for some background on the case. After the review of this case, the committee concurred with the classification of NON-VALID/DEAD-AT-SCENE.

CASE NO. 1129:

The EMS Council staff classified this case as NON-VALID. Other than flail chest, the staff found no other indications for MedEvac. Dr. Moerkirk commented on the poor Pre-Hospital assessment. After the review of this case, the committee concurred with the classification of NON-VALID.

CASE NO. 1131:

The EMS Council staff classified this case Valid Trauma/Non-Valid Means Of Transportation. The staff felt it was a valid trauma but the patient could have been handled just as well by the ALS ground transport. Dr. Reese felt the case proved to be a valid false positive, because MedEvac was on-scene with the patients extrication and the helicopter was then the fastest mode of transportation. The committee re-classified this case to VALID FALSE POSITIVE.

CASE NO. 1136:

The EMS Council staff classified this case Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1141:

The EMS Council staff classified this case as valid, but commented that Lehigh Valley Hospital Center is not the closest hospital as noted. Mike Emery stated Quakertown Hospital is less than five minutes, but he knows Quakertown Hospital does not perform cardiac surgery. For this reason, he felt the flight was valid. The committee concurred with the classification of VALID.

CASE NO. 1156:

The EMS Council staff classified this case as Non-Valid. The staff commented the flight may have been valid for MedEvac to initially respond for the Class I patient who was entrapped. However, this patient could and was taken to Pocono Hospital by ground. MedEvac should not have transported the second patient. This patient should have been sent to Pocono Hospital. The committee concurred with this classification of NON-VALID.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1157:

The EMS Council staff classified this case as Non-Valid/Dead-At-Scene. Mike Emery asked if a patient is dead would resuscitative methods be used? Dr. Moerkirk informed him that in certain cases like witnessed codes, resuscitative methods would be used. Rick Frazier informed the committee that the first responder to the scene noted the patient as being verbal. After the review of this case, the committee re-classified the case as VALID.

CASE NO. 1161:

The EMS Council staff classified this case as Valid False Positive. The staff commented that despite a long entrapment and unconscious state, the patient's condition did not end up serious. The committee concurred with the classification of VALID FALSE POSITIVE.

CASE NO. 1163:

The EMS Council staff classified this case as Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1167:

The EMS Council staff classified this case as Valid False Positive. The staff felt there was entrapment, but the injuries were not significant. The committee concurred with the classification of Valid False Positive.

CASE NO. 1172:

The EMS Council staff questioned the circumstance. The committee was informed by Dr. Moerkirk that the patient was found in the canal. The classification remained as VALID.

CASE NO. 1180:

The EMS Council staff classified this case as Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1185:

The EMS Council staff classified this case as Valid False Positive. The staff felt the only indication was the low blood (88/palpation) and the fact the patient was trapped. The committee concurred with the classification of Valid False Positive.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1188:

The EMS Council staff classified this case as Valid False Positive. The staff commented that the patient being tapped, the low BP (70/palpation) and the fact the patient was unconscious were the reasons for this classification. The committee concurred with the classification of VALID FALSE POSITIVE.

CASE NO. 1193:

The EMS Council staff did not classify this case because of lack of information. Dr. Moerkirk informed the committee the scenario was a car accident in Hunterdon County, New Jersey. The patient was entrapped 33 minutes. The committee concurred and classified the flight as being VALID.

CASE NO. 1194:

The EMS Council staff classified this case as Valid False Positive. The staff commented that despite facial lacerations and right ear avulsion, the injuries were not serious. Dr. Reese felt the flight was non-valid. A correction was noted that there was entrapment. The committee concurred with the classification of VALID FALSE POSITIVE.

CASE NO. 1195:

The EMS Council staff classified this case as Valid, but questioned the two (2) day hospital stay. Dr. Moerkirk informed the committee the patient had been transferred to the University of Pennsylvania. The classification of this case remained VALID.

CASE NO. 1200:

The EMS Council staff classified this case as Valid False Positive. The staff felt the injuries did not end up critical. The committee concurred with the classification of VALID FALSE POSITIVE.

CASE NO. 1210:

The EMs Council staff classified this case as Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1217:

The EMs Council staff classified this case as Valid False Positive. The staff commented this fact the three year old patient was originally unconscious after the accident attributed to the case classification. The committee concurred with the classification of this case. VALID FALSE POSITIVE.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1230:

The EMS Council staff classified this case as Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1237:

The EMS Council staff classified this case as Valid False Positive. The staff felt the injuries did not end up being critical. The committee concurred with the classification of VALID FALSE POSITIVE.

CASE NO. 1240:

The EMS Council staff classified this case as Valid Trauma/Non-Valid Means Of Transportation. The staff felt the patient could have been transported by ground with BLS and ALS in the 47 minutes they waited before calling for MedEvac. The committee concurred with the classification of VALID TRAUMA/NON VALID MEANS OF TRANSPORTATION.

CASE NO. 1248:

The EMS Council staff classified this case as Non-Valid. The committee concurred with this classification.

CASE NO. 1257:

The EMS Council staff classified this case as Non-Valid/Dead-At-Scene. The committee concurred with this classification.

CASE NO. 1258:

The EMS Council staff classified this case as Non-Valid. The committee concurred with this classification.

Dr. Evan Reese requested the following cases be reviewed.

CASE NO. 1260:

Dr. Reese asked why the staff had not declared this case as a Non-Valid. He questioned why the patient was not transported by ground to Grandview.

Mike Emery commented that Grandview has a good trauma team. If the BLS requests a team they will be awaiting the patients arrival. Since the doctor is involved in the MedEvac request process Mike felt it must have been an approved flight. After the review of this case, the classification remained as VALID.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CASE NO. 1111:

Dr. Reese questioned the land travel time to St. Luke's. A.J. informed Dr. Reese that St Luke's is a medical command facility. The classification remained VALID.

CASE NO. 1093:

Dr. Reese felt that ground transport by land was quicker then by air. Land travel: 8 minutes. Air travel: 11 minutes. Dr. Reese felt the case should have been classified VALID FALSE POSITIVE. However, after reviewing the circumstances the committee concurred with the initial classification of VALID.

CASE NO. 1261:

Dr. Reese questioned why this patient was taken by air transport. After reviewing the circumstances: Class 5 patient, 2 Class 1 patients, initial BP 50/palpation, possible abdominal injuries and flail chest. The committee concurred with the initial classification of VALID.

CASE NO. 1178:

Dr. Reese the means of transportation for this patient. After reviewing the circumstances, the committee felt someone must have been at-scene to request MedEvac and concurred with the initial classification of VALID.

Mike Emery requested the following case be reviewed.

CASE NO. 1052:

Mike questioned whether the patient was truly in need of a trauma center. After reviewing the circumstances, the committee concurred with the initial classification of VALID.

This concluded the committee's review of cases for the period referenced. Mr. Heightman then provided a summary of the case categories which had been reviewed and described upon the committee.

These included the following:

Valid False Positive	17 Of 120 Cases 14%
Valid Trauma/Non-Valid Means of Transportation	3 Of 120 Cases 25%
Non-Valid	8 Of 120 Cases 6.6%
Non-Valid/Dead-At-Scene	8 Of 120 Cases 6.6%
Valid Without Questions	84 Of 120 Cases 83%

Dr. Reese commented that the recommendations of the Pre-Hospital Care and Transportation Committee should prove to be helpful in preparing the patient for flight and making sure the necessary pre-hospital care is being carried out.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Dr. Reese also pointed out the importance of the flight crew receiving the initial patient information.

Trauma scores were discussed, the fact that the material is sizable, the committee may have to look at statistics.

The committee discussed their next meeting date for some time in October and agreed that they would try to complete case reviews from the months of April through August, 1985.

There being no further business, the meeting was adjourned at 3:00 P.M.

Respectfully submitted,

Annamarie T. Robertone
EMS Representative

A.J. Heightman, Executive Director
Annamarie T. Robertone, EMS Representative

Dr. Evan Reese, Committee Chairman, began the meeting by having all in attendance introduce themselves. Dr. Reese advised the committee that this meeting would cover the review of pre-hospital MedEvac cases handled between September 1, 1983 and December 30, 1983. He noted there were seventy (70) cases during this time period. However, the committee members were asked to be prepared to discuss cases for which they had questions or which would be categorized as anything other than valid.

Dr. Reese handed out a packet prepared by the EMS Council staff which provided definitions of the case categories and staff comments on selected cases (see attached copy in Appendix I).

Dr. Reese began the case review by discussing Case No. 558 which involved a pedestrian accident on Rt. 378 near the Upper Saucon/Lower Saucon line. Dr. Patterson noted that this case was within close transport time to St. Luke's Hospital. Following review, it was felt this was a valid trauma case, but invalid means of transportation (see Appendix I).

Case No. 565

Following review, the committee classified this case as Valid Trauma but Non-Valid Means of Transportation. It was felt that due to their location, the ALS ambulance could have transported this patient by ground ambulance as expeditiously as the helicopter to Lehigh Valley Hospital Center.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Case No. 576

Classified by the committee as a non-valid flight. Dr. Rhodes had noted to the committee that this case did not meet the criteria for helicopter transport to the trauma center.

Several committee members pointed out that Pocono Hospital does not always have a neurosurgeon available and there was no way to know this status for this case. It was suggested that future reviews take this into account.

Dr. Rhodes told the committee members that the American College of Surgeons recently approved new transport guidelines relative to trauma centers. He pointed out that they include categories such as:

--- A fall of greater than 20 feet.

--- A greater than 30 mph auto accident.

--- Penetrating injuries to the trunk.

He noted that they rely on use of the Trauma Score and stressed that he does not feel use of the Trauma Score in the pre-hospital setting is appropriate. He suggested that the committee look at these new criteria at the next meeting. Dr. Reese asked Dr. Rhodes to send EMS a copy for inclusion on the next meeting agenda.

Dr. Rhodes also advised the committee that he was in the process of conducting a prospective study using two (2) mechanisms of injury and four (4) vital sign parameters, to determine their effectiveness in predicting serious trauma cases. He promised to share his results with the committee.

Case No. 577

Classified as a Valid-False Positive case. (See Appendix I and II). Patient found by MedEvac crew not to be as serious as originally described by pre-hospital basic life support personnel. Patient ended up having minor injuries.

Case No. 582

The committee felt this was a Valid trauma case but an Invalid Means of Transportation. It was felt this patient could have rapidly been transported to North Penn Hospital and then transferred by MedEvac to Lehigh Valley Hospital Center.

Dr. Moerkirk and Eileen Pozzi noted that a time delay was caused by a Montgomery County paramedic at the scene who would not allow the flight crew to intubate the patient. It was noted that this Montgomery

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Dr. Rhodes told the committee that pre-hospital personnel must be conditioned to "load and go" as rapidly as possible because studies have shown this to be critical to patient outcome. Dr. Rhodes asked EMS to emphasize this point to all pre-hospital personnel.

Case No. 626 A & B

The committee questioned this case due to the length of time spent at the scene by all personnel. It was noted that the patient had an unstable airway and had to be re-intubated by the flight crew. It was pointed out that the Bucks County crew had used an esophageal airway (E.O.A.) initially but still could not secure a good airway. Dr. Rhodes noted that Bucks County is moving toward endotracheal intubation as a frontline procedure. Dr. Reese stated the minutes of this meeting would be referred to Bucks County EMS for their review. The case was left as a Valid Flight due to the airway problems.

Case No. 631

Dr. John Patterson questioned the long delay in request for MedEvac on this case. Mr. Bergstresser stated he was aware of this case and that MedEvac had been requested, canceled, then re-requested. This case, after discussion was classified as Valid.

Case No. 644

This case was termed a Valid False Positive. It appeared serious to at-scene personnel, but ended up as minor trauma.

Case No. 646

This case was called a valid trauma, but non-valid means of transportation by EMS staff. However, Dr. Moerkirk told the committee that there was an inaccurate assessment by crews at the scene. He stated the reported that the patient's "foot was blown off". This was not the case. Dr. Moerkirk stated the patient would have done as well with ambulance transport with the paramedic who was at the scene accompanying the patient. Therefore, the committee changed this case to a Non-Valid.

Case No. 649

Dr. Reese noted that there was a sixteen minute delay from the time ALS arrived on scene until MedEvac arrived and the patient was only 5 to 10 minutes from Easton Hospital. He was told the crews had difficulty intubating this patient due to severe head injury. He stated that he felt the crews should have transported the patient to Easton Hospital for airway control. The committee agreed and classified the case as a Valid Trauma but Non-Valid Means of Transportation.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Case No. 656

EMS staff and MedEvac had labeled this case as Valid False Positive due to the report of partial amputation of the hand. However, Dr. Rhodes told the committee that the cases did not fit MedEvac's criteria and should be called non-valid. Therefore, the committee changed this to a Non-Valid case.

The committee conducted a lengthy discussion about Case No. 658. There were four patients involved and the crew didn't have enough ambulance vehicles. A 41 minute time period was noted until MedEvac reached the scene. However, MedEvac was called as a resource to transport a patient with multiple injuries when another ambulance was not available. Therefore, committee members felt it was appropriate to use MedEvac but were not sure what to classify the case.

A.J. Heightman stated that since it was a valid use of MedEvac it should be called valid. Therefore, the committee agreed and classified the case as Valid.

Case No. 663

The committee discussed this case at length and felt that, although it was a Valid Trauma, it was a Non-Valid Means of Transportation to wait for MedEvac when no entrappment existed. The committee felt that this was a valid trauma case but improper basic life support management. The patient should have gone by ground with ALS/BLS unit.

Case No. 667

This case was termed a Valid False Positive. MedEvac was called to the scene of an ambulance accident. However, another ambulance was available to transport the patient and the patient's condition was not critical.

Case No. 675

MedEvac and the EMS staff labeled this case as Non-Valid. The committee concurred.

A.J. Heightman advised the committee that, of the 70 cases reviewed by the committee, 5 (7%) were termed non-valid, 5 (7%) valid-false positive, and 5 (7%) valid trauma-non-valid means of transportation. (See Attached Summary Sheet.)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The committee members stressed the need to let BLS and/or ALS crews know when their assessment and/or treatment was either inappropriate or could be improved on. Mr. Heightman noted that the MedEvac crew was in the best position to know this and asked whether they could jot down "helpful hints" to that crew regarding their particular case and have those comments sent to the crew along with the standard format letter sent by Dr. Moerkirk after each flight. The committee felt this would be helpful. Dr. Moerkirk said he would consider this.

The meeting concluded with a discussion of the new MedEvac Dispatch Approval Procedures. Dr. Moerkirk stated that a mechanism was needed to obtain the necessary form when a command physician denies a field request for MedEvac. A.J. Heightman asked that the MedEvac office inform EMS whenever a physician denies MedEvac dispatch to a scene and EMS will contact the command facility involved to obtain the completed cancellation form for review by the committee.

There being no further business to come before the committee, the meeting was adjourned.

Respectfully submitted,

A.J. Heightman
Executive Director
