Seattle, WA 98104-1703

Dear Mr. Krochalis:

The City Council at its meeting on September 28, 1992, adopted the recommendation of its Land Use Committee on Comptroller's File No. 297288, entitled:

> Council Conditional Use Application of Children's Orthopedic Hospital and Medical Center to build a helistop at the hospital at 4800 San Point Way N.E.

The Committee recommendation is as follows:

> The Council Conditional Use application be granted.

Pursuant to Seattle Municipal Code Section 23.76.56C, this decision shall be final and conclusive unless within 15 calendar days of September 28, 1992, the date the decision is filed with the City Clerk, a party of record makes application to King County Superior Court for a writ of review, provided that application for a writ of review of a decision approving or disapproving a subdivision preliminary plat shall be made within thirty days of September 28, 1992, the date of filing of the decision with the City Clerk.

Sincerely,

Rufino R. Moraleja, CPA
City Comptroller

FINDINGS, CONCLUSIONS AND DECISION
OF THE CITY COUNCIL OF THE CITY OF SEATTLE

Council Conditional Use Application of Children's Orthopedic Hospital and Medical Center to build a helistop at the hospital at 4800 Sand Point Way N.E.	)	C.F. #297288 Appl. #8405870 FINDINGS, CONCLUSIONS AND DECISION
Council Conditional Use Permit Application of Children's Hospital for future use of an existing surface helistop on U.W. Campus by Children's Hospital and Medical Center at 2501 N.E. 45th Street.	)	C.F. #298740 Appl. #9106441 FINDINGS, CONCLUSIONS AND DECISION

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Introduction

The applicant has requested Council conditional use permits to allow helistops accessory to Children's Hospital and Medical Center on the campus of Children's Hospital and Medical Center and on the University of Washington campus. On May 14, 1992, DCLU recommended that the proposal be approved, with conditions. On July 16, 1992, the Hearing Examiner issued a recommendation that the Council grant the proposal, subject to revised conditions proposed by DCLU and revisions recommended by the Hearing Examiner.

This matter came before the City Council Land Use Committee on September 18, 1992 and September 23, 1992. The Committee voted 2-0 on September 23, 1992 to recommend to the full Council that the applicant's request for Council conditional use permits be granted, subject to the conditions set forth in the Hearing Examiner's

recommendation.

Findings and Conclusions

The Council hereby adopts the Hearing Examiner's Findings of Fact and Conclusions as stated in the Findings and Recommendation of the Hearing Examiner dated July 16, 1992, as its own Findings and Conclusions.

Decision

The applicant's request for Council conditional use permits is granted, subject to the revised conditions proposed by DCLU and the revisions recommended by the Hearing Examiner, as stated in the Findings and Recommendation of the Hearing Examiner dated July 16, 1992.

Dated this 28th day of September, 1992.

FINDINGS AND RECOMMENDATION

OF THE HEARING EXAMINER

FOR THE CITY OF SEATTLE

FILED
CITY OF SEATTLE
1992 JUL 16 AM 11:12

In the Matter of the Petition of

CHILDREN'S HOSPITAL and MEDICAL CENTER

Application No. 8405870 and 9106441
C.F. NO: 297288 and 298700

for Council Conditional Use permits

Introduction

The applicant has requested council conditional use permits to allow a helistop accessory on the campus of Children's Hospital and Medical Center (CHMC) and at the Intramural Activities Field on the campus of the University of Washington.

For purposes of this recommendation, all section numbers refer to the Seattle Municipal Code (SMC), as amended, unless otherwise indicated.

The Director's report, submitted by the Department of Construction and Land Use (DCLU), recommended that the conditional use permits be granted with certain conditions.

The hearing on this matter was held on June 23, and June 24, 1992. The record was left open for additional public comment, for the applicant to submit proposed findings of fact and conclusions and for the Deputy Hearing Examiner (Examiner) to conduct a site inspection. The Examiner visited the CHMC campus, the surrounding neighborhood, the IMA field, and toured AIRLIFT NW II and the fixed-wing aircraft. The record closed on July 1, 1992.

Parties present at the proceeding were: John Keegan and Craig Gannett, attorneys at law for the applicant CHMC; and Faith Lumsden, Land Use Specialist, for the Director.

After due consideration of the information presented by the applicant and provided by the DCLU report, and all evidence submitted during the hearing process, and as a result of the personal inspection of the subject property and the surrounding area by the Examiner, the following shall constitute the findings of fact, conclusions and recommendation of the Hearing Examiner.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Findings of Fact

1. The applicant, CHMC submitted an initial application or November 13, 1984, for a helistop on the CHMC campus. The proposed location for the helistop would be north of the emergency room on a site known as the Kitchen Garden. DCLU issued a Determination of Significance on January 13, 1986. A draft Environmental Impact Statement was published on September 2, 1986. The Final Environmental Impact Statement (EIS) was published on April 25, 1991. No appeal was filed to the Final EIS.

2. During the course of public hearings on the draft EIS and during the written comment period, alternative locations for the helistop were recommended. One of the alternative locations involved landings at the University of Washington Intramural Athletic (IMA) Field also known as Graves Field. As a result of the public comments a new proposal emerged which became known as the "Preferred Alternative". Under the preferred alternative, only the most critical patients would land at the Kitchen Garden site on the CHMC campus. The less critical patients would land at the IMA location and be transported by ground to CHMC. On December 5, 1991, CHMC submitted a new application to include the IMA field site.

3. The CHMC campus is a 25-acre site located in the Laurelhurst neighborhood in north Seattle. The CHMC campus is located approximately one-mile east of the University of Washington. The campus is situated on a west facing hillside. The campus consists of several interconnected buildings, ranging from one to five stories above grade, that generally follow the site topography.

4. The IMA site is located south of the golf course driving range near the northwest corner of the sports field. The site is relatively flat. The site is northeast of the north parking lot for Hec Edmundson Pavilion and Husky Stadium.

5. The neighborhood surrounding the CHMC campus is primarily zoned single-family and developed with single family homes. To the east of the CHMC campus is the Laurelhurst Elementary School, the Laurelhurst Playfield, the Battell Memorial Institute and Villa Academy. The area to the north and west of the campus is developed with multi-family residences. Across Sand Point Way is a large Planned Unit Development. There are commercial uses along Sand Point Way.

The Proposal

6. CHMC proposes to construct a helistop which would be a 40 ft. X 40 ft. concrete pad surrounded by 48-foot radius of unobstructed grass area. The center of the pad would be marked with a white cross with arms 30 ft. long by 10 ft. wide. A 6 ft. by 10 ft. red "H" would be in the center to designate the helicopter landing site from the air. A 30-inch tall fence with a locked gate would surround the circular area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Ground light, which would "glow" rather than emanate direct light, would surround the site and would be turned on for nighttime landings. Other safety light features will be included for safe night landings on the target. (EIS p. 48) The proposed site would be 142 feet away from the entrance of the emergency room. Several trees on the site and along Penny Lane will be removed.

7. The IMA Field referenced in the preferred alternative is the existing site for the University of Washington's Medical Center helistop. The IMA field helipad would have a 76 ft. diameter circular pad centered in a 150 ft. asphalt apron. The lighting would be similar to the proposed lighting for the CHMC campus helipad.

8. There would be significantly more landings at the IMA Field than at the CHMC campus, if the proposal is adopted as recommended by DCLU, because of the limitation placed on landings at the CHMC campus. For example, if it was necessary to transport medical staff to accompany the patient to the emergency room, the staff would be dispatched from the IMA Field. The IMA Filed is also the site of the University Hospital's medical flights.

9. SMC 23.84.005 establishes the criteria for a helistop accessory to a major institution.

> 1. A helistop may be permitted as a Council conditional use if the Council finds that:
>
> a. The helistop is needed to save lives:
>
> b. The helistop is located so as to minimize impacts upon surrounding residential property;
>
> c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.
>
> 2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

Medical Necessity for the Helistop

10. CHMC has indicated that the primary reasons for helicopter transport are to reduce the time before appropriate advanced treatment can begin and to decrease patient manipulation.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. CHMC is one of three pediatric tertiary[1] care centers in the state. The other two others are Mary Bridge Children's Hospital in Tacoma and Sacred Heart Medical Center in Spokane. CHMC is the largest, in terms of staffing numbers and size, and is the best equipped to offer full service tertiary care for children.[2] (EIS p. 11)

12. CHMC is a part of a regional tertiary care system for a four-state region including Washington, Alaska, Idaho and Montana. This informal "regional medical referral system" is a part of a health care referral system. The system allows for specialized health care to be delivered to patients throughout the region without duplication of services or competition for patients.

13. In addition to the regional medical referral system, Washington hospitals have organized as Washington Emergency Medical Service (EMS), which ensures an appropriate hospital referral during emergency situations. The EMS is composed of a helicopter service, trauma, burn and pediatric care center.

14. Historically, approximately 90% of the children who are transported to CHMC by helicopter enter one of the intensive care units at the hospital. Approximately one-fourth of the children are so critically ill that they die. (Exhibit 10) Volume III of the Final EIS contains a complete listing of the key characteristics of the critically ill patients brought to CHMC by helicopter from August 1985 through March 1989, and Exhibit 10 extends the listing through March 1992. The diagnosis of the patients include: respiratory failure, drowning, asphyxia, seizures, ingestion of toxic substances, cardiac arrest and viral encephalitis.

15. In some other emergency situations, helicopter transport is necessary because ground transport is infeasible such as where the distance to the emergency center is too long or where transportation such as the ferry is not practical.

16. Airlift Northwest helicopter services is the primary air transport service for patients destined for Children's Hospital. Airlift NW, started in 1982, is operated as a non-profit service by a hospital consortium composed of CHMC, Harborview Medical Center, and Providence Medical.

17. Helicopter or air transport comprise a very small per percentage of emergency room visits at CHMC. In 1991, only 76 patients (0.3%) arrived by helicopter

---

[1]Tertiary Care is defined as those advanced services necessary to deal with illness characterized by complex path-physiologic processes. Tertiary care requires continous management from presentation of an illness to its resolution. Complex illness such as severe congential anomalies, multiple organ system trauma, prematurity in newborns, poisonings and neuropsychiatic disorders. (EIS p. 10)

[2] "Children" is used to refer to all patients served by CHMC from neonates, younger than one-month, to persons twenty-one years of age.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

compared to 23,080 emergency room visits in the year. Emergency landings at the campus is also a small percentage of the total number of air transport patients.

The helistop is located so as to minimize impacts upon surrounding residential property;

18. The two primary impacts on the surrounding residential community are anticipated to be safety and noise and vibration from the helicopters. A very detailed analysis of these impacts is discussed in the Final EIS, however, for a clarification of the issues raised by the scope of these impacts as well as to address the community's concerns, a summary of the EIS follows:

Safety

19. In addressing the issue of safety to the residents in the vicinity surrounding the CHMC campus helistop, the EIS looked generally at the history of medical flights, the accident history of Airlift NW, the primary helicopter service used by EMS and a review of the information available for the accident history of military helicopter flights. The EIS also addressed the probability of accidents on Airlift NW helicopter flights to the CHMC campus.

20. The final EIS analysis of the probability of an accident at the CHMC campus is based on what is considered the worst case scenario of 20 flights per month including all flight segments. (The average of 20 flights includes take-off from base, landing to pick up patient, take off with patient landing at CHMC and take-off from CHMC). Under this analysis, an accident would be statistically expected to occur less than once every 59.1 years. Under the preferred alternative, landings at the CHMC campus would be restricted to landing with the patient and take-off, with a corresponding reduction in the probability of an accident to once every 177 years.

21. Airlift NW has not had a helicopter accident in eight years. During this period Airlift NW has flown approximately 9,000 flights. There was a non-injury "incident " at Harborview in 1989. (An "incident" is an event causing minor damage for minor injury.)

22. National Transportation Safety Association (NTSA) conducted a study on the major causes of helicopter accidents. Listed as contributors to helicopter accidents are: human error (68%); adverse weather (30%); mechanical failure (25%). Airlift NW engages in preventative measures to ensure that Airlift NW maintains it safety record. Airlift NW has a safety committee to ensure that safe operations are integrated into the Emergency Service (EMS).

23. Airlift NW maintains high standards for its pilots by requiring them to meet higher safety standards than are required by the Federal Aviation Administration (FAA). The pilot training program includes "factory training" by the Augusta

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

manufacturer, and annual training time. Airlift has sought to minimize weather-related accidents by keeping its pilots "instrument current" and "instrument rated" which allows them to fly without ground visibility. Another policy which allows for safer pilot decisions is to give pilots the discretion to decide whether they want to fly in adverse weather conditions.

24. The designated flight path raises issues of both safety and noise. To the greatest extent possible the flight path follows bodies of water and arterials. The current flight paths are designed to reduce flights over residential neighborhoods, by flying over SR-520, Montlake Blvd and I-5 when coming from the south. The flight path to the IMA was altered when Airlift NW pilots expressed concerns regarding large numbers of birds on the athletic field during certain times of the year. According to the EIS, the possibility of a bird strike has been reduced but not eliminated by the change in flight paths.

25. The EIS also noted several locations in the vicinity of CHMC that could be used for emergency landings. In additions to parking surfaces and streets, the University campus, and the Sand Point Naval Station could be used.

Noise and Vibration

26. A full analysis of noise and vibration appears in the Final EIS at pages 105 through 121. A variety of different terms are used to measure noise and the effect of noise on people. Sound levels are measured in decibels (dB). Environmental noise is measured in A-weighted decibel levels (dBA) To evaluate the effect of noise on people, a day/night average sound level (Ldn) with a penalty for noise occurring between 10:00 p.m. and 7:00 p.m. "Lmax" is used to measure the maximum sound level and the probability of sound interference from single noise events.

27. Sound measurements for noise impacts from the proposal were analyzed from five residential sites in the vicinity of the CHMC campus. The measurements in the EIS are based on the original proposal which would have increased the number of flights landing and taking of from the campus. The study showed the original proposal would increase the Ldn sound levels by between zero to three. A "worst one day Ldn" assuming two daytime and two nighttime flights (a total of eight trips including crew pickup) would show an increase of 0 to 5 dBA.

28. Exhibit 20 (Table 16, p.106 of the Final EIS) is a chart placing the sound levels of the Augusta helicopter in the context of other noise sources and conditions.

Sound level (dBA)	Source or Condition
140	Hearing damage risk for short exposure
130	Threshold of pain
120	Race car at 50 feet

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

110	Orchestra fortissimo; rock and roll concert
100	Ambulance siren at 50 feet
90	Occupational noise limit for 8 hour/day exposure
85	Accelerating truck or bus 50 ft; lawn mower
84	**Augusta helicopter, measured at receptor location closest to CHMC**
80	Ambulance siren at 500 ft., average downtown traffic
75	Inside auto, accelerating
70	Inside auto, steady speed
65	Typical auto measured at residential setback;urban residential average noise
60	Normal conversation
55	Suburban residential average noise
50	General office
45	Typical residential
40	Quit indoor
20	Whisper
0	Threshold of hearing

29. SMC 25.08.530 of the Seattle Noise Control Ordinance, lists the sounds which are exempt from the Noise Control Ordinance. Relevant to this proposal, exempt sounds are:

> 1. Sounds originating from the aircraft in flight, and sounds which originate at airports and are directly related to flight operations;
>
> 4. Sounds created by emergency equipment and emergency work necessary in the interests of law enforcement or of the health, safety or welfare of the community;

30. There are no local, state or federal noise regulations which set a standard for acceptable noise levels for helistops. The review of the standards outlined in the Final EIS are summarized in the footnote below.[3]

---

3. United States Environmental Protection Agency (USSEPA) Noise Guidelines,Ldn, affecting residential, hospital and educational activity under USSEPA Guidelines, indicates that significant impacts are considered to exist if exterior Ldn is 65 dBA or above. Increases above the 65 Ldn of 0 to 5 dBA is a slight impact, five to ten dBA is a significant impact , and over 10 dBA a very serious impact.

United States Housing and Urban Development (USHUD) Noise Standards, for USHUD- assisted projects (the proposal is not a USHUD-assisted project and those the information is for reference only) an Ldn of 65 dBA or less is "acceptable". Ldn exceeding 65dBA, but less than 75 dBA, is normally acceptable, Ldn exceeding 75dBA is "unacceptable".

FAA Land Use Compatibility Critreria, residential or hospital land use is not compatible where yearly Ldn is 65 dBA or above.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

31. The noise study reported noise levels in the area surrounding CHMC, without any helicopters was between 52 and 68 Ldn. Under the worst case of 40 flights the sound levels would increase to between 54 and 68 Ldn.

32. Some helicopters, primarily two-bladed helicopters, produce an "impulse" noise known as "blade slap". The noise caused by blade slap distinguishes helicopter noise from other types of loud noises. The Augusta 109 used by Airlift NW, has four-bladed rotors which reduces the blade slap noise. Some of the military helicopters such as the Huey have two-bladed rotors which make more noise and cause more vibration. Restricting the use of Huey and other two-bladed rotor helicopters from landing on the CHMC campus would greatly reduce the noise and vibration impacts on the residences in the immediate vicinity.

33. Residents in the immediate vicinity of the CHMC, would be impacted by noise from helicopters landing on the campus. The noise studies in the EIS shows that there would be sleep interference (people awakened by nighttime flights) and that young children and older people are more affected by the noise. The extent to which the residents will be bothered depends on location, whether the windows are open or closed and the physical characteristics of the sleeper. There are measures to mitigate, but not to eliminate the noise impacts. The mitigating measures are included as recommended conditions of approval of the project.

34. Noise-induced vibration in structures depends on a variety of factors including construction type and the window size and type. Detectable vibration of portions of the building can occur if exterior sound pressure levels are above 65 to 80 dB. In the Final EIS, it was concluded that the vibration of the structures in the vicinity near CHMC was not expected to cause structural damage. This conclusions was based on studies that showed that the Concorde supersonic jet transport, at 104 dBA produced insignificant structural damage. The helicopters used by Airlift NW would produce significantly lower sound levels than the Concorde.

Use restricted to occurrences involving life-threatening emergencies

35. CHMC began helicopter landings on the campus in 1984. DCLU issued a notice of violation in response to complaints about the operation of the helistop but allowed CHMC to continue flight operation pending a decision on this application.

36. The decision to use helicopter is made either by the physician at the referring hospital after consultation with the receiving hospital or by the paramedics, after consultation with a physician. Airlift Northwest determines which children are transported by helicopter directly to CHMC campus according to established standards. If any one of the following conditions occur at the initiation of the helicopter or occur during the course of the flight, landing at CHMC is authorized. The conditions involve:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I. Unstable Airway
II. Inability to Ventilate/Oxygenate
III. Inability to Maintain Adequate Cardiac Output
IV. Inability to Maintain Adequate Cerebral Blood Pressure Flow
V. The Persistence of Unstable Vital Sign Despite Heroic Attempts to Control Them

37. In order to ensure compliance with the standards, the attending crew completes a medical justification form which is reviewed by CHMC and Airlift NW. During a review of flight landing at the CHMC campus and a sampling of a few flights to Harborview, only one landing at CHMC and/or Harborview was found to be questionable.

38. There is a one-mile distance and approximate 10 minutes to transport a patient from the IMA Field to the CHMC campus. In many cases, timing is of such a critical factor, that the extra 10 minutes could determine whether the patient will live.

39. In addition to the added time of transporting a patient from the IMA Field to the emergency room at CHMC, many patients are unable to sustain the manipulation, or movement that is associated with the transfer from the helicopter to the ambulance and to the emergency room. Some of the factors involved in the manipulation which could jeopardize the patients' life are, changes in temperature, loss of intravenous or other tubal connections, the dislocation of monitors, and/or unnecessary movement.

40. The projected number of CHMC campus helicopter landings for 1991 to 1995 is between four or five. The Public Health Department estimated six patients per month would be transported to the CHMC campus. The projected number of IMA helistop for the same period is between 12 and 13.

Alternative Sites

41. Several alternative locations for a helistop, on and off the CHMC campus, were reviewed and rejected for a variety of reasons. A more detailed explanation is outlined in the Final EIS pages 47 through 49. The on-campus locations which were considered were landing the helicopters on the roof of the parking garage, which was not acceptable due to the time and manipulation needed to then transfer the patient to the emergency room. Landing on the roof of the medical center building was rejected because it would necessitate major structural changes to support the weight of the helicopter and extend the elevator to the roof.

42. Three other campus locations, outside of the east entrance of the campus, outside of the south entrance and in the parking lot were also considered unacceptable because all would require ground transport by ambulance after the patient landed in one of the landing sites. There was also the added factor that landings at the east entrance would place the helicopter closer to the residences to the east.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

43. Several off-campus locations were suggested but only three were selected for a detailed analysis in the EIS. The three locations included the IMA Field location on the University campus, which became a part of the Preferred Alternative. Another location was the roof top of the University of Washington Medical Center, which is not under consideration by the University. The third alternative location, known as the "No Action Alternative" would provide for landings at Boeing Field or Harborview and then ground transport to CHMC. The third alternative is considered to be unacceptable because of the length of time involved in ground transport to CHMC.

44. The Preferred Alternative, requiring the most critically ill to land at CHMC and those who could be stabilized to land at the IMA Field and then ground transport to CHMC, emerged as the alternative best designed to meet the needs of reducing the time to access to specialized treatment, minimizing manipulation of the most critically ill. The preferred alternative also reduces the associated noise impacts of ground transport.

45. There are no current plans by other local area hospitals to apply for helistop permits. Consequently, there are no other alternative sites under review. In addition, concern about a proliferation of helistop request if the application under review in this matter is approved, is not supported by the record.

DCLU Analysis and Recommendation

46. DCLU recommended conditional approval for an emergency helistop at the Kitchen Garden site on the CHMC campus and a second full service helistop at the IMA Field at the University of Washington. Conditions were recommended to mitigate impacts to the public safety and welfare. DCLU concluded that the anticipated adverse noise impacts could not be mitigated, but the benefits from the preferred alternative outweighed the adverse impacts. The recommended noise mitigation are intended to alleviate to the greatest extent possible the noise and safety impacts. DCLU made minor revisions to the conditions as they appear in the analysis. The text with the line through the words or printed in "bold" type reflect the revisions from the original text. The original conditions and the revisions are included below:

47. The DCLU recommended conditions are:

1. Only the most critical and life-threatening medical emergencies shall be allowed to land at CHMC. All other patients shall land at the Intramural Activities field site. The initial decision whether to land at the Kitchen Garden site or the IMA field is to be made by the referring physician and/or attending medical team. For patients whose condition deteriorates in flight, the medical team on board the helicopter may decide to land at CHMC. The following conditions indicate a landing at CHMC is appropriate:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a. unstable airway;
b. inability to ventilate/oxygenate;
c. inability to maintain adequate cardiac output;
d. inability to maintain adequate cerebral bloodflow; or
e. the persistence of unstable vital signs despite heroic attempts to control them.

2. Military Assistance to Safety and Traffic (MAST)~~, Coast Guard, and Navy~~ **HUEY** helicopters shall not be permitted to land at CHMC, but shall land at the IMA field or at Harborview, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area. **Other helicopters, military or civilian, shall be permitted to land at CHMC only if they demonstrate a noise profile equal to or less than the Agusta 109 and meet FAA size guidelines for the CHMC helipad.**

3. A Medical Review Committee shall be established to review compliance with Condition 1 above, allowing only the most critically ill patients to land at CHMC. The Committee shall consist of the following five members:

1) The Director of the Seattle-King County Department of Public Health, or the Director's appointee, who will serve as Committee chair;

2) A representative of CHMC selected by the Chief Executive Officer;

3) A physician representative of the Washington State Medical Association (WSMA), selected by the President of the Association. The representative must be a qualified neonatology, pediatric intensivist, or pediatric emergency physician;

4) A physician representative of the Washington State Society of Pediatrics (WSSP), selected by the President of the Society. The representative must be a board certified pediatrician.

5) A citizen, residing in one of the neighborhoods in the area of CHMC, to be nominated by the Department of Neighborhoods and confirmed by the City Council.

Committee members will be appointed for terms not to exceed three years, with replacements to be made by the original appointing authority. The role of the Committee is advisory only. The Committee shall meet at least twice per year to review and evaluate helicopter transports to CHMC. The Committee shall submit a report after each

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

review meeting to DCLU, the Chief Executive Officer of CHMC, the Airlift Northwest Executive Committee and Medical Director, and the Citizens' Advisory Committee for CHMC Master Plan. Committee members will receive no compensation or other remuneration for their service on the Committee. The Committee shall adopt rules and procedures as necessary to ensure compliance with laws and administrative rules governing confidentiality of patient medical records, while also providing for public input and review of the Committee's work.

CHMC shall provide administrative and staff support needed by the Committee. The necessity for, and performance of, the Committee shall be evaluated by DCLU after two years and a recommendation shall be made to the City Council regarding whether to continue, reorganize, or discontinue the Committee's work.

4. CHMC shall continue to report on a quarterly basis to the community regarding the number and nature of transports to the campus. The report shall also include the number of helicopter landings at the IMA/Graves Field site for the given quarter.

5. Helicopters shall not be allowed to land at CHMC to pick up medical staff prior to patient transport.

6. DCLU shall review the quarterly reports of CHMC and the reports of the Medical Review Committee. If it appears that inappropriate or non-medically necessary landings have occurred, DCLU shall work with CHMC, the Public Health Director, the Medical Review Committee and ALNW to revise guidelines or procedures to ensure compliance with the limited landings requirement stated in condition one (1). Failure to demonstrate clear improvement in implementation of the limited landings criteria may result in suspension of the permit for landings and shall be subject to enforcement action pursuant to Chapter 23.90 of the Land Use Code.

7. ~~Only helicopters with a four bladed rotor shall be permitted to land at the CHMC campus helistop~~. Should Airlift Northwest or other aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Agusta 109 studied in the EIS, a showing must be made to DCLU proving the noise impacts of the alternative equipment are no greater than for the Agusta 109. **Technological features (twin engines, navigation equipment,etc) must equal or exceed the Agusta 109.** DCLU must give approval of the new equipment prior to its regular use for flights to CHMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

8. The flight paths for approach and departure to the CHMC and IMA/Graves Field helistops shall be strictly maintained as described in the Final EIS and shall to the greatest extent possible avoid residential areas. Airlift Northwest and any other regular carrier shall establish a training program to introduce all pilots to the approved flight paths. ALNW or other regular carrier shall confirm in writing to DCLU its commitment to the training program and to ensuring the approved flight paths are followed.

9. Prior to beginning regular use of the Kitchen Garden helistop, all ALNW pilots shall make at least one test landing and take-off at the site. CHMC and ALNW shall schedule the training/test flights for a weekday between the hours of noon and 3:00 p.m. Advance notice of at least ten days shall be given to the surrounding communities of the test/training time, date, and expected number of flights. The number of flights shall be held to the minimum necessary to provide adequate training.

10. New pilots shall make at least one landing at CHMC under supervision of a pilot experienced in landing at CHMC prior to unsupervised patient transport landings. Non-patient transport training flights, if desired, may be scheduled no more than twice per year without approval from DCLU. Notice shall be provided to surrounding communities as stated in Condition ~~10~~ 9.

48. CHMC does not oppose any of the conditions recommended by DCLU. In response to concerns raised by neighborhood, CHMC recommended that Condition 3 and 4 be revised to exclude appointment of salaried physicians from Children's as members of the Medical Review team.

Public Comment

49. The proposal has generated a significant quantity of public comments, during the eight years the matter has been pending. DCLU estimated hundreds of letters, and telephone calls were received by DCLU during the review period. There were well organized campaigns by parties on both sides of the issue, resulting in substantial public awareness and commentary on the issues. In addition to comments by the public, Volume II of the Final EIS contains responses from City and State agencies who were given the opportunity to review the EIS. They are generally in agreement that the proposal would not have any significant adverse impacts. Concerns were raised by many community group representatives as to noise, safety, vibration, medical necessity and whether the proposal was consistent with the City's land use policies.

Favorable

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

50. The number of comments in favor of the project vastly exceeded the number opposed to the project. Health care professionals all across the state wrote in support of the helistop and offered statements as to the vital need for the service in providing prompt specialized tertiary care to children. Several parents whose children were brought to CHMC campus by helicopter testified at the hearing in support for the helistop. The numbers of commentators who indicated that they resided in the Laurelhurst neighborhood were also overwhelmingly in favor of the campus helistop and expressed their belief that the benefits outweighed the inconvenience of the noise.

Opposition

51. A sizeable segment of the organized public opposition to the CHMC campus helistop location was represented by North East Families for Residential Neighborhoods (NEFRN). The members of NEFRN are primarily families living in close proximity to CHMC, and as such, are most susceptible to impacts from the helistop. NEFRN's spokesperson raised several concerns regarding the helistop at the CHMC campus. First, NEFRN feels it is important to address this matter as a Land Use and not an issue of medical care. NEFRN feels strongly that the services offered at CHMC can be offered at other locations, thus it is not an issue of medical care, but an institutional decision that CHMC made to offer the care at that particular location. NEFRN's primary concerns are noise, safety and diminished property values.

52. NEFRN has offered some counter proposals to the conditions recommended by DCLU. NEFRN's proposals are outlined below because its proposals were representative of the concerns and recommendations of many of the resident commentators who opposed the CHMC helistop location. Among the proposals offered by NEFRN, which differed substantially from the DCLU conditions are:

1. That the helistop at CHMC receive conditional approval for two years and then be reviewed again as a part of the CHMC Master Planning process.

2. Approval of the helistop should be limited to the proposed site only, except during construction. Location at any other site would require additional environmental review.

3. Landings at the CHMC campus should be limited to 9 landings per month and shall not exceed 18 landings in any given month

4. Only Augusta 109 helicopters with a four-bladed rotor shall be permitted to land at the CHMC campus. If Airlift NW seeks to use an alternative a new noise analysis shall be conducted and an opportunity for additional public comment.

5. The Medical Review Committee shall consist of five members, including two representatives of the Laurelhurst Community Club (LCC). Committee members shall be compensated at the rate of $100 for each landing review.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. CHMC shall report quarterly to the Committee and the community on the number and nature of the helicopter landings at the IMA Field.

7. The flight paths for approach and departure from CHMC and the IMA Field shall be strictly followed. All flights plans are designed to avoid flying over residential areas.

8. Prior to beginning regular use of the CHMC campus helistop site, all Airlift NW pilots shall make at least one test landing and take-off at the site. Ten days advance notice shall be given to the community.

53. NEFRN's recommended conditions 4, 6, 7, and 8 are adequately addressed in the DCLU's recommended conditions. No persuasive evidence was presented to support NEFRN's suggestion that the review process for the proposed helistops should begin anew when the CHMC Master Plan is reviewed.

54. NEFRN has not shown how its proposal to place a limit of 9 landings at the CHMC campus helistop would be a reasonable limitation if the proposal met the requirement for a Council conditional use permit, i.e., that the helistop is medically necessary and is only used for life-threatening situations.

55. Several members of the community suggested that the size of the CHMC campus helistop should be reduced from the proposed 40 ft. by 40 ft. size to 20 ft. by 20 ft. Reducing the size of the helistop would have aesthetic benefits, as there would be a smaller slab of concrete and it would also serve as a limitation on the size of helicopters that could land on the site, since the larger noisier Huey or other military helicopter could not land on the smaller helipad. The restriction against Huey helicopter landing on the site is recommended as a condition for approval of the site. The neighbors have not shown that the size of the helipad will have any adverse impacts. The size of the helipad, with the proposed limitation on Huey landings will not decrease the anticipated impacts from the proposal.

Conclusions

1. On a Council Land Use decision, the Hearing Examiner shall conduct a public hearing which shall constitute a hearing by the Council, and shall make recommendations to the City Council. (SMC 23.76.052)

2. The first and third criteria for Council conditional use approval for a helistop, i.e., that it is needed to save lives and use restricted to life-threatening occurrences, have been satisfied. Both the CHMC campus helistop and the IMA Field helistop are necessary components of medical emergency response system for critically ill children. A review of medical condition of children who have been transported indicates that the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

children were inflicted with serious life threatening illness and that the use of ground transport could have resulted in a loss of life. The statistical data that 25% of the children transported by helicopter die despite the extraordinary efforts to save them is evidence of the seriousness of the medical condition.

3. The standards established by Airlift NW for air transport and for landing at the CHMC campus are designed to ensure that only those children with life threatening illness are transported. It is also important to note that there is no evidence of abuse of this service under the self-monitoring system and that the likelihood of future abuse is diminished by the monitoring requirement of the Medical Review team.

4. The second criteria for approval requires locating the helistop so as to minimize impacts on the surrounding residential community. It is important to note at this point, that the concerns of noise and safety impacts raised by the residents in the community are significant and important considerations. However, when compared to the substantial evidence of the medical necessity of air transport for children in life-threatening emergencies, the benefits of the availability of the service outweigh the occasional impacts (the highest anticipated number of flights was six per month) to the surrounding community. This conclusion is reached in significant part because of the safeguard which will ensure minimal impacts. The impacts to the community cannot be eliminated, however, the recommended conditions are designed to minimize the impacts to the greatest extent possible.

5. The following additions or changes to the conditions proposed by DCLU were made in an effort to incorporate some of the concerns raised by the community residents. Many of the conditions proposed by neighbors would have needlessly extended the review process or added additional levels of bureaucracy that would unnecessarily hamper, or in some cases defeat, the purpose of the helistop service.

1. CHMC can temporarily relocate the helistop to another location on campus during the construction of the helistop at the Kitchen Gardens location. The temporary location, which is subject to approval by DCLU, should be selected to reduce construction related impacts on the surrounding residential community. Once the helistop has commenced permanent operation at the Kitchen Garden site it is not subject to further review. Should CHMC decide to relocate the helistop to any other location on its campus, including the alternative sites which were specifically rejected during the EIS review process, the proposal shall be subject to an environmental review and land use approvals.

2. The composition of the Medical Review Team should be revised to add an additional member from the surrounding community and to ensure that it is not heavily

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

weighted with physicians who are affiliated with CHMC. The Medical Review Team as proposed by DCLU (Condition 3) is acceptable except that:

The physician representative selected by the President of the Washington State Society of Pediatrics (WSSP) shall not be a CHMC affiliated pediatric physician.

3. Two citizens, residing in the neighborhoods in the area of CHMC shall be selected. One representative shall be selected by the Laurelhurst Community Council and the other representative shall be selected by the Department of Neighborhoods.

Recommendation

The Hearing Examiner recommends that the City Council grant the proposal for an emergency helistop at the Kitchen Garden site on the CHMC campus and a second full service helistop at the University of Washington IMA/Graves Filed site, subject to the revised conditions proposed by DCLU and the revisions recommended by the Examiner in Conclusion 5 above.

Entered this 16th day of July, 1992

Ruperta Alexis
Deputy Hearing Examiner

NOTICE OF RIGHT TO PETITION
FOR FURTHER CONSIDERATION

Pursuant to Seattle Municipal Code Section 23.76.054, as amended, any person substantially affected by a recommendation of the Hearing Examiner may submit a petition in writing to the City Council requesting further consideration. The petition must be submitted within fifteen (15) calendar days after the date of mailing of the recommendation of the Hearing Examiner, and be addressed to;

Seattle City Council, Land Use Committee
c/o Seattle City Clerk
First Floor, Municipal Building

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

600 Fourth Avenue
Seattle, Washington 98104

The request for further consideration shall clearly identify specific objections to the Hearing Examiner's recommendation, facts missing from the record, and the relief sought.

Pursuant to Seattle Municipal Code Section 23.76.054(D), if there is no request for further consideration, Council action shall be based on the record established by the Hearing Examiner.

The City Council Land Use Committee should be consulted for further information on the Council review process.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CITY OF SEATTLE
ANALYSIS AND RECOMMENDATION
OF THE DIRECTOR OF THE
DEPARTMENT OF CONSTRUCTION AND LAND USE

Application Number: 8405870, 9106441
C.F. No. 297288 and 298740

Project Address: 4800 Sand Point Way N.E.

Applicant Name: Children's Hospital and Medical Center

SUMMARY OF PROPOSED ACTION

Council Land Use Action to allow helistops accessory to Children's Hospital and Medical Center on the campus of Children's Hospital and Medical Center and on the campus of the University of Washington.

The following permit approvals are required:

Council Conditional Use Permit - To allow a helistop accessory to a major institution, Sections 23.48.005 and 23.69.012 C, Seattle Municipal Code (SMC);

SEPA - Adequacy of EIS and recommendation to grant with conditions, Chapter 25.05 SM.

SEPA DETERMINATION: [ ] Exempt [ ] DNS [ ] MDNS [X] EIS

[ ] DNS with conditions

[ ] DNS involving non-exempt grading or demolition or involving another agency with jurisdiction

BACKGROUND INFORMATION

Proposal Description and Application History

The proposal would legally establish an emergency helistop on the CHMC campus at the Kitchen Garden site near the entrance to the hospital's emergency room. In addition, under the Preferred Alternative presented in the Final EIS, a second helistop for CHMC would be established at the Intramural Activities Field (IMA) on the University of Washington campus. The helistop at the IMA Field would receive most of the helicopter landings. The most critically ill or injured patients would land at CHMC.

The Kitchen Garden helistop would be a 40 ft. by 40 ft. square concrete pad centered in an approximately 96 ft. diameter circular grass area. The helipad would be floodlit with ground lights around the perimeter and would be enclosed with a low fence. The IMA field helipad would have a 65 ft. diameter circular concrete pad centered in a 150 ft. diameter asphalt apron. Area and perimeter lighting similar to the Kitchen Garden site helipad will be provided.

The first application (#8405870) was submitted by Children's Hospital and Medical Center (previously called Children's Orthopedic Hospital) on November 13, 1984. Following an initial comment period, the Department of Construction and Land Use (DCLU) issued a Determination of Significance on January 13, 1986. A Draft Environmental Impact Statement (DEIS) was published September 2, 1986, and a public hearing on the Draft EIS was held September 23, 1986. The Final EIS (FEIS) was published April 25, 1991. For purposes of this report, Children's Hospital and Medical Center will be designated "Children's" or "CHMC" and AirLift Northwest will be "ALNW."

The initial project application was for a helistop accessory to CHMC located on the CHMC campus. That facility and location, north of the hospital emergency room at the site of the Kitchen Garden, was described in the DEIS as the proposal and became known as the Kitchen Garden Site. Other alternative locations on the campus were described and given other names. Another alternative presented in the DEIS involved landings at the University of Washington Intramural Athletic (IMA) Field. This alternative became known as the Intramural Field Alternative (also known as Graves Field). In response to comments received on the DEIS, a new alternative was developed and presented in the FEIS. It involved the majority of the Children's destined landings occurring at the Intramural Field and the most critical patients landing at the Kitchen Garden site. This alternative was dubbed the preferred alternative. On December 5, 1991, Children's submitted an application (#9106441) for the addition of Children's destined landings at and the physical upgrade of the IMA field helistop on the University of Washington campus.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Site Description

The Kitchen Garden site is located on the 25-acre campus of Children's Hospital and Medical Center, along the western edge of the Laurelhurst neighborhood. The Children's campus is developed with a series of interconnected hospital and medical related buildings which generally follow the site topography as it slopes up to the east. These buildings, which range from one to five stories in height above grade, are located on the southern half of the site. A four-story, detached parking garage occupies portions of the north half of the site. Several large surface parking lots and large landscaped open spaces cover the rest of the site.

Construction over the last few years on the site has included closing off the rear vehicular access to the site from 45th Avenue N.E., completion of a four-story medical office building to the northeast of the main hospital buildings, and approval of a series of additions on and around the main structures.

The proposed helistop on the Children's campus would be where the Kitchen Garden is now located. This area is in the center of the Children's campus; approximately 142 feet from the emergency room entrance and 104 feet to the parapet of the medical office building. The main campus access road, Penny Lane, and the parking garage are to the north. Minor access roads are adjacent to the Kitchen Garden to the east and west.

The Intramural Activities Field site is located south of the golf driving range, near the northwest corner of IMA sports field number two and the northeast corner of the large parking area north of Hec Edmundson Pavilion and Husky Stadium.

Vicinity Description

The neighborhood surrounding the Children's campus is primarily zoned and developed for single family use with density limitations ranging from one lot per 9600 square feet to one lot per 5000 square feet. One block east of the Children's campus is the Laurelhurst Elementary School and Laurelhurst Playfield. A half block southeast of the Children's campus is the Battelle Memorial Institute. Four blocks east of the campus is the Villa Academy; with St. Bridget's Church located north of N.E. 50th Street at 49th Avenue N.E., to the south of the school.

Along Sand Point Way N.E., to the north and west of the hospital, are multi-family and commercial uses. Laurelon Terrace, with predominantly elderly occupants, is adjacent to the campus to the west. To the northwest, across Sand Point Way, is a large Planned Unit Development with single and multi-family development. A variety of other low-rise multi-family structures

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and commercial uses line Sand Point Way, including an Albertson's, a medical/dental clinic, and small restaurants and retail shops.

Public Comment

Hundreds of letters, telephone calls, and oral comments at public meetings have been received by DCLU over the eight year review period for this proposal. Beginning in 1984, DCLU received complaints about the noise of helicopter landings and take-offs from nearby residents. Many of these comment also expressed concern over safety hazards related to landings and take-offs over a densely populated urban area. Public comments also stated concern about possible proliferation of helistops at other hospitals or in residential areas generally. Whether the proposal is consistent with the City's land use policies for major institutions and for residential areas was also questioned.

Volume II of the Final EIS contains 64 written comments on the Draft EIS from State agencies, City departments, community and professional organizations, and individuals. Recent letters received in 1991 and 1992 on the proposal have been included in the file for review by the Hearing Examiner and the City Council.

OTHER INFORMATION

Flight History

In 1991, ALNW flew a total of 253 Children's destined flights. 177* of these flights landed at the IMA field; 76 landed on the CHMC campus. In 1990, of the total 199 ALNW flights, 140* landed at the IMA field and 59 at CHMC. In 1989, of 220 ALNW flights, 171* landed at the IMA field and 49 at CHMC. In 1988, of 163 ALNW flights, 127* landed at the IMA fields and 36 at CHMC. (*A few landings occurred at Harborview or at Boeing Field.) In addition to ALNW flights, there were flights by other vendors including MAST and Med-Flight (see Aeromedical Vendors section, below). These landings accounted for a small percentage of additional flights (generally 10% or fewer).

Since the time helicopter landings commenced at Children's in 1984, there have been no accidents or injuries at CHMC related to the flights. (See, Safety section, below.)

Regulatory Framework

There is no single jurisdiction regulating the siting of a helistop and the operation of emergency patient transport services. Instead, as many as 8 different agencies regulate or support emergency air transport. These are briefly summarized in this section.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Federal Aviation Administration (FAA) provides programs certifying pilots and ensuring that aircraft are operated consistent with regulations. There are no FAA regulations regarding private helistops. Instead, an advisory circular titled "Helistop Design" is distributed to interested persons. Helistop operators are required to file with the FAA in order for the FAA to review and approve flight paths for a proposed helistop.

FAA regulations establish general rules for aviation, qualifications for pilots and airmen, and specifications for equipment. Examples of such regulations are the limitation of emergency medical service (EMS) pilots to eight hours of flight time during a 24-hour period). EMS services must meet FAA regulatory standards for "Air Taxi" services.

The Washington State Health Department has several programs which interact with the provision of EMS service. Until January 1991, new helistops were required to obtain Certificate of Need approval, similar to most other new medical facilities. New State administrative rules, however, now exempt helistops from such requirements. The State also administers an Emergency Medical Services Program. Through this program, the State provides statewide EMS program planning, establishes minimum standards for EMS equipment and personnel, establishes EMS system standards, and evaluates EMS program changes.

The Puget Sound Health Systems Agency (PSHSA) was a non-profit, quasi-public corporation established to assist in implementing federal health regulations. Although an active entity at the time of the DEIS issuance, the organization is no longer active.

The City of Seattle regulates helistops through the provisions of the Seattle Land Use Code. According to the zoning, helistops are allowed or disallowed according to standards which vary with zone and type of helistop. Major Institutions are allowed accessory helistops according to the provisions for Council Conditional Uses and the criteria of SMC 23.48.005 or 23.69.012 C.

The Seattle-King County Public Health Department, a joint Seattle/King County agency, provides health services throughout the City and County. In addition to various direct health service programs, the Department's Emergency Medical Services Division plans, develops and administers paramedic services outside Seattle. The Public Health Department has no direct regulatory authority over an EMS helistop.

The Washington State Department of Transportation provides statewide transportation planning services to enhance safety

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

programs and fund transportation improvements. The Department does not have specific authority with respect to EMS helistop siting or operation.

The Association of Air Medical Services (AAMS) and the National Emergency Medical Services Pilots Association (NEMSPA) are voluntary organizations established within the EMS industry to provide organization and guidance to EMS service providers. These organizations do not have legal authority to impose regulations except to the extent that hospitals or helicopter operators must meet their guidelines in order to be accepted as members. AAMS and NEMSPA each have developed uniform guidelines for EMS helicopter service. These standards address aircraft, flight crew capabilities, staffing, training, program review, standards for receiving hospitals, communications, and other key issues related to EMS service. The standards for both organizations are provided in Appendix B of the FEIS.

The Washington State Medical Association is a trade organization representing doctors in the state. The organization's subcommittee on Air Ambulance Services has submitted to the State Department of Health protocols to be used by the air ambulances that operate in the state. These protocols, which are included in Appendix A of the Final EIS, set forth criteria for use of pre-hospital air ambulance services, criteria for non-use of air ambulances, and present examples of patient medical conditions that would warrant the use of an air ambulance. The State Health Department has drafted amendments to the Washington Administrative Code in concert with these protocols. These amendments have been in draft form for several years, while parties try to reach a consensus on the changes.

The Washington State Hospital Association and Seattle Area Hospital Council are trade organizations representing hospitals in the state and Seattle area, respectively. Neither organization is directly involved in emergency airborne transport issues.

<u>Aeromedical Vendors</u>

The use of helicopters for transporting wounded solders was first established during the Korean War. This application, which was further refined during the Vietnam War, translated to the development of the nation's first medivac operation in 1969. Aeromedical transport has expanded and improved in the years since 1969.

For the past 10 years, the primary aeromedical service provider in the Seattle area has been Airlift Northwest (ALNW). It provides air ambulance service throughout the Pacific Northwest and Alaska. Airlift Northwest is governed by a consortium of Children's, the University of Washington Medical Center,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Harborview Medical Center, and Providence Medical Center. St. Joseph's Hospital in Tacoma, Virginia Mason Medical Center and Swedish Hospital Medical Center in Seattle are Associate members of the consortium. Multicare, which operates the Mary Bridge Children's Hospital in Tacoma, is negotiating a contract to become an associate member of the consortium. As the administrative arm of the consortium, Harborview Hospital provides the equipment, staff and medical director for the program. The ALNW medical director is the Medical Director of the Harborview Trauma Center.

Harborview contracts with the Seattle Jet Center to provide fixed wing aircraft, pilots, mechanics, and fuel for Airlift Northwest. That includes a Citation 500 "Eagle" which is used for transport of patients located more than 120 miles from the King County Airport base. Other aircraft are also available for these long distance transports from Alaska, eastern Washington, Idaho and Montana. Some patients do come from outside this four-state region.

In 1985, ALNW added helicopter service. Harborview contracts with Hospital Air Transport to provide the rotary-wing aircraft, pilots, and mechanics to ALNW. The contract includes two Agusta 109 Mark II helicopters. The specifications of this helicopter and others frequently used for aeromedical purposes are provided in Table 4 of the FEIS (p. FEIS 27). The Agusta is slightly larger and faster than other privately based helicopters, but is significantly smaller and lighter than the various government based helicopters used for EMS purposes. The two Agusta helicopters, one of which is used half-time, are equipped with "state-of-art" avionics and airframe systems. In addition, standard medical equipment on each helicopter includes standard and advanced stabilization and life support equipment and supplies. They can also carry specific support necessary for particular transports, such as an isolette unit for transport of neonates (infants less than one month old).

ALNW transport teams come from a pool of about 20 flight physicians and nurses who are trained and experienced in a variety of medical disciplines such as pediatrics, infectious disease, burns and neonatology. Although most flight teams are based at Harborview, the helicopter base, some specialized teams may be necessary in order to meet the unique needs of a particular patient. In those cases, the flight team either reports to Harborview or is picked up at the Intramural Activities Field.

Airlift Northwest provided about 88 percent of the patient transports to Children's in 1990. Other providers were MAST and Med-Flight. These two providers along with other aeromedical operators are discussed in the FEIS (p. 32-35).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

MAST, which stands for Military Assistance to Safety and Traffic, provides emergency transport of all military personnel and their dependents within 100 nautical miles of Fort Lewis. Military personnel are required to use MAST services under most circumstances. It is available for civilian flights in areas where there are inadequate civilian programs and when civilian programs are already on a mission.

MAST operates seven "Huey" helicopters out of western and eastern Washington bases. These helicopters are staffed with various medical personnel generally from Madigan Hospital at Fort Lewis and carry basic medical and life-support systems. Over the past 5 years, MAST is estimated to have transported 17 to 20 Children's destined patients per year. Because the "Hueys" are noisy and cause substantial vibration, Children's has discouraged their use at the campus landing sites.

Med-Flight is an aeromedical transport program sponsored by St. Luke's Hospital in Bellingham. It flies a MBB-105 helicopter, which is slightly smaller and slower than the Agusta, primarily to missions in the four northwest Washington counties. The number of flights to Children's by Med-Flight ranges from one to eight per year since 1985.

The U.S. Navy operates aeromedical services in conjunction with their Whidbey Island Naval Air Station. Most Navy rescue missions involve military personnel, their dependents or other situations where the Navy is the only service available. The number of Navy flights to Children's has dropped from 10 in 1985 to zero in 1990. The U.S. Coast Guard station in Port Angeles is similarly available. Its operations are generally limited to 50 miles off the coast. Inland operations and interhospital transports are rare. There have been no Coast Guard transports to Children's.

Other helicopter operators are available to transport patients in limited circumstances. As an example, one patient transport by a local television station occurred in the past. Transports by these other operators are rare.

ANALYSIS-SEPA

Alternatives

The original proposal was to establish the CHMC Kitchen Garden helistop and allow all flights to land on campus. In the Final EIS, the Preferred Alternative is presented, under which both the Kitchen Garden helistop and the IMA Field helistop would be established. Under the Preferred Alternative, only the most critically ill or injured patients would land at Children's.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Most flights would land at the IMA Field and the patients would be transported by ground ambulance to the hospital.

Alternative helistop locations were considered in the Draft and Final EIS. On-campus alternative locations were the roof of the medical center, the roof of the parking garage, the east entrance to the medical center, the south entrance to the medical center (described as the core building), the administrative wing (northwest corner) entrance, and the surface parking lots. Off-campus alternatives were to make all landings at the IMA Field, at a rooftop helistop at the University of Washington Medical Center, or at Harborview and Boeing Field, with ground ambulance transport of all patients to CHMC.

The rooftop helistop on the UW campus is no longer under consideration by the University and will not be discussed in this report. On-campus locations other than the Kitchen Garden site will not be discussed in this report. The Department has concluded that if helicopter landings are allowed to continue on the CHMC campus, they should be made at the most open, flat, and nearest location to the emergency room. The on-campus sites noted above are all located at distances far enough away from the emergency room to require transport by ambulance or circuitous routes through other sections of the medical center. In addition, the alternative on-campus locations are located either closer to neighboring residential and educational properties or on steeper or depressed terrain that would be somewhat less safe for landings and take-off.

Noise

For the full analysis of noise and vibration, see the Draft EIS and pages 105 through 121 of the Final EIS. The noise analysis presented in the EIS considers a worst case scenario, including four flight segments for each patient transport: 1) from helicopter base to CHMC or IMA Field to pick up medical crews; 2) from CHMC or IMA Field to patient; 3) transport of patient to CHMC helistop; and 4) return from CHMC helistop to base. (Only on rare occasions are medical crews from Children's necessary on the helicopter. The vast majority of flights use a medical crew based with ALNW at Boeing Field or at Harborview.)

For noise analysis purposes, sound levels are measured in decibels (dB), with a weighted adjustment (A-weighting) based on the sensitivity of human hearing to various sound frequencies. The dBA measurement scale is logarithmic, not linear, and a doubling of loudness occurs for roughly each 10 dBA increase. For example, 80 dBA is judged to be twice as loud as 70 dBA and four times as loud as 60 dBA. Sound level increases of one to two dBA are barely perceptible. Increases of three to five dBA are generally noticeable.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In evaluating the effect of noise on people, a day/night average sound level (L_{dn}) with a penalty for noise occurring between 10:00 p.m. and 7:00 a.m., is used. The highest sound level occurring in a given time period is called the maximum sound level (L_{max}). L_{max} is sometimes used to estimate the probability of sleep interference from single noise events. Intermittent indoor sound levels above 70 dBA have a significant probability of causing sleep interference. Intermittent sound levels between 40 and 70 dBA have varying potential for causing sleep interference. The elderly and children in some age groups are more susceptible to awakening.

Noise impacts were analyzed for five locations in the primarily residential neighborhoods surrounding the campus. In the Draft EIS, the noise study found the original proposal would increase the day/night average (L_{dn}) sound levels by between one and five dBA. This result derived from an assumption of 20 landings and take-offs to pick up medical crews and 20 landings and take-offs for patient transports (40 round trips) per month.

The final EIS used a revised flight path in its noise analysis that reduces L_{max} sound levels, particularly at the Laurelon Terrace location. The Final EIS (p. 117) found an increase in day/night average sound levels of zero to three dBA. A "worst one-day L_{dn}," assuming two daytime and two nighttime flights (eight round trips counting crew pickup), was also calculated. This worst case analysis showed an increase of zero to five dBA.

For the Preferred Alternative, total landings were projected at four to five per month at CHMC, with an average of one night landing per month. This estimate is low compared to actual 1991 levels. Under the Preferred Alternative, with no landings on campus to pick up medical crew and with only the most critical patients landed on campus, monthly and worst day day/night averages would be three or more dBA lower than under the original proposal. Maximum sound level impacts would be the same. The increase in noise would not rise to the level generally considered significant. (U.S. Environmental Protection Agency guidelines cite activities with a 65 dBA day/night average as significant.) Noise level increases of zero to five dBA are considered slight; five to ten, significant; and over ten, very serious. FAA and federal Housing and Urban Development standards consider L_{dn} below 65 dBA generally acceptable for residential areas.

Under the alternative with all landings t the IMA (Graves) Field site, noise levels at CHMC would be lower than with the original proposal or the preferred alternative. A minor increase in monthly day/night average sound levels could occur related to ground ambulance sirens. Occasional helicopter noise would be noticeable in the student dormitories and classrooms above the IMA fields.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The noise analysis reported in the EIS relies on calculated estimates of actual noise impacts. No test landings and take-offs were conducted. The noise study addresses the potentially greater sleep interference impacts from low frequency (blade slap) noise generally, without specific frequency segregation and analysis.

Some helicopters generate a loud "impulse" noise known as blade slap, which distinguishes helicopter noise from other noise sources. Blade slap noise is primarily related to helicopters with two-bladed rotors. The Agusta 109 helicopters used by ALNW have four-bladed rotors, which reduce blade slap noise. The Huey (used by MAST) and most other military helicopters have two-bladed rotors and are noisier and cause more vibration than the ALNW helicopters.

Detectable vibration can occur when sound levels are above 65 to 80 dB in the low frequencies. Vibration in a structure depends on construction type and window size and type. Detectable buzzing or rattling of windows, dishes, and other lightweight objects increases levels of annoyance, but is not damaging to structures unless sound pressure levels are greater than 134 dB. Truck drive-bys and general aircraft fly-overs are usually in the 65 to 80 dB range. The EIS finds that vibration impacts would not be significant with the original proposal, the Preferred Alternative, or the other alternatives. Therefore, the Department concludes that mitigation of vibration impacts would not be required.

A number of mitigating measures have been or could be implemented to minimize noise impacts. As noted in the EIS, these include: using primarily multi-blade helicopters to reduce blade slap impacts, enforcing flight path rules to keep the helicopters primarily over Sand Point Way N.E. and at high altitudes, and prohibiting landings at Children's to pick up medical crews.

Approximately 20 percent of the landings and take-offs at Children's occur during the night or early morning (generally one to two per month). According to the noise study, it appears the likelihood of being awakened by a nighttime flight will vary depending on location, whether bedroom windows are open or closed, and the age or general physical condition of the sleeper. Some nearby residents will probably be awakened by nighttime flights to CHMC.

<u>Safety</u>

The Final EIS addresses safety issues related to helicopter transport on pages FEIS 75 - 104. The EIS sets forth general information from national studies of air ambulance helicopter safety over five to ten year periods. Specific flight history

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

for the ALNW service is examined, and safety concerns associated with the alternative helipad locations are considered.

Pages FEIS 98 - 100 summarize the general findings regarding the probability of accidents for ALNW helicopter flights to the CHMC campus. The worst case assumption was for 20 landings per month at the hospital by ALNW. The calculated probability for accidents during a flight ultimately destined for CHMC was found to be one in 14,184 flights, or roughly, one accident every 59.1 years. When the number of landings at CHMC is reduced under the preferred alternative by a factor of three or four, the probability of accidents is similarly reduced. Under the preferred alternative, an accident during a CHMC flight would be expected less than once every 177 years.

Further reducing the probability of an accident in the CHMC campus area is the fact that the accident probabilities include all flight segments, i.e., take-off from base, landing to pick up patient, take off with patient, landing at CHMC, take off from CHMC. There would be a decrease in accident probability if only landings and take-offs from Children's were considered.

Airlift Northwest has had no accidents in the eight year history reported in the Final EIS. One "incident" occurred July 24, 1989, when a tail rotor struck the helistop perimeter fence at Harborview. (An "incident" is an event causing minor damage or minor injury, but not rising to the level of a defined "accident." See page FEIS 76 for a definition of accident.)

Data regarding military helicopter safety are not reported under the same categories as for civilian helicopter flights. The FEIS presents only an abbreviated analysis of military helicopter safety, but concludes that for the year sampled (1986), the military experienced a lower fatality rate per hours of flight than did the civilian aeromedical industry (p. FEIS 92).

The main causes of helicopter accidents are discussed in the FEIS. One study by the National Transportation Safety Board found that 68% of EMS helicopter accidents involved human error. Thirty percent (30%) of accidents were attributable to adverse weather including windshear, ice, snow, rain, fog, or reduced visibility. Mechanical failure was responsible for 25% of accidents. Obstacle strikes, which involve the main or tail rotors coming in contact with trees, wires, buildings or other obstacles occurred in 21% of all accidents. For the period between 1972 and 1990, these three factors, weather, engine failure, and obstacle strikes, were the leading cause of accidents.

Most EMS helicopter accidents occur during daylight hours (64% to 93% depending on study). In addition to weather and mechanical failure, pilot fatigue, lack of pilot familiarity with the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

landing area, and poor visibility or obstruction of the landing area were significant factors in accident occurrences.

The FEIS considered safety factors related to the design and location of the several alternative helipad locations described in the document. The Kitchen Garden site and proposed design for the helipad would meet or exceed the FAA guidelines for the ALNW helicopters. The design would not meet the guidelines for MAST aircraft. Several trees and light poles would need to be removed or relocated to provide for unobstructed primary and secondary approach and departure routes. A natural gas meter house is located approximately 38 feet northwest of the northern edge of the proposed Kitchen Garden site. The meter is protected by a concrete structure and a fence, and is not viewed as a hazard to take offs and landings at the site.

Other campus locations considered in the EIS included the rooftops of the medical center or the parking garage, the east, south and northwest entrances to the medical center, and the surface parking lots. These locations were all considered somewhat less safe due to their proximities to obstructions, location in a topographically depressed area, or proximities to nearby residences or schools.

Safety issues at the IMA Field site are minor. The helipad design is consistent with FAA guidelines. The approach and departure paths are free of obstructions. The flight paths have been revised to avoid areas known as bird roosting sites.

Cumulative Effects

During the scoping process, the potential for the approval of the Children's helistop to establish a precedent for the siting of helistops at other Seattle-area hospitals was determined to be a potentially significant impact. There was concern that other medical institutions would seek approval to construct helistops on their campuses. This could result in more dispersed EMS helicopter operations throughout the City, with new aeromedical vendors to compete with existing services. Extensive and uncoordinated competition could result in compromised safety standards.

Although all hospitals treat critically ill and injured patients, only a few hospitals in Seattle are considered tertiary care centers for these emergencies. Children's is a regional referral center for neonatal and pediatric medical and surgical emergencies; Harborview for trauma and burn emergencies; Providence for adult cardiac emergencies; and the University of Washington for neonatal, obstetrical, and adult medical emergencies. Helistop facilities currently exist for Harborview and the University of Washington. Aside from Children's no other applications have been received nor are other hospitals

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

considered candidates for helistops. A survey of Seattle's major medical facilities indicated that no other helistops were being considered (FEIS-133).

Mitigation of the possible impacts associated with the proliferation of helicopter facilities and services would come from several factors associated with the structure and organization of EM service in the Puget Sound region. The consortium operating Air Lift Northwest significantly reduces the likelihood of other aeromedical vendors being established. Every tertiary care provider in Seattle is part of the consortium, as are other Seattle area hospitals not providing tertiary emergency services, and other hospitals outside the Seattle area, providing emergency service to other regions. A new vendor would have to complete directly with the established Air Lift network and the extensive services available to the consortium member hospitals. New vendors would also have the extensive capital cost for acquisition of aircraft and equipment.

With the completion of airmedical transport services to Children's, each of the full consortium members will have established helicopter facilities on their respective campuses. The current specializations of the other institutions do not indicate demand for helicopter service. Any applications by the other member hospitals, or other institutions, would be subject to an evaluation for Council Conditional Use approval, including a likely EIS requirement. FAA regulations, along with possible state and regional EMS guidelines, also help limit the expectation of additional helicopter facilities and services.

The preferred alternative would result in two helistops within close approximation of one another. However, the balance between increased number of facilities and the appropriate sorting of patients to reduce noise and safety impacts, indicates the additional facility is appropriate. Although there remains a potential for additional hospital helicopter facilities and services, the Department concludes that such an outcome is unlikely.

ANALYSIS - COUNCIL CONDITIONAL USE

Seattle Municipal Code Section 23.48.005 (superseded by 23.69.012 C) establishes the standards for consideration of a helistop accessory to a major institution. The proposals for the helistop on the CHMC campus and for the related helistop at Graves Field on the University of Washington campus are both subject to the same criteria. The analysis for the two permits is combined below.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. A helistop may be permitted as a Council conditional use if the Council finds that:

   a. The helistop is needed to save lives;

   b. The helistop is located so as to minimize impacts upon surrounding residential property;

   c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

19
This section of the report summarizes the health care background information provided in the EIS along with an assessment of the medical need information regarding this proposal.

The mission of Children's is the treatment of patients from birth to 21 years of age including the practice of neonatology (practice of medicine on children less than 1 month old) and pediatrics (medical care of children). In addition to the different categories of patient by age, hospitals are grouped by the level of patient care they provide: primary, which is offered by all hospitals; secondary, which provides more advanced care capabilities; and tertiary, which generally includes medical specialists. Because of the relative infrequency of need of medical specialists' expertise, specialists are generally affiliated with regional medical centers in urban areas, with patients coming from the surrounding rural and urban areas. This aspect of health care is informally referred to as the regional medical referral system.

Only a few hospitals in the three-state Pacific Northwest provide pediatric tertiary care: Children's, Harborview Hospital, Mary Bridge Children's Hospital in Tacoma, Sacred Heart and Deaconess Medical Centers in Spokane, St. Luke Regional Medical Center in Boise, and Emmanuel Medical Center in Portland. CHMC is the largest of these medical facilities specializing in children. Key sections of the Children's tertiary care service are the Infant Intensive Care Unit (IICU) and Pediatric Intensive Care Unit (PICU). The FEIS (p. 11) lists the types of patient conditions typically admitted to the IICU.

The University of Washington NICU is operated in conjunction with the University's high-risk obstetrical program so that low birth-weight babies born at the University of Washington Medical Center do not have to be transported to Children's. Some low birth-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

weight babies born in outlying community hospitals require transport to a tertiary care facility. A program administered by the University of Washington determines which medical facility, Children's or the University, is appropriate for referral of a low birth-weight baby.

Pediatric emergencies in the Puget Sound are generally referred to the PICU at Children's or Mary Bridge. The two Spokane hospitals also have PICUs.

A formal agreement establishes Children's as the pediatric teaching hospital for the University of Washington School of Medicine. The University of Washington also administer the County's Harborview Medical Center. Most traumatized or severely burned children in the Puget Sound first go to Harborview, as it is the region's recognized trauma center. Children's does not meet all the criteria to be considered a trauma hospital, although it does treat some trauma patients.

There are two types of medical referrals to a regional hospital; interhospital transports between clinics and community hospitals where a diagnosis has occurred, and pre-hospital transports, which bring a patient from a field location such as home, work or accident scene. Children's has been transporting patients by helicopter to the campus since August 1984. The types of patients brought to Children's include near-drownings, premature births, severe injuries, overwhelming infections, and ingestion of toxic substances. Appendix D of the FEIS provides summary profiles of the patients referred directly to Children's from August 1985 to March 1989. Quarterly reports providing summary profiles of patients flown to the CHMC campus are provided to the community and City.

According to Children's, the two objectives of helicopter transport are to reduce the time before appropriate advanced treatment can begin and to decrease patient manipulation. Because of the severe nature of the medical conditions referred to Children's, delays in the initiation of advanced treatment may affect patient outcomes.

The Department has concluded the proposed helistops meet the first criterion of being needed to save lives. As discussed in the FEIS (Medical Rationale for Helicopter Transport section, pages 18-22, FEIS) and detailed in the report from the Seattle-King County Department of Public Health (Volume III, Appendix A, FEIS), shortening the time of transport for some patients is essential and even a minimal shortening of time may be lifesaving. The Public Health Department report concludes that "there are hospital transfers to Children's where 10 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small." In its conclusion that

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the helistop was needed to save lives, Public Health also noted that the use of the helistop could be restricted to life-threatening emergencies.

In response to this issue and the third criterion noted above, DCLU presented a new alternative, the "Preferred Alternative," in the Final EIS. Under this alternative, most helicopter landings occur at the University of Washington IMA field site, with only the most critically ill or injured patients being flown directly to CHMC. This alternative has been adopted by the hospital for the interim period before a final decision is made by the City Council.

The FEIS predicted four to five landings at the hospital per month under the preferred alternative approach. Public Health, in its comment to DCLU, estimated six patients per month requiring transport directly to the hospital. In 1991, an average of slightly over six patients per month were landed at CHMC.

The remaining flights carried patients to the IMA field. These flights carried less critically injured children. According to the criteria used to determine whether to use air transport or not, many of these flights can be considered necessary to save lives due to the shorter transport times, even though direct flight to the hospital campus was not required.

The remaining conditional use criterion requires that helistops be located to minimize impacts on surrounding residential property. The EIS analysis concludes that the kitchen garden location proposed on the hospital campus provides the best noise buffering and flight safety of any alternative that allows flights to land on campus. In reliance on the EIS analysis, the Department concludes the third criterion is met for the Kitchen Garden site.

With respect to the IMA/Graves Field location, it is far from residential uses and does not create the noise or safety concerns arising from the hospital campus location. The Graves Field helistop works to minimize flights to the Children's campus, further minimizing impacts to the hospital neighborhood. Impacts to the University of Washington campus are shown to be minor in the Final EIS. The Department concludes that IMA/Graves Field helistop, as an integral piece of the CHMC preferred alternative, meets the required conditional use criteria.

As discussed in the EIS analysis, concerns about overuse of the CHMC campus helistop and consequent increases in noise and safety impacts could be addressed by the formation of a review panel to consider whether flights landing at CHMC were appropriately directed. The review panel should meet at least twice yearly and should file reports with DCLU on the same schedule.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Other conditions discussed in the EIS analysis include prohibition of staff pickup at CHMC by helicopters, continuation of the quarterly public newsletter reporting on helicopter landings, establishing a regular training schedule to familiarize pilots with the specific characteristics of the helistops, and limiting landings at CHMC to helicopters no noisier than the Agusta 109.

These conditions, as set forth below, should be imposed based on Council authority under the conditional use provisions of the Land Use Code and on the City SEPA noise and transportation policies.

DECISION - SEPA

The Department concludes the Environmental Impact Statement for the CHMC helistop proposal adequately discloses and analyzes expected impacts from the proposal and from reasonable alternatives. The Department finds the proposal can be expected to result in significant adverse noise impacts which cannot be mitigated. However, the Department also finds that the benefits of the proposal, as defined in the Preferred Alternative, outweigh the adverse impacts. The Department recommends mitigation to the extent possible of noise and safety impacts as set forth in the Conditions section based on substantive authority found in sections 25.05.675 L and R, Noise and Transportation.

RECOMMENDATION - COUNCIL CONDITIONAL USE

The Department recommends the proposal for an emergency helistop at the Kitcher Garden site at CHMC and a second, full service helistop at the University of Washington IMA/Graves Field site be approved, with conditions to mitigate impacts to the public safety and welfare. The recommended conditions, based on Council authority to mitigate averse impacts including that set forth in the Land Use Code and the Noise and Transportation policies of Seattle's SEPA Ordinance, are set forth below.

RECOMMENDED CONDITIONS

1. Only the most critical and life-threatening medical emergencies shall be allowed to land at CHMC. All other patients shall land at the Intramural Activities field site. The initial decision whether to land at the Kitchen Garden site or the IMA field is to be made by the referring physician and/or attending medical team. For patients whose condition deteriorates in flight, the medical team on board

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the helicopter may decide to land at CHMC. The following conditions indicate a landing at CHMC is appropriate:

a. unstable airway;
b. inability to ventilate/oxygenate;
c. inability to maintain adequate cardiac output;
d. inability to maintain adequate cerebral bloodflow; or
e. the persistence of unstable vital signs despite heroic attempts to control them.

2. Military Assistance to Safety and Traffic (MAST), Coast Guard, and Navy helicopters shall not be permitted to land at CHMC, but shall land at the IMA field or at Harborview, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area.

3. A Medical Review Committee shall be established to review compliance with Condition 1 above, allowing only the most critically ill patients to land at CHMC. The Committee shall consist of the following five members:

1) The Director of the Seattle-King County Department of Public Health, or the Director's appointee, who will serve as Committee chair;

2) A representative of CHMC selected by the Chief Executive Officer;

3) A physician representative of the Washington State Medical Association (WSMA), selected by the President of the Association. The representative must be a qualified neonatologist, pediatric intensivist, or pediatric emergency physician;

4) A physician representative of the Washington State Society of Pediatrics (WSSP), selected by the President of the Society. The representative must be a board certified pediatrician.

5) A citizen, residing in one of the neighborhoods in the area of CHMC, to be nominated by the Department of Neighborhoods and confirmed by the City Council.

Committee members will be appointed for terms not to exceed three years, with replacements to be made by the original appointing authority. The role of the Committee is advisory only. The Committee shall meet at least twice per year to review and evaluate helicopter transports to CHMC. The Committee shall submit a report after each review meeting to DCLU, the Chief Executive Officer of CHMC, the Airlift Northwest Executive Committee and Medical Director, and the Citizens' Advisory Committee for CHMC Master Plan.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Committee members will receive no compensation or other remuneration for their service on the Committee. The Committee shall adopt rules and procedures as necessary to ensure compliance with laws and administrative rules governing confidentiality of patient medical records, while also providing for public input and review of the Committee's work.

CHMC shall provide administrative and staff support needed by the Committee. The necessity for, and performance of, the Committee shall be evaluated by DCLU after two years and a recommendation shall be made to the City Council regarding whether to continue, reorganize, or discontinue the Committee's work.

4. CHMC shall continue to report on a quarterly basis to the community regarding the number and nature of transports to the campus. The report shall also include the number of helicopter landings at the IMA/Graves Field site for the given quarter.

5. Helicopters shall not be allowed to land at CHMC to pick up medical staff prior to patient transport.

6. DCLU shall review the quarterly reports of CHMC and the reports of the Medical Review Committee. If it appears that inappropriate or non-medically necessary landings have occurred, DCLU shall work with CHMC, the Public Health Director, the Medical Review Committee and ALNW to revise guidelines or procedures to ensure compliance with the limited landings requirement stated in condition one (1). Failure to demonstrate clear improvement in implementation of the limited landings criteria may result in suspension of the permit for landings and shall be subject to enforcement action pursuant to Chapter 23.90 of the Land Use Code.

7. Only helicopters with a four-bladed rotor shall be permitted to land at the CHMC campus helistop. Should Airlift Northwest or other aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Agusta 109 studied in the EIS, a showing must be made to DCLU proving the noise impacts of the alternative equipment are no greater than for the Agusta 109. DCLU must give approval of the new equipment prior to its regular use for flights to CHMC.

8. The flight paths for approach and departure to the CHMC and IMA/Graves Field helistops shall be strictly maintained as described in the Final EIS and shall to the greatest extent possible avoid residential areas. Airlift Northwest and any other regular carrier shall establish a training program to introduce all pilots to the approved flight paths. ALNW or

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

other regular carrier shall confirm in writing to DCLU its commitment to the training program and to ensuring the approved flight paths are followed.

9. Prior to beginning regular use of the Kitchen Garden helistop, all ALNW pilots shall make at least one test landing and take-off at the site. CHMC and ALNW shall schedule the training/test flights for a weekday between the hours of noon and 3:00 p.m. Advance notice of at least ten days shall be given to the surrounding communities of the test/training time, date, and expected number of flights. The number of flights shall be held to the minimum necessary to provide adequate training.

10. New pilots shall make at least one landing at CHMC under supervision of a pilot experienced in landing at CHMC prior to unsupervised patient transport landings. Non-patient transport training flights, if desired, may be scheduled no more than twice per year without approval from DCLU. Notice shall be provided to surrounding communities as stated in Condition 10.

MASTER USE PERMIT

****
NOTICE OF APPLICATION
****

Seattle's Department of Construction and Land Use is currently reviewing the Master Use Permit applications described below. Your WRITTEN COMMENTS ARE ENCOURAGED AND MAY BE SUBMITTED TO:

Department of Construction and Land Use
710 Second Avenue, Suite 200
Seattle, Washington 98104-1703

For projects other than those requiring shoreline approvals, the comment period may be extended an additional fifteen (15) days. A written request to extend the comment period must be received by this Department within the initial 15-day comment period as published in this bulletin. For additional information, contact the Master Use Information and Notification Center, 710 Second Avenue, First Floor of the Dexter Horton Building (684-8467).

Please note that "SEPA" refers to the State Environmental Policy Act.

2501 NE 45th St Zone MIO37/65L1/3 **Project #9108441**

Master Use Permit to allow Children's Hospital and Medical Center to use an existing helistop located on the U of W campus. (Helistop to be used for medical emergencies.) The project includes the construction of approx. 65 ft. diameter landing pad and apron improvements. Environmental review completed under MUP# 8405870.
The following approvals are required:

Council Conditional Use to allow addition of Children's Hospital and Medical Center flights to the UW's heliport at Graves Field.

Written Comments may be submitted until **January 30, 1992**

Council Conditional Use

ORDER

In order to provide a fair opportunity for all interested parties and witnesses to testify in this matter, the order for presentation of evidence and testimony shall be as follows:

1. DCLU presents summary and submittal of file.

2. The applicant, Children's Hospital and Medical Center (Children's) shall have up to one and a half hours to present an overview of its proposal and witnesses.

3. For the remainder of the day, we will alternate on hourly intervals between witnesses in favor of the petition and witnesses opposed to the petition.

On Wednesday, June 24, 1992:

1. Children's will complete the presentation of its case.

2. All other witnesses in favor of the proposal will testify.

3. Testimony from opposing witnesses will begin immediately after the witnesses in favor.

4. Witnesses with legitimate time restraints will have a block of time from 1 p.m. to 2 p.m. on Wednesday, June 24, 1992 to present their testimony.

Entered this 16th day of June, 1992.

DETERMINATION OF SIGNIFICANCE AND SCOPING NOTICE

Application Number 8405870 Comptroller's File # CC84-022

Applicant Name Children's Orthopedic Hospital and Medical Center, by Dorothy Teeter, Dir. of Planning, COHMC

Address of Proposal 4800 Sand Point Way N.E.

SUMMARY OF PROPOSED ACTION

Applicant proposes to construct an emergency helistop facility accessory to an existing hospital/medical center.

The following approvals are required:

Council Conditional Use for a helistop. Seattle Municipal Code (SMC) 23.48.05

S.E.P.A. - Environmental Determination. State Environmental Policy Act and Rules Chapter 25.05 SMC

BACKGROUND DATA

The proposed helistop site is located at Children's Orthopedic Hospital and Medical Center (COHMC), 4800 Sand Point Way N.E., within the Laurelhurst neighborhood. Within the hospital grounds, the proposed helistop site is 85 feet due north of the existing COHMC emergency room.

Land on the 9552 square foot site is generally rolling, with the steepest slope at 10%. The hillslope at the proposed site appears stable with an existing retaining wall located to the west.

COHMC is designated a Major Institution under the Seattle Land Use Code. As such it is subject to provisions in Chapters 23.48; 23.80; and 23.82 of the code. The proposed helistop site is within COHMC's major institution boundary.

The surrounding area is developed with single and multi-family residences and with community businesses.

The use of the helistop is proposed to be limited to the transportation of critically ill or seriously injured infants, children and adolescents. The number of patients per month estimated by COHMC to be transported by helicopter would average 15 to 20; each transport would generate four trips to or from COHMC, for a monthly average of between 60 and 80 helicopter trips.

Under the current system helicopters land at the University of Washington soccer field, and the patient is transferred to an ambulance for final transport to COHMC.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

SEPA DETERMINATION:

☐ Exempt ☐ DNS ☒ EIS

☐ DNS involving non exempt grading or demolition or involving another agency with jurisdiction.

ANALYSIS - SEPA

The department has reviewed the proposed development and has concluded that the proposal may have a probable significant adverse environmental impact. Preliminary analysis indicates that as a part of the scoping process, areas of impact and alternatives to be discussed in the EIS should include the following:

Areas of Impact

Noise
Vibrations
Safety

Alternatives
- -alternative sites
- -alternative uses, i.e.,shared use of helicopter sites
- -no action alternative

SCOPING

Agencies, affected parties and members of the public are invited to comment on the scope of the Environmental Impact Statement prior to its preparation. You may comment on alternatives, mitigation measures, probable significant adverse impacts, and licenses or other approvals that may be required.

Comments should be in writing and received at the following address by February 3, 1986:

Beatrice Farrar Ryan, Director
Department of Construction and Land Use
Room 400 - Municipal Bldg., Seattle, WA 98104

DECISION

This decision was made after review by the responsible official on behalf of the lead agency of a completed environmental checklist and other information on file with the responsible department. This constitutes the Threshold Determination and form. The intent of this declaration is to satisfy the requirements of the State Environmental Policy Act (RCW 43.21C), including the requirement to inform the public of agency decisions pursuant to SEPA.

☐ Determination of Non-Significance. This proposal has been determined to not have a significant adverse impact upon the environment. An EIS is not required under RCW 43.21C.030(2)(c).

☒ Determination of Significance. This proposal has or may have a significant adverse impact upon the environment. An EIS is required under RCW 43.21C.030(2)(c).

There is no agency appeal.

MUNICIPAL CODE CHAPTER 23.90
LAND USE CODE - ORDINANCE 110381

DEPARTMENT OF CONSTRUCTION AND LAND USE

ORDER OF THE DIRECTOR

FOLLOWING RECONSIDERATION OF NOTICE OF VIOLATION

February 20, 1986
File No. 2855646

Treuman Katz, Chief Executive Officer
Childrens Orthopedic Hospital
4800 Sand Point Way Northeast
Seattle, Washington 98105

Michael Copass, Medical Director
Airlift Northwest
325 - 9th Avenue
Seattle, Washington 98104

Subject: Premises known as 4800 Sandpoint Way Northeast
which location is described as follows:

That portion of the West half of the Southeast quarter of the Southwest Quarter of Section 10, Township 25 North, Range 4 East, W. M., in King County, Washington, described as follows:

Beginning on the Easterly line of said subdivision at a point 658.20 feet Northerly of the Southeast corner thereof; thence West 271.44 feet, more or less, to the Northerly production of the Westerly line of Block 1, of Gwinn's Laurelhurst Manor Addition according to Plat recorded in Volume 41 of Plats Page 27, in King County, Washington; thence North 0'26'19" East along the Northerly production of said Westerly line to the Southeasterly line of Sand Point Way; thence Northeasterly along said Southeasterly line of East 50th Street; thence Easterly along said Southerly line to the Easterly line of said subdivision thence Southerly along said Easterly line 630 feet, more or less, to the point of beginning.

PARCEL B

The West 5.00 feet of the Northeast quarter of the Southeast quarter of the Southwest Quarter of Section 10, Township 25 North, Ranger 4 East, W. M., in King County, Washington, except the North 30.00 feet thereof, and the South 25 thereof;

PARCEL C

Blocks 1, 2, 3, 4, 5, and 6 of Gwinn's Laurelhurst Manor addition to Plat recorded in Volume 41 of Plats, Page 27, in King County, Washington except Lot 12 in said Block 6;

PARCEL D

Those portions of 42nd Avenue Northeast, 43rd Avenue Northeast, 44th Avenue Northeast and East 47th Street, vacated under Ordinance No. 76010 of the City of Seattle.

Subject to:

Right of the public to make neccesary slopes for cuts or fills upon said premises in the reasonable original grading of streets, avenues, alleys and roads, as dedicated in the Plat.

Also subject to:

Right to make necessary slopes for cuts of fills over the Northerly 558 feet of said Parcel as granted to the City of Seattle by Deed recorded under Auditor's File No.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2553722.

Also subject to:

Right of the public to use that portion of Lot 9 and 10, Block 4, of Gwinn's Laurelhurst Manor addition, lying within boundaries of East 47th Street.

Upon request for reconsideration of a Notice of Violation dated December 10, 1985, a hearing was held before the Director of the Department of Construction and Land Use in accordance with Section 23.90.16 of the Land Use Code on February 10, 1986. BASED UPON THE EVIDENCE PRESENTED, THE DIRECTOR HAS DETERMINED AND HEREBY ORDERS THAT SAID NOTICE OF VIOLATION IS MODIFIED AS FOLLOWS:

THE COMPLIANCE DATE IS EXTENDED TO AUGUST 31, 1986

A copy of this Order will be filed by the Director of the Department of Construction and Land Use with the Department of Records and Elections of King County.

The Land Use Code provides that any party affected by this final order may file a written notice of appeal with the Hearing Examiner, stating in what respects the notice is erroneous and the specific grounds upon which the party relies for the reversal or modification of the Order. The notice of appeal shall be accompanied by a filing fee of $25.00. The appeal shall be filed with the Office of the Hearing Examiner, 400 Yesler Building, Seattle, Washington 98104, by five o'clock p.m. of the fourteenth calendar day following service of the final order of notice of violation. When the last day of the appeal period so computed is a Saturday, Sunday, Federal or City holiday, the appeal period shall run until five o'clock on the next business day.

Please review the contents of the Notice of Violation, including the procedures for compliance on the first page. Any communications should be addressed to the Inspector whose signature appears on that Notice, c/o Housing and Zoning Enforcement Division, Department of Construction and Land Use, Room 408 Municipal Building, 600 4th Avenue, Seattle, Washington 98104. Telephone 625-2271. Please feel free to call upon us if we may be of service.

CITY OF SEATTLE
DEPARTMENT OF CONSTRUCTION AND LAND USE

FINDINGS AND DECISION
OF THE
HEARING OFFICER

ATTACHMENT TO FINAL ORDER

Re: Premises known as 4800 Sand Point Way Northeast
Childrens Orthopedic Hospital, Airlift Northwest
File No. 2853959

INTRODUCTION

Childrens Orthopedic Hospital and Airlift Northwest contest the Notice of Violation filed on August 30, 1985 against 4800 Sandpoint Way.

The hospital and Airlift Northwest sought a reconsideration hearing pursuant to Seattle Municipal Code 23.90.

The matter was heard before the Hearing Officer on October 31, 1985.

Parties to the proceeding were: Childrens Orthopedic Hospital by attorney Rand Koler; Airlift Northwest by attorney Steve Milam, and Department of Construction and Land Use by Hermia Ip.

FINDINGS OF FACT

1. Helicopters bearing critically ill infants landed at Children's Orthopedic Hospital (COH) on August 3, 20 and 27, 1985. In each case the helicopter was operated by Airlift Northwest.

2. Airlift Northwest (A'W) is operated by a consortium of five hospitals, one of which is Childrens Orthopedic. Airlift was created several years ago in order to provide emergency services, and recently added helicopter service. Under its agreement with ANW, COH agrees to accept patients from ANW.

3. As one of five member hospitals, Childrens Orthopedic cannot by itself control Airlift Northwest. Airlift Northwest is essentially run from Harborview Medical Center.

4. No specific agreement between Airlift Northwest and COH allows the landing of helicopters at COH.

5. Under the terms of COH's participation in ANW, the financial contribution of COH is reduced relative to other hospitals on the basis that it does not have a helipad.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. In the case of each of the helicopter landings at COH, the decision to land at COH was made by the director of ANW, located at Harborview, and the on-board physician. In the case of the first landing, COH was given only several minutes notice that the helicopter would be landing.

7. Each landing occurred on a small lawn in the center of the hospital's circular entryway to the emergency ward.

8. Under the Major Institution zoning applicable to COH, a helistop requires a conditional use permit (Seattle Municipal Code 23.48.05).

9. COH has applied for, but does not yet have a conditional use permit for a helistop. Helistop is defined in Seattle Municipal Code Section 23.84.16 as "A transportation facility in which an area on a roof or on the ground is used for the take-off and landing of helicopters of steep gradient aircraft, but not include fueling services, hangers, maintenance, overhaul or tie-down space for more than one aircraft."

10. COH did not protest any of the three landings to ANW.

11. Section 248-18-285 of the Washington Administrative Code defines a hospital's duty with respect to emergency care services. It states:

> (1) The hospital shall provide the following basis out-patient emergency care services.
>
> (a) Assessment of a person's condition to determine the nature, acuity, and severity of the person's immediate medical need.
>
> The condition of each person, who comes or is brought to the hospital for emergency medical care, shall, upon arrival, be assessed by a registered nurse, physician, or physician's assistant for the purpose of determining the nature and urgency of the person's medical need and the timing and place of the person's care and treatment.
>
> (b) Immediate diagnosis and treatment of any life-threatening cardiac arrythmia, respiratory insufficiency or shock.

12. The Notice of Violation, dated August 30, 1985, alleges violations of Land Use Code Sections 23.40.02C, 23.48.05A, and 23.90.02B. The Notice of Violation states "The specific violation and corrections are as follows: Using or permitting the use of the premises as a landing pad for helicopter, immediately discontinue the use of a helicopter pad or obtain a permit for such use".

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

13. Section 23.40.02 is not divided into subsections. Thus, there is no 23.40.02C.

14. The parties agreed that the section of 23.90.02 applicable to this proceeding was subsection "A", not "B".

15. The Land Use Code includes no definition of "landing pad for helicopters" or "helicopter pad".

16. Section 23.40.02 of the Land Use Code reads as follows:

> No structure or premises shall hereafter be used or occupied and no structure or part of a structure shall be erected, moved, reconstructed, extended, enlarged or altered, except in conformity with the regulations specified in Title 24 or this Title for the zone and overlay district, if any, in which it is, or will be located. Changes to existing structures may be permitted which make the structures nonconforming if the changes are required by law for reasons of health and safety.

Section 23.48.05, referred to in paragraph 8, reads as follows:

A. Helistops

1. A helistop may be permitted as a Council conditional use if the Council finds that:

   a. The helistop is needed to save lives;

   b. The helistop is located so as to minimize impacts upon surrounding residential property;

   c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Section 23.84.40 defines "use" as follows:

> The purpose for which land or a structure is designed, built, arranged, intended, occupied, maintained, let or leased.

Section 23.90.02A reads as follows:

> A. It is a violation of this Land Use Code to use or cause to be used any structure or land, or to construct, locate, or cause to be constructed or located any structure within the City of Seattle without first obtaining the permits or authorizations required by the Land Use Code for the respective use, location, or construction.

CONCLUSIONS

1. There is no dispute that the three landings occurred and that they occurred on COH premises. There is also no dispute that the helicopter in each case was operated by Airlift Northwest.

2. It is not clear that the three landings should be seen as constituting "use" of the lawn as a helipad. In each instance COH was informed that a helicopter bearing a sick child was on its way, and in each instance COH had no part in the decision that the helicopter should be diverted to COH. Once that decision was made, it does not appear that COH had the option of diverting the helicopter. In fact, diversion might have placed COH in violation of State provisions governing hospitals. On the other hand, there is no question that for purposes of the landings, the lawn was used as a defacto helipad.

3. Occasional use of a lawn for emergency landings can violate the Land Use Code if part of an ongoing pattern. It should be noted that even permitted institutional helistops are restricted to occurrences involving life threatening emergencies. Thus, the fact that a situation is life-threatening does not exempt a hospital from securing a conditional use permit before having a helistop.

4. In this case, it need not be decided if the helicopter landings justifies a finding that the lawn was used as a helipad, because it is plain that the Notice of Violation was defective. Of the three listed Code provisions, two were mis-cited, and the Notice must therefore be withdrawn. However, based on its pending permit application for a helipad conditional use permit and the discussion at the violation hearing, COH must now be seen as aware of the Land Use Code issues involved in its use of the lawn for helicopter landing purposes. Similarly, Airlift Northwest must also be seen as aware of the possible legal complications with its land helicopters at COH.

FOR IMMEDIATE RELEASE

DCLU Publishes Children's Hospital Helistop EIS

A Final Environmental Impact Statement (EIS) for a helistop proposed by Children's Hospital and Medical Center was released April 25 by the Seattle Department of Construction and Land Use.

The proposal, which requires City Council Conditional Use Approval, would allow construction of a helistop for the transport of critically ill and injured children to the Children's Hospital Laurelhurst campus.

The EIS discusses a new alternative to the hospital's original proposal, which called for all helicopter landings with patients destined for Children's Hospital to take place on the Children's campus. This could have resulted in as many as 40 landings per month.

The new alternative calls for the majority of the landings with patients for Children's Hospital to occur at the University of Washington Intramural Field. Landings with patients for both Children's and the University of Washington Hospital have occurred there in the past. A minority of the patient transports, in the most critical condition, would be allowed to land on the Children's Hospital campus. This could result in approximately 7 landings per month at the Children's campus. The EIS proposes an oversight panel to review the appropriateness of the landings at both facilities.

An application by Children's Hospital to allow additional landings at the University of Washington Helistop at the Intramural Field is anticipated to be filed soon with the Department of Construction and Land Use. The Director of the Department of Construction and Land Use will subsequently issue a recommendation on whether to approve, conditionally approve, or deny that proposal. At that time, a public hearing before the City's Hearing Examiner will be announced. Interested citizens will have an opportunity to comment on the proposal and the recommendation at that hearing. The Hearing Examiner will make a recommendation to the City Council; who will make the final decision on this permit.

CITY OF SEATTLE

ANALYSIS AND DECISION OF THE DIRECTOR OF

THE DEPARTMENT OF CONSTRUCTION AND LAND USE

DETERMINATION OF SIGNIFICANCE AND SCOPING NOTICE

Application Number 8405870 Comptroller's File # CC84-022

Applicant Name Children's Orthopedic Hospital and Medical Center, by Dorothy Teeter, Dir. of Planning, COHMC

Address of Proposal 4800 Sand Point Way N.E.

SUMMARY OF PROPOSED ACTION

Applicant proposes to construct an emergency helistop facility accessory to an existing hospital/medical center.

The following approvals are required:

Council Conditional Use for a helistop. Seattle Municipal Code (SMC) 23.48.05

S.E.P.A. - Environmental Determination. State Environmental Policy Act and Rules Chapter 25.05 SMC

BACKGROUND DATA

The proposed helistop site is located at Children's Orthopedic Hospital and Medical Center (COHMC), 4800 Sand Point Way N.E., within the Laurelhurst neighborhood. Within the hospital grounds, the proposed helistop site is 85 feet due north of the existing COHMC emergency room.

Land on the 9552 square foot site is generally rolling, with the steepest slope at 10%. The hillslope at the proposed site appears stable with an existing retaining wall located to the west.

COHMC is designated a Major Institution under the Seattle Land Use Code. As such it is subject to provisions in Chapters 23.48; 23.80; and 23.82 of the code. The proposed helistop site is within COHMC's major institution boundary.

The surrounding area is developed with single and multi-family residences and with community businesses.

The use of the helistop is proposed to be limited to the transportation of critically ill or seriously injured infants, children and adolescents. The number of patients per month estimated by COHMC to be transported by helicopter would average 15 to 20; each transport would generate four trips to or from COHMC, for a monthly average of between 60 and 80 helicopter trips.

Under the current system helicopters land at the University of Washington soccer field, and the patient is transferred to an ambulance for final transport to COHMC.

SEPA DETERMINATION:

☐ Exempt ☐ DNS ☒ EIS

☐ DNS involving non exempt grading or demolition or involving another agency with jurisdiction.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ANALYSIS - SEPA

The department has reviewed the proposed development and has concluded that the proposal may have a probable significant adverse environmental impact. Preliminary analysis indicates that as a part of the scoping process, areas of impact and alternatives to be discussed in the EIS should include the following:

Areas of Impact

Noise
Vibrations
Safety

Alternatives
- -alternative sites
- -alternative uses, i.e.,shared use of helicopter sites
- -no action alternative

SCOPING

Agencies, affected parties and members of the public are invited to comment on the scope of the Environmental Impact Statement prior to its preparation. You may comment on alternatives, mitigation measures, probable significant adverse impacts, and licenses or other approvals that may be required.

Comments should be in writing and received at the following address by February 3, 1986:

Beatrice Farrar Ryan, Director
Department of Construction and Land Use
Room 400 - Municipal Bldg., Seattle, WA 98104

DECISION

This decision was made after review by the responsible official on behalf of the lead agency of a completed environmental checklist and other information on file with the responsible department. This constitutes the Threshold Determination and form. The intent of this declaration is to satisfy the requirements of the State Environmental Policy Act (RCW 43.21C), including the requirement to inform the public of agency decisions pursuant to SEPA.

☐ **Determination of Non-Significance. This proposal has been determined to not have a significant adverse impact upon the environment. An EIS is not required under RCW 43.21C.030(2)(c).**

☒ **Determination of Significance. This proposal has or may have a significant adverse impact upon the environment. An EIS is required under RCW 43.21C.030(2)(c).**

There is no agency appeal.

Seattle City Council
Memorandum

Date: September 14, 1992

To: Land Use Committee

From: Ingrid Holmlund

Subject: Application of Children's Hospital and Medical Center for Council Conditional Use permits (helistops)
C.F. #297288 & #298740 / Appl. #8405870 & #9106441

Proposal: The applicant seeks Council Conditional Use permits to allow helistops accessory to Children's Hospital and Medical Center ("CHMC") at the CHMC campus and at the Intramural Activities ("IMA") Field on the University of Washington campus. The most critically ill or injured patients would land at the helistop at CHMC. The less critical patients would land at the helistop at the IMA Field and be transported by ground to CHMC. The IMA field helistop would receive more of the helicopter landings than the CHMC campus helistop. This proposal was presented as the "preferred alternative" in the FEIS.

The proposed location for the helistop on the CHMC campus would be north of the emergency room on a site known as the Kitchen Garden. This helistop would be a 40 ft. by 40 ft. concrete pad surrounded by a 48-foot radius of unobstructed grass area. A 30-inch tall fence with a locked gate would surround the circular area. Ground light would surround the site. The IMA Field helistop would be at the existing site for the University of Washington Medical Center's helistop. It would have a circular pad centered in a 150 ft. asphalt apron, with lighting similar to that for the CHMC campus helipad.

Zoning, site and surrounding properties: The CHMC campus is a 25-acre site located in Laurelhurst. The neighborhood surrounding the CHMC campus is primarily zoned single-family and developed with single-family homes. To the east of the campus is the Laurelhurst Elementary School, Laurelhurst Playfield, Battelle Memorial Institute and Villa Academy. The area to the north and west of the campus is developed with multi-family residences. Across Sand Point Way is a large Planned Unit Development. There are commercial uses along Sand Point Way.

The IMA field site is located south of the golf course driving range near the northwest corner of an IMA sports field. The site is northeast of the north parking lot for Hec Edmundson Pavilion and Husky Stadium.

Action to Date

DCLU: Issued a Determination of Significance on January 13, 1986.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT

A Final EIS was issued on April 25, 1991. On May 14, 1992, DCLU issued a report recommending that the proposal be approved, with conditions.

Hearing Examiner: On July 16, 1992, issued a recommendation that the Council grant the proposal, with revised conditions proposed by DCLU and revised conditions recommended by the Hearing Examiner.

Note: No request for further consideration of the Hearing Examiner's recommendation was submitted to the Council.

Criteria for Council conditional use decision on this proposal:

SMC 23.48.005[1] establishes the following criteria for a helistop accessory to a major institution:

1. A helistop may be permitted as a Council conditional use if the Council finds that:

   a. The helistop is needed to save lives;

   b. The helistop is located so as to minimize impacts upon surrounding residential property;

   c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

Summary of Hearing Examiner's Decision:

Satisfaction of the above criteria for Council conditional use:

Regarding these criteria, the Hearing Examiner's findings and conclusions include the following (note: the findings and conclusions stated below are selected; please refer to Hearing Examiner's decision for additional relevant findings and conclusions):

a. Helistop needed to save lives: The Examiner concluded that

---

[1] SMC 23.48.005 was superseded by SMC 23.69.012.C in 1990, but SMC 23.48.005 has been treated as applicable in this case, apparently given that CHMC submitted its original application in 1984. The language of SMC 23.69.012.C, in any event, is substantially similar to that of SMC 23.48.005.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

this criterion was satisfied. Conclusion 2. She found that CHMC has indicated that the primary reasons for helicopter transport are to reduce the time before appropriate advanced treatment can begin and to decrease patient manipulation. Finding 10. She concluded that both the CHMC campus helistop and the IMA Field helistop are necessary components of [a] medical emergency response system for critically ill children. A review of [the] medical condition of children who have been transported indicates that the children were inflicted with serious life threatening illness and that the use of ground transport could have resulted in a loss of life. Conclusion 2. See also Findings 11 - 17.

b. Helistop located so as to minimise impacts upon surrounding residential property: The Examiner found that the two primary impacts on the surrounding residential community are anticipated to be safety and noise and vibration from the helicopters. Finding 18.

Safety:

The Examiner made numerous findings regarding the analysis of safety in the EIS. She found that the final EIS analysis of the probability of an accident at the CHMC campus is based on what is considered the worst case scenario of 20 flights per month including all flight segments. (The average of 20 flights includes take-off from base, landing to pick up patient, take off with patient landing at CHMC and take-off from CHMC). Under this analysis, an accident would be statistically expected to occur less than once every 59.1 years. Under the preferred alternative, landings at the CHMC campus would be restricted to landing with the patient and take-off, with a corresponding reduction in the probability of an accident to once every 177 years. Finding 20. See also Findings 19, 21 - 23.

The Hearing Examiner also found that the designated flight path raises issues of both safety and noise. To the greatest extent possible the flight path follows bodies of water and arterials. The current flight paths are designed to reduce flights over residential neighborhoods, by flying over SR-520, Montlake Blvd and I-5 when coming from the south. The flight path to the IMA was altered when Airlift NW pilots expressed concerns regarding large numbers of birds on the athletic field during certain times of the year. According to the EIS, the possibility of a bird strike has been reduced but not eliminated by the change in flight paths. Finding 24. See also Finding 25.

Noise and vibration:

The Examiner made a number of findings about the FEIS's measurement and analysis of noise and vibration impacts. See Findings 26 - 31. The Examiner also made the following findings on noise and vibration:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Some helicopters, primarily two-bladed helicopters, produce an "impulse" noise known as "blade slap." The noise caused by blade slap distinguishes helicopter noise from other types of loud noises. The Augusta 109 used by Airlift NW, has four-bladed rotors which reduces the blade slap noise. Some of the military helicopters such as the Huey have two-bladed rotors which make more noise and cause more vibration. Restricting the use of Huey and other two-bladed rotor helicopters from landing on the CHMC campus would greatly reduce the noise and vibration impacts on the residences in the immediate vicinity. Finding 32.

Residents in the immediate vicinity of the CHMC would be impacted by noise from helicopters landing on the campus. The noise studies in the EIS show that there would be sleep interference (people awakened by nighttime flights) and that young children and older people are more affected by the noise. The extent to which the residents will be bothered depends on location, whether the windows are open or closed and the physical characteristics of the sleeper. There are measures to mitigate, but not to eliminate the noise impacts. The mitigating measures are included as recommended conditions of approval of the project. Finding 33.

Noise-induced vibration in structures depends on a variety of factors including construction type and the window size and type. . . . In the Final EIS, it was concluded that the vibration of the structures in the vicinity near CHMC was not expected to cause structural damage. . . Finding 34.

The Examiner made the following overall conclusion about the criterion of locating the helistop to minimize impacts on the surrounding residential community:

. . . the concerns of noise and safety impacts raised by the residents in the community are significant and important considerations. However, when compared to the substantial evidence of the medical necessity of air transport for children in life-threatening emergencies, the benefits of the availability of the service outweigh the occasional impacts (the highest anticipated number of flights was six per month) to the surrounding community. This conclusion is reached in significant part because of the safeguard which will ensure minimal impacts. The impacts to the community cannot be eliminated, however, the recommended conditions are designed to minimize the impacts to the greatest extent possible. Conclusion 4.

c. Use restricted to occurrences involving life-threatening emergencies: The Hearing Examiner concluded that this criterion was satisfied. Conclusion 2. The Examiner found that the decision to use [a] helicopter is made either by the physician at the referring hospital after consultation with the receiving hospital or by the paramedics, after consultation with a physician. Airlift Northwest determines which children are transported by helicopter

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

directly to CHMC campus according to established standards. . . Finding 36. (See Finding 36 for a list of these standards.) See also Findings 35, 37 - 39.

The Hearing Examiner also found that the projected number of CHMC campus helicopter landings for 1991 to 1995 is between four or five [per month]. The Public Health Department estimated six patients per month would be transported to the CHMC campus. The projected number of IMA helistop [landings] for the same period is between 12 and 13. Finding 40.

The Examiner further concluded that the standards established by Airlift NW for air transport and for landing at the CHMC campus are designed to ensure that only those children with life threatening illness are transported. It is also important to note that there is no evidence of abuse of this service under the self-monitoring system and that the likelihood of future abuse is diminished by the monitoring requirement of the Medical Review team. Conclusion 3.

Alternative sites:

The Hearing Examiner found that several alternative locations for a helistop, on and off the CHMC campus, were reviewed and rejected for a variety of reasons. See Finding 41. See also Findings 42 - 45.

Public comment:

The Hearing Examiner found that the proposal has generated a significant quantity of public comments. See Finding 49. She also found that the number of comments in favor of the project vastly exceeded the number opposed to the project. See Finding 50. She further found that a sizeable segment of the organized public opposition to the CHMC campus helistop location was represented by North East Families for Residential Neighborhoods (NEFRN). Finding 51. See Findings 51 - 54 and Conclusion 5 for Hearing Examiner's discussion of NEFRN's concerns and suggestions.

Conditions recommended by the Hearing Examiner:

The Hearing Examiner's recommendation includes revised conditions proposed by DCLU as well as the Examiner's own additions and changes to those revised conditions. See the Hearing Examiner's decision, pp. 10 - 13 and pp. 16 - 17, for language of these recommended conditions.

Seattle City Council

MEMORANDUM

DATE: August 26, 1992

TO: Persons on mailing list compiled at Hearing Examiner hearing

FROM: Ingrid Holmlund, Council Central Staff

RE: Application of Children's Hospital and Medical Center for Council Conditional Use permits (helistops)
C.F. #297288 and #298740 / Appl. #8405870 and #9106441

The City Council received no requests for further consideration of the Hearing Examiner's recommendation on the above matter.

This matter is scheduled for a sufficiency of the record meeting before the City Council Land Use Committee at its meeting on September 18, 1992. The Committee meeting begins at 9:30 a.m. and is held in the City Council Chambers on the 11th floor of the Municipal Building, 600 4th Avenue, in downtown Seattle. At this meeting, the Committee will decide whether the record established by the Hearing Examiner is sufficient for the Committee to determine its recommendation to the full Council, in accordance with the "Rules for Quasi-Judicial Proceedings Before the City Council."

If you have any questions, please call me at 684-8148.

Re: Children's Hospital and Medical Center
Application Nos. 8405870 and 9106441

Dear Members of the Council:

The Hearing Examiner, Ms. Ruperta Alexis, has recommended City Council approval for the proposed Children's helistops on the CHMC campus and at the University of Washington Intramural Field site. Children's fully supports the Examiner's recommended decision and recommended conditions of approval and requests a minor clarification.

In Conclusion 5(2), the Examiner recommended the following provision:

> The physician representative selected by the President of the Washington State Society of Pediatrics (WSSP) shall not be a CHMC ***affiliated*** pediatric physician.

Examiner's Report, p. 17 (emphasis supplied).

CHMC agrees with the intent of the above condition to exclude from the Medical Review Team a pediatric physician with significant ties to CHMC. Unfortunately, the term "affiliated" is vague and subject to potential misinterpretation.

17722\160\00045.LTR
Seattle

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

We believe that the term "affiliated", for purposes of membership on the Medical Review Team, should be defined and suggest the following (new language in bold italics):

> The physician representative selected by the President of the Washington State Society of Pediatrics (WSSP) shall not be a CHMC affiliated ***(i.e., a salaried, contracted or active physician who is a voting member of Children's medical staff)*** pediatric physician.

This definition would exclude from membership on the Review Team the 575-675 physicians, whether employed by Children's or not, who regularly admit patients to Children's and practice at Children's. This proposed definition also addresses the concern raised by NEFRN at the hearing. NEFRN stated:

> For instance, it is not at all uncommon for a physician to be a University of Washington-salaried employee, but yet work at CHMC (which is the pediatric teaching facility of the University of Washington). Additionally, grant-supported personnel have offices at CHMC, but would not be considered CHMC-salaried employees.

NEFRN Post-hearing Statement, p. 9. A definition which covers the contracted physicians and active physicians will exclude from the Review Team the UW-salaried physicians and the grant-supported physicians referred to by NEFRN. It will also exclude the 400-500 private physicians who practice actively at Children's but who are not employed by Children's, UW or grant-supported.

This proposed definition would not cover "courtesy staff" who are non-voting members of Children's medical staff and admit patients infrequently or what are known as "affiliated physicians" who receive mailings and attend education sessions at Children's but who are not members of the medical staff and don't admit patients or have staff privileges at Children's. Unless the definition is limited as we have suggested, we are concerned that nearly every pediatric physician in the state could be excluded from appointment to the Medical Review Team by the Washington State Society of Pediatrics. This would defeat the purpose of having pediatric expertise from the WSSP on the Review Team.

Norman B. Rice, Mayor

May 14, 1992

MASTER USE PERMIT

NOTICE OF DIRECTOR'S RECOMMENDATION ON COUNCIL CONDITIONAL USE, ENVIRONMENTAL DETERMINATION AND PUBLIC HEARING

Children's Hospital and Medical Center has applied for a permit to allow an emergency helistop on the CHMC campus and a second, primary helistop on the University of Washington campus near the intramural fields.

Project numbers: 8405870 and 9106441
Addresses: 4800 Sand Point Way N.E. and 2501 N.E. 45th Street
CF numbers: 297288 and 298740

The Director's recommendation is that the Council Conditional Use be conditionally approved. Recommended conditions relate to limiting noise, improving safety and monitoring of landings (types of equipment used and flight paths).

ENVIRONMENTAL DETERMINATION

DCLU has determined that the Final Environmental Impact Statement (FEIS) adequately describes and assesses the adverse impacts of the proposal. The proposal has been conditioned to mitigate impacts. Although significant noise impacts occur, the benefits of the proposal have been found to outweigh the adverse impacts.

INFORMATION AVAILABLE

Copies of the Director's Report and Recommendation and the application materials are available at the DCLU Master Use Permit Information and Notification Center, 710 Second Avenue, Suite 200, Dexter Horton Building. Questions may be directed to Faith Lumsden, Senior Land Use Specialist, 684-8875, at DCLU.

PUBLIC HEARING

A public hearing to take public comment on the Director's recommendation and to establish the record for this application will be held on **June 23, 1992**, beginning at 9:00 a.m. in Room 1310 Alaska Building, 618 Second Avenue. The first two hours of the hearing have been scheduled for presentations by DCLU and CHMC. (This location is accessible.) Citizens may call the Office of Hearing Examiner in June to confirm timing for public testimony or to request accommodations for disability.

WRITTEN COMMENTS

Written comments may be submitted through **June 23, 1992**. Comments may be sent to:

Office of Hearing Examiner
1320 Alaska Building
618 Second Avenue
Seattle, Washington 98104

Those persons who want to receive a notice of the Hearing Examiner's recommendation should specify that request in their comment letter.

HOW TO APPEAL THE ENVIRONMENTAL DETERMINATION

Appeals of the decision finding the EIS to be adequate may be submitted to the Hearing Examiner through **May 29, 1992**. Appeals should be addressed to the Hearing Examiner at the address above.

Any appeal of the SEPA determination will be heard at the conclusion of the public hearing. A second day, June 24, 1992, is available for the appeal, if necessary.

FOR IMMEDIATE RELEASE

DCLU Recommends Children's Hospital Helistop Solution

The City of Seattle Department of Construction and Land Use has published a recommendation to allow helicopter landings at Children's Hospital in Northeast Seattle for patients who are "most critically ill."

DCLU's recommendation on the hospital's request for conditional use approval to establish a helistop will next be the subject of a public hearing before the City's Hearing Examiner on June 23. City Council consideration of the helistop will follow in late summer. Approval requires City Council action.

DCLU's recommendation calls for limited landings at Children's Hospital, with the majority of helicopter landings to take place at an improved helistop located by the intramural playfields on the University of Washington campus. The recommendation also would establish limits on type of helicopter, noise restrictions and various safety standards.

DCLU's files on the helistop issue, including a detailed Environmental Impact Statement are available for public review at the Master Use Counter, Suite 200, Dexter Horton Building, 710 2nd Avenue. Project numbers for the helistop, which has been under review since 1984, are 8405870 and 9106441.

FLL MUPs #8405870 and #9106441 FLL

Suzanne Peterson, Director
Governmental Relations
Children's Hospital and Medical Center
4800 Sand Point Way Northeast
P. O. Box C-5371
Seattle, Washington 98105

Dear Ms. Peterson:

The Department of Construction and Land Use (DCLU) is preparing to publish its recommendation on the proposed helistop at Children's Hospital and Medical Center (CHMC). Prior to publication of the recommendation, CHMC must pay the fee for the time spent reviewing the project. On February 22, 1989, DCLU notified CHMC that $71.00 per hour would be charged for environmental review costs incurred after January 1, 1989. CHMC must also pay, at an hourly rate of $71.00, for all time spent on the original Council Conditional Use component.

To date, over 600 hours of land use review time have been spent on this project. Since January, 1989, approximately 84 of these hours have been charged to billable environmental review. Since January, 1985, approximately 170 hours have been charged to the Council Conditional Use component. The remaining hours were assigned to environmental review and, according to our letter of February 22, 1989, are not billable.

The majority of the billable hours for this project have been, and will continue to be, charged to the original project, #8405870. CHMC also has a second project, at the Intramural Activities Field site, #9106441. This project is an integral piece of the preferred alternative to the originally proposed CHMC helistop. Because of its more recent application date, it is subject to the current fee ordinance with an hourly charge of $110. The hourly fee for project #9106441 will be $1,798.50 for 16.35 hours. You have paid a deposit of $1,100 toward this fee, so only an additional $698.50 is owing.

In addition to the hourly fees incurred to date, we estimate a substantial number of additional billable hours will be

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

spent in the upcoming public hearings. To cover these hours, as well as the time to finalize the recommendation, we are adding 50 hours to the current bill. Following a Council decision on the project, DCLU will total the billable hours. In the unlikely event that fewer than an additional 50 hours are accounted for, the overpayment will be credited to any other fees owing or will be refunded. If more than 50 hours are shown, a new bill will be generated.

The amount owing at this time accounts for hours spent through approximately April 20, 1992, plus an estimate of time needed to complete the project.

MUP #8405870

Council Conditional Use	170 hours	
Environmental Review	84 hours	
Additional Billable (estimate)	50 hours	
TOTAL	304 X $71.00 =	$21,584.00

MUP #9106441

Council Conditional Use (average hours)	16.35 X $110.00 =	1,798.50
	less deposit	<1,100.00>
TOTAL		$ 698.50
TOTAL AMOUNT DUE		$22,282.50

5/4/92

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

BEFORE THE HEARING EXAMINER
OF THE CITY OF SEATTLE

In the Matter of the Petition of CHILDREN'S HOSPITAL AND MEDICAL CENTER Council Conditional Use	C.F. File: 297288 and 298740 DCLU Application: 8405870 and 9106441 NEFRN STATEMENT IN SUPPORT OF REVISED HELISTOP CONDITIONS

I. INTRODUCTION.

These comments on the Children's Hospital and Medical Center's ("CHMC") proposal to locate helistops at its Laurelhurst campus and at the University of Washington's nearby Graves Field are submitted on behalf of North East Families for Residential Neighborhoods ("NEFRN"). NEFRN is a non-profit corporation that was formed, in part, to assist the residential community adjacent to CHMC in reviewing and addressing the impacts of the proposed helicopter use. Its diverse membership includes residents (both property owners and tenants) of single-family, multifamily and senior housing from a range of economic backgrounds.

CHMC was established in the Laurelhurst residential neighborhood as a private children's orthopedic hospital in 1953. Although the character and uses surrounding the CHMC campus are predominantly residential (and CHMC's underlying zoning continues to be single-family), the one-time community hospital has in recent years aggressively pursued a growth policy, resulting in substantial expansion of both its facility and programs. CHMC's incremental growth (including, for instance, the construction of medical office space and a multi-level parking garage) has for the most part been permitted by the City without any serious regard for the effect on the residential neighborhood of converting a small community hospital into a mushrooming medical center. However, the land use incompatibility and cumulative environmental impacts of CHMC have become increasingly apparent with every new expansion.

Despite (or perhaps because of) the campus expansion during the last decade, CHMC continues to pursue major development and new uses for the campus. New proposed expansions (which include additions to the hospital, height increases, buffer reductions and another parking facility) are being considered as part of CHMC's first major institution master planning process. The process is in its early stages (the Master Plan Advisory Committee is still discussing scoping for the environmental

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

impact statement -- "EIS") and adoption of a final Master Plan is anticipated by the end of 1993 (per telephone conversation with Cheryl Cronander of the Department of Neighborhoods assigned to CHMC Master Plan Advisory Committee).

However, one significant CHMC proposal is conspicuously absent from the Master Plan proposed development: the CHMC campus helistop. Initially proposed by CHMC in 1984 to be served by Airlift Northwest, a hospital-sponsored emergency medical air service,[1] the helistop was the subject of a 1986 Draft EIS that substantially underestimated the number of helicopter landings projected for the campus.[2] Rather than complete the permitting and EIS process at the time, CHMC instead apparently chose to forego City approvals, while continuing to receive an increasing number of non-permitted helicopter landings. Now, after a nearly five year lapse in the permit process, CHMC has resurrected the helistop proposal, seeking its review in isolation from the substantial additional development proposed for the CHMC campus and outside of the now-established master planning process.

II. ADDITIONAL CONDITIONS ARE REQUIRED TO MITIGATE IMPACTS ON THE SURROUNDING RESIDENTIAL COMMUNITY IF THE HELISTOPS AT CHMC AND GRAVES FIELD ARE APPROVED.

The helistops proposed for the CHMC campus and the University's Graves Field can only be permitted as a Council

---

[1] Airlift Northwest was founded in 1982 by a consortium of Seattle-area regional medical centers, including the University of Washington Medical Center, Harborview Medical Center, Providence Medical Center and CHMC. See April 1991 Final EIS, Volume I, page 23. Contrary to statements made in DCLU's Analysis and Recommendation for the helistop, CHMC is not the only consortium member without a helistop on its campus; Providence Hospital, which, like CHMC, is also located in a residential neighborhood, does not have a helistop.

[2] According to the helistop's Final EIS, Airlift Northwest's actual helicopter transports to CHMC between 1986 and 1990 (which occurred even though CHMC had not obtained the required City approvals) exceeded the earlier Draft EIS projections for each of the five years as follows: actual CHMC transports exceeded projections for 1986 by 7%; 1987 by 47%; 1988 by 31%; 1989 by 68% and 1990 by 49%. The discrepancy between Airlift Northwest's actual total helicopter transports (to CHMC and other hospitals) and estimated total transports is even greater: actual total transports exceeded projections for 1986 by 4%; 1987 by 41%; 1988 by 77%; 1989 by 82% and 1990 by 96%. See April 1991 Final CHMC Helistop EIS, Volume I, page 28.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Conditional Use. SMC 23.69.012.C establishes the following criteria for review and approval of helistops proposed for sites located in a Major Institution overlay zone:

1. A helistop may be permitted as a Council conditional use if the Council finds that:

   a. The helistop is needed to save lives;

   b. The helistop is located so as to minimize impacts upon surrounding residential property;

   c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

The Land Use Code, through the Council conditional use criteria described in Section II above, seeks to establish a balance between CHMC's goals and the City's obligation to protect surrounding residents and properties from the incompatible helistop use and its associated impacts. Permitting all emergency medical service helicopter landings only at the Graves Field site would strike such a balance.

Nonetheless, CHMC continues to support (and DCLU has recommended) a proposal for joint use of the CHMC campus site and the Graves Field site, identified in the FEIS as CHMC's "preferred Alternative". Should the Hearing Examiner determine that the two-site proposal is generally consistent with the conditional use criteria, additional conditions and modification of DCLU-proposed conditions are necessary to ensure that the helistop, once constructed and in operation, remains consistent with the criteria for approval and with the impacts and mitigation measures identified in the EIS and the DCLU Analysis and Recommendation. A separate statement of the text of NEFRN's proposed conditions for the helistop approvals is attached for the Examiner's review; the basis for each of the proposed conditions is discussed in detail below.

Condition No. 1:

Approval of the helistop at the Children's Hospital Medical Center (CHMC) Kitchen Garden site is temporarily granted for a period not to exceed two (2)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

years. During this time, the helistop proposal for the Kitchen Garden site shall be reviewed as part of the CHMC Master Planning process.

If, through the Master Planning process, City Council approves a more permanent helistop at the Kitchen Garden site, conditions contained in this temporary approval of the helistop at the Kitchen Garden site shall be incorporated into the adopted CHMC Master Plan, together with any additional conditions that may be identified and required by City Council. The Kitchen Garden helistop shall cease operation at the end of this temporary approval period if the helistop is not approved in the CHMC Master Plan.

Discussion:

NEFRN proposes a temporary conditional use approval for the helistop. Temporary approval allows CHMC to legally operate its helistop facility, and provides the City and neighborhood some limited control over its impacts, until the full implications of the helistop can be evaluated in the context of CHMC's expansion and Master Plan. Such coordinated environmental and land use review of the helistop and proposed campus expansion is essential in order to determine whether the expanded facilities and activities proposed in the CHMC Master Plan (such as the increase in beds) will precipitate increased use of the helistop--perhaps beyond unacceptable levels. See Attachment A, description of Master Plan Proposal distributed April 20, 1992 to Master Plan Advisory Committee. Further, the CHMC Master Plan proposal to significantly increase the allowable building height from 50 feet to 105 feet above and around the Kitchen Garden site must be reviewed for its potential effect on the proposed helistop. See Attachment B, Proposed Height Standards, distributed April 20, 1992 to Master Plan Advisory Committee.

Despite the obvious advantages (and legal mandate) to coordinate environmental and land use review of concurrent development on the CHMC campus, there is no reference in the helistop EIS to CHMC's proposed expansion and pending Master Plan. Similarly, the CHMC Master Plan seems to indicate that the helistop is either non-existent, or is an approved, existing facility, rather than a proposed project like the rest of the Master Plan development. See Attachment C, proposed Master Plan illustrations distributed April 20, 1992 to Master Plan Advisory Committee. The relationship between CHMC's proposed expanded activities and facilities and the helistop should be evaluated in the CHMC Master Plan. A condition making the helistop approval temporary pending completion of the Master Plan process would ensure that the Master Plan process would not be frustrated by piecemeal approval of the helistop.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Condition No. 2:

> Approval and operation of the Kitchen Garden helistop on the CHMC campus is dependent upon concurrent approval and operation of the Intramural Activities/Graves Field site. If, for any reason, the Graves Field helistop is not approved, or ceases operation after approval, the use of the Kitchen Garden site shall not be expanded in any way beyond this conditional approval.

Discussion:

NEFRN's proposed clarifying condition addresses the relationship between the Kitchen Garden and Graves Field helistops, and particularly the use of the Kitchen Garden site in the absence of the Graves Filed helistop.

Both CHMC and DCLU support the joint approval of helistops at the Kitchen Garden and Graves Field sites and link them inextricably. Yet, DCLU does not carry over this link to its approval conditions, even though its Analysis and Recommendation concludes that the Graves Field site actually serves as impact mitigation, by reducing the number of helicopter landings that might otherwise be directed to the CHMC campus:

> Under the Preferred Alternative, only the most critically ill or injured patients would land at Children's. Most flights would land at the IMA [Graves] Field and the patients would be transported by ground ambulance to the hospital...
>
> * * *
>
> The Graves Field helistop works to minimize flights to the Children's campus, further minimizing impacts to the hospital neighborhood . . . The Department concludes the IMA/Graves Field helistop, as an integral piece of the CHMC preferred alternative, meets the required conditional use criteria.

See May 14, 1992 DCLU Analysis and Recommendation, pages 10 and 18.

Thus, while DCLU relies on the ability of Graves Field to accept the majority of CHMC-bound helicopters, the DCLU-recommended conditions do not include language necessary to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ensure that this intent is carried out so that the Graves Field site, which is not owned and controlled by CHMC but by the University of Washington, would continue to be available to CHMC for as long as the Kitchen Garden helistop is in operation. NEFRN's proposed condition clarifies that the Kitchen Garden site cannot be used to accommodate additional, less-essential landings in the event the Graves Field site should be discontinued. Alternatively, the Hearing Examiner could require that the Kitchen Garden helistop shall only be operated if the Graves Field site is available to reduce helicopter demand and help minimize unauthorized landings.

Condition No. 3:

> Approval for the helistop on the CHMC campus is limited solely to the proposed Kitchen Garden site as shown on Figure 5 of the April 1991 Final Environmental Impact Statement. Location of the helistop on any other portion of the CHMC campus will require additional environmental review and new land use approvals, including as part of the CHMC Master Plan review process.

Discussion:

NEFRN'S proposed condition prohibits the operation of the helistop on any CHMC campus site other than the Kitchen Garden site currently before the Examiner for approval without going through a new, complete environmental review and permitting process. Both DCLU and CHMC have identified and evaluated the Kitchen Garden site as the location of the CHMC campus helistop; the approval conditions should therefore specify that the conditional use permit, if granted, is not a general license for any CHMC campus location (which might entail different impacts, flight paths, and safety considerations), but is specific to the Kitchen Garden site. It is not uncommon for an applicant, particularly a major institution, to request site "substitutions" after approval for a particular use or facility is granted, and public and Hearing Examiner scrutiny has abated. In this case, the possibility of a site substitution is heightened by CHMC's apparent failure to specifically commit to the Kitchen Garden helistop location pad in its proposed Master Plan, and by its concurrent, unexplained request for substantial building height increases for the Kitchen Garden site. See Attachments B and C. Site substitution in this case would be well beyond the scope of the helistop conditional use analysis; indeed, DCLU has already determined in its analysis that no alternative sites on the CHMC campus are appropriate for a helistop:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

On-campus locations other than the Kitchen Garden site will not be discussed in this report. The Department has concluded that if helicopter landings are allowed to continue of the CHMC campus, they should be made at the most open, flat, and nearest location to the emergency room...the alternative on-campus locations [considered in the EIS] are located either closer to neighboring residential and educational properties or on steeper or depressed terrain that would be somewhat less safe for landings and take-off.

Condition No. 4:

Only the most critical and life-threatening medical emergencies shall be allowed to land at CHMC. All other patients shall land at the Intramural Activities field site. The initial decision whether to land at the Kitchen Garden site or the Intramural Activities field is to made by the referring physician and/or attending medical team. For patients whose condition deteriorates in flight, the medical team on board the helicopter may decide to land at CHMC. The following conditions indicate a landing at CHMC is appropriate:

a. unstable airway;
b. inability to ventilate/oxygenate;
c. inability to maintain adequate cardiac output;
d. inability to maintain adequate cerebral bloodflow; or
e. the persistence of unstable vital signs despite heroic attempts to control them.

Discussion:

NEFRN supports DCLU Condition No. 1 as recommended.

Condition No. 5:

Landings at the CHMC Kitchen Garden site shall not exceed an average of 6 landings per month (calculated for each three-month quarter) and shall not exceed 15 landings in any given month. Additional landings that are clearly due to catastrophic events shall not be subject to the above limitations.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Discussion:

NEFRN proposes a condition that will limit the use of the Kitchen Garden helistop to approximately the level of use established in the Final EIS. Although the Final EIS and DCLU Analysis and Recommendation clearly represented that "only the most critically ill and injured patients [would] land at a helistop that would be constructed at the Kitchen Garden site," DCLU's decision is void of any substantive condition limiting the number of landings to those that formed the basis of the environmental review and DCLU's analysis. Without such a threshold, residents surrounding CHMC and directly in the flight paths will have little hope of limiting impacts to the levels represented in the Final EIS.

The need for definitive limits on the number of landings at the Kitchen Garden helistop, consistent with the very same EIS analysis on which DCLU bases its recommended approval, is apparent in the Final EIS. Draft EIS projections of the number of landings at CHMC for a future five-year period substantially underestimated the growth in the use of emergency helicopter service on the CHMC campus. The Final EIS identifies some of the factors which can contribute to an increase in emergency helicopter service:

> advances in medical technologies; growth in population of children; inability to predict disasters -such as toxic spills, nuclear facility accidents, earthquakes; increase poverty that results in the increase in premature births; changes in hospital referral patterns or the capabilities of Children's or of other community hospitals..."

Thus, without established limits within which CHMC is permitted to operate the helistop, the intensity of the helistop use at the Kitchen Garden site could easily and quickly exceed the level of use that formed the basis of the conditional use approval.

The Final EIS estimates that there will be approximately 3 to 5 landings per month at the Kitchen Garden site if only the most critically ill patients are flown directly to the CHMC campus. See April 1991 Final EIS, Volume I, page 72. Elsewhere in the Final EIS and the DCLU Analysis and Recommendation, the Director of the Seattle-King County Department of Public Health estimated the number of landings at the Kitchen Garden site to be 6. See April 1991 Final EIS, Volume III, Appendix A, page A-7 and May 14, 1992 DCLU Analysis and Recommendation, page 18. Finally, according to CHMC's listing of critically ill and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

injured patients transported directly to CHMC from 1985 to 1989, only once during the approximately four and one-half year period did the number of landings reach 7 per month; the average number of monthly landings were 2.5 (1985), 3.1 (1986), 3.5 (1987), 3 (1988), and 4.7 (1989).

Therefore, based on the above EIS projections and historical records, it is reasonable to establish landing thresholds at an average of 6 landings per month (averaged over a three month interval, or quarterly, to be concurrent with the medical review committee meetings), with a maximum of 9 landings for any given month. Maintaining these thresholds will help ensure that the proposed helistop remains consistent with representations made in the Final EIS, which form the record basis for DCLU's recommended approval.

Condition No. 6:

> Only Augusta 109 helicopters, with a four-bladed rotor, shall be permitted to land at the CHMC campus helistop, in order to reduce noise impacts and reduce the potential for helicopter accidents in the CHMC area. Should Airlift Northwest or another aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Augusta 109 studied in the EIS, a supplemental EIS must first be prepared to evaluate the noise impacts of the new equipment, and new land use approvals must first be obtained. Two-bladed rotor helicopters, such as but not limited to the Huey helicopters typically used by the Military Assistance to Safety and Traffic (MAST), Coast Guard, and Navy, are prohibited from landing at the CHMC campus.

Discussion:

NEFRN proposes several revisions to DCLU recommended Conditions No. 2 and No. 7[3] in order to more effectively preclude use of the CHMC campus helistop by larger, more noisy, unauthorized helicopters. NEFRN's revisions focus on the helicopter and not the service organization flying them.

DCLU correctly determined in its Analysis and Recommendation that helicopter landings at the CHMC campus should be limited to "helicopters no noisier than the Augusta 109." See May 14, 1992

---

[3] At the start of the hearing, DCLU itself indicated it would propose revisions to conditions concerning Huey helicopters and the use of helicopters by MAST, the Coast Guard and the Navy.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

DCLU Analysis and Recommendation, page 19. According to the Final EIS, the Augusta 109, with its four-bladed rotor, "represents near-current low-noise helicopter design." See April 1991 Final EIS, Volume I, page 112. Noise generated by other two-bladed rotor helicopters, such as those used by MAST, the Coast Guard and the military (commonly referred to as the Huey), "would be more noticeable than [the noise] of the Augusta because of more blade slap" that is inherent with two-bladed rotor helicopters. See April 1991 Final EIS, Volume I, page 118.

In its attempts to minimize noise impacts to both the nearby residents and schools, DCLU-proposed Conditions No. 2 and No. 7, which preclude MAST, Coast Guard and Navy helicopters from using the campus helistop and restrict use of the campus helistop to helicopters with four-bladed rotors, respectively. In addition, DCLU permitted helicopter substitution in Condition No. 7 if noise impacts were "shown" to be no greater than those of the Augusta 109. While these conditions seek additional impact mitigation for the residential neighborhood, they fall short of providing the intended elimination of noise-generating helicopters.

For instance, DCLU's proposed Condition No. 2 inappropriately focuses on the service organization and not on the type of noise-generating helicopter typically used by the organization. Moreover, DCLU's provision in Condition No.7 for a helicopter substitution based simply on a "showing" of reduced noise, does not address the need for expert noise analysis of any newly proposed helicopter, nor the public's right to participate in the review process.

NEFRN's proposed revisions address these concerns. In addition, NEFRN has included a limitation on the size of the landing pad (20 feet X 20 feet) to more accurately reflect FAA Guidelines for the Augusta 109 and help discourage use by other, unauthorized larger helicopters, such as the prohibited Huey. As currently proposed by CHMC, the 40 foot X 40 foot landing pad unnecessarily, and by the Final EIS' own admission, "exceeds the requirement for size and weight limitations" of the Augusta, and, in fact, would meet the FAA landing pad specifications for the Huey. See Attachment D, April 1991 Final EIS, Volume III, Appendix B, Table B-1. See also April 1991 Final EIS, Volume I, page 100.

Condition No. 7:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A Medical Review Committee shall be established to review compliance with Conditions 4, 5 and 6, allowing only the most critically ill patients and only certain helicopters to land at CHMC. The Committee shall consist of the following 5 members:

a. One representative of CHMC selected by the Chief Executive Officer, who will co-chair the Committee with the representative from the Laurelhurst Community Club (LCC) described below;

b. One representative of the Laurelhurst residential neighborhood selected by the LCC, who will co-chair the Committee with the CHMC representative;

c. Two general non-CHMC-affiliated pediatric practitioners (primary care physicians), to be nominated and agreed upon by both the CHMC and LCC members in a) and b) above;

d. One representative with experience in emergency airlift services, to be nominated and agreed upon by both the CHMC and LCC members in a) and b) above.

Committee members will be appointed for up to a three year term, with replacements to be made by the original appointing authority. Committee members in b), c) and d) shall have no affiliation with CHMC, the University of Washington Hospital, Airlift Northwest or other organization that may present a potential conflict of interest, or the appearance of a conflict of interest. Nominees for positions c) and d) above shall submit to the CHMC and LCC Committee members a statement disclosing any potential conflict of interest, including but not limited to any past or present affiliation with CHMC, the University of Washington Hospital and Airlift Northwest, which can be evaluated by CHMC and LCC.

The Committee shall meet quarterly to review and evaluate helicopter transports to CHMC. To facilitate this review, CHMC will make available to the Committee all helicopter and medical data relating to each landing, including the number and type of helicopter landings, progress notes from the transport team and transfer notes from the referring institution and physician. It will be CHMC's responsibility to ensure patient-identifying information is removed prior to release of medical data to the Committee. The Committee shall evaluate the data to determine whether the use of air transport directly to the CHMC campus

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

was justified in each case and whether the operation of the helistop complies with Conditions 4, 5 and 6. The Committee evaluations shall be included in a report submitted after each quarterly review meeting to the Department of Construction and Land Use (DCLU), the Chief Executive Officer of CHMC, LCC, the Airlift Northwest Executive Committee and Medical Director, and the Citizens' Advisory Committee for CHMC Master Plan. The report shall be made available to the public upon request and for a reasonable duplicating fee.

The Committee shall adopt rules and procedures as necessary to ensure compliance with laws and administrative rules governing confidentiality of patient medical records, while also providing for public input and review of the Committee's work. Each Committee member for positions b), c) and d) above will be compensated for his/her service on the Committee at the rate of $100.00 per landing, and all Committee members may be reimbursed for reasonable out-of-pocket expenses identified by the rules promulgated by the Committee. Compensation and expense reimbursement shall be paid by CHMC. CHMC shall provide administrative and staff support needed by the Committee, including assistance in preparing the quarterly report for Committee review and approval.

The Committee shall monitor CHMC helicopter landings for as long as there remains a helistop on the CHMC campus. Changes in Committee structure and operation shall be made only upon concurrence by CHMC, LCC and DCLU.

Discussion:

CHMC and DCLU have proposed in DCLU recommended Condition No. 3 that a medical review committee be established to monitor compliance with permit conditions restricting landings on the CHMC campus. While monitoring is no substitute for effective, tangible mitigation, this proposed mitigation measure will be rendered particularly ineffective in the absence of substantial revisions proposed by NEFRN regarding the composition and compensation of the committee. NEFRN's revisions are required in order to ensure a neutral, objective and complete monitoring of helistop landings.

One of the most serious flaws in the DCLU proposed committee is its composition. For the committee to have any credibility and for it to be able to freely review helistop landings and information, it is essential that no committee member have a real or perceived conflict of interest with CHMC. To the contrary,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the committee membership proposed by DCLU is actually weighted very heavily in favor of CHMC.

For instance, the "qualified neonatologist, pediatric intensivist or pediatric emergency physician" representatives are all specialized, tertiary care physicians (as opposed to more generalized, primary care physicians who would likely be on the referring end of any helicopter transport); if from the local area, it is very likely that each would have present or former ties with the University of Washington (which uses CHMC as its pediatric teaching facility), or, even more likely, with CHMC itself. While the current President of the Washington State Medical Association, responsible under DCLU's proposed conditions for appointing one of the above tertiary specialists, does not at this time appear to be directly employed by the University or CHMC, it would not be at all unusual for this to occur.

Indeed, such is the case with the President of the Washington State Society of Pediatrics, Edgar Marcuse. Although he is the Director of CHMC's Ambulatory Care unit, Marcuse would nonetheless be empowered to select one of the five committee members. Thus, when Marcuse's committee appointment is combined with CHMC's own direct representative and the CHMC-trained or -employed tertiary specialist, CHMC would be able to highly influence the composition and decisionmaking of the committee under DCLU's proposal. In addition, under DCLU's proposed condition, there are no safeguards to ensure that the anticipated "citizen representative" does not work or perform other services for CHMC or a CHMC affiliate.

NEFRN's proposed condition establishes a more balanced committee with decision-making shared by CHMC and community representatives (co-chairs). Actual and potential conflicts of interests would be identified and screened by the committee co-chairs. Unlike the DCLU proposal which unreasonably anticipates a volunteer monitoring committee, CHMC would budget for and pay committee members modestly for their review of the circumstance of each helistop landing. Such compensation is essential due to the amount of review time required (thoughtful review of medical notes and deliberation on approximately 18 cases or landings each quarter). This same compensation will also help maintain committee continuity, reduce absenteeism, and most importantly, will enable the selection of committee members that are beyond the local area and, therefore, CHMC's sphere of influence.

Another critical aspect of NEFRN's proposed condition calls for committee monitoring throughout the operation of the helistop. The committee is the conduit through which DCLU and the public can obtain and review helicopter landing information that is not first processed by CHMC. Without the committee, access to such information, and the ability to enforce compliance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

with permit conditions, will be extremely limited. And while monitoring and enforcement are important under static conditions, these functions take on increasing importance as CHMC pursues the expansion proposed in its Master Plan. Unforeseen or planned changes to the CHMC campus and program, or to the Graves Field site, could easily affect helistop landings at the Kitchen Garden site and potentially increase the pressure for CHMC to expand its emergency air service beyond that approved by the conditional use. The monitoring committee should thus be provided for the life of the helistop project to ensure ongoing compliance with permit conditions.

Condition No. 8:

> CHMC shall report on a quarterly basis to the Committee and to the community the number and nature of helicopter landings at the Intramural Activities/Graves Field site.

Discussion:

NEFRN supports the DCLU recommended Condition No. 3 with the revision that the CHMC-produced quarterly lists of landings be provided to the monitoring committee, in addition to the normal neighborhood distribution. Although the list is distinct from the more-detailed and unaltered information provided to the committee in accordance with Condition No. 7, it can be used by the committee, in part, to cross-reference and confirm the consistency of the public lists with separately provided committee information.

Condition No. 9:

> Use of the CHMC campus helistop is limited solely to the transport of patients (and accompanying medical transport teams). Helicopters shall not be allowed to land at CHMC campus to transport medical staff prior to (or after) patient transport, or to transport organs, tissue, medical treatments, medical equipment or any other material not specifically required for and accompanying a patient.

Discussion:

DCLU recommends that the Kitchen Garden helistop be used only for the "most critical and life-threatening medical emergencies" as proposed in CHMC's Preferred Alternative in the Final EIS. See May 14, 1992 DCLU Analysis and Recommendation, Condition No. 1. Part of this limitation is the DCLU recommended

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

prohibition (Condition No. 5) against transporting medical staff when not accompanied by a patient requiring treatment. NEFRN supports this condition and proposes additional detailed limitations on the transport of other non-patient related items. Such specificity is required in order to eliminate ambiguity regarding future landings and potential CHMC requests to expand the use of its helicopter service.

Condition No. 10:

DCLU shall review the quarterly reports of the Medical Review Committee. More than one landing in violation of Condition No. 4, 5 or 6, above, in any given month shall be grounds for DCLU suspension of the helistop permit for the Kitchen Garden site. CHMC may request reinstatement of the suspended conditional use permit by appealing to the Hearing Examiner, who shall then hold a public hearing during which CHMC and the general public may offer testimony regarding the violations, suspension and requested reinstatement. The Hearing Examiner shall reinstate the helistop conditional use permit based only on effective, specific corrective measures that will be implemented to prevent repeated violations.

Discussion:

NEFRN proposes specific enforcement thresholds that reflect CHMC and DCLU representations in the environmental review documents regarding the intensity of use and level of impacts. In situations where a significantly incompatible use such as the helistop is imposed on a residential community, it is the City's obligation to clearly define the limits of tolerance and ensure that permit violations, particularly those involving substantial impacts, are swiftly acted upon. The NEFRN condition clearly provides a specific enforcement threshold that is reasonable and consistent with CHMC's stated intensity of use (plus some leeway); it also provides a public process through which concerns can be raised and resolved.

Condition No. 11:

The flight paths for approach and departure to the CHMC and Intramural Activities/Graves Field helistops shall be strictly maintained as described in the Final EIS and shall to the greatest extent possible avoid residential areas. All helicopters shall follow the primary flight path along Northeast 45th Street and Sand Point Way, entering the CHMC campus from the north

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and northwest. The secondary flight path, which enters the CHMC campus from the northeast over the residential neighborhood, shall be followed only when winds out of the northwest quadrant are in excess of approximately 17 knots. Airlift Northwest and any other regular carrier shall establish a training program to introduce all pilots to the approved flight paths.

More than one deviation from or unjustified use of the approved flight paths per month shall be grounds for DCLU suspension of the helistop permit at the Kitchen Garden site. CHMC may request reinstatement of the suspended conditional use permit by appealing to the Hearing Examiner, who shall then hold a public hearing during which CHMC and the general public may offer testimony regarding the violations, suspension and requested reinstatement. The Hearing Examiner shall reinstate the helistop conditional use permit based only on effective, specific corrective measures that will be implemented to prevent repeated violations.

Discussion:

Similar to Condition No. 10 above, NEFRN proposes a specific enforcement threshold that reflects CHMC and DCLU representations in the environmental review documents regarding the helicopter flight patterns. The condition also specifies the flight patterns described in the Final EIS and the conditions under which they shall be followed. See April 1991 Final EIS, Volume I, pages 55 through 58.

Condition No. 12:

Prior to beginning regular use of the Kitchen Garden helistop, all Airlift Northwest (ALNW) pilots shall make at least one test landing and take-off at the site. CHMC and ALNW shall schedule the training/test flights for a weekday between the hours of noon and 3:00 p.m. Advance notice of at least ten (10) days shall be given to the surrounding communities of the test/training time, date and expected number of flights. The number of flights shall be held to the minimum necessary to provide adequate training.

Discussion:

NEFRN supports DCLU condition No. 9 as recommended.

Condition No. 13:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

New pilots shall make at least one landing at CHMC under supervision of a pilot experienced in landing at CHMC prior to unsupervised patient transport landings. Non-patient transport training flights, if desired, may be scheduled no more than twice per year without approval from DCLU. Notice of training flights shall be provided to surrounding communities as stated in Condition 13.

Discussion:

NEFRN supports DCLU condition No. 10 as recommended.

DATED this 24 day of June, 1992.

BEFORE THE HEARING EXAMINER
OF THE CITY OF SEATTLE

In the Matter of the Petition of CHILDREN'S HOSPITAL AND MEDICAL CENTER	C.F File: 297288 and 298740 DCLU Application: 8405870 and 9106441
Council Conditional Use	NEFRN-PROPOSED MINIMUM CONDITIONS FOR THE HELISTOP AT THE KITCHEN GARDEN SITE

NEFRN proposes that the following minimum conditions be recommended by the Hearing Examiner for approval by City Council in the event the helistop Council Conditional Use is approved by the City:

1. Approval of the helistop at the Children's Hospital Medical Center (CHMC) Kitchen Garden site is temporarily granted for a period not to exceed two (2) years. During this time, the helistop proposal for the Kitchen Garden site shall be reviewed as part of the CHMC Master Planning process.

   If, through the Master Planning process, City Council approves a more permanent helistop at the Kitchen Garden site, conditions contained in this temporary approval of the helistop at the Kitchen Garden site shall be incorporated into the adopted CHMC Master Plan, together with any additional conditions that may be identified and required by City Council. The Kitchen Garden helistop shall cease operation at the end of this temporary approval period if the helistop is not approved in the CHMC Master Plan.

   [New NEFRN Condition]

2. Approval and operation of the Kitchen Garden helistop on the CHMC campus is dependent upon concurrent approval and operation of the Intramural Activities/Graves Field site. If, for any reason, the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Graves Field helistop is not approved, or ceases operation after approval, the use of the Kitchen Garden site shall not be expanded in any way beyond this conditional approval.

[New NEFRN Condition].

3. Approval for the helistop on the CHMC campus is limited solely to the proposed Kitchen Garden site as shown on Figure 5 of the April 1991 Final Environmental Impact Statement. Location of the helistop on any other portion of the CHMC campus will require additional environmental review and new land use approvals, including as part of the CHMC Master Plan review process.

[New NEFRN Condition]

4. Only the most critical and life-threatening medical emergencies shall be allowed to land at CHMC. All other patients shall land at the Intramural Activities field site. The initial decision whether to land at the Kitchen Garden site or the Intramural Activities field is to made by the referring physician and/or attending medical team. For patients whose condition deteriorates in flight, the medical team on board the helicopter may decide to land at CHMC. The following conditions indicate a landing at CHMC is appropriate:

   a. unstable airway;
   b. inability to ventilate/oxygenate;
   c. inability to maintain adequate cardiac output;
   d. inability to maintain adequate cerebral bloodflow; or
   e. the persistence of unstable vital signs despite heroic attempts to control them.

[DCLU Condition No. 1]

5. Landings at the CHMC Kitchen Garden site shall not exceed an average of 6 landings per month (calculated for each three-month quarter) and shall not exceed 15 landings in any given month. Additional landings that are clearly due to catastrophic events shall not be subject to the above limitations.

[New NEFRN Condition]

6. Only Augusta 109 helicopters, with a four-bladed rotor, sha..l be permitted to land at the CHMC campus helistop, in order to reduce noise impacts and reduce the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

potential for helicopter accidents in the CHMC area. Should Airlift Northwest or another aeromedical vendor seek to establish regular flights to CHMC in helicopters other than the Augusta 109 studied in the EIS, a supplemental EIS must first be prepared to evaluate the noise impacts of the new equipment, and new land use approvals must first be obtained. Two-bladed rotor helicopters, such as but not limited to the Huey helicopters typically used by the Military Assistance to Safety and Traffic (MAST), Coast Guard, and Navy, are prohibited from landing at the CHMC campus.

To help ensure that the above restriction is observed, the size of the helicopter concrete landing pad at the Kitchen Garden site shall not exceed 20 feet by 20 feet.

[Revised DCLU Conditions No. 2 and No. 7]

7. A Medical Review Committee shall be established to review compliance with Conditions 4, 5 and 6, allowing only the most critically ill patients and only certain helicopters to land at CHMC. The Committee shall consist of the following 5 members:

a. One representative of CHMC selected by the Chief Executive Officer, who will co-chair the Committee with the representative from the Laurelhurst Community Club (LCC) described below;

b. One representative of the Laurelhurst residential neighborhood selected by the LCC, who will co-chair the Committee with the CHMC representative;

c. Two general non-CHMC-affiliated pediatric practitioners (primary care physicians), to be nominated and agreed upon by both the CHMC and LCC members in a) and b) above;

d. One representative with experience in emergency airlift services, to be nominated and agreed upon by both the CHMC and LCC members in a) and b) above.

Committee members will be appointed for up to a three year term, with replacements to be made by the original appointing authority. Committee members in b), c) and d) shall have no affiliation with CHMC, the University of Washington Hospital, Airlift Northwest or other organization that may present a potential conflict of interest, or the appearance of a conflict of interest. Nominees for positions c) and d) above shall submit to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the CHMC and LCC Committee members a statement disclosing any potential conflict of interest, including but not limited to any past or present affiliation with CHMC, the University of Washington Hospital and Airlift Northwest, which can be evaluated by CHMC and LCC.

The Committee shall meet quarterly to review and evaluate helicopter transports to CHMC. To facilitate this review, CHMC will make available to the Committee all helicopter and medical data relating to each landing, including the number and type of helicopter landings, progress notes from the transport team and transfer notes from the referring institution and physician. It will be CHMC's responsibility to ensure patient-identifying information is removed prior to release of medical data to the Committee. The Committee shall evaluate the data to determine whether the use of air transport directly to the CHMC campus was justified in each case and whether the operation of the helistop complies with Conditions 4, 5 and 6. The Committee evaluations shall be included in a report submitted after each quarterly review meeting to the Department of Construction and Land Use (DCLU), the Chief Executive Officer of CHMC, LCC, the Airlift Northwest Executive Committee and Medical Director, and the Citizens' Advisory Committee for CHMC Master Plan. The report shall be made available to the public upon request and for a reasonable duplicating fee.

The Committee shall adopt rules and procedures as necessary to ensure compliance with laws and administrative rules governing confidentiality of patient medical records, while also providing for public input and review of the Committee's work. Each Committee member for positions b), c) and d) above will be compensated for his/her service on the Committee at the rate of $100.00 per landing, and all Committee members may be reimbursed for reasonable out-of-pocket expenses identified by the rules promulgated by the Committee. Compensation and expense reimbursement shall be paid by CHMC. CHMC shall provide administrative and staff support needed by the Committee, including assistance in preparing the quarterly report for Committee review and approval.

The Committee shall monitor CHMC helicopter landings for as long as there remains a helistop on the CHMC campus. Changes in Committee structure and operation shall be made only upon concurrence by CHMC, LCC and DCLU.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

[Revised DCLU Condition No. 3]

8. CHMC shall report on a quarterly basis to the Committee and to the community the number and nature of helicopter landings at the Intramural Activities/Graves Field site.

[Revised DCLU Condition No. 4]

9. Use of the CHMC campus helistop is limited solely to the transport of patients (and accompanying medical transport teams). Helicopters shall not be allowed to land at CHMC campus to transport medical staff prior to (or after) patient transport, or to transport organs, tissue, medical treatments, medical equipment or any other material not specifically required for and accompanying a patient.

[Revised DCLU Condition No. 5]

10. DCLU shall review the quarterly reports of the Medical Review Committee. More than one landing in violation of Condition No. 4, 5 or 6, above, in any given month shall be grounds for DCLU suspension of the helistop permit for the Kitchen Garden site. CHMC may request reinstatement of the suspended conditional use permit by appealing to the Hearing Examiner, who shall then hold a public hearing during which CHMC and the general public may offer testimony regarding the violations, suspension and requested reinstatement. The Hearing Examiner shall reinstate the helistop conditional use permit based only on effective, specific corrective measures that will be implemented to prevent repeated violations.

[Revised DCLU Condition No. 6.]

11. The flight paths for approach and departure to the CHMC and Intramural Activities/Graves Field helistops shall be strictly maintained as described in the Final EIS and shall to the greatest extent possible avoid residential areas. All helicopters shall follow the primary flight path along Northeast 45th Street and Sand Poirt Way, entering the CHMC campus from the north and northwest. The secondary flight path, which enters the CHMC campus from the northeast over the residential neighborhood, shall be followed only when winds out of the northwest quadrant are in excess of approximately 17 knots. Airlift Northwest and any other regular carrier shall establish a training program to introduce all pilots to the approved flight paths.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

More than one deviation from or unjustified use of the approved flight paths per month shall be grounds for DCLU suspension of the helistop permit at the Kitchen Garden site. CHMC may request reinstatement of the suspended conditional use permit by appealing to the Hearing Examiner, who shall then hold a public hearing during which CHMC and the general public may offer testimony regarding the violations, suspension and requested reinstatement. The Hearing Examiner shall reinstate the helistop conditional use permit based only on effective, specific corrective measures that will be implemented to prevent repeated violations.

[Revised DCLU Condition No. 8.]

12. Prior to beginning regular use of the Kitchen Garden helistop, all Airlift Northwest (ALNW) pilots shall make at least one test landing and take-off at the site. CHMC and ALNW shall schedule the training/test flights for a weekday between the hours of noon and 3:00 p.m. Advance notice of at least ten (10) days shall be given to the surrounding communities of the test/training time, date and expected number of flights. The number of flights shall be held to the minimum necessary to provide adequate training.

[DCLU Condition No. 9.]

13. New pilots shall make at least one landing at CHMC under supervision of a pilot experienced in landing at CHMC prior to unsupervised patient transport landings. Non-patient transport training flights, if desired, may be scheduled no more than twice per year without approval from DCLU. Notice of training flights shall be provided to surrounding communities as stated in Condition 13.

[DCLU Condition No. 10.]

Seattle Department of Construction and Land Use

Laura Gilbert, Acting Director
Norman B. Rice, Mayor

May 14, 1992

RECEIVED BY
92 MAY 15 AM 10:27
OFFICE OF
HEARING EXAMINER

MASTER USE PERMIT

NOTICE OF DIRECTOR'S RECOMMENDATION ON COUNCIL CONDITIONAL USE, ENVIRONMENTAL DETERMINATION AND PUBLIC HEARING

Children's Hospital and Medical Center has applied for a permit to allow an emergency helistop on the CHMC campus and a second, primary helistop on the University of Washington campus near the intramural fields.

Project numbers: 8405870 and 9106441
Addresses: 4800 Sand Point Way N.E. and 2501 N.E. 45th Street
CF numbers: 297288 and 298740

The Director's recommendation is that the Council Conditional Use be conditionally approved. Recommended conditions relate to limiting noise, improving safety and monitoring of landings (types of equipment used and flight paths).

ENVIRONMENTAL DETERMINATION

DCLU has determined that the Final Environmental Impact Statement (FEIS) adequately describes and assesses the adverse impacts of the proposal. The proposal has been conditioned to mitigate impacts. Although significant noise impacts occur, the benefits of the proposal have been found to outweigh the adverse impacts.

INFORMATION AVAILABLE

Copies of the Director's Report and Recommendation and the application materials are available at the DCLU Master Use Permit Information and Notification Center, 710 Second Avenue, Suite 200, Dexter Horton Building. Questions may be directed to Faith Lumsden, Senior Land Use Specialist, 684-8875, at DCLU.

PUBLIC HEARING

A public hearing to take public comment on the Director's recommendation and to establish the record for this application will be held on **June 23, 1992**, beginning at 9:00 a.m. in Room 1310 Alaska Building, 618 Second Avenue. The first two hours of the hearing have been scheduled for presentations by DCLU and CHMC. (This location is accessible.) Citizens may call the Office of Hearing Examiner in June to confirm timing for public testimony or to request accommodations for disability.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WRITTEN COMMENTS

Written comments may be submitted through **June 23, 1992**. Comments may be sent to:

Office of Hearing Examiner
1320 Alaska Building
618 Second Avenue
Seattle, Washington 98104

Those persons who want to receive a notice of the Hearing Examiner's recommendation should specify that request in their comment letter.

HOW TO APPEAL THE ENVIRONMENTAL DETERMINATION

Appeals of the decision finding the EIS to be adequate may be submitted to the Hearing Examiner through **May 29, 1992**. Appeals should be addressed to the Hearing Examiner at the address above.

Any appeal of the SEPA determination will be heard at the conclusion of the public hearing. A second day, June 24, 1992, is available for the appeal, if necessary.

OFFICE OF
HEARING EXAMINER

MEMORANDUM

TO: Ruperta Alexis, Deputy Hearing Examiner

FROM: Faith Lumsden, Sr. Land Use Specialist FL

DATE: July 2, 1992

SUBJECT: Applicant's Proposed Findings and Conclusions
NEFRN Proposed Conditions

The Department of Construction and Land Use (DCLU) specifically objects to the applicant's proposed conclusion #6 if it includes the statement that "[r]emaining noise impacts are not significant at either helistop." This sentence should be deleted. A conclusion should be added confirming DCLU's conclusion that maximum noise impacts, L_{max}, to residences near the ER helistop remain significant, but that these impacts are outweighed by the benefits to be gained from the preferred alternative proposal.

Applicant's proposed findings E.4, E.5, E.6, E.7, and E.9 should be modified to clarify that DCLU does not accept the 24-hour average, L_{dn}, as an appropriate noise descriptor in situations where the noise is infrequent and unscheduled, especially whereas here, single very loud events result in little or no increase in the 24-hour average.

Finding E.4 should note that L_{dn} is a widely accepted noise descriptor and has been used to evaluate noise impacts and land use compatibility for airport and heliport uses (where noise occurs more frequently than would be expected at the ER or the IMA helistops). Finding E.4 should also state that L_{max} is a poor indicator of average noise impacts on a community.

Finding E.5 should be clarified to indicate that the noted 4 and 5 dBA increases relate to average sound levels over the course of 24 hours.

Finding E.6 should be deleted or should be modified to explain DCLU's position that average sound levels are not the most appropriate measure to consider when examining infrequent and unscheduled noise events. EPA and FAA criteria for average noise significance were only one of several issues considered by DCLU in our determination of significant noise impacts.

Finding E.7 should be modified to state that the maximum sound levels at nearby residences are expected to be about 84 dBA.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Finding E.9 should be modified to delete the last sentence stating a 20-25% probability of awakening even without helicopter noise. There is no evidence in the record to clarify how this probability might relate to the probability of helicopter-caused awakenings.

DCLU reiterates our previous comments on the original proposed NEFRN conditions and has the following comments on the new or revised NEFRN conditions. NEFRN condition #3 is acceptable. DCLU has the same concerns voiced earlier about placing an upper limit on the number of permitted landings (condition #5). Rather than attempting to prohibit valid landings, if landings increase substantially over time, initiating a public review process through DCLU (similar to NEFRN condition #10) could be required to re-evaluate the landing criteria and other mitigation measures.

Regarding NEFRN condition #6, the discussion states a noise analysis, not a supplemental EIS, should be prepared. It may be the reference to "supplemental EIS" is an error.

NEFRN condition #10 sets out one reasonable approach for monitoring and enforcing the conditions of approval. DCLU expects to implement a system similar to this, but has not yet determined the reasonableness of the timing suggested by NEFRN, or whether preliminary measures such as meetings with the interested parties, short of a hearing process, could facilitate resolution of potential problems.

In the Matter of CHILDREN'S HOSPITAL AND MEDICAL CENTER, Application Nos. 8405870, 9105441	)	C.F. No. 297288 and 298740 APPLICANT'S PROPOSED FINDINGS OF FACT AND CONCLUSIONS

The applicant, Children's Hospital and Medical Center ("Children's"), submits the following proposed findings of fact and conclusions for the subject applications. These findings and conclusions are supported by the record before the Hearing Examiner.

PROPOSED FINDINGS OF FACT

A. Background.

1. Children's has applied for Council conditional use permits to allow a helistop on the Children's campus outside the Emergency Room entrance (the "ER" helistop), and a second helistop on the University of Washington campus near the Intramural Fields (the "IMA Field" helistop). (The names used herein for the two helistops have been chosen for clarity. The ER helistop is also commonly known as the "Kitchen Garden" or the "Children's" or "CHMC" helistop; the IMA Field helistop is also known as the "Graves Field" helistop.)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. The Director issued a recommendation on May 14, 1992, that the Council conditional use permits be conditionally approved, pursuant to sections 23.48.005 and 23.69.012C, Seattle Municipal Code ("SMC"). See "City of Seattle Analysis and Recommendation of the Director of the Department of Construction and Land Use," (hereafter "Director's Report"). The Director recommended conditions which relate primarily to noise and safety.

3. Children's original application in this matter, made in November, 1984, No. 8405870, was a request for approval of a single helistop at the Children's campus.

4. Pursuant to the State Environmental Policy Act (RCW 43.21C), and the Seattle SEPA Ordinance, Chapter 25.05 SMC, a draft environmental impact statement (the "DEIS") was issued in September, 1986, and a final environmental impact statement (the "FEIS") was issued in April, 1991. The FEIS included a new alternative to the original proposal (the "Preferred Alternative"), which was developed in response to public comments. Under the Preferred Alternative, the large majority of helicopter flights with patients destined for Children's would land at the University of Washington's IMA Field. A minority of the flights, with the most critical patients, would land at the ER helistop.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. Based upon the FEIS, the Director recommended ten conditions for approval. See Director's Report at 19-22. At the hearing before the Examiner, the Director requested modifications to conditions 2 and 7. Condition 2 will no longer preclude landings by all military helicopters, but only by "Huey" helicopters and all other helicopters which are not of a type and design approved by DCLU. The purpose of this revision was to mitigate noise impacts, while allowing for the possibility of changes in the technology used by the military. Condition 7 will no longer limit Airlift Northwest and other aeromedical vendors landing at the ER helistop to use of a helicopter with a four-bladed rotor. Vendors seeking to establish regular flights to Children's ER helistop in helicopters other than the Agusta 109, which is currently used by Airlift Northwest, shall be required to make a showing to the DCLU proving that the noise impacts of the alternative equipment are no greater than for the Agusta 109.

6. Children's concurred in the ten conditions recommended by the Director, as modified by the Director at the hearing. In addition, Children's recommended that Condition 3(3) and (4), which describes two of the medical members of the Medical Review Committee, be revised to exclude appointment of any Children's-salaried physician, or selection by any Children's-salaried physician who may hold the position of president of one of those medical associations at the time of selection.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. **Medical Need Considerations**.

1. Children's is a regional pediatric tertiary care center for a four-state region (Washington, Montana, Alaska, and Idaho). Children's cares only for children, provides all essential elements of secondary and tertiary pediatric hospital health care, and provides that care in a comprehensive way. Children's is one of only twenty-five such comprehensive specialty care centers in the country. Testimony, Katz, Neff; Exhibit 11.

2. Children's has three service missions: patient care, education, and research. Its patient care mission includes providing advanced medical care to children regardless of their financial status. In 1991, for example, Children's provided approximately $19 million of uncompensated care. Testimony, Katz. Ability to pay is not a factor in determining which patients receive transportation by helicopter. Testimony, Katz, Copass.

3. Children's is one of the few providers of advanced pediatric tertiary care in the Pacific Northwest. There are no other such facilities in Seattle or King County. See Exhibit 5. Other pediatric tertiary care centers outside King County are listed in the FEIS, (Exhibit 3), Volume I, pp. 10-11, the closest being in Tacoma, Spokane, and Portland. Even among these centers, Children's is the largest, and offers tertiary care

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

services not available anywhere else in Washington, Alaska, Montana, or Idaho. Testimony, Copass, Neff. The geographic origin of Children's patients covers a broad area. In 1990, for example, patients came from the following areas (percentages in parentheses): Seattle (27%); other King County (24%); Pierce, Snohomish and Kitsap Counties (25%); other Washington State (19%); and out-of-state (6%). Exhibit 6.

4. Pediatric care is a necessary specialty. Because children are a population infrequently seen by doctors and other medical personnel, and because of their small size, childhood illnesses and injuries require particular skills and experience. Testimony, Copass, Sampson. Even ordinarily routine medical tasks, such as the insertion of an intravenous needle, are often beyond the capabilities of those not specialized in pediatric care. Testimony, Held, Marsh, Sampson, Lozano.

5. Tertiary care is considered the most advanced of medical care services, beyond primary and secondary care. It involves provision of care by medical specialists, as necessary to deal with illnesses characterized by complex patho-physiologic processes. Exhibit 3, Volume I, at 10; Testimony, Neff.

6. In the Pacific Northwest, patients requiring tertiary care are referred to the appropriate provider through what is informally known as the "regional medical referral system." Exhibit 3, Volume I, at 10; Testimony, Katz, Copass.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

This system allows for sophisticated health care to be delivered to the region as a whole, by removing the costs of duplication and competition among specialized services. Testimony, Copass. Specialists at Children's include pediatric cardiologists, pediatric neurosurgeons, neonatologists, pediatric anesthesiologists, and a staff of pediatric nurses and pediatric technicians. Testimony, Neff, Lozano.

7. In conjunction with this regional system, referrals in emergency situations may be made either from hospital to hospital, by a referring physician, or from highly-trained paramedics in the field to the hospital, as a part of Washington's Emergency Medical Service ("EMS") System. Testimony, Katz, Copass, Marsh; see also Exhibit 16 (describing Seattle's paramedic training program). With one helicopter service and a designated trauma, burn and pediatric care center, Seattle and its Puget Sound neighbors have developed an EMS system recognized as a national model of collaboration between medical care providers. Testimony, Katz, Copass.

8. Timely transport of critically ill or injured patients to the referral hospital is a key element of the regional medical referral system. Exhibit 3, Volume I, at 13. Appropriate transport, within an acceptable time duration, means that the strengths of one hospital can be extended to the entire region. Testimony, Copass.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

9. The Director found, based on a report by Dr. Nicola, Director of the Seattle-King County Department of Public Health (Exhibit 3, Volume III, Appendix A) that some emergency patients, whether they are coming from other hospitals or the field, will have medical need of helicopter transport to a tertiary care center such as Children's in order to save their lives.

10. A medical need for helicopter transport can arise from a wide variety of situations and conditions. Typical of the children transported by helicopter to Children's (to either helistop) are those with admitting diagnoses of meningitis, severe asthma, near-drowning, seizures, epiglottitis, asphyxia, chemical poisoning, choking, near-SIDS, and other cardiac, respiratory, or cerebral disorders. Testimony, Neff, Sampson, Lozano; Exhibit 10. Premature infants and other neonates are also a significant group of patients requiring helicopter transport to Children's, with conditions such as congenital heart defects, meconium aspiration, diaphragmatic hernia, and others. Testimony, Copass, Neff, Marsh, Lozano, Sampson.

11. A need for helicopter transport can also be the result of an emergency condition for which ground transport might have been appropriate were it not for the great distance to be travelled, the land or water masses to be negotiated, or the fact

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that traffic patterns or gridlock would make sufficiently quick transport impossible. Testimony, Copass; Exhibit 17.

12. Although traumatized or severely burned patients may require helicopter transport, they would usually be referred to Harborview rather than to Children's. Director's Report at p. 17; Exhibit 3, Volume I, at 13; Testimony, Copass, Logerfo. However, Harborview is not a children's hospital and does not have the staff, skills, or equipment to handle the type of cases that Children's handles. Testimony, Copass, Logerfo.

13. Aeromedical transport, when accompanied by a certified nursing or physician team and appropriate equipment, is a first step in providing tertiary care to the patient. See Exhibit 3, Volume I, at 16; Testimony, Copass. Tertiary care continues with delivery to an appropriate referral hospital, such as Children's. Testimony, Copass, Sampson.

14. Airlift Northwest helicopter services operate 24 hours per day. Each of its two helicopters is staffed by two nurses, one specializing in adult care, and one in pediatric/neonatal care. Testimony, Childs, Sampson. In approximately one half of its pediatric transports, a pediatric physician is substituted for the adult nurse. Testimony, Sampson. The helicopters contain both standard equipment and specialized air transport and pediatric/neonatal equipment, as

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

listed in the FEIS. Exhibit 3, Volume I, at 25; Testimony, Sampson.

15. The Director also found, based on the report by Dr. Nicola, that in some Children's-destined emergency cases the patient's condition is sufficiently critical to require transport directly to the emergency room entrance. The purpose is to minimize the number of minutes in transport, and/or the amount of patient manipulation. Exhibit 3, Volume III, Appendix A.

16. In other cases, the care provided by the specialized team within the helicopter is sufficient to stabilize a patient with a life-threatening condition to a point where a landing at the IMA Field, with ambulance transfer, is adequate. Testimony, Neff, Sampson. However, there have been instances in the past where a patient who landed at the IMA Field became unstable in transfer to and transport by an ambulance to the Children's emergency room. Testimony, Sampson.

17. Dr. Nicola found that it is possible for nurses and/or physicians attending to the patient at the time of transport to distinguish between the types of cases requiring transport to each of the two helistops, although this decision must necessarily involve the exercise of medical judgment. Exhibit 3, Volume III, Appendix A. The medical personnel currently involved in this decision process confirmed that, in their experience, it is possible to make appropriate decisions as

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

to which helistop the child should be transported. Testimony, Neff, Sampson, Lozano.

18. In addition to Dr. Nicola, the medical need for Children's proposed ER and IMA Field helistops has been supported by the testimony of Dr. Michael Copass, Medical Director of Airlift Northwest; Dr. James Logerfo, Medical Director of Harborview; Dr. John Neff, Medical Director of Children's; Mr. Bill Marsh, Operations Manager, King County Medic I; Ms. Debbie Sampson, Chief Flight Nurse for Airlift Northwest; and Dr. Paula Lozano, Pediatric Resident. The record also contains many statements of medical need for the Children's helistops by physicians, hospitals and paramedics throughout Western Washington. One of the reasons identified in such statements is the lack of capability in these outlying areas to adequately treat critically ill children. See also Exhibits 11, 12, 13 and 14.

19. This section incorporates by reference the Proposed Findings below discussing Considerations Regarding Limitations of Usage to Life-Threatening Emergencies.

C. Considerations Regarding Limitation of Usage to Life-Threatening Emergencies.

1. This section incorporates by reference the Proposed Findings above discussing Medical Need Considerations.

2. Children's has been accepting helicopter transport referrals, which arrive either at the IMA Field or on an area of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

grass outside the Children's emergency room entrance, since the 1970s. Exhibit 3, Volume I, p.1. Summary profiles of every patient transported by helicopter to Children's emergency room entrance from August 1985 to March 1989 are contained in Appendix D of the FEIS, and from March 1989 until March 1992, in Exhibit 10.

3. Helicopter landings which presently occur at Children's emergency room entrance are made on an area for which Children's has no helistop permit. These landings are not, however, a violation of Seattle's Land Use Code. It is DCLU's policy to treat the landings as legal pending the City's final decision on the helistop application, which has been pending since November, 1984. This is the application which is being acted upon in this proceeding. Testimony, Lumsden.

4. The primary helicopter transport service operating within the Northwest's regional referral system has, since 1985, been Airlift Northwest. Airlift Northwest was started in 1982, and is a Seattle-based air ambulance service operated as a non-profit consortium by Children's, the University of Washington Medical Center, Harborview Medical Center, and Providence Medical Center. It is designed to support the regional medical referral system and specifically to make specialized critical care accessible to patients throughout the Pacific Northwest and Alaska. Testimony, Copass, Childs.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. The decision to use helicopter services is made either by a physician at the referring hospital, after communication with a physician at the receiving hospital, or by paramedics in the field, in consultation with a local emergency doctor. Testimony, Marsh, Sampson.

6. All of the Airlift Northwest transports destined for Children's involve life-threatening situations. Helicopter transport is necessary due to the exhaustion of skills, equipment, or other resources at the place of patient pickup, the length of time required for ground transport, and the critical condition of the patient. Testimony, Copass, Sampson. Use of the helicopters to transport patients whose condition is less than life-threatening is unlikely, given that the referring doctors and paramedics realize that if the helicopter is used unnecessarily, it may not be available for the patient who is in a life-threatening situation. Testimony, Marsh. Those patients who are flown to the IMA Field rather than to the ER helistop are patients who, while they were in a life-threatening condition at the time of pickup, have been adequately stabilized pre-flight or in-flight. Testimony, Sampson.

7. Airlift Northwest has, since 1989, operated according to standing orders by which its in-flight medical teams identify those emergency cases requiring helicopter transport directly to the Children's emergency room. These conditions are:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1) unstable airway; 2) inability to ventilate/oxygenate; 3) inability to maintain adequate cardiac output; 4) inability to maintain adequate cerebral blood flow; and 5) the persistence of unstable vital signs despite heroic attempts to control them. See Exhibit 10, Medical Justification Form; Testimony, Copass, Neff, Sampson. The decision where to land is made, and can be changed, in-flight, depending on the condition of the patient. Testimony, Sampson.

8. The number of landings on the CHMC campus is quite small compared to the total number of patients brought to CHMC's emergency room. For example, in 1991, only 76 patients (0.3%) arrived by helicopter at the emergency room, compared to a total of 23,080 emergency room patients in the same year. See Exhibits 7 and 8.

9. Historically, approximately ninety percent of the patients transported to Children's campus by helicopter have entered one of Children's intensive care units. Testimony, Sampson. The condition of these patients is so critical that approximately twenty-five percent of them die despite heroic efforts to save them. Testimony, Neff. See Exhibit 10.

10. The evidence indicated that the average of ten extra minutes required to land at the IMA Field and transfer the patient by ambulance to Children's emergency room is critical and could mean the difference between life and death to those

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

critically ill patients who have unstable airways, inability to ventilate/oxygenate, inability to maintain adequate cardiac output, inability to maintain adequate cerebral blood flow, or who exhibit the persistence of unstable vital signs. Testimony, Neff, Sampson, Lozano; see also Exhibit 10. In some cases, the manipulation required to transfer a patient from a helicopter to an ambulance at the IMA Field could jeopardize the life of the patient because of changes in temperature, loss of intravenous or other tubal connections, the dislocation of monitors, and/or unnecessary movement. Testimony, Sampson, Lozano.

11. Children's and Airlift Northwest currently conduct regular reviews of all cases of helicopter landings at the emergency room. The analysis of such information serves to determine whether the landing decisions have been appropriately made, and to instruct the referring physicians or medical team in how to handle similar future situations. Testimony, Neff, Copass.

12. Dr. Nicola reviewed the landings at Children's, and a sampling of those which went to Harborview. He found that, with only one possible exception, all of the landing decisions were appropriate given the patient's condition. Exhibit 3, Volume III, Appendix A.

13. Children's has agreed to DCLU's recommendation to form a Medical Review Committee to continue to monitor whether

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

flights landing at the ER helistop are appropriately directed. The Committee will be composed of the Director of the Seattle-King County Department of Public Health or his or her appointee; a physician representative of the Washington State Medical Association; a physician representative of the Washington State Society of Pediatrics; a citizen from one of the neighborhoods surrounding Children's; and a representative from Children's. The Committee contains a balanced combination of interested and experienced members. Because the decision regarding whether an ER landing is necessary is primarily a medical one, and at times a difficult one even in hindsight, it is appropriate that the committee be primarily composed of physicians experienced in neonatology, pediatrics and emergency care. See Dr. Nicola, Exhibit 3, Volume III, Appendix A, p. A-6; Testimony, Sampson.

14. The Medical Review Committee can act as an effective check on the appropriateness of landings at the ER helistop. Not only will it advise as to future actions and decisions, but it will deter any inappropriate actions and decisions, by communicating them to the community. Testimony, Copass.

15. The DCLU shall review the semi-annual reports of the Medical Review Committee and of Children's. If it appears that inappropriate or non-medically necessary landings have occurred, DCLU shall work with Children's, the Public Health

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Director, the Medical Review Committee, and Airlift Northwest to ensure compliance. Failure by Children's to demonstrate clear improvement in implementation of the limited landing criteria may result in suspension of the permit and other enforcement action. Director's Report at p. 21.

16. The past and projected future numbers of helicopter landings at the IMA Field and ER helistops were reported in the FEIS at pp. 50-51, and 72. Implementation of the Preferred Alternative would lead to an average of four to five landings per month at the ER helistop for the years 1991 through 1995. Exhibit 3, Volume I, at 72. At the IMA helistop, between twelve and thirteen landings per month are projected in 1991 to 1992, and between 13 and fourteen landings per month from 1993 to 1995. Testimony, Carona.

D. **Safety Considerations**.

1. The FEIS examined the causes of accidents which have occurred among EMS helicopters in the past, and discussed the probability of accidents on Airlift Northwest helicopter flights of Children's-destined patients.

2. Based on the FEIS, the Director found that under the Preferred Alternative, an accident during the transport of a Children's-destined patient, whether occurring during takeoff from the base, in the field, or around Children's itself, could

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

be statistically expected to occur less than once every 177 years. Director's Report at 13.

3. The FEIS did not separately calculate the probability of an accident in the area surrounding Children's itself. As pointed out by the Director, the probability of an accident in the Children's area should in fact be far less than the overall probability figure (i.e. the number of years between "expected" accidents should be greater than 177). Director's Report at 13. This is because a substantial amount of the flight time and at least one-half of the takeoffs and landings accounted for in the probability figures would occur away from Children's. The accident probability may be reduced still further in that there are many factors which have been found to contribute to helicopter accidents at "non-host" landing sites which would not occur, or would be less influential, at the ER helistop. These factors include pilot unfamiliarity with the area, poor visibility, and obstruction of the landing area. In fact, the ER helistop would offer safety features that many non-host landing sites do not have, including lighting, paving, and a glide slope indicator light. See Exhibit 3, Volume I, at 85.

4. Harborview Medical Center's helistop should not be considered a "safer" alternative than Children's ER helistop from the standpoint of the affected population. Harborview is located in a residential area, consisting of low-income and older

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

persons' housing, that is more densely populated than the Laurelhurst area. Testimony, Logerfo.

5. Airlift Northwest has a safety committee, whose responsibility it is to ensure that safe operations are integrated into the EMS program. The Committee includes representatives of Airlift Northwest, Hospital Air Transport (Airlift Northwest's helicopter vendor), dispatchers, and flight nurses. Testimony, Childs. The Committee meets quarterly to engage in an ongoing discussion regarding safety issues, and it uses the results of its discussions pro-actively. Exhibit 3, Volume I, at 3; Testimony, Childs. Airlift Northwest is committed to the safety of the flight crew, patients, public, and aircraft. Exhibit 3, Volume I at 93; Testimony, Childs.

6. Airlift Northwest has not had a helicopter accident in the seven years that it has been in operation. Exhibit 3, Volume I, at 96; Testimony, Childs, Davidson. Airlift Northwest flights during this period numbered approximately 9,000. Testimony, Childs. There was one noninjury incident at Harborview in 1989.

7. To minimize the possibility of human error, Airlift Northwest requires that its pilots meet higher standards than those required by the FAA. Exhibit 3, Volume I, at 94; Testimony, Childs. Airlift Northwest deliberately chooses pilots who are experienced and professional. Testimony, Davidson.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Airlift Northwest pilots are all "factory-trained" by the Agusta manufacturer and return for yearly follow-up training. In addition, pilots each take a "check ride" every six months to test their knowledge of emergency and other procedures. Testimony, Davidson.

8. Airlift Northwest has sought to minimize the possibility of weather-related accidents by keeping its pilots "instrument current" and "instrument rated." In short, they are able to fly without the ground being visible. Testimony, Childs.

9. Airlift Northwest does not fly when weather conditions reduce visibility below certain minimums; the minimums used by Airlift Northwest are consistent with the minimums recommended by the AAMS, and stricter than the FAA weather guidelines. Exhibit 3, Volume I, at 94; Testimony, Davidson. Airlift Northwest has a policy of not flying in winds in excess of 40 knots.

10. Airlift Northwest pilots have authority over whether to discontinue operations in marginal weather conditions, are provided with guidelines for making this decision, and are not put under pressure to fly. Exhibit 3, Volume I, at 94; Testimony, Davidson. Where a patient has been picked up but adverse flying conditions on the way to Children's make continuation of the flight unsafe, the helicopter may change

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

course for Boeing Field, where it can land under instrument flight rules. Exhibit 3, Volume I, at 94; Testimony, Davidson.

11. The Agusta 109 helicopter chosen by Airlift Northwest has a number of features which minimize the possibility of mechanical failures. The Agusta 109 is twin-engined, unlike most traffic and news helicopters, and has state-of-the-art instruments. It also has complete redundancy in its hydraulic and electrical systems; in other words, if the primary systems fail, a complete backup system will take over. Testimony, Davidson. Worldwide, the Agusta 109 has to date been involved in only three EMS-related accidents and four incidents, none of which resulted in fatalities or injuries. Exhibit 3, Volume I, at 90.

12. The ER helistop meets the FAA design guidelines for horizontal clearance and clear area requirements for takeoff and landing, and for the distances between the approach and transitional surfaces and obstructions. Exhibit 3, Volume I, at 101; Testimony, Miller, Van Eaton. The helistop lighting and markings will also meet FAA guidelines, and will include nighttime landing lights and a glide slope indicator light. Exhibit 3, Volume 1, at 59; Testimony, Miller, Van Eaton. In order to reduce the possibility of obstacle strikes, Children's plans to remove several trees and light poles, and will place

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

obstruction lights on the boiler stacks. Exhibit 3, Volume I, at 100; Testimony, Miller.

13. The ER helipad will be constructed in accordance with applicable FAA design guidelines for the size of the Agusta 109 helicopter. Testimony, Miller, Van Eaton. The helipad is not intended for the large Huey helicopters used by MAST and other military operations, and does not meet the FAA guidelines for helicopters of that size. Children's policy has always been to discourage landings by large military helicopters. Exhibit 3, Volume I, at 59, 100. Landings by Huey and other non-approved military helicopters are prohibited in the conditions recommended by the Director. Testimony, Lumsden.

14. The 40 foot by 40 foot concrete pad to be constructed at the ER helistop is appropriate not only for helicopter landing safety, but to provide adequate space for unloading the patient from the helicopter, and to accommodate the numerous medical personnel attending to the patient during unloading and transfer into the emergency room. Testimony, Van Eaton, Miller, Davidson.

15. Children's proposed master plan for future hospital expansion will not affect the location or safety features of the ER helistop. Exhibit 3, Volume I, at 100; Testimony, Miller.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

16. During Children's upcoming expansion of the North and South wings and the emergency room entrance (presently scheduled to commence in July of 1992), coordination with the project contractors and others during construction has been planned to ensure unobstructed helicopter landings. Procedures for such coordination, including communications and plans for removing or lowering cranes or machinery during landings, were developed and utilized during earlier construction, and no problems are anticipated in implementing these procedures once again. Testimony, Scheibe, Davidson.

17. The proposed IMA Field helistop location is considered to be safe, with very few obstructions. Testimony, Davidson, Van Eaton. The flight path has been revised to avoid the possibility of a bird strike. Exhibit 3, Volume I, at 102. The IMA Field helipad will also be constructed in accordance with applicable FAA design guidelines for landing surface, size, weight, lighting and markings, and other features, with sufficient room to accept Agusta or MAST helicopters. Testimony, Van Eaton; Exhibit 3, Volume I, at 61, 101.

E. <u>Noise Considerations</u>.

1. The Seattle Noise Ordinance does not apply to use of the proposed helistops. The ordinance specifically exempts noise from emergency as well as aircraft operations. Exhibit 3, Volume I, at 108; Testimony, Hauge.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. Based on the projected flight figures for the Preferred Alternative, any noise impacts on the residential community around the Children's ER helistop will occur five to six times per month, or ten to twelve times when including the two overflights (landing and takeoff) necessary for each transport. An estimated average of less than one landing per month would occur during nighttime hours. Exhibit 3, Volume I, at 120.

3. The FEIS findings regarding noise levels and impacts were based on a study by Towne, Richards & Chaudiere ("TRC"), which itself was based in part on a 1985 Seton, Johnson & Odell ("SJO") study. Both studies presented a "worst case" analysis of noise impacts, as they were based on projections of 40 landings (80 overflights) per month at the ER helistop. These projections assumed that (1) all helicopter flights with Children's-destined patients would land at the ER helistop, and (2) the number of overflights per patient would be doubled, because each mission would involve two landings, one to pick up the medical crew and one to drop off the patient. Testimony, Hauge. In fact, under the Preferred Alternative, not only will the majority of patients go to the IMA Field, but any needed medical personnel will be picked up at the IMA Field or at Harborview. The noise analysis, therefore, substantially

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

overstates the actual noise impacts of the Preferred Alternative. Testimony, Hauge; Exhibit 3, Volume I, at 105.

4. In the neighborhood surrounding Children's, the SJO study measured the noise associated with actual helicopter landings in A-weighted decibel levels ("dBA") (a measurement which is adjusted to reflect the sensitivity of the human ear). The study projected the dBA over a 24 hour period to evaluate the cumulative sound level ("Leq"), then added a 10 dBA penalty for the portion of the noise occurring at night, to arrive at the day-night sound level ("Ldn"). The Ldn is the most widely accepted noise descriptor in the U.S. and is used by the EPA, HUD, and the FAA to evaluate noise impacts and land use compatibility. Testimony, Hauge. The study also measured the maximum instantaneous sound level (Lmax); which, although a poor indicator of the impact of noise on a community, can be used to estimate the likelihood of sleep interference from single-noise events. Exhibit 3, Volume I, at 107; Testimony, Hauge.

5. Actual measurements of sound levels in the area around the ER helistop showed an existing Ldn sound level, without any helicopters, of between 52 and 68 Ldn. Under the assumption of 40 round trip flights (a total of 80 overflights) per month to the ER helistop, the range of sound levels increased to between 54 and 68 Ldn. The largest increases were 5 dBA at

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

one receptor, and 4 dBA at another receptor. Exhibit 3, Volume I, at 115, Table 18; Testimony, Hauge.

6. These measurements and increases are below the recommended significant impact criteria or other standards of any of the relevant federal agencies. Exhibit 19; Testimony, Hauge. The EPA recommends that noise not exceed an Ldn of 65 dBA, and not increase by more than 5 dBA. Exhibit 3, Volume I, at 107, 115-116; Exhibit 19; Testimony, Hauge. Similarly, HUD standards state that Ldn sound levels of 65 dBA or less are acceptable for HUD-assisted projects. The FAA's land use compatibility criteria state that residential and hospital use is not compatible where the yearly Ldn is 65 dBA or above. Exhibit 19; Testimony, Hauge. Although sound levels of 68 Ldn were found at one location (along Sand Point Way), the Ldn level there is the same with or without helicopter flights. Testimony, Hauge; Exhibit 3, Volume I, at 116.

7. The helicopter noise heard in the residential area near Children's will be infrequent and short-term in nature. Because the rise in this noise will be gradual, startle effects will not occur. Exhibit 3, Volume I, at 116, 118.

8. The primary flight path now used to land at the ER helistop was developed in order to meet the FEIS-recommended mitigation measures that flights be at high altitude over Sand Point Way N.E., and use a noise abatement approach and departure

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that reduces disturbances to residences by primarily following waterbodies and arterials. Exhibit 3, Volume I, at 54-56, 120. Airlift Northwest pilots are trained in, and routinely follow this path. Testimony, Davidson. The previously-proposed flight path was modified so that helicopters come in higher and stay farther from the Laurelon Terrace Apartments directly west of Children's. This modification results in 7-9 dBA lower maximum levels around Laurelon Terrace. Exhibit 3, Volume I, at 115; Testimony, Hauge.

9. The FEIS noted that there would be some sleep disturbance associated with the nighttime landings (projected under the Preferred Alternative to be approximately one per month). Exhibit 3, Volume I, at 117. At the residences closest to the helistop, the estimated Lmax sound levels are expected to cause about a 20 percent probability of awakening with windows closed. With windows partly open, the probability would rise to 30 per cent. Exhibit 3, Volume I at 117. However, this should be compared to the 20-25% probability that residents of this neighborhood with their windows partly open will be awakened by existing sounds even with no helicopters. Testimony, Hauge.

10. The impulse noise caused by blade slap was also considered in evaluating noise impacts. Exhibit 3, Volume I, at 107. The Agusta 109 Mark II meets the mitigation measure proposed in the FEIS that the helistop be used primarily by a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"modern, multi-blade helicopter representing near current low-noise technology." Exhibit 3 Volume I, at 112, 120; Testimony, Hauge. The Agusta 109 Mark II's main feature is that it has four blades, which reduces the blade-slap associated with two-bladed helicopters. Exhibit 3, Volume I, at 112; Testimony, Hauge. The Agusta 109 also has a cap on the rotor head to reduce the air flow angle into the blades, and a vortex generator to further reduce blade slap noise. Exhibit 3, Volume I, at 112; Testimony, Hauge.

11. Based on the projected landing figures for the IMA Field helistop, any noise impacts on the surrounding area would occur 12 or 13 times per month in 1991 to 1992 (or 24 to 26 when taking into account the two overflights per landing); and between 13 and 14 times per month from 1993 to 1995 (or 26 to 28 when taking into account the two overflights necessary per landing). Testimony, Carona. However, the FEIS found that landings at the IMA Field would not cause significant noise impacts, because residences are a substantial distance from the helistop. Exhibit 3, Volume I, at 118, 120. The flight path was also chosen to minimize impacts on wildlife in the nearby ecological area. Exhibit 3, Volume I, at 62.

12. The noise analyst for the FEIS concluded that the noise impacts associated with the ER helistop and the IMA Field helistop were less than significant. Testimony, Hauge.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

F. **Cumulative Impact Considerations.**

1. The Director found that it was unlikely that approval of the Children's helistop would begin a trend toward siting helistops at other Seattle-area hospitals. Director's Recommendation at 14-15. This possibility was addressed during the FEIS process. A survey of Seattle's major medical facilities indicated that no other hospital helistops were being considered. Exhibit 3, Volume I, at 122. Every tertiary care provider in Seattle is already part of the Airlift Northwest consortium, and all except Children's already have a helistop on their campus or access to one nearby. Testimony, Childs. Other than Harborview and the University of Washington, no major institution hospital has a helistop in their adopted or pending master plans. Testimony, Lumsden, Miller. In addition, the review process itself would act as a deterrent against any plans to establish a helistop. Testimony, Lumsden.

G. **Alternative Location Considerations.**

1. The Director's report considered whether alternative sites would accomplish the purpose of the helistop, while having a lesser impact upon the surrounding area. The "Preferred Alternative" under present consideration is itself the result of the examination of alternative locations which took place during the EIS process. Director's Report at 3.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2. The IMA Field was chosen for incorporation into the Preferred Alternative as the most feasible among other off-campus possibilities, including a rooftop helistop at the University of Washington, (no longer being considered by the University); Harborview Medical Center; and Boeing Field. Exhibit 3, Volume I at 48.

3. Among other possible sites on the Children's campus, the Director found that the ER location best achieved both the purposes of the helistop and the goal of mitigating impacts. The location allows transports from the helicopter directly, and across flat surfaces into the emergency room. Exhibit 3, Volume I at 47. Other locations would require transport over longer distances using circuitous and/or steep routes. Also, the alternative locations are all located closer to neighboring residential and educational properties than the proposed ER helistop. Exhibit 3, Volume I at 120; Testimony, Lumsden.

PROPOSED CONCLUSIONS

1. The Hearing Examiner has jurisdiction over these parties and the subject matter pursuant to Chapter 23.76.052 SMC.

2. The standards for consideration of a helistop accessory to a major institution are found in SMC section 23.48.005. While superseded by SMC 23.69.012.C in 1990, this section remains applicable based on the 1984 date of Children's application. In

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

any case, the two sections are substantially similar, and use of the later section would not change the analysis and conclusions herein.[1] Section 23.48.005 provides that:

> 1. a helistop may be permitted as a Council conditional use if the Council finds that:
>
> a. The helistop is needed to save lives;
>
> b. The helistop is located so as to minimize impacts upon surrounding residential property;
>
> c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.
>
> 2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

3. Both the ER and IMA Field helistops are needed to save lives. Children's is a unique and important tertiary care

---

[1] SMC 23.69.012.C provides that a helistop may be permitted as a council conditional use where:

> 1. The helistop is needed to save lives; and
>
> 2. Use of the helistop is restricted to life-threatening emergencies; and
>
> 3. The helistop is located so as to minimize impacts on the surrounding area.

The section also requires that:

> The Director's report to the Council shall examine alternative locations for the helistop as identified by the major institution, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon the surrounding area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

facility within the Pacific Northwest to which children with life-threatening emergencies are routinely and systematically referred. For these children, ground transport would be inadequate because it would take too long to reach them and begin the process of tertiary care, and because it would take too long to transport them to Children's to continue such tertiary care. The consequence of not having such helistops would be the loss of life for an indeterminate number of patients.

4. As part of the region's Emergency Medical System, use of the ER and IMA Field helistops have historically and will continue to involve life-threatening emergencies. Referring physicians and paramedics limit their use of helicopter transport of children to situations involving life-threatening emergencies. Use of the ER helistop will be even further restricted. Decisions made by the helicopter transport medical team and the referral physician or paramedic would limit the ER helistop's use to situations in which the patient exhibits unstable airways, an inability to ventilate or oxygenate, or to maintain adequate cardiac output, and/or other signs of medical instability. The decision as to whether a patient's condition is so serious as to be life-threatening or so critical as to require transport to the ER helistop is a matter of medical judgment for which appropriate latitude should be given for the sake of the patient's health and survival.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. Restrictions on use of the ER helistop would be monitored by the proposed Medical Review Committee, which will be an effective means of deterring misuse and guiding future use of the helistop.

6. Measures taken to minimize noise at the ER and IMA Field helistops are reasonable and effective. They include the selection of a location and a flight path that reduce, to the extent practicable, noise to surrounding residences; the limitation to helicopters with low-noise features at the ER helistops; and the reduction of the number of flights to the ER helistop through implementation of the Preferred Alternative. Remaining noise impacts are not significant at either helistop.

7. Measures taken to reduce safety risks at the ER and IMA Field helistops are reasonable and effective. They include reducing the number of takeoffs and landings; using technologically-advanced helicopters; emphasizing pilot, aircrew, and groundcrew safety training and quality control; implementing policies regarding adverse or marginal weather conditions; taking measures to prevent bird strikes at the IMA Field; locating the helistop in a clear area; and removing trees and poles near the ER helistop. The proposed helipads comply with applicable FAA guidelines.

8. As required, the Director examined alternative locations for the helistop, including sites outside Children's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

boundaries, which might accomplish the purpose of the helistop with a lesser impact upon the surrounding area. Among the alternatives mentioned, the Preferred Alternative, in which the majority of landings would be made at the IMA Field site, with the most critical patients landed at the ER helistop, appears to best balance the medical purpose of the helistops with the goals of minimizing impacts on the residential and other uses which surround Children's.

RECOMMENDATION

Based upon the extensive evidence in the Examiner's Record demonstrating that the proposed helistops meet the Council Conditional Use Permit criteria, Children's Hospital and Medical Center respectfully requests that the Examiner recommend approval to the City Council of such helistops. Children's concurs in the ten conditions requested by the Director. In addition, Children's concurs with the modifications to the conditions made by the Director at the hearing, subject to the restriction concerning Condition 3 described in proposed finding A(5) above. All other requests for modification of the conditions by opponents of the helistop should be rejected because the effect of such modifications would be to substantially impair the

(?) allows direct two-way communication, from both the driver's and patient's compartments, with all hospital(s) in the service area of the vehicle;
(?) incorporates appropriate encoding and selective signaling devices; and
(?) allows communications with designated EMS/TC facilities state-wide.

WAC 246-976-280 AIR AMBULANCE SERVICES.

[NOTE: These standards are for inter-facility transport. Do we need a separate section for "field" air ambulance operation?]

(1) The department shall:
(a) Issue licenses to air ambulance services and aircraft which meet the following standards;
(b) The department shall exclude from licensure requirements Military Assistance to Safety and Traffic (MAST), National Search and Rescue (SAR) units and other military or civil aircraft that may be called into service to initiate the emergency air lift at the scene of the emergency and transports the patient to the nearest available treatment facility or rendezvous point with other means of transportation. Air ambulance services and vehicles shall comply with all regulations pertaining to ground ambulance services and vehicles, except as specifically modified in this section.

(?) [STAFF RECOMMEND DELETE: Air ambulance services shall comply with all regulations pertaining to ground ambulance services and vehicles, except as specifically modified in this section];

(?) Air ambulance services shall provide the following personnel:
(a) A physician director who is:
(i) Trained and experienced in emergency, trauma and critical care; and
(ii) Responsible for supervising and evaluating the quality of patient care provided by the medical flight crew.
(b) A medical flight crew with sufficient personnel to provide adequate patient care, to include:
(i) One specially trained, experienced registered nurse or paramedic; and
(ii) One other person who may be a physician, nurse, physicians assistant, respiratory therapist, paramedic, EMT, or other appropriate specialist appointed by the physician director.
(c) All medical flight crew shall:
(A) Be trained in emergency, trauma and critical care;
(B) Be certified in ACLS;
(D) Be trained in:
(?) Altitude physiology;
(?) EMS communications;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(?) Aircraft and flight safety; and
(?) The use of all patient care equipment on board the aircraft;

(E) Be familiar with:
(?) The use of extrication devices; and
(?) Survival techniques appropriate to the terrain;

(F) Perform under protocols;

(H) Have their physical well being ensured through periodic examination. The results of the examination shall be provided to the service physician director;

(c) Helicopter pilot must:
(i) Have commercial rotor-craft certification;
(ii) Have a minimum of 2,000 rotor-craft flight hours as pilot in command;
(iii) Have at leave five hours in the specific type of aircraft before flying as a pilot in command on patient missions;
(iv) Have extensive mountain flying experience if assigned in mountainous terrain.
(v) If flying IFR, have instrument certification with a minimum of 250 hours of instrument flying time, to include no more than 125 hours of simulated time.

(d) Helicopter mechanic must be:
(i) A certified air frame and power plant mechanic with two years of experience; and
(ii) Factory trained or the equivalent in the specific type of aircraft flown.

(e) Fixed wing pilots must have:
(i) A commercial airplane multi-engine instrument certification;
(ii) A minimum of 2,000 airplane pilot flight hours, with 50 hours as pilot-in-command;
(iii) At least five flight hours in the specific type of aircraft flown; and
(iv) If flying IFR, instrument certification with a minimum of 250 hours of instrument flying time, to include no more than 125 hours of simulated time.

(3) Minimum standards for services, vehicles and medical equipment that are necessary for licensing will be described in department procedures and guidelines:

(?) All aircraft operated as air ambulances shall::
(i) Be configured in such a way that the medical attendants have adequate access to the patient within the cabin to give advanced life support;
(ii) Allow loading by two attendants without excessive maneuvering of the stretcher;
(?) Have radio communication with hospitals, medical control, air traffic control facilities, and public safety vehicles;
(?) Appropriate navigational aids;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(v) Be equipped with the following:
(A) Airway management equipment, including:
(I) Oxygen;
(II) Suction;
(III) Intubation equipment;
(IV) Pediatric ventilation and intubation equipment;
(B) Cardiac Monitor/Defibrillator;
(C) Supplies, equipment, and medication necessary for emergency, cardiac, trauma, pediatric care and other missions as required by the program physician director; and
(vi) Have adequate interior lighting for patient care arranged so as not to interfere with the pilots vision.
(?) Additionally, fixed-wing aircraft operated as air ambulances shall:
(i) Be multi-engined;
(?) Be pressurized
(4) In instances where aeromedical evacuation of a patient is necessary because of a life threatening condition and a licensed air ambulance is not available, patient transportation may be accomplished by the nearest available aircraft that can accommodate the patient. The physician ordering the transport shall justify the need to transport the patient in writing to the department within 30 days after the incident.

WAC 246-976-300 AMBULANCE AND AID SERVICES -- RECORD REQUIREMENTS.
(1) Each ambulance and aid vehicle service shall maintain a record of:
(a) Current certification levels of all personnel;
(b) [OPTION TO DELETE: Current CME status of all certified personnel;]
(c) Make, model, and license number of all vehicles; and
(d) A record of each patient contact with at least the following information:
(i) Names and certification levels of driver and attendants;
(ii) Date and time of medical emergency;
(iii) Age of patient;
(iv) Applicable components of system response time as defined elsewhere in this chapter;
(v) Patient vital signs;
(vi) Procedures performed on the patient;
(vii) [OPTION TO DELETE: Level(s) of certification;]
(viii) Mechanism of injury or type of illness;
(x) Patient destination;
(xi) Other data points identified in this chapter for the Trauma Registry.
(?) [STAFF RECOMMEND DELETE - ADEQUATELY COVERED ELSEWHERE] In addition to the requirements of paragraph(???) above, prehospital services shall submit required trauma registry

THE LAW

TRUST VERSUS ANTITRUST

No one wants bad doctors, but procedures for barring them from practice may run afoul of federal law

THE AMERICAN PUBLIC has told American doctors forcefully in recent years that it wants the medical profession to prevent incompetents from practicing medicine. But much of the public is unaware of an intimidating problem that a doctor may face in trying to intervene when a colleague's performance is not up to standard: he may be sued for violation of the Sherman Antitrust Act—for conspiracy in restraint of trade or for attempt to monopolize.

Doctors are competitors. They also must determine who among them will be allowed to ply his trade. When a group of physicians reviews a colleague's medical record—an undertaking known as peer review—it has the authority to recommend suspending his hospital privileges (if the peer-review committee has been empaneled by a hospital) or even his license to practice (if the committee is a state board of medical examiners). Antitrust law does not look kindly on such collaboration in any other business, and the Sherman Act is therefore settling awkwardly on doctors who engage in peer review. A case now before the Ninth Circuit Court of Appeals in San Francisco, *Patrick* v. *Burget* et al., has prompted hundreds of phone calls to the American Medical Association and the Federal Trade Commission from doctors and state medical boards worried about what liability they might incur if they conduct honest, and tough, reviews of their fellow doctors. The American Medical Association, the Oregon Medical Association, and the Joint Commission on Accreditation of Hospitals have together filed an *amicus curiae* brief in behalf of the defendants in the case.

Patrick v. *Burget* resulted in 1984 in a $2.2 million antitrust judgment against eleven physicians who had been sued for conspiracy to monopolize the market in medical care in the town of Astoria, Oregon. *Patrick* has already had a chilling effect on peer review in the Pacific Northwest. Many physicians are now afraid to sign their names even to the stringent evaluations that constitute routine peer review in all hospitals; these regular critiques, aimed at promoting quality, often form the starting point for a disciplinary review that can result in suspension of hospital privileges. At some hospitals doctors are conducting reviews but not maintaining written records. Other doctors, though continuing to attend peer-review meetings, are simply keeping their mouths shut. "If this is the system we're left with, then we have some serious problems, bigger than this case," James Kronenberg, the associate executive director of the Oregon Medical Association, told me recently. "We're doing stop-gap things, but they're not acceptable in the long run."

A case like *Patrick* reflects a transformation in American medicine. There is far more competition in the health-care business now than there was only a decade ago, and antitrust law has to a considerable extent shaped that competition. It has done so owing largely to the U.S. Supreme Court's 1975 decision in *Goldfarb* v. *Virginia Bar*, which declared that lawyers, doctors, and other professionals were not to be considered immune from the antitrust laws regulating competitive industry.

Since then antitrust law has exerted great influence on health-care services. Doctors are now allowed to advertise. Chiropractors, still regarded with some suspicion by other health-care providers, are suing for access to hospitals. Insurance groups are asking doctors for discounts and forcing them to offer competitive prices. The medical profession, once governed chiefly by medical ethics and peer review, is now governed increasingly by business ethics and the courts.

Hundreds of antitrust lawsuits are being brought each year involving some aspect of the medical profession. The largest number of health-care antitrust cases now in litigation concern the allocation or denial of hospital staff privileges and physician licenses.

Patrick is of special interest not only because its particulars illustrate how untidy antitrust issues can be but also because the case is one of only a handful of medical-staff-privilege antitrust cases to have reached the federal circuit-court level. A decision by the Ninth Circuit Court is expected shortly. Whichever way the court rules, an appeal to the U.S. Supreme Court is likely.

ASTORIA, OREGON, is a logging and fishing town, with a population of 10,000, situated at the mouth of the Columbia River. The Astoria Clinic, which figures at the heart of *Patrick* v. *Burget*, has served for more than fifty years as the predominant private practice in the community, providing multi-specialty care for at least three quarters of the local population. At the time when the lawsuit was filed, in 1981, there were thirteen doctors on the clinic's staff, twelve of them partners in the clinic. Although other doctors practiced in Astoria, most of them, including all but seven of those on the staff at the local Columbia Memorial Hospital, were somehow affiliated with the clinic. This is not an unusual situation for doctors in small-town America; half of America's community hospitals are located outside metropolitan areas, and many, perhaps most, face no real competition.

Under federal law, monopolies are not, per se, illegal. Attempting to maintain a monopoly, or to acquire one, is almost always illegal, under Section 2 of the Sherman Act. Therefore the motives of a monopoly group are critical in determining liability in any Section 2 antitrust

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

case. When those conducting a peer review are also those with a stake in an existing monopoly (as the Astoria Clinic was arguably close to being), the motives behind the peer-review process itself become open to question. Yet doctors are required by law and by their ethical code to participate in peer reviews. Peer review is mandated by the federal government as a condition for receiving Medicare payments, and it is also mandated by hospital-licensing laws in all fifty states.

Dr. Timothy Patrick came to Astoria in 1972 to work as a surgeon with the Astoria Clinic. A year later he was offered a partnership. He declined the invitation and instead opened a private practice. In the years after Patrick left the clinic, relations between Patrick and other doctors in Astoria began to deteriorate. Some doctors refused to refer cases to Patrick, to consult on his surgeries, or to cover for him when he was out of town. What Patrick came to see as evidence of a conspiracy, Gary M. Boelling, an internist at the Astoria Clinic, explains as the result of a growing lack of trust in Patrick's professional judgment. "Quite frankly, [we] did not want to be associated with him," he said in a recent interview. "It got to the point . . . that I really dreaded being asked to consult cases for him, and did things to avoid it."

By early 1980 the Oregon Board of Medical Examiners had received several complaints about Patrick's performance and decided to review fifteen of Patrick's cases. Among the charges that the board investigated were that Patrick had left patients without adequate backup care when he went out of town and that he had performed unnecessary surgeries. After reviewing Patrick's file the board sent a letter of reprimand to Patrick. It also sent a letter chiding Columbia Memorial's medical staff for having been remiss in not monitoring Patrick's clinical practice more closely. Patrick, in response, filed a civil suit against the state board. Further board investigation of Patrick found no clear violation of the Medical Practices Act, the criterion for a full state board review. Because letters of concern are normally sent only to the physician under review, the board retracted its letter.

Late in 1980, before the letter was retracted, Dr. Patrick, in a case that was referred to him, performed an appendectomy on a fifteen-year-old boy with abdominal pain. He did so without examining the boy for the cause of the pain. When the pain persisted, Patrick three weeks later performed exploratory surgery, again without a prior examination. A consulting physician was called in to examine the boy, and he immediately diagnosed (as it turned out, correctly) testicular cancer. The boy sued Patrick for malpractice. This was the second malpractice suit Patrick had recently sustained. Citing these incidents, as well as the state board's previous letter of reprimand, the chief surgeon at Columbia Memorial Hospital requested corrective action.

In March of 1981 the hospital's executive committee, on which several Astoria Clinic partners served, recommended suspension of Patrick's privileges. An ad hoc committee was subsequently appointed to hear testimony and recommend final action to the hospital's board of trustees. Before the month was out, Patrick lodged an antitrust complaint in the U.S. District Court for the State of Oregon against the partners of the Astoria Clinic, claiming a conspiracy to monopolize the local medical trade.

On the recommendation of the medical staff's legal counsel the in-house disciplinary process continued. The ad hoc committee was convened in November of 1981 and heard testimony until April of 1982, when Patrick resigned from the hospital staff, charging that the committee was biased and the outcome a foregone conclusion. He subsequently added the hospital as a defendant in his original antitrust action. However, on the eve of trial Columbia Memorial settled out-of-court with Patrick, for $100,000, leaving the Astoria Clinic doctors, who had undertaken the peer review on the hospital's behalf, to fend for themselves. The peer review was never completed.

In his antitrust claim Patrick contended that his peer review to date had been discriminatory and unfair. He charged that Astoria Clinic physicians refused to refer patients to him, and that patients who preferred him were coerced into using a clinic surgeon. (The clinic physicians involved pleaded justifiable cause.) He asserted that the clinic's doctors had refused to extend him routine professional courtesies (as they themselves admitted, though again pleading justifiable cause). He later pointed out that the letter of reprimand from the Oregon Board of Medical Examiners, though signed by the board's chairman, had in fact been drafted by a partner in the Astoria Clinic. (He was a member of the state board but at earlier stages in the board's scrutiny of Patrick had excused himself, citing a conflict of interest.)

Because Patrick charged the clinic's partners with conspiracy to monopolize, the case revolved almost entirely around the question of motive. Determining whether the prime concern of the clinic doctors was public health or economic self-interest depended on the jury's interpretation of numerous confusing but largely indisputable facts. In December of 1984 the jury found for Dr. Patrick and awarded him the largest judgment yet against individual doctors in a staff-privilege antitrust suit. (Triple damages are frequently awarded in antitrust judgments, and such awards are difficult to pay off; insurance companies often refuse to cover anything except legal fees, on the grounds that they should not indemnify criminal activity). Patrick remains in private practice in Astoria and has staff privileges at a nearby hospital in Ilwaco, Washington. Of the eleven defendants, three have retired, four have left Astoria, two have left the clinic, and two still practice there. The Astoria Clinic is on the verge of bankruptcy and is seeking a buyer.

THE PATRICK CASE is in many respects unusual. It involves a single clinic with a large share of the market, a single hospital to serve a town, a settlement between the hospital and Patrick that left the clinic doctors to defend against charges without backing from the hospital board, years of animosity and mistrust, and an uncompleted peer review. Precisely because all of these circumstances are atypical, the case highlights some specific problems that the AMA, state medical boards, and legal analysts would like to see corrected.

The AMA's prime concern is legal protection for the peer-review process. One reason that the jury's 1984 verdict surprised many doctors is that Oregon state law explicitly protects physicians from almost any legal liability in conducting peer reviews. Under state law, peer-review documents are not admissible as evidence in court. Such protections—deriving as they do from what have always been deemed legitimate state regulatory activities—have rarely been challenged in federal courts. However, the district-court judge held that federal law in this case pre-empted the Oregon statutes. The judge's decision is one of the issues being appealed.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

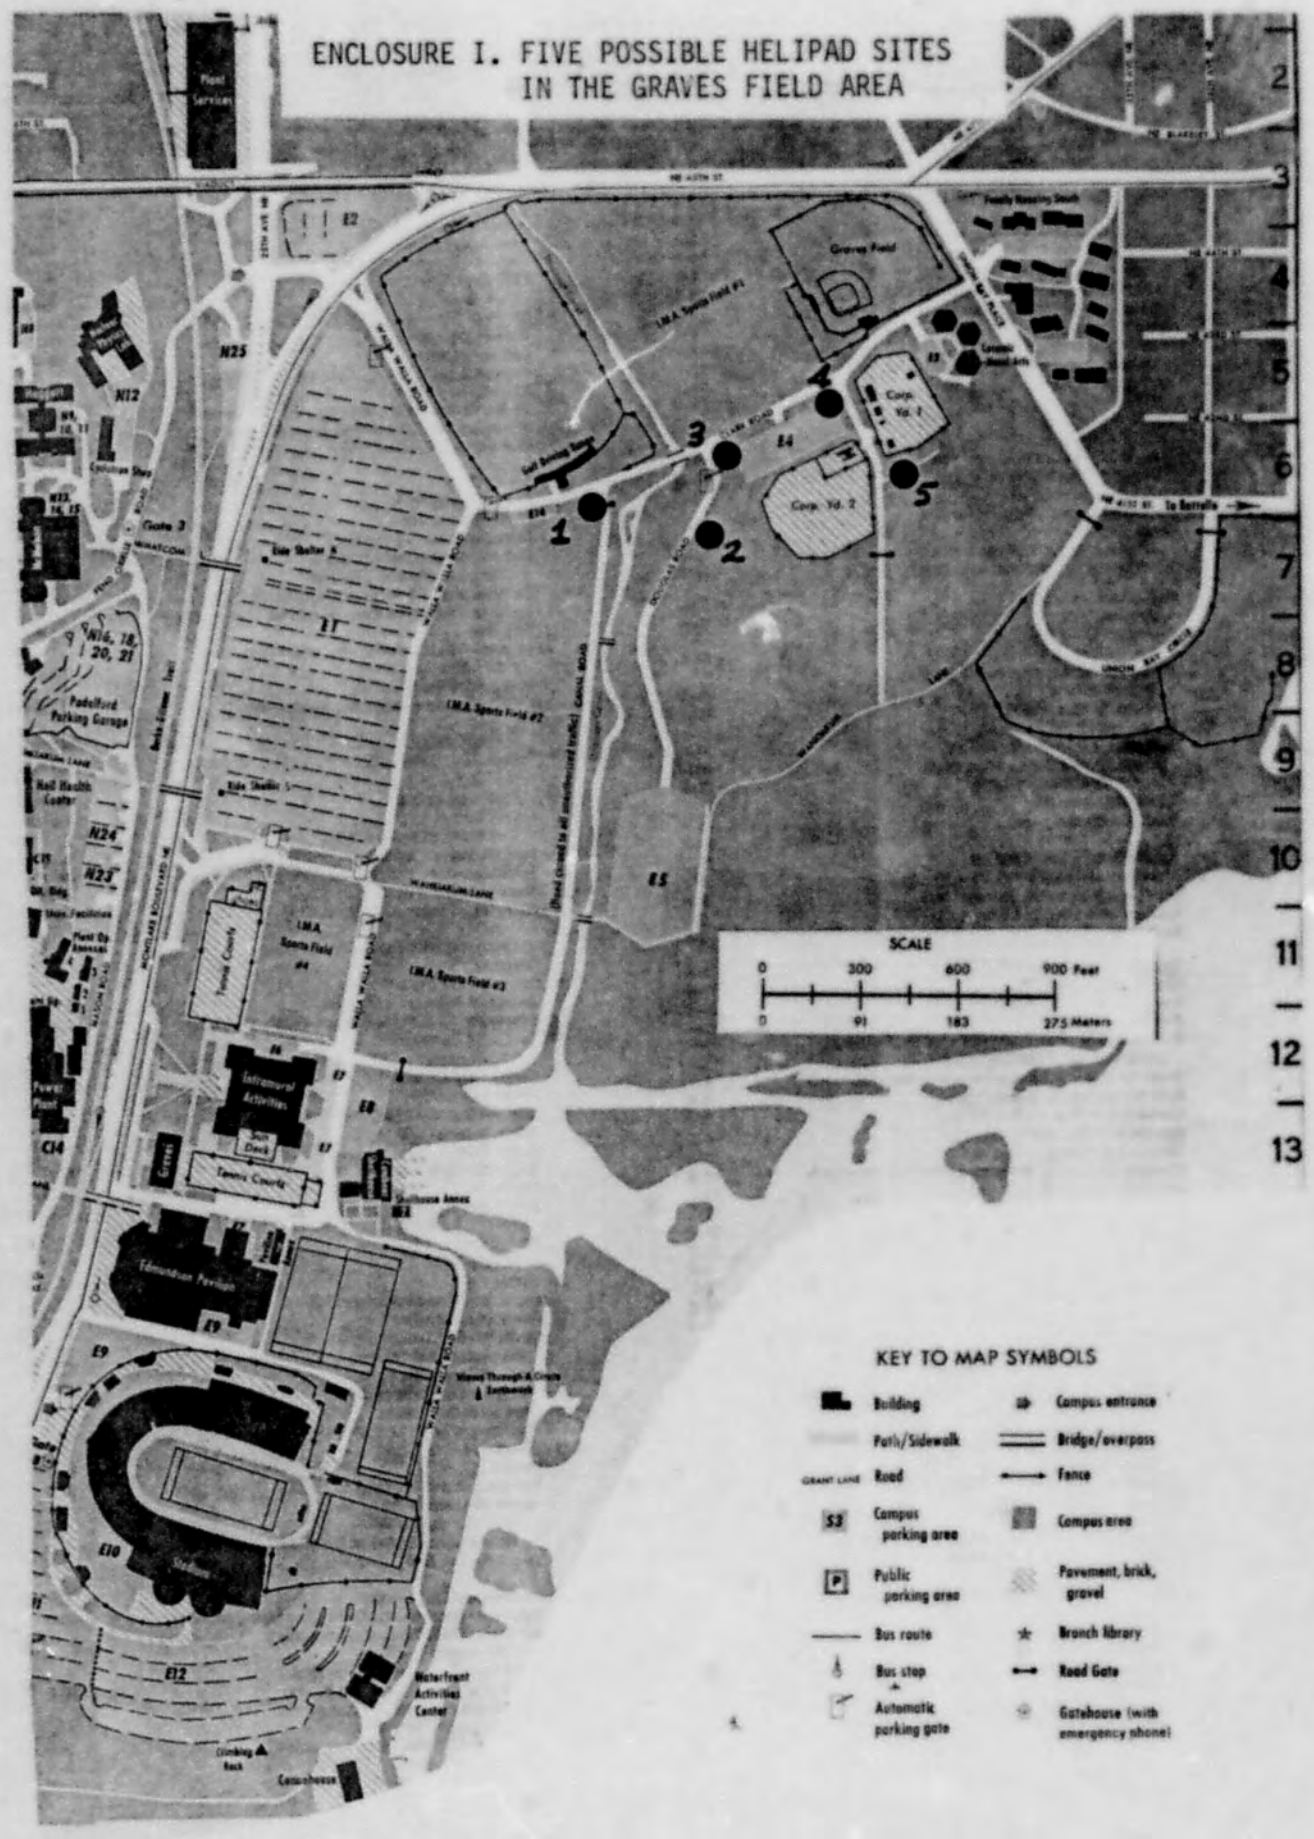
By introducing the peer-review records Patrick's attorneys were able to subject them to meticulous examination. Had the records not been opened, the jury would not have known who drafted the letter from the state medical board, or that one physician tied fishing lures during review hearings. In addition, testimony that physicians gave to the review committee, in confidence, about their own medical practices could not have been revealed and used against them. The American Medical Association and state medical boards maintain that immunity and confidentiality are essential to effective peer review. One of Patrick's lawyers, Barbee Lyon, counters that disclosure can be essential and that it threatens only those physicians who have ulterior motives. Lyon has said, "So long as physicians avoid bias and conflict of interest, whatever they do will be upheld in court." Representative Ron Wyden, of Oregon, has introduced legislation in Congress that, without exempting doctors from the provisions of federal antitrust law, would provide some measure of legal insulation for doctors participating in peer review.

Another problem doctors face is that the courts themselves seem bewildered. When the U.S. Supreme Court in 1975 broadened the interpretation of antitrust law to include the professions, the Court did not specify how antitrust law should be applied. Despite the large number of antitrust lawsuits in the health-care field since then, the legitimate scope of the law has yet to be adequately defined. How should the Sherman Act apply to cases in which ensuring the quality of a service is arguably as important as promoting competition? According to Susan Philp, an attorney specializing in medical antitrust issues, the nation's district courts, lacking experience in health-care matters, are not only ruling inconsistently but also producing few well-reasoned written opinions.

In an article on physicians and antitrust law, published in the *Duke Law Journal*, Clark C. Havighurst, a professor of law at Duke University, writes that antitrust law should uphold the self-policing that doctors take part in, "only because [peer reviews] promote competition and efficiency and not because they are in some other sense 'in the public interest' or because they are undertaken by professionals, as distinct from ordinary businessmen. Antitrust law does not, as a general rule, tolerate competitor collaboration simply because it serves worthy purposes, professional or otherwise." Elizabeth Gee, a Federal Trade Commission official in charge of health-care antitrust enforcement, has stated that peer review is not *necessarily* anti-competitive—that indeed it can be a beneficial form of self-regulation and, when conducted in a reasonable way, even pro-competitive. Proper peer review can provide information to consumers (or to their representatives) even as it enables hospitals to offer high-quality service and physicians to enhance their skills. The AMA has asked the Justice Department for a statement to the effect that peer review is not necessarily anti-competitive, so far to no avail.

Certainly among the Astoria Clinic doctors' worst problems were that they were competing in the same market as the doctor whose performance was under review and that they held a large share of that market—circumstances that apply to hundreds of small hospitals and clinics, and therefore potentially are problems for them, too. The AMA has been looking into the appropriateness of calling in outside physicians to conduct peer reviews—a growing custom among Oregon hospitals. The Oregon Medical Association, however, fears that this procedure can never match, in thoroughness or insight, a review conducted by local doctors of one of their own. Judgment under fire and routine daily decision-making, as much as technical proficiency, determine a physician's competence. Yet while physicians who work together have a deeper knowledge of each other's competence, they also have emotional and economic ties that may influence their actions. Havighurst says that in staff-privilege antitrust cases the courts should keep the law from turning on motive; in his view, actual effects on the competitive process—not just on one competitor—should determine antitrust liability. The best protection for a hospital and a medical staff, he believes, is for the hospital board to assume, and not relinquish, the central decision-making role. Hospitals as competitive enterprises, with a legitimate concern for maintaining high quality, lack the conflicts of interest that the medical staff may have.

In emphasizing medicine's commercial aspects antitrust law is changing not only the practice but also the character of American medicine. The public has been quick to notice such changes as advertising and flexible fee schedules. Peer review is not a prominent activity of the medical profession. But to many doctors it is a matter of profound significance. Peer review is at the heart of the professional and social contract that physicians make with the public—an implicit promise of high quality in exchange for popular trust.



Dr. Arnold Relman, the editor of the *New England Journal of Medicine*, believes that neither the public nor the federal and state governments would be satisfied if medicine were run simply as a business. "It is fashionable to believe that everything is a market," he says. "The fact is, we don't live in an economy, we live in a society. Economic laws are imperfect at best and properly applied only to certain aspects of society. I believe that at some point in the future it will become clear to everyone that the consequences of taking a commercial view of health-care services are going to include a great deal of inequity." What Relman sees in the "doctor as businessman" is the tarnished image of a once golden profession. On the one hand, Relman says, the public seems reluctant to trust doctors to place their patients before their pocketbooks; on the other hand, the public still *wants* to trust doctors to do so. "You can't be angry at us for being businessmen and at the same time, when we try to be professionals, say we're being hypocritical," he says. "Doctors can do a lot to improve their own performance, but are they to be guided by the ethics of professionalism or by the rules of the marketplace?"

In a sense Relman's question is what *Patrick* v. *Burget* is all about. One way or another, it will be the American public, not the medical profession, that decides the answer.

MASTER USE PERMIT

NOTICE OF DIRECTOR'S RECOMMENDATION ON COUNCIL CONDITIONAL USE, ENVIRONMENTAL DETERMINATION AND PUBLIC HEARING

Children's Hospital and Medical Center has applied for a permit to allow an emergency helistop on the CHMC campus and a second, primary helistop on the University of Washington campus near the Intramural fields.

Project numbers: 8405870 and 9106441
Addresses: 4800 Sand Point Way N.E. and 2501 N.E. 45th Street
CF numbers: 297288 and 298740

The Director's recommendation is that the Council Conditional Use be conditionally approved. Recommended conditions relate to limiting noise, improving safety and monitoring of landings (types of equipment used and flight paths).

ENVIRONMENTAL DETERMINATION

DCLU has determined that the Final Environmental Impact Statement (FEIS) adequately describes and assesses the adverse impacts of the proposal. The proposal has been conditioned to mitigate impacts. Although significant noise impacts occur, the benefits of the proposal have been found to outweigh the adverse impacts.

INFORMATION AVAILABLE

Copies of the Director's Report and Recommendation and the application materials are available at the DCLU Master Use Permit Information and Notification Center, 710 Second Avenue, Suite 200, Dexter Horton Building. Questions may be directed to Faith Lumsden, Senior Land Use Specialist, 684-8875, at DCLU.

PUBLIC HEARING

A public hearing to take public comment on the Director's recommendation and to establish the record for this application will be held on **June 23, 1992**, beginning at 9:00 a.m. in Room 1310 Alaska Building, 618 Second Avenue. The first two hours of the hearing have been scheduled for presentations by DCLU and CHMC. (This location is accessible.) Citizens may call the Office of Hearing Examiner in June to confirm timing for public testimony or to request accommodations for disability.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WRITTEN COMMENTS

Written comments may be submitted through **June 23, 1992**. Comments may be sent to:

Office of Hearing Examiner
1320 Alaska Building
618 Second Avenue
Seattle, Washington 98104

Those persons who want to receive a notice of the Hearing Examiner's recommendation should specify that request in their comment letter.

HOW TO APPEAL THE ENVIRONMENTAL DETERMINATION

Appeals of the decision finding the EIS to be adequate may be submitted to the Hearing Examiner through **May 29, 1992.** Appeals should be addressed to the Hearing Examiner at the address above.

Any appeal of the SEPA determination will be heard at the conclusion of the public hearing. A second day, June 24, 1992, is available for the appeal, if necessary.

ENVIRONMENTAL CHECKLIST

Purpose of Checklist.

The State Environmental Policy Act (SEPA), chapter 43.21 RCW, requires all governmental agencies to consider the environmental impacts of a proposal before making decisions. An environmental impact statement (EIS) must be prepared for all proposals with probable significant adverse impacts on the quality of the environment. The purpose of this checklist is to provide information to help you and the agency identify impacts from your proposal (and to reduce or avoid impacts from the proposal, if it can be done) and to help the agency decide whether an EIS is required.

Instructions for Applicants.

This environmental checklist asks you to describe some basic information about your proposal. Governmental agencies use this checklist to determine whether the environmental impacts of your proposal are significant, requiring preparation of an EIS. Answer the questions briefly, with the most precise information known, or give the best description you can.

You must answer each question accurately and carefully, to the best of your knowledge. In most cases you should be able to answer the questions from your own observations or project plans without the need to hire experts. If you really do not know the answer, or if a question does not apply to your proposal, write "do no know" or "does not apply." Complete answers to the questions now may avoid unnecessary delays later.

Some questions ask about governmental regulations, such as zoning, shoreline, and landmark designations. Answer these questions if you can. If you have problems, the governmental agencies can assist you.

The checklist questions apply to all parts of your proposal, even if you plan to do them over a period of time or on different parcels of land. Attach any additional information that will help describe your proposal or its environmental effects. The agency to which you submit this checklist may ask you to explain your answers or provide additional information reasonably related to determining if there may be significant adverse impact.

Use of Checklist for Nonproject Proposals.

Complete this checklist for nonproject proposals, even though questions may be answered "does not apply." IN ADDITION, complete the SUPPLEMENTAL SHEET FOR NONPROJECT ACTIONS (part D).

For nonproject actions, the references in the checklist to the words "project," "applicant," and "property or site" should be read as "proposal," "proposer," and "affected geographic area," respectively.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A. BACKGROUND

1. Name of proposed project, if applicable:

Meadowbrook Nursing and Convalscent Center

2. Name of applicant:

Mr. and Mrs. Louis Sternberg

3. Address and phone number of applicant and contact person:

3540 NE 110th
Seattle, WA 98125

Mr. Louis Sternberg, Owner 363-7733
Mr. Albert Nelson, Architect/Owner Representative
The Schemmer Associates Inc. 3650-131st Ave. SE. Ste. 536
Bellevue, WA 98006 643-6993

4. Date checklist prepared:

2/21/91

5. Agency requesting checklist:

Department of Construciton and Land Use

6. Proposed timing or schedule (including phasing, if applicable):

Phase I - Start Construction 1/11/92
Phase II - Start Construction 5/1/92

7. Do you have any plans for future additions, expansion, or further activity related to or connected with this proposal? If yes, explain.

No

8. List any environmental information you know about that has been prepared, or will be prepared, directly related to this proposal.

None

9. Do you know whether applications are pending for governmental approvals of other proposals directly affecting the property covered by your proposal? If yes, explain.

DSHS approval through design development

10. List any government approvals or permits that will be needed for your proposal, if known.

None

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. Give brief, complete description of your proposal, including the proposed uses and the site of the project and site. There are several questions later in this checklist that ask you to describe certain aspects of your proposal. You do not need to repeat those answers on this page. (Lead agencies may modify this form to include additional specific information on project description.) An addition of 34 beds tothe existing 47 is planned resulti in a total finished project of 81 beds. The existing facility is being upgraded to meet all applicable life/safety codes. The kitchen is being relocated on the main floor. Additional parking and landscaping is being provided.

12. Location of the proposal. Give sufficient information for a person to understand the precise location of your proposed project, including a street address, if any, and section, township, and range, if known. If a proposal would occur over a range of area, provide the range our boundaries of the site(s). Provide a legal description, site plan, vicinity map, and topographic map, if reasonably available. While you should submit any plans required by the agency, you are not required to duplicate maps or detailed plans submitted with any permit applications related to this checklist.

EVALUATION FOR AGENCY USE ONLY

B. ENVIRONMENTAL ELEMENTS

1. Earth

a. General description of the site (circle one): (Flat,) rolling, hilly, steep slopes, mountainous, other: _____.

b. What is the steepest slope on the site (approximate percent slope)?

2%

c. What general types of soils are found on the site (for example, clay, sand, gravel, peat, muck)? If you know the classification of agricultural soils, specify them and note any prime farmland.

Sandy, gravelly loam

d. Are there surface indications or history of unstable soils in the immediate vicinity? If so, describe.

None

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

e. Describe the purpose, type, and approximate quantities of any filling or grading proposed. Indicate source of fill.

None

f. Could erosion occur as a result of clearing, construction, or use? If so, generally describe.

No Yes, minor

g. About what percent of the site will be covered with impervious surfaces after project construction (for example, asphalt or buildings)?

63%

h. Proposed measures to reduce or control erosion, or other impacts to the earth, if any:

Water retention/detention systems Comply with Grading & Drainage Control Ordinance Not

2. Air

a. What type of emissions to the air would result from the proposal (i.e., dust, automobile, odors, industrial wood smoke) during construction and when the project is completed? If any, generally describe and give approximate quantities if known. Minimal, all parking areas to be paved. Small increase in vehicular traffic. Kitchen filtered exhaust which presently occurs but will be replaced with new improved equipment.

b. Are there any off-site sources of emissions or odor that may affect your proposal? If so, generally describe.

None

c. Proposed measures to reduce or control emissions or other impacts to air, if any:

None Compliance with PSAPCA regulations when applicable NGT

3. Water

a. Surface:

1) Is there any surface water body on or in the immediate vicinity of the site (including year-round and seasonal streams, saltwater, lakes, ponds, wetlands)? If yes, describe type and provide names. If appropriate, state what stream or river it flows into.

None Thorton Creek → Flows into Lake Washington NGT

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

2) Will the project require any work over, in, or adjacent to (within 200 feet) the described waters? If yes, please describe and attach available plans.

No Yes, part of the proposed addition is within 200 ft of Thorton Creek NGT

3) Estimate the amount of fill and dredge material that would be placed in or removed from surface water or wetlands and indicate the area of the site that would be affected. Indicate the source of fill material.

None

4) Will the proposal require surface water withdrawals or diversions? Give general description, purpose, and approximate quantities if known.

None, basic water retention/detention systems

5) Does the proposal lie within a 100-year floodplain? If so, note location on the site plan.

No- Yes, the extreme southwest corner of the site is within a 100 year floodprone area

6) Does the proposal involve any discharges of waste materials to surface waters? If so, describe the type of waste and anticipated volume of discharge.

No

b. Ground:

1) Will ground water be withdrawn, or will water be discharged to ground water? Give general description, purpose, and approximate quantities if known.

No

2) Describe waste material that will be discharged into the ground from septic tanks or other sources, if any (for example: Domestic sewage; industrial, containing the following chemicals ...; agricultural; etc.). Describe the general size of the system, the number of such systems, the number of houses to be served (if applicable), or the number of animals or humans the system(s) are expected to serve.

None

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

c. Water Runoff (including storm water):

1) Describe the source of runoff (including storm water) and method of collection and disposal, if any (include quantities, if known). Where will this water flow? Will this water flow into other waters? If so, describe.
All surface water will be disposed of through the City of Seattle storm water system. System will be designed to meet all applicable code requirements.
A Drainage Control Plan will be required by S.E.D. (detention w/ controlled release)

2) Could waste materials enter ground or surface waters? If so, generally describe.

No

d. Proposed measures to reduce or control surface, ground, or runoff water impacts, if any:

Planting and retention Comply with DRAINAGE CONTROL ORDINANCE NGT

4. Plants

a. Check or circle types of vegetation found on the site:

X deciduous tree: alder, maple, aspen, other
X evergreen tree: fir, cedar, pine, other
X shrubs
X grass
__ pasture
__ crop or grain
__ wet soil plants: cattail, buttercup, bullrush, skunk cabbage, other
__ water plants: water lily, eelgrass, milfoil, other
__ other types of vegetation

b. What kind and amount of vegetation will be removed or altered?

Native material, blackberries, weeds

c. List threatened or endangered species known to be on or near the site.

None

d. Proposed landscaping, use of native plants, or other measures to preserve or enhance vegetation on the site, if any:

See Landscape Plan

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

5. Animals

a. Circle any birds and animals that have been observed on or near the site or are known to be on or near the site:

birds: hawk, heron, eagle, (songbirds), other:

mammals: deer, bear, elk, beaver, other:
None

fish: bass, salmon, trout, herring, shellfish, other:
None

b. List any threatened or endangered species known to be on or near the site.
None

c. is the site part of a migration route? If so, explain.
No

d. Proposed measures to preserve or enhance wildlife, if any:
New planting

6. Energy and Natural Resources

a. What kinds of energy (electric, natural gas, oil, wood stove, solar) will be used to meet the completed project's energy needs? Describe whether it will be used for heating, manufacturing, etc.
Natural Gas

b. Would your project affect the potential use of solar energy by adjacent properties? If so, generally describe.
None (one story building)

c. What kinds of energy conservation features are included in the plans of this proposal? List other proposed measures to reduce or control energy impacts, if any:
. Solar
. Insulation
. Minimal Windows
project will comply w/ Energy Code NGT

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

7. Environmental Health

a. Are there any environmental health hazards, including exposure to toxic chemicals, risk of fire and explosion, spill, or hazardous waste, that could occur as a result of this proposal? If so, describe.

No

1) Describe special emergency services that might be required.

Aid car, Ambulance

2) Proposed measures to reduce or control environmental health hazards, if any:

No Environmental Health Hazards. All exhausted air will be filtered to meet EPA requirements.

b. Noise

1) What types of noise exist in the area which may affect your project (for example: traffic, equipment operation, other)?

No equipment noises, minimal traffic and garbage disposal

2) What types and levels of noise would be created by or associated with the project on a short-term or a long-term basis (for example: traffic, construction, operation, other)? Indicate what hours noise would come from site? Minimal air conditioning equipment, short term construction noise during daytime hours (weekdays), generator, noise from staff and patients NOT noise from emergency vehicles, delivery trucks

3) Proposed measures to reduce or control noise impacts, if any:

Planting screens to all adjoining properties and streets

Comply with Noise Ordinance. SMC 25.08 and limit hours of construction activity to 7:30 a.m.-6:00 p.m, non-holiday weekdays NOT

8. Land and Shoreline Use

a. What is the current use of the site and adjacent properties?

Nursing Home (no change) Adj. properties: Single family homes NOT

b. Has the site been used for agriculture? If so, describe.

No

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

c. Describe any structures on the site.
Existing (1) story nursing home with 47 beds and ancillary required spaces.

d. Will any structures be demolished? If so, what?
Yes, [redacted] which needs to be upgraded in use and code requirements
a single family dwelling

e. What is the current zoning classification of the site?
SF 7200

f. What is the current comprehensive plan designation of the site?
Single Family

g. If applicable, what is the current shoreline master program designation of the site?
N/A

h. Has any part of the site been classified as an "environmentally sensitive" area? If so, specify.
~~No~~ Yes, the extreme southwest corner is within the 100 year Flood Prone Area

i. Approximately how many people would reside or work in the completed project?
81 beds, 30 staff average during daytime use, 10 at night 28 maximum.

j. Approximately how many people would the completed project displace?
None

k. Proposed measures to avoid or reduce displacement impacts, if any;
N/A

l. Proposed measures to ensure the proposal is compatible with existing and project land uses and plans, if any:
See Conditional Use Narrative
Comply with Seattle Zoning Code Not

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

9. Housing

a. Approximately how many units would be provided, if any? Indicate whether high, middle, or low-income housing?

81 beds Medicade/~~Medicare, Private~~ NGT

b. Approximately how many units, if any, would be eliminated? Indicate whether high, middle, or low-income housing?

~~None~~ One single family home (MIDDLE) NGT

c. Proposed measures to reduce or control housing impacts, if any: Need nursing care beds and 81 have been approved for this site by the State of Washington.

10. Aesthetics

a. What is the tallest height of any proposed structure(s), not including antennas; what is the principal exterior building material(s) proposed?

25 feet, wood, brick, sloping roofs, 1 story structure

b. What views in the immediate vicinity would be altered or obstructed?

None

c. Proposed measures to reduce or control aesthetic impacts, if any: Stepping of exterior facades, low residental profile, small residential scale gable roofs

Adherence to Land Use Codes NGT

11. Light and Glare

a. What type of light or glare will the proposal produce? What time of day would it mainly occur?

Minimal parking lot lighting

b. Could light or glare from the finished project be a safety hazard or interfere with views?

No

c. What existing off-site sources of light or glare may affect your proposal?

None

d. Proposed measures to reduce or control light and glare impacts, if any:

Planting screens, parking lot lighting shielding

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

12. Recreation

a. What designated and informal recreational opportunities are in the immediate vicinity?
N/A

b. Would the proposed project displace any existing recreational uses? If so, describe.
No

c. Proposed measures to reduce or control impacts on recreation, including recreation opportunities to be provided by the project or applicant, if any:
~~Walking~~

13. Historic and Cultural Preservation

a. Are there any places or objects listed on, or proposed for, national, state, or local preservation registers known to be on or next to the site? If so, generally describe.
No

b. Generally describe any landmarks or evidence of historic, archaeological, scientific, or cultural importance known to be on or next to the site.
None

c. Proposed measures to reduce or control impacts, if any:
N/Ap

14. Transportation

a. Identify public streets and highways serving the site, and describe the proposed access to the existing street system. Show on site plans, if any.
NE 110th St, 36th Ave NE

b. Is site currently served by public transit? If not, what is the approximate distance to the nearest transit stop.
Yes

c. How many parking spaces would the completed project have? How many would the project eliminate?
23 total (6 added) A parking study will be completed by the applicant NOT

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

d. Will the proposal require any new roads or streets, or improvements to existing roads or streets, not including driveways? If so, generally describe (indicate whether public or private).

~~No~~ Yes, per requirements by the Seattle Engineering Department NGT

e. Will the project use (or occur in the immediate vicinity of) water, rail, or air transportation? If so, generally describe.

No

f. How many vehicular trips per day would be generated by (see below also) the completed project? If known, indicate when peak volumes would occur. Peak volumes- 2:00-2:30, weekdays (shift change) NGT

~~2:00 p.m., 30 trips~~, staff & visitors ITE figures= WEEKDAY TRIPS = 88 trips
A.M.-P.M. PEAK = 6 trips
SATURDAY PEAK = 13 trips
SUNDAY PEAK = 14 trips

g. Proposed measures to reduce or control transportation impacts, if any.

. Metro
. Car Pooling

15. Public Services

a. Would the project result in an increased need for public services (for example: fire protection, police protection, health care, schools, other)? If so, generally describe.

No

b. Proposed measures to reduce or control direct impacts on public services, if any.

Very little impact

f. continued- TRUCK DELIVERY

Garbage - 3 days a week
Food- 1 a week
Laundry - 2 a week
Milk - 1 or 2 a week
Oxygen- varies

> # of times and time of delivery will not change NGT

EVALUATION FOR AGENCY USE ONLY

D. SUPPLEMENTAL SHEET FOR NONPROJECT ACTIONS
(Do not use this sheet for project actions)

Because these questions are very general, it may be helpful to read them in conjunction with the list of the elements of the environment.

When answering these questions, be aware of the extent the proposal, or the types of activities likely to result from the proposal, would affect the item at a greater intensity or at a faster rate than if the proposal were not implemented. Respond briefly and in general terms.

1. How would the proposal be likely to increase discharge to water; emissions to air; production, storage, or release of toxic or hazardous substances; or production of noise?

Proposed measures to avoid or reduce such increases are:

2. How would the proposal be likely to affect plants, animals, fish, or marine life?

Proposed measures to protect or conserve plants, animals, fish, or marine life are:

3. How would the proposal be likely to deplete energy or natural resources?

Proposed measures to protect or conserve energy and natural resources are:

April 25, 1991

Final Environmental Impact Statement
Master Use Permit No. 8405870
4800 Sand Point Way N.E.
Children's Hospital and Medical Center Helistop

This document has been prepared in compliance with the State Environmental Policy Act (RCW 43.21C) and the Seattle SEPA Ordinance, Chapter 25.05, SMC. Copies of this document are available for public review at the Master Use Information and Notification Center, 408 Seattle Municipal Building and the following branches of the Seattle Public Library:

Downtown Branch - 1000 4th Avenue, Seattle 98104
Governmental Research Assistance Library - 3rd Floor, Seattle Municipal Building, Seattle 98104
North East Branch - 6801 35th Avenue N.E., Seattle 98115
University Branch - 5009 Roosevelt Way N.E., Seattle 98105

Copies of the document are also available at the University of Washington Suzzallo and Health Sciences Libraries.

A limited number of copies for public distribution are available at the Land Use Information Center, 684-8467.

This Final Environmental Impact Statement (EIS) includes a new alternative to the original proposal which was developed in response to comments. Under this alternative, the majority of the helicopter flights with patients destined for Children's Hospital would land at the University of Washington's Intramural Field or Harborview Medical Center. A minority of the flights, with the most critical patients destined for Children's Hospital, would land on the Children's Hospital Laurelhurst campus.

The EIS does not include a transcript of the public hearing on the Draft EIS. After review of the comments submitted on the Draft EIS, DCLU determined the issues were sufficiently covered by the responses to the written comments.

The Department of Construction and Land Use will issue a recommendation on whether to grant, condition, or deny the project described above no sooner than seven days after the date of this document. A public hearing for citizens to comment on the proposal and recommendation will be scheduled at that time.

An equal opportunity affirmative action employer
Seattle Department of Construction and Land Use, 400 Municipal Building, Seattle, Washington 98104

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The final decision will be made by the Seattle City Council. Notice of the decision will be published either on a Monday or a Thursday in tne Daily Journal of Commerce. Notice of the decision will also appear in the Department's twice weekly Land Use Information Service bulletin and will be mailed to those who request a copy of the decision.

Sincerely,

Rebecca R. Herzfeld

John T. Doan
Department of Construction and Land Use
Room 405 - Municipal Building

Subject: Children's Hospital & Medical Center
Helistop: Final EIS

Dear Mr. Doan:

We reviewed portions of this Final EIS. The many ways to minimize accident risks and community impacts appear to be very thoroughly covered. We did note that recreation impacts were not considered significant and therefore were not discussed. Is that judgment still valid with the new alternative that would shift a majority of the landings to the UW's Intramural Field or Harborview? It is not really in this Department's jurisdiction, but the UW provides recreation space for a large campus population and we would be at least indirectly interested if their capacity to provide for it is being diminished by this proposal.

Thank you for the opportunity to comment.

Sincerely,

Holly Miller

ENVIRONMENTAL CHECKLIST

Purpose of Checklist.

The State Environmental Policy Act (SEPA), chapter 43.21 RCW, requires all governmental agencies to consider the environmental impacts of a proposal before making decisions. An environmental impact statement (EIS) must be prepared for all proposals with probable significant adverse impacts on the quality of the environment. The purpose of this checklist is to provide information to help you and the agency identify impacts from your proposal (and to reduce or avoid impacts from the proposal, if it can be done) and to help the agency decide whether an EIS is required.

Instructions for Applicants.

This environmental checklist asks you to describe some basic information about your proposal. Governmental agencies use this checklist to determine whether the environmental impacts of your proposal are significant, requiring preparation of an EIS. Answer the questions briefly, with the most precise information known, or give the best description you can.

You must answer each question accurately and carefully, to the best of your knowledge. In most cases you should be able to answer the questions from your own observations or project plans without the need to hire experts. If you really do not know the answer, or if a question does not apply to your proposal, write "do no know" or "does not apply." Complete answers to the questions now may avoid unnecessary delays later.

Some questions ask about governmental regulations, such as zoning, shoreline, and landmark designations. Answer these questions if you can. If you have problems, the governmental agencies can assist you.

The checklist questions apply to all parts of your proposal, even if you plan to do them over a period of time or on different parcels of land. Attach any additional information that will help describe your proposal or its environmental effects. The agency to which you submit this checklist may ask you to explain your answers or provide additional information reasonably related to determining if there may be significant adverse impact.

Use of Checklist for Nonproject Proposals.

Complete this checklist for nonproject proposals, even though questions may be answered "does not apply." IN ADDITION, complete the SUPPLEMENTAL SHEET FOR NONPROJECT ACTIONS (part D).

For nonproject actions, the references in the checklist to the words "project," "applicant," and "property or site" should be read as "proposal," "proposer," and "affected geographic area," respectively.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A. BACKGROUND

1. Name of proposed project, if applicable:
   Emergency Helistop for The Children's Orthopedic Hospital & Medical Center

2. Name of applicant:
   The Children's Orthopedic Hospital & Medical Center
3. Address and phone number of applicant and contact person:
   4800 Sand Point Way N.E.
   Seattle, WA 98105 contact: Dorothy Teeter, 526-2004

4. Date checklist prepared:
   October 16, 1984
5. Agency requesting checklist:
   DCLU
6. Proposed timing or schedule (including phasing, if applicable):
   Propose to construct immediately after receiving all necessary approvals.

7. Do you have any plans for future additions, expansion, or further activity related to or connected with this proposal? If yes, explain.

   No.

8. List any environmental information you know about that has been prepared, or will be prepared, directly related to this proposal.

   None.

9. Do you know whether applications are pending for governmental approvals of other proposals directly affecting the property covered by your proposal? If yes, explain.

   No others

10. List any government approvals or permits that will be needed for your proposal, if known.

    Seattle Conditional Use
    Seattle Building Permit
    FAA Approval

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. Give brief, complete description of your proposal, including the proposed uses and the site of the project and site. There are several questions later in this checklist that ask you to describe certain aspects of your proposal. You do not need to repeat those answers on this page. (Lead agencies may modify this form to include additional specific information on project description.) Construction and use of an emergency heilstop and use of same for transporting critically ill or injured children rapidly into the hospital for treatment.

12. Location of the proposal. Give sufficient information for a person to understand the precise location of your proposed project, including a street address, if any, and section, township, and range, if known. If a proposal would occur over a range of area, provide the range our boundaries of the site(s). Provide a legal description, site plan, vicinity map, and topographic map, if reasonably available. While you should submit any plans required by the agency, you are not required to duplicate maps or detailed plans submitted with any permit applications related to this checklist.

The Children's Orthopedic Hospital & Medical Center
4800 Sand Point Way N.E.

85 feet due north of the existing emergency entrance

B. ENVIRONMENTAL ELEMENTS

1. Earth

a. General description of the site (circle one): (Flat), rolling, hilly, steep slopes, mountainous, other: _____.

b. What is the steepest slope on the site (approximate percent slope)?

10°

c. What general types of soils are found on the site (for example, clay, sand, gravel, peat, muck)? If you know the classification of agricultural soils, specify them and note any prime farmland.

Clay loam.

d. Are there surface indications or history of unstable soils in the immediate vicinity? If so, describe.

No.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

e. Describe the purpose, type, and approximate quantities of any filling or grading proposed. Indicate source of fill.

We will use fill from other location on hospital site.

f. Could erosion occur as a result of clearing, construction, or use? If so, generally describe.

No.

g. About what percent of the site will be covered with impervious surfaces after project construction (for example, asphalt or buildings)?

50%

h. Proposed measures to reduce or control erosion, or other impacts to the earth, if any:

Retaining wall and drainage system to storm drains.

2. Air

a. What type of emissions to the air would result from the proposal (i.e., dust, automobile, odors, industrial wood smoke) during construction and when the project is completed? If any, generally describe and give approximate quantities if known.

Small amounts of jet engine exhaust during landing and take off.

b. Are there any off-site sources of emissions or odor that may affect your proposal? If so, generally describe.

No.

c. Proposed measures to reduce or control emissions or other impacts to air, if any:

None.

3. Water

a. Surface:

1) Is there any surface water body on or in the immediate vicinity of the site (including year-round and seasonal streams, saltwater, lakes, ponds, wetlands)? If yes, describe type and provide names. If appropriate, state what stream or river it flows into.

No.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

2) Will the project require any work over, in, or adjacent to (within 200 feet) the described waters? If yes, please describe and attach available plans.

No.

3) Estimate the amount of fill and dredge material that would be placed in or removed from surface water or wetlands and indicate the area of the site that would be affected. Indicate the source of fill material.

Does not apply.

4) Will the proposal require surface water withdrawals or diversions? Give general description, purpose, and approximate quantities if known.

No.

5) Does the proposal lie within a 100-year floodplain? If so, note location on the site plan.

No.

6) Does the proposal involve any discharges of waste materials to surface waters? If so, describe the type of waste and anticipated volume of discharge.

No.

b. Ground:

1) Will ground water be withdrawn, or will water be discharged to ground water? Give general description, purpose, and approximate quantities if known.

No.

2) Describe waste material that will be discharged into the ground from septic tanks or other sources, if any (for example: Domestic sewage; industrial, containing the following chemicals ...; agricultural; etc.). Describe the general size of the system, the number of such systems, the number of houses to be served (if applicable), or the number of animals or humans the system(s) are expected to serve.

Does not apply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

c. Water Runoff (including storm water):

1) Describe the source of runoff (including storm water) and method of collection and disposal, if any (include quantities, if known). Where will this water flow? Will this water flow into other waters? If so, describe.

Water runoff will not be changed and existing storm drains will continue to be utilized.

2) Could waste materials enter ground or surface waters? If so, generally describe.

No.

d. Proposed measures to reduce or control surface, ground, or runoff water impacts, if any:

None.

4. Plants

a. Check or circle types of vegetation found on the site:

X deciduous tree: alder, maple, aspen, other
X evergreen tree: fir, cedar, pine, other
X shrubs
X grass
__ pasture
__ crop or grain
__ wet soil plants: cattail, buttercup, bullrush, skunk cabbage, other
__ water plants: water lily, eelgrass, milfoil, other
__ other types of vegetation

b. What kind and amount of vegetation will be removed or altered?

130 sq. ft. of grass
3 trees removed

c. List threatened or endangered species known to be on or near the site.

None.

d. Proposed landscaping, use of native plants, or other measures to preserve or enhance vegetation on the site, if any:

Returned to previous condition.
Wildlife plantings on western slope.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

5. Animals None.

a. Circle any birds and animals that have been observed on or near the site or are known to be on or near the site:

birds: hawk, heron, eagle, songbirds, other:
None.

mammals: deer, bear, elk, beaver, other:
None.

fish: bass, salmon, trout, herring, shellfish, other:
None.

b. List any threatened or endangered species known to be on or near the site.
None.

c. Is the site part of a migration route? If so, explain.
No.

d. Proposed measures to preserve or enhance wildlife, if any:

Not applicable.

6. Energy and Natural Resources

a. What kinds of energy (electric, natural gas, oil, wood stove, solar) will be used to meet the completed project's energy needs? Describe whether it will be used for heating, manufacturing, etc.

Electric for lighting the helistop.

b. Would your project affect the potential use of solar energy by adjacent properties? If so, generally describe.

No.

c. What kinds of energy conservation features are included in the plans of this proposal? List other proposed measures to reduce or control energy impacts, if any:

Does not apply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

7. Environmental Health

a. Are there any environmental health hazards, including exposure to toxic chemicals, risk of fire and explosion, spill, or hazardous waste, that could occur as a result of this proposal? If so, describe.

No.

1) Describe special emergency services that might be required.

Fire Department/Aid Unit response.

2) Proposed measures to reduce or control environmental health hazards, if any:

Not applicable.

b. Noise

1) What types of noise exist in the area which may affect your project (for example: traffic, equipment operation, other)?

None.

2) What types and levels of noise would be created by or associated with the project on a short-term or a long-term basis (for example: traffic, construction, operation, other)? Indicate what hours noise would come from site?

There will be helicopter noise for the brief intervals it is arriving & departing. Hours of noise will vary depending on time of the emergency.

3) Proposed measures to reduce or control noise impacts, if any:

Controlled flight paths to minimize impact in neighborhood, and prudent helicopter blades to reduce noise.

8. Land and Shoreline Use

a. What is the current use of the site and adjacent properties?

Hospital grounds and hospital.

b. Has the site been used for agriculture? If so, describe.

No.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

c. Describe any structures on the site.

None.

d. Will any structures be demolished? If so, what?

No.

e. What is the current zoning classification of the site?

I-3

I-2 (35,500 sq ft official max ps.

f. What is the current comprehensive plan designation of the site?

Hospital grounds

g. If applicable, what is the current shoreline master program designation of the site?

Does not apply.

h. Has any part of the site been classified as an "environmentally sensitive" area? If so, specify.

No.

i. Approximately how many people would reside or work in the completed project?

Does not apply.

j. Approximately how many people would the completed project displace?

None.

k. Proposed measures to avoid or reduce displacement impacts, if any;

Does not apply.

l. Proposed measures to ensure the proposal is compatible with existing and project land uses and plans, if any:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

9. Housing

a. Approximately how many units would be provided, if any? Indicate whether high, middle, or low-income housing?

Does not apply.

b. Approximately how many units, if any, would be eliminated? Indicate whether high, middle, or low-income housing?

Does not apply.

c. Proposed measures to reduce or control housing impacts, if any:

Does not apply.

10. Aesthetics

a. What is the tallest height of any proposed structure(s), not including antennas; what is the principal exterior building material(s) proposed?

There is no structure.

b. What views in the immediate vicinity would be altered or obstructed?

None.

c. Proposed measures to reduce or control aesthetic impacts, if any:

Aesthetics should remain unchanged.

11. Light and Glare

a. What type of light or glare will the proposal produce? What time of day would it mainly occur?

No glare. Ground lighting only used for emergency night landing.

b. Could light or glare from the finished project be a safety hazard or interfere with views?

No.

c. What existing off-site sources of light or glare may affect your proposal?

None.

d. Proposed measures to reduce or control light and glare impacts, if any:

Use of lights only for emergencies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

12. Recreation

a. What designated and informal recreational opportunities are in the immediate vicinity?

None.

b. Would the proposed project displace any existing recreational uses? If so, describe.

No.

c. Proposed measures to reduce or control impacts on recreation, including recreation opportunities to be provided by the project or applicant, if any:

Does not apply.

13. Historic and Cultural Preservation

a. Are there any places or objects listed on, or proposed for, national, state, or local preservation registers known to be on or next to the site? If so, generally describe.

No.

b. Generally describe any landmarks or evidence of historic, archaeological, scientific, or cultural importance known to be on or next to the site.

None

c. Proposed measures to reduce or control impacts, if any:

Does not apply.

14. Transportation

a. Identify public streets and highways serving the site, and describe the proposed access to the existing street system. Show on site plans, if any.

Does not apply.

b. Is site currently served by public transit? If not, what is the approximate distance to the nearest transit stop.

Does not apply.

c. How many parking spaces would the completed project have? How many would the project eliminate?

Does not apply.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

d. Will the proposal require any new roads or streets, or improvements to existing roads or streets, not including driveways? If so, generally describe (indicate whether public or private).

No.

e. Will the project use (or occur in the immediate vicinity of) water, rail, or air transportation? If so, generally describe.

Yes, helicopter transporting critically ill or injured children.

f. How many vehicular trips per day would be generated by the completed project? If known, indicate when peak volumes would occur.

None.

g. Proposed measures to reduce or control transportation impacts, if any.

Does not apply.

15. Public Services

a. Would the project result in an increased need for public services (for example: fire protection, police protection, health care, schools, other)? If so, generally describe.

No.

b. Proposed measures to reduce or control direct impacts on public services, if any.

No impact.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

16. Utilities

a. Circle utilities currently available at the site: (electricity) (natural gas) (water) (refuse service) (telephone) (sanitary sewer) septic system, other.

b. Describe the utilities that are proposed for the project, the utility providing the service, and the general construction activities on the site or in the immediate vicinity which might be needed.

Electricity for emergency lighting. Storm drains for rain water runn off.

C. Signature

The above answers are true and complete to the best of my knowledge. I understand the lead agency is relying on them to make its decision.

Signature: Dorothy F. Treter

D. SUPPLEMENTAL SHEET FOR NONPROJECT ACTIONS
(Do not use this sheet for project actions)

Because these questions are very general, it may be helpful to read them in conjunction with the list of the elements of the environment.

When answering these questions, be aware of the extent the proposal, or the types of activities likely to result from the proposal, would affect the item at a greater intensity or at a faster rate than if the proposal were not implemented. Respond briefly and in general terms.

1. How would the proposal be likely to increase discharge to water; emissions to air; production, storage, or release of toxic or hazardous substances; or production of noise?

Proposed measures to avoid or reduce such increases are:

2. How would the proposal be likely to affect plants, animals, fish, or marine life?

Proposed measures to protect or conserve plants, animals, fish, or marine life are:

3. How would the proposal be likely to deplete energy or natural resources?

Proposed measures to protect or conserve energy and natural resources are:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TO BE COMPLETED BY APPLICANT:

EVALUATION FOR AGENCY USE ONLY

4. How would the proposal be likely to use or affect environmentally sensitive areas or areas designated (or eligible or under study) for governmental protection; such as parks, wilderness, wild and scenic rivers, threatened or endangered species habitat, historic or cultural sites, wetlands, floodplains, or prime farmlands?

   Proposed measures to protect such resources or to avoid or reduce impacts are:

5. How would the proposal be likely to affect land and shoreline use, including whether it would allow or encourage land or shoreline uses incompatible with existing plans?

   Proposed measures to avoid or reduce shoreline and land use impacts are:

6. How would the proposal be likely to increase demands on transportation or public services and utilities?

   Proposed measures to reduce or respond to such demand(s) are:

7. Identify, if possible, whether the proposal may conflict with local, state, or federal laws or requirements for the protection of the environment.

Subject: Draft Environmental Impact Statement
for Children's Hospital Helistop
4800 Sandpoint Way N.E.
Application #8405870

To Whom It May Concern:

This document has been prepared in compliance with the State Environmental Policy Act, RCW 43.21C and the Seattle SEPA Ordinance, Chapter 25.05, SMC.

Comments are invited and will be received until 5:00 p.m., October 2, 1986. Written comments should be addressed to:

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Building
Seattle, Washington 98104

Copies of this document are available for public review at the Land Use Information Center, Room 408, Seattle Municipal Building and the following branches of the Seattle Public Library:

Downtown Branch - 1000 4th Avenue, Seattle, WA 98104
Governmental Research Assistance Library - 3rd Floor,
Seattle Municipal Building, Seattle, WA 98104
University Branch - 5009 Roosevelt Way N.E.

A limited number of copies for public distribution are available at the Land Use Information Center.

A public hearing on this document will be held on September 23, 1986 at 6:00 p.m. at Laurelhurst Elementary School, 4530 - 46th Avenue N.E. Members of the public are invited to attend. A copy of the document of the document will be available for public review at the hearing.

A final Environmental Impact Statement (EIS) will be prepared to address comments made on the proposal and draft EIS. If you wish to be notified when the final EIS is available, please call the Land Use Information Center at 625-5200.

Sincerely,

Holly Miller

MASTER USE PERMIT

September 1, 1986

DRAFT ENVIRONMENTAL IMPACT STATEMENT - PUBLIC HEARING

Seattle's Department of Construction and Land Use has issued a Draft Environmental Impact Statement (EIS) for the proposed:

Project Description

4800 SAND POINT WY NE ZONE I-4/I-2/SF 5 PROJ #8405870/KROLL 16W TO CONSTRUCT AN EMERGENCY HELISTOP FACILITY ACCESSORY TO AN EXISTING HOSPITAL/ MEDICAL CENTER (CHILDREN'S HOSPITAL & Medical Center).

The following Master Use Permit components are part of this application
SEPA ENVIRONMENTAL DETERMINATION
COUNCIL CONDITIONAL USE
TO ALLOW A HELISTOP WITHIN A MAJOR INSTITUTION ZONE.

Further Information Available:
A copy of the Draft EIS is available for public review at the downtown Seattle Public Library, 1000 Fourth Avenue the Governmental Research Assistance Library, Seattle Municipal Building, and the branch library in the neighborhood in which the project is located.

Additional information and a limited number of copies of the draft EIS are available through the Master Use Information and Notification Center, Room 408, Seattle Municipal Building (625-5200).

Opportunity For Public Involvement

A public hearing to gather comments on the environmental impacts of the proposal will be held on
SEPTEMBER 23, 1986 at LAUREL HURST ELEM SCHOOL 06:00PM.
4530 46th Ave. N.E.
In addition, written comments may be submitted through OCTOBER 02, 1986

Comments should be addressed to: Director, Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.
If you wish to receive notice of the decision(s) on this project or to receive notice of the availability of the Final EIS (which responds to comments made at the public hearing or on the Draft EIS), please return the completed form below to: Seattle Department of Construction and Land Use, 400 Municipal Building, Seattle, Wa 98104.

FACT SHEET

Title and Description	The proposed action is for approval of a Council Conditional Use Permit to allow development of a helistop outside the Emergency Room entrance of Children's Hospital and Medical Center (Children's). Implementation of the Proposed Action would allow 15-20 critically ill children to be brought by helicopter to Children's each month without exposing the child to the risk of life-threatening delays or transfers associated with ground transport. Alternatives to the Proposed Action include the construction of a helistop at University of Washington's Intramural Field, or sharing a helistop with University Hospital, both of which involve ground transport of critically ill patients to Children's, a Limited Landings at Children's Alternative involving no construction of the Proposed Action or alternatives and landing of helicopters at Boeing Field and Harborview with ground transport to Children's and with only a few helicopter flights (with destabilizing patients) landing on the grassy area outside Children's Emergency Room entrance. In addition, a No Action Alternative is characterized by all flights landing at Boeing Field, Harborview or other helistop, with ground transport of patients to Children's.
Action Sponsor	Children's Hospital and Medical Center 4800 Sand Point Way N.E. Seattle, Washington 98105
Approximate Date of Implementation	Construction would be completed within approximately two months of approvals.

ELEMENTS OF THE ENVIRONMENT

Following is a list of Elements of the Environment as set forth in Chapter 25.05.444 of the Seattle Municipal Code. Items marked "Reviewed" are discussed in this document, on pages specified in the preceding Table of Contents. Items marked "Not Reviewed" have impacts deemed to be non-significant, for reasons briefly stated thereafter.

1. Natural Environment

a. Earth

i. Geology	Not reviewed; no unusual conditions exist on this urban site.
ii. Soils	Not reviewed; no unusual conditions exist on this urban site.
iii. Topography	Not reviewed; no unusual conditions exist on this urban site.
iv. Unique Physical Features	Not reviewed; no unique physical features exist on this urban site.
v. Erosion/Enlargement of Land Area (Accretion)	Not reviewed; construction-related erosion would not be significant.

b. Air

i. Air Quality	Not reviewed; helicopter emissions would not be significant.
ii. Odor	Not reviewed; helicopter emissions not expected to generate significant odor.
iii. Climate	Not reviewed; construction of helistop and operation of helicopter would not result in significant impact.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

c. Water		
i.	Surface Water Movement/ Quantity/Quality	Not reviewed; no surface water on site.
ii.	Runoff/Absorption	Not reviewed; amount of impervious surfaces would not be significant.
iii.	Floods	Not reviewed; not applicable to this urban site.
iv.	Groundwater Movement/ Quantity/Quality	Not reviewed; not applicable to this urban site.
v.	Public Water Supplies	Not reviewed; water consumption of proposal expected to have no impact on overall City of Seattle supply.
d. Plants and Animals		
i.	Habitat for and Numbers or Diversity of Species of Plants, Fish or other Wildlife	Not reviewed; currently only usual urban birds or small mammals can reasonably be expected on site.
ii.	Unique Species	Not reviewed; none exist on site.
iii.	Fish or Wildlife Migration Routes	Not reviewed; not applicable to site.
e. Energy and Natural Resources		
i.	Amount Required/Rate of Use/Efficiency	Not reviewed; insigificant amounts of energy consumed.
ii.	Source/Availability	Not reviewed; energy requirements would have insignificant effect on overall supplies.
iii.	Nonrenewable Resources	Not reviewed; the only use of resources would be for normal building materials, and energy requirements.
iv.	Conservation and Renewable Resources	Not reviewed; no significant impacts on conservation and renewable resources.
v.	Scenic Resources	Not reviewed; no significant impacts on scenic resources.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2.	**Built Environment**	
	a. Environmental Health	
	i. Noise	Reviewed
	ii. Risk of Explosion	Reviewed; discussed under Traffic Hazards (Helicopter Safety).
	iii. Releases or Potential Releases to the Environment Affecting Public Health, such as Toxic or Hazardous Materials	Not reviewed; proposal involves no significant hazard in this area.
	b. Land and Shoreline Use	
	i. Relationship to Existing Land Use Plans and to Estimated Population	Not reviewed; proposal involves no significant departure from land use.
	ii. Housing	Not reviewed; proposal has no significant impact on housing.
	iii. Light and Glare	Not reviewed; increase in light and glare determined to be non-significant.
	iv. Aesthetics	Not reviewed; proposal involves no significant changes to aesthetic character.
	v. Recreation	Not reviewed; no significant demand for recreation resources would be generated.
	vi. Historic and Cultural Preservation	Not reviewed; no affected historic or cultural resources have been identified.
	vii. Agricultural Crops	Not reviewed; small therapeutic garden on-site would be relocted.
	c. Transportation	
	i. Transportation Systems	Not formally reviewed; the proposed action by its nature would alter the transport of pediatric medical teams and patients; discussed under Introduction, Description and Traffic Hazards (Helicopter Safety).
	ii. Vehicular traffic	Not reviewed; proposal not expected to have significant impact on vehicular traffic.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

iii.	Waterborne, Rail and Air Traffic	Not reviewed; proposal would generate relatively insignificant amount of air traffic, which is quantified in description of proposed action.
iv.	Parking	Not reviewed; not applicable to site or proposed action.
v.	Movement/Circulation of People or Goods	Not reviewed; proposal would not have significant impact on movement/circulation.
vi.	Traffic Hazards	Reviewed
d.	Public Services and Utilities	
i.	Fire	Not reviewed; existing and future services not significantly affected.
ii.	Police	Not reviewed; existing and future services not significantly affected.
iii.	Schools	Not reviewed; no significant increase in school population is anticipated to result from development of this project.
iv.	Parks or Other Recreational Facilities	Not reviewed; not applicable to site.
v.	Maintenance	Not reviewed; owner would contribute taxes to pay for maintenance of public systems.
vi.	Communications	Not reviewed; proposed action not expected to disrupt communications.
vii.	Water/Storm Water	Not reviewed; project would be served by existing system with minimal upgrade.
viii.	Sewer/Solid Waste	Not reviewed; project would not require sanitary sewer or generate solid waste.
ix.	Other Governmental Services or Utilities	Not reviewed; provision of energy discussed in energy section; demand for government services would be small.

EXECUTIVE SUMMARY

Introduction

This environmental impact statement examines the University District and Laurelhurst neighborhoods of northeast Seattle and the potential impacts associated with construction and operation of the proposed Children's Hospital Helistop. The proposed action is the approval of a Council Conditional Use Permit to allow development of the Children's helistop located on the campus of the Children's Hospital and Medical Center at the northeast corner of Sand Point Way N.E. and N.E. 47th Street. The sponsor of the project is the Children's Hospital and Medical Center.

The sponsor's objective in developing the proposal is to create a landing pad for helicopters transporting critically ill or injured children to Children's. The specific objectives of the proposed action are to minimize both the patient transport time and the number of potentially destabilizing patient transfers from the place of patient pickup to the Emergency Room entrance at Children's while maintaining appropriate medical treatment and to construct a helistop and to operate the helicopter service so as to minimize potential environmental impacts.

The Children's campus is located in the Laurelhurst neighborhood, less than one mile east of the University of Washington. The Children's campus is situated on an east-facing hillside and consists of one large hospital building and a detached parking garage along the north edge of the campus boundary. The proposed helistop pad would be located approximately 120 feet north of the Emergency Room entrance, somewhat southwest of the parking garage and in the central portion of the campus.

Description of the Proposed Action and Alternatives

The proposed action would relocate the existing "Kitchen Garden" to a new site on campus and would remove three tall trees and assorted shrubbery prior to grading and construction of the helistop. The 40-foot-square helistop would be marked by a large red "H" and would be surrounded by a fence 2.5 to 3.5 feet tall. The helistop would be identified from the air by the red "H" and at night by ground lights that would be turned on for emergency landings. The helistop would initially involve ten patient transports per month and over time would receive up to an estimated 15-20 critically ill patients each month. For the near-term, approximately ten patients per month are expected to be transported by helicopter to Children's. The majority of these flights would be performed by Airlift Northwest (ALNW), a Seattle vendor based at Boeing Field; although flights could occur by other ambulance services, U.S. Army MAST helicopters, or private helicopters. Two takeoffs and two landings would be associated with each ALNW patient delivered to Children's--one landing and takeoff for the pickup of the pediatric medical team, the other for the delivery of the patient and departure of the helicopter.

Nearly all of these flights would approach Children's from the southwest, along Sand Point Way N.E., before turning to the south over the parking garage and making final approach to the helistop from the north. In

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

rare conditions of strong winds from the northwest quadrant, the helicopter would approach and land from the northeast (final flight paths would be approved by the FAA). Upon arriving at the helistop, the engine would be shut down, a ground crew would assist the on-board medical team for transporting the patient to the Emergency Room. The patient would be removed from the helicopter, placed on a gurney, and wheeled to the Emergency Room entrance. Once the patient is inside the Emergency Room and medical equipment is retrieved, the pilot would restart the engines and depart, following approximately the same flight path as the approach, but with greater altitude.

There are four alternatives to the proposed action discussed in the EIS. The University of Washington Intramural Field Helistop Alternative would consist of construction of a secured helistop at Graves Field on the University of Washington athletic field complex. The helistop would receive a similar number of Children's-destined flights as the proposed action. As with the proposed action, four flights wold be associated with each patient delivery. Patients landing at the Intramural Field Helistop would be transferred to a ground ambulance for the trip to Children's Emergency Room. Total transfer and transport time from helicopter touchdown to entry to the Children's Emergency Room would be a minimum of 10 minutes.

The University of Washington Hospital Helistop Alternative would consist of receiving approval by the Seattle City Council for a Conditional Use Permit on an already constructed, secured helistop on the roof of the hospital's expansion wing. As with the Intramural Field Helistop Alternative, this alternative would receive a similar number of Children's-bound patients as the proposed action in addition to an undetermined number of University of Washington-destined flights. As with the Intramural Field Helistop Alternative, this alternative would require the transfer of Children's-bound patients to a ground ambulance for the transport to Children's. Total transfer and transport time from landing to Children's Emergency Room is estimated at a minimum of 17 minutes.

The third alternative examined in this document is the Limited Landings Alternative, under which Children's-destined patients would be flown to Boeing Field and/or Harborview Hospital, stabilized, and transferred to a ground ambulance for transport to Children's. Occasional landings of destabilizing patients would occur in the grass area outside the Children's Emergency Room.

The final alternative is the No Action Alternative under which all Children's destined patients would be flown to Boeing Field and/or Harborview Hospital, stabilized and transferred to a ground ambulance for transport to Children's. No landings would be allowed on the Children's campus.

Impacts on patient outcome are expected to be more favorable under the proposed action than under the Intramural Field Helistop Alternative, the University Hospital Helipad Alternative, Limited Landings or the No Action Alternative. The increased time of transport and increased manipulation of patients that would result from any of the alternatives other than the proposed action could result in suffering, the need for prolonged treatment, or even death.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Environmental Impacts of the Proposed Action and Alternatives

Through the mandatory scoping process, two elements of the environment were identified as warranting analysis in the EIS. These elements are Noise and Vibration, and Helicopter Safety. "Cumulative Impacts" was added as a scoped element because of the possibility that the proposed action could serve as a precedent for the development of other helistops in Seattle.

An evaluation of noise and vibration impacts expected to be caused by the proposed action indicates that although helicopter noise would be noticeable, it would not cause significant impact during daytime hour, when three-quarters of the patient transports are expected to occur. During sleeping periods, helicopter flights could cause sleep disturbance of varying degrees to 15-30% at the closest, line-of-sight residences. The worst case impact of monthly helicopter noise exposures would increase ambient levels of 55-58 dBA by 3-5 dBA at residences closest to the helistop, which does not represent a significant increase over existing levels. Structural vibrations due to helicopter flights are not expected to be significant, although helicopter-induced vibrations could cause movement of small household objects, such as dishes, in the residences nearest the flight path. The Intramural Field Helistop Alternative would not be expected to create noise impacts when the primary approach and departure paths are used, although some impact could occur to the occupants of the University of Washington dormitories and classrooms when the secondary path over the University of Washington is used. The University Hospital Helistop Alternative would result in noise impacts for residents south of the Montlake Cut; due to a slightly greater distance from the flight path, these impacts would be slightly less than those impacts expected for residents in the vicinity of the Children's Helistop. Under the Limited Action Alternative, helicopter flights and resultant Ldn noise levels are expected to remain at current levels, resulting in occasional but not significant impacts. Under the No Action Alternative, there would be no noise impacts from helicopter operations at Children's or in the vicinity; however, there would be noise at Boeing Field and Harborview Hospital. Any alternatives to the proposed action could result in ambulance sirens being used between the landing area and Children's. These sirens are approximately as loud as the helicopter.

Helicopter safety impacts associated with the proposed action would be similar to those associated with the Intramural Field Helistop Alternative and the University Hospital Helistop Alternative. The difference between the three would be the probable location of potential helicopter accidents. Based on available data, the worst case expected statistical frequency of a helicopter accident on a flight destined for one of the proposed helistops would be one in every 5,459 flights, which, assuming an average of 20 patient transports a month, translates to a worst case of an accident occurring once every 23 years. Such an accident could occur anywhere along the flight path. Since the number of helicopter flights in the area would be less under the Limited Landings or No Action Alternatives than any of the other alternatives, the resulting helicopter safety impacts on the University/Laurelhurst area would be expected to be less as well, with the potential for impacts displaced to the other approach and departure loca-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

tions, i.e. Boeing Field and Harborview Hospital. It should be noted that limited landings in the grassy area do pose some public safety risks because the site is not secured.

In addition to helicopter safety, there are safety issues associated with ground ambulance transport and the natural gas meter house located near the site of the proposed action. In the case of a helicopter accident on the Children's site that breached the natural gas supply line, the natural gas would flare until shut off at the main valve across from Children's on Sand Point Way N.E. Under the Intramural Field Helistop Alternative, the University Hospital Helistop Alternative, and the Limited Landings and No Action Alternatives, patients destined for Children's would require ground transport from the Intramural Field, the University Hospital, and Boeing Field, Harborview Hospital, respectively, creating the possibility of traffic accidents that would not exist under the proposed action. Although specific statistics are not available regarding the frequency of traffic accidents involving ground ambulances, it is considered to be higher than the frequency associated with non-emergency vehicles.

The potential for cumulative impacts associated with the action alternatives centers around the likelihood of helistops proliferating at additional Seattle-area hospitals. There are three primary factors that would tend to discourage the improper use and proliferation of helicopter services in Seattle. First, the land use criteria used by the City of Seattle to evaluate helistop applications limit the use of helistops to those facilities that can demonstrate that the helistop is needed to save lives. (Only a few Seattle area hospitals that serve as tertiary care centers, offering specialized services to the region, are routinely involved in treating life-threatening emergencies that are referred from other hospitals and physicians in the region.) Therefore, the few hospitals in the Seattle area that can demonstrate the need or unique medical services and capabilities would be the only likely candidates for helistops. Second, the Puget Sound Health Systems Agency (PSHSA) has written two proposals to develop guidelines for the siting of helistops and to develop policy options for integrating helicopter services with regional and statewide Emergency Medical Service planning efforts. The Washington State Medical Association is drafting guidelines for assisting referring physicians in the selection of appropriate emergency medical transport. Finally, through the Certificate of Need process, the State Department of Social and Health Services (DSHS) will evaluate all future helistop installations at hospitals. (It should be noted that DSHS has exempted the Children's helistop proposal from the Certificate of Need process and, therefore, has not reviewed this proposal.) It is assumed that only those institutions with a demonstrated need for a helistop would be granted DSHS approval.

I. INTRODUCTION

The purpose of this document is to provide decision-makers, regulatory agencies, and interested citizens with a review of pertinent background information, a description of the construction and operation of a proposed helistop that would allow critically ill patients to be brought by helicopter to Children's Hospital and Medical Center (Children's), a description of alternative means of transporting critically ill patients (including alternative helistop locations), and an analysis of the potential impacts and mitigation associated with the proposed action.

This document is organized into three primary chapters: Background Information, Description of the Proposed Action and Alternatives, and Affected Environment, Significant Impacts and Mitigating Measures. The chapter on background information is intended to provide the reader with a context for the consideration of the proposed action. The chapter profiles the provision of general health care and describes the unique medical services offered by Children's; describes the conditions of patients who have been and would be transported to Children's by helicopter; characterizes the transport of critically ill patients--highlighting the role of helicopter transport; and reviews the authority of various public and private agencies with respect to the helistop construction approval and the provision of emergency helicopter transport services.

The chapter on the Proposed Action and Alternatives identifies the proponent's objectives, describes the process used to identify potential helistop sites; explains the derivation of the number of anticipated flights; and for each alternative characterizes flight operations and flight paths, and describes the transfer of the patient from the helicopter to the Emergency Room entrance at Children's.

The chapter on the Affected Environment, Significant Impacts and Mitigating Measures provides a detailed analysis of the elements of the environment that were determined to be significant during the scoping process. These elements are noise and vibration, helicopter safety, and cumulative impact.

Although the issue of medical need is not within the scope of this EIS, it is a requirement of the City Council's Conditional Use Permit and, therefore, is related to this proposal. At the request of the Seattle Department of Construction and Land Use, a report on medical need issues was prepared by Dr. Nicola, Director of the Seattle-King County Health Department. Dr. Nicola's report is appended to this document.

II. BACKGROUND INFORMATION

Health Care Services

The evolution of medicine has been characterized by increasing sophistication of both medical professionals and the capabilities of technical support equipment. The complexities of the medical system are reflected in the emergence of numerous specialty disciplines within the medical profession. In simple terms patients with complex illnesses or injuries are now commonly referred to specialists who have the particular expertise and equipment for their effective treatment. Because of the relative infrequency of need of their expertise (on a per capita basis), medical specialists are generally affiliated with regional medical centers located in populated areas, with patients coming from the surrounding urban center, as well as from rural and remote areas (Nicola, 1986). This aspect of the provision of health care is referred to as the regional medical referral system.

The provision of medical services can also be considered from the perspective of the age of the patient: neonatal (less than one month old), children, adults and the elderly. Each of these stages in life development are unique in that the health care of the individual requires attention to specific physiological and psychological conditions. Pediatrics is the specialized branch of medicine that deals with the development, care and diseases of children.

In the Pacific Northwest, many clinics, hospitals and medical centers offer pediatric services; however, Children's is the largest medical center that is equipped and, with 1,050 active physicians, staffed to offer full service, tertiary care for children and as such is an integral component of the regional health care network. Tertiary care is defined, by Children's and University Hospital, as those services necessary to deal with illnesses characterized by complex patho-physiologic processes. The most effective management of these illnesses requires integrated diagnostic and therapeutic services provided by multiple specialists. Tertiary care services require continuous management from the presentation of an illness to its resolution. Complex illnesses may present numerous conditions, such as severe congenital anomalies, multiple organ system trauma, prematurity in newborns, poisonings and neuropsychiatric disorders (Neff, 1985). Children's is recognized as the regional, tertiary referral center for children in the Pacific Northwest. A summary of 1984-1985 cases indicate that of the 621 Children's patients affiliated with the Blue Cross system, 64% were categorized as unique cases (defined as patients diagnosed with illness or medical need common to no other or one other patient affiliated with the Blue Cross system).

In the Puget Sound area, hospitalized neonatal emergencies are generally admitted to the Neonatal Intensive Care Unit (NICU) at Children's, which has 19 beds, or to the NICU at the University of Washington Medical School Hospital (University Hospital), which has 12 beds. The only other NICU beds in the Puget Sound area are the twelve located at Tacoma General Hospital. The only other neonatal intensive care beds in the state are located in Spokane. Pediatric medical emergencies in the Puget Sound region

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

that require hospitalization are generally admitted to the Pediatric Intensive Care Unit (PICU) of Children's, which has 17 beds. Children's, through its formal affiliation agreement, is the pediatric teaching hospital for the UW School of Medicine. There are an average of 450 occupied pediatric beds (excluding NICU beds) in the state of Washington; one-third of these are locted at Children's.

The University Hospital high-risk obstetrical program uses the University Hospital's NICU beds so that most low birthweight babies born at the University Hospital do not have to be transported between hospitals. Even with an excellent maternal transport program, there are still mothers who deliver low birthweight babies in community hospitals; many of these babies need to be stabilized and transported to a tertiary care hospital (Nicola, 1985). Because the University Hospital's NICU is often busy caring for the babies of mothers who delivered at University Hospital, low birthweight babies born in outlying hospitals are frequently transported to Children's. The two institutions have developed a system for coordinating the transport of these infants to either hospital based on the child's needs and the availability of services.

Children's has seven of the ten Board-certified pediatric surgeons in Washington, Alaska, Montana and Idaho. These surgeons offer a variety of unique capabilities including bone marrow and kidney surgery. Much of the pediatric surgery in the four-state region is currently performed at Children's.

Traumatized and severely burned children in the Puget Sound region generally go first to the region's recognized trauma center, Harborview Medical Center, but may be transferred to Children's for follow-up surgery or treatment and stabilization. (Harborview Medical Center is a County institution that is administered by the University of Washington.) Children's is not a trauma center, as it does not meet all criteria necessary to be so designated.

In 1985, Children's admitted 11,612 inpatients and 66,006 outpatients. As Table 1 indicates, 55% of these patients were from King County; 22% from Snohomish, Pierce and Kitsap Counties; 11% from other counties west of the crest of the Cascades; 7% from east of the Cascades; 2% from Alaska; 1% from Montana; and the remainder from other states and countries. The distribution of origins is displayed in Figure 1.

Emergency Transport of Patients

A key element of the regional medical referral system is the transport of the critically ill or injured patient to the referral hospital. This referral may occur either for a patient in a clinic or hospital who needs the services offered by a more sophisticated and/or specialized medical facility, or for a patient in the "field" (home, work, play or the scene of an accident).

The Emergency Medical Service (EMS) system refers to the extension of medical services to critically ill patients and, if necessary, the transport of these patients to appropriate medical facilities. The State of Washington's Department of Social and Health Services coordinates EMS

SHAPIRO & ASSOCIATES

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

planning for the entire state. The EMS transport system in the central Puget Sound region is comprised of Medic One units, Fire Department aid units, private ground ambulance, military and private helicopter services and the specific emergency medical services offered by area hospitals.

Transporting critically ill children to Children's has long been a service offered by the hospital. Sending a specially trained transport team to referral hospitals has ensured specialized medical care en route and increases the potential for better outcomes for the patients brought to Children's. The Children's/University Hospital pediatric ground transport team has been in operation about ten years and currently brings more than 300 transports per year to the intensive care units at both hospitals.

Interhospital Transport

Under emergency conditions the interhospital transport of patients may occur by ambulance, by helicopter, by fixed wing aircraft or by a combination of these modes. Although there are existing medical guidelines and standards for patient care while being transported (American Academy of Pediatrics and American College of Obstetricians and Gynecologists, 1985 as cited in Nicola, 1985), there are no standard published guidelines for determining which mode of transport should be used for particular patient conditions. The Washington State Medical Association's EMS Standards Committee is in the process of developing guidelines to assist in the selection of appropriate modes of transport, with final recommendations scheduled to be considered during the summer of 1986. (See discussion under Washington State Medical Association, below.) Because a patient's presenting conditions may be complex and the attending medical personnel are best able to observe and synthesize the medical data with which they are presented, it is the opinion of the Seattle-King County Department of Public Health that any recommendations be used as guidelines and not standards (Nicola, 1986).

Distance is one factor in determining the selection of ambulance, helicopter and/or fixed-wing aircraft in the emergency transport of patients. Helicopter transport may be preferred in instances where distance is not great but when ground transport time would be long because of crossing Puget Sound, because of poor traffic conditions, or other circumstance that would significantly delay the critically ill patient receiving treatment that could only be available at the referral hospital. Additional determinants are the condition of the patient, the patient's ability to withstand transfers, and weather.

Field Transport

Field transport refers to the transport of injured or ill patients from non-hospital settings to hospitals or other medical centers. King County coordinates the delivery of certain emergency medical services throughout King County. The King County EMS system is a layered system response program: local Fire Departments' Aid Service, staffed by an Emergency Medical Technician (EMT), responds to all calls. EMT's have a minimum of 81 hours of training while paramedics, who are trained to perform emergency work in the field, have at least 1500 hours of training. Thus, paramedic units are dispatched to the more severely injured or ill patients in the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

field, including patients facing life-threatening medical situations. In King County, seven area hospitals provide medical control to paramedics:

Auburn General	Auburn
Evergreen General	Kirkland
Harborview Medical Center	Seattle
Highline Community	Burien
Overlake	Bellevue
Northwest	Seattle - Shoreline
Valley Medical Center	Renton

Volunteer medic units are also located in Carnation, Duvall, Enumclaw, Issaquah and on Vashon (Call, 1986b).

Paramedics operate as an extension of the physician services offered at the base hospital. Unless otherwise stipulated by the patient or patient's physician, paramedics will recommend transport of those patients requiring advanced treatment to the closest facility that provides the appropriate level of care. To that end, the King County Medical Society, the King County Emergency Medical Society, the King County Emergency Medical Services Coordinating Council and EMS Division of the Seattle-King County Department of Public Health have developed a classification of hospitals according to the services that they provide. The King County EMS Division has prepared a Patient Distribution Guide to assist field and base hospital medical staff in determining the appropriate medical center for treating the patient. The King County Medical Society has assumed responsibility for periodically updating the Guide.

The Patient Distribution Guide classifies Children's as both a Group A and Group B hospital. The Group A hospitals, of which there are 25, are characterized by the following services (King County Division of Emergency Medical Services, 1978):

- 24-hour Emergency Room Physician, trained in resuscitative measures
- Intensive Care Unit, staffed and operated at all times
- Coronary Care Unit, staffed and operated at all times
- Laboratory and X-ray unit services available at all times
- Major sub-specialty services available (on call) within one hour of notification

The 15 Group B hospitals satisfy the criteria for categorization as Group A and also have a neurosurgeon "actively involved with the hospital and [who] will examine and operate on patients in that hospital if it becomes necessary" (King County Division of Emergency Medical Services, 1978).

Only Harborview Medical Center is categorized as either a Group C (operating room staffed 24 hours a day) or Group D (intensive burn patient care) hospital.

Group E hospitals are subgrouped into specialized services including alcohol, psychiatric, neonatal, cardiac bypass and hyperbaric treatment. Only two hospitals--Children's and University--offer neonatal services, while Children's is one of six designated hospitals that can perform cardiac

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

bypass surgery. Although not a formal subgroup, pediatric emergency services involving critically ill or injured patients are generally referred to Children's (Call, 1986b). In 1985, there were a total of 141 patients who were served by the County's EMS system and subsequently transported to Children's--two of these by helicopter (Call, 1986b). Additional EMS ground transports were made by the Seattle Fire Department, which provides comparable services in incorporated Seattle.

The County's EMS Division has established guidelines for paramedics in South King County in order to assist in selecting air or ground transport for critically ill patients (Call, 1986a). The underlying principle is the consideration that air transport provides a rapid method for getting the appropriate medical help to the patient, not that the patient gets to the hospital quickly (Call, 1986a). The following guidelines are used by EMS paramedics in South King County in order to assess the need for helicopter transport (Call, 1986a):

"1. Must be an extremely ill patient [such] that the arrival at a hospital capable of providing specialized care will immediately save their life or reverse their medical deterioration.

   Examples of presenting medical problems that would most likely indicate use of a helicopter in order to expedite transport of a patient are as follows:

   a. Gunshot wound with vitals of blood pressure (BP) less than 80 and heart rate (HR) over 120 with possible respiratory problems

   b. Aneurysm (aortic) with BP less than 100 and dropping, or other internal bleeding signs requiring immediate intervention.

   c. Major medical problems in a pediatric patient where time is critical for survival of the mother and/or baby.

   d. Multiple injuries that indicate bleeding of such a nature that the patient is in danger of bleeding out within minutes.

   e. Obstetrical problems that require immediate medical intervention and that are not generally handled at local hospitals.

   f. Major head injuries.

2. Time must be the major consideration when using a helicopter. Overall, the time discussed means the helicopter must be able to reach the designated receiving hospital, in less time than the paramedic unit could reach the hospital if they scooped and ran. The time on scene is always a major concern and under no circumstances should there be a delay at the scene waiting for a ride from the helicopter. If a patient is committed to a ground vehicle, under most circumstances transportation should continue in the vehicle to avoid unnecessary delays or interruption in treatment by the ground vehicle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Generally, a helicopter should only be used in areas in eastern and southeastern King County when the patient must be transported for specialized care to a distant hospital such as:

Harborview Medical Center	- Major trauma, head injuries, burns
Children's Orthopedic Hospital	- Pediatric medical emergencies that would be delayed by ground transportation
University Hospital	- Obstetrical emergencies

4. Permission to use any helicopter by a paramedic must be obtained from the medic unit's base hospital physician.

5. Helicopters should only be requested when there are qualified emergency medical personnel on scene who can evaluate the patient's needs. Paramedics should be responsible for requesting helicopter transport as they are usually the most qualified medical personnel. While in route to an accident, it may be appropriate for paramedics to consult with EMTs on scene regarding the patient's condition.

6. Under no circumstances should paramedics request dispatch centers to get comparative estimated time of arrival from MAST and Airlift Northwest. The paramedics are expected to make a decision regarding which helicopter transport service can best serve the needs of the patient, and to request it. If the first service of choice is not available, then the second helicopter service should be requested."

The Role of Helicopters in the Transport of Patients in Western Washington

The Korean conflict was the first to recognize that the helicopter's ability to land nearly anywhere and then to transport the patient rapidly to Mobile Army Surgical Hospitals (MASH) greatly increased the ability of wounded soldiers to receive medical treatment. During the Vietnam War, the airborne MASH teams provided rescue, medical stabilization, and evacuation to approximately one million military and civilian personnel. Postwar studies on the application of military helicopters in a civilian context provided the basis for the development of medevac operations that were inaugurated by the Maryland State Police in 1970. The first civilian helicopter ambulance service in the United States was initiated in 1972 at Saint Anthony's Hosital in Denver. In the past 14 years, this concept has expanded to include 75 hospital-based helicopter services that land at more than 900 hospital helistops (Reich and Kania, 1985).

Patients who are transported to Children's by helicopter are in critical condition. Children's defines critically ill or injured patients as those patients who might die or become seriously damaged unless appropriate treatment is received immediately (Neff, 1986). Critically ill patients who are brought to Children's include but are not limited to near-drownings, premature children, severe injuries, overwhelming

KEY CHARACTERISTICS OF CRITICALLY ILL PATIENTS
TRANSPORTED BY AIRLIFT NORTHWEST HELICOPTER DIRECTLY TO CHILDREN'S
(August 1, 1985 - June 10, 1986)

Admission Date	Time[1]	Referring Hospital/Scene	Age/Weight	Presenting Condition	Admitted To	Discharge/Current Status
8/3/85	1600-1800	Naval Hospital Bremerton, WA	Newborn	Perforated bowel; two surgeries	IICU	Expired 8/4/85
8/20/85	1100-1550	Forks Community Hospital, Forks, WA	Premature infant; 2 lbs	Collapsed lung; extreme prematurity	IICU	Dischgd. Olympic Memorial 9/25/85; dischgd. home 10/85
8/27/85	1800-2022	St. Helen's Chehalis, WA	1 month	Fulminating meningitis (bacterial inflammation of the brain); coma; neurologically damaged	IICU	Dischgd. home 12/13/85
10/15/85	0630-0800	Wenatchee	Premature newborn; 27 wk. gestation	Multiple congenital abnormalities; spinal Trisome 18; CPR in route with twin	ER	Expired 10/15/85
11/19/85	0300-0400	Covington, WA (scene)	Premature newborn; 28 wk. gestation; 2-1/2 lbs.	Delivered at home; extreme prematurity; developed overwhelming infection; chronic lung disease	IICU	Discharged to Valley General 2/22/86
11/27/85	1150-1225	St. Joseph's Bellingham, WA	Newborn; 37 week gestation	Respiratory distress; severe pneumonia; overwhelming blood borne infection and shock	IICU	Discharged 12/5/86
11/28/85	1125-1255	St. Peter's Olympia, WA	2 months	Subdural hematomas; some vision and brain damage	IICU	Dischgd. to St. Peter's, Olympia, 12/16/85
12/4/85	0935-0945	Harrison Memorial Bremerton, WA	Premature newborn; 32 wk. gestation; 4 lbs.	Severe lung disease; overwhelming infection; respiratory failure	IICU	Expired 12/14/85
12/13/85	2215-2245	St. Helen's Chehalis	Newborn; 37 wk. gestation	Pneumomediastum (air dissecting around heart and lungs)	IICU	Dischgd. home 1/5/86
12/22/85	1329-1350	Skagit Valley Hospital Mt. Vernon	7 months	Overwhelming infection and shock; meningitis (bacterial inflammation of brain); no brain activity; possible loss of some fingers	PICU	Dischgd. to Skagit Valley Hospital 1/8/86
1/11/86	1510-1740 (Boeing) -1800 (COH)	Ketchikan, AL	Newborn; 35 week gestation; 4-1/2 lbs.	Overwhelming infection; Group B strep; intracranial bleeding; from Alaska to Boeing 2 seizures;	IICU	Expired 1/20/86

Table 2 (continued)

Admission Date	Time[1]	Referring Hospital/Scene	Age/Weight	Presenting Condition	Admitted To	Discharge/Current Status
1/20/86	0735-0805 (Boeing) -0815 (COH)	Yakima Valley Hospital, Yakima, WA	18 months	Massive bleeding from intestines and lungs; shock	PICU	Expired 1/20/86
2/12/86	2100-2200	Grays Harbor Community Hospital, Grays Harbor	3 year old	Lost child found in river. Extremely low temp. 37.5 degrees C. Decision made to begin extensive resuscitation efforts. Required continuous CPR.	ER	Expired 2/12/86
2/13/86	1040-1055	Whidbey General Whidbey Island	Newborn term infant	Massive generalized body edema, heart failure. Difficulty breathing at birth, collapsed lung cyanotic. Later determined congenital problems resulting in ruptured bladder.	IICU	Expired 2/14/86
3/21/86	2225-2245	Harrison Memorial Hospital, Bremerton, WA	Newborn; full term	Critical congenital anamoly collapsed lung; diaphragmatic hernia (surgery performed at COHMC)	IICU	Expired 3/22/86 following surgery
4/5/86	1005-1020	Federal Way (scene)	19 months	Child found partially submerged in lake by father; cold, pulseless and no spontaneous respiration. Pupils fixed and dilated. Father began CPR, Medics arrived and contacted ALNW. During hospitalization, child developed aspiration pneumonia. She was treated successfully and should be completely normal in every respect.	ER/PICU	Discharged to home 4/10/86
4/18/86	1510- -1600 (COH)	Sunnyside Hospital Sunnyside, WA	Newborn; full term 5 lbs.	Multiple congenital anamolies including a diaphragmatic hernia, no anus, possible heart disease and absence of a part of the lower spinal canal. At birth the child was severely acidotic , requiring intubation and mechanical ventilation with high pressures. Immediate surgery was the child's only hope for survival. The child was transported to Boeing by fixed wing and by helicopter to COH.	IICU	Expired 4/18/86
5/21/86	0850-0910	Bainbridge Island Middle School Winslow, WA	14 year old	Born with transposition of great vessels. Had cardiac surgery at COH 10/84. Had seizure in gym class with acute caridac arrest. Paramedics were called who in turn called ALNW. Child showed gradual improvement with a very rapid downhill course 12 hours before she died. She was found to have increased intracranial pressure and herniation of her brain stem.	PICU	Expired 5/26/86

Table 2 (continued)

Admission Date	Time[1]	Referring Hospital/Scene	Age/Weight	Presenting Condition	Admitted To	Discharge/Current Status
5/31/86	0015-0040	Whidbey Island	Newborn; full term	At delivery, child had marked progressive respiratory difficulty requiring increasing amounts of 02 by mouth. Chest x-ray showed child had aspirated newborn fecal material and had a right-sided partially collapsed lung. Possibility of complicating pneumonia.	IICU	Discharged to Whidbey Island 6/3/86
6/1/86	1218-1235	Medic 6[2] (Auburn Area) (scene)	21 months	Chemical ingestion (Pine-Sol). Child had respiratory distress, became cyanotic and comatose in a short time and had vomited. Child had a past history of asthma and showed evidence of penumonia.	PICU	Discharged home 6/11/86
6/17/86	0915-0940	Bremerton Naval Hospital	Newborn; 35 week gestation, 6 lbs.	Child born to diabetic mother. Increasingly severe respiratory distress. Child was acidotic with low blood oxygen. Child was intubated. Shows evidence that blood is being intermittently shunted away from the lungs, making it impossible for the baby to completely oxygenate his own blood, even with 100% oxygen.	IICU	Still at COH 6/20/86

infections, and ingestion of toxic substances. It is important to note that not all patients in these medical situations warrant helicopter transport to the Emergency Room entrance: that is a decision properly made by the referring physician in consultation with the advanced care unit or by the transport physician (Nicola, 1986). Although many outlying hospitals are equipped and staffed to appropriately deal with these medical conditions, there are situations when the severity of the condition warrants treatment at a tertiary care center. For example, pediatric surgeons and pediatric plastic surgeons are most capable of performing surgery on severed arteries, severe toxic shock may require dialysis, other conditions are best served by the recognized medical specialists that work in the infant and pediatric intensive care units. Table 2 presents data on the medical conditions of patients who were transported directly to Children's by helicopter.

The two main objectives of a helicopter transport system are to reduce the time before appropriate advance treatment can begin and to decrease patient manipulation.

Critical Time Saved

Surgical emergencies in the child, as well as infections, near drownings and trauma, are some of the conditions that need immediate intervention. Since time is critical, transport time has a direct bearing on the patient's prognosis. For critical patients, every moment lost increases mortality (Neff, 1986). Table 3 illustrates the time savings hypothetically involved in transporting and transferring an infant and equipment from Enumclaw to Children's Emergency Room.

Decreased Patient Manipulation

Whenever a patient is loaded or unloaded during an emergency transport, there are risks involved not only because of time loss but also because of patient handling. Two major risks are the possibility of losing critical life support tubes and lines, and the consequences of a lowered body temperature (hypothermia).

Isolettes are self-contained units that incorporate advanced life support systems. If an isolette that keeps a transported premature infant warm is opened to replace a tube that has been jostled, there is a risk that the child will become hypothermic if the outside temperature is below the ideal temperature of approximately 91°F (Neff, 1986). The hypothermic infants will try to breathe faster due to increased oxgen needs, which only results in more heat loss. In addition, a build-up of acid in the blood is also associated with hypothermia, which can contribute to the rupture of a premature infant's fragile blood vessels in the brain, which can cause brain damage or brain death.

The role of helicopter transport is generally described in a statement from the Puget Sound Health Systems Agency:

> "Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care en route can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

> Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services" (PSHSA, 1985).

The City of Seattle's Department of Construction and Land Use requested that Dr. Nicola, the Director of the Seattle-King County Department of Public Health, provide expertise in the assessment of medical need for the proposed Children's helistop. Dr. Nicola prepared recommendations based on a review of the literature, discussion with transport physicians, a review of helicopter flight logs, public hearing and discussions with knowledgeable individuals both in and out of the region (Nicola, 1986). Dr. Nicola's findings are appended to this report.

In Dr. Nicola's review of the literature examining the situations warranting helicopter transport, there are several cited studies that relate severity of illness to need for transport. One study revealed that over a six and one-half year period 81% of the patients transported by helicopter to a regional center were admitted to the ICU or were taken to surgery (overall mortality of 9%). A second study demonstrated that nearly one half of the patients arriving directly from the injury scene were delivered by helicopter (overall mortality of 6%). Another study cited in Nicola's report evaluated air transport of 569 patients in a rural EMS system and, using uniform guidelines, determined that helicopter transport was essential to 16.5%, helpful to 10.9%, and not a factor to the preservation of life in 54.7% of the cases. "In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8)" (Nicola, 1985).

A fourth study examined seven hospital-based helicopter transport medical emergency services that treated and transported 1273 blunt trauma patients. The study indicated that there was a 21% reduction in expected morbidity, however, there is some debate about methodologic soundness of the study (Nicola, 1985). The authors noted that the data must be viewed with caution and further suggested that predicted reduction in total trauma-related mortality may be more directly correlated to experienced medical teams reaching a patient than to the transport of a stabilized patient by helicopter rather than by ground transport (Baxt and Moody, 1983).

Dr. Nicola's review of literature prepared for DCLU concluded:

> "...that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transporta-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

tion, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on (DCLU's) question (of the appropriate location for siting Children's helipad)." (Nicola, 1985)

Dr. Nicola also concluded that of the ten patients that he estimated would be transported to Children's by helicopter each month, an estimated three or four "may have a medical need for helicopter transport to the doors of the hospital" (Nicola, 1985). The outcome of these patients may be adversely affected by a 3-5 minute delay in receiving treatment in the hospital (Nicola, 1985).

Dr. Nicola further noted that "the literature review indicated that there are not definitive predictive clinical indicators of prognosis; that is, any number [of transferred patients] would have to include an additional number of patients whose condition at time of referral was appropriate for air transport..." (Nicola, 1985).

Helicopter transport in the central Puget Sound area is provided by two general services: Military Assistance to Safety and Traffic (MAST) and Airlift Northwest.

MAST

MAST is responsible for the emergency transport of all military personnel and their dependents within 100 nautical miles of Fort Lewis. Military personnel and their dependents have no choice but to use MAST, unless a private airlift service is arranged and paid for by them or the military. MAST will fly civilians in areas where there are no civilian transport programs or where civilian programs do not have the appropriate equipment to respond (e.g., a mountain rescue). MAST units accept missions according to the following criteria: 1) life and death emergencies; 2) loss of limb or eyesight; 3) undue suffering; 4) only accessible transport due to terrain, etc.

MAST helicopters transfer patients from accident sites within a 100 nautical mile radius of Fort Lewis to Harborview, Children's, and other hospitals in Seattle and to St. Joseph in Tacoma. The MAST program in Puget Sound is based at Fort Lewis where six "Huey" helicopters are located; a seventh "Huey" is located at the U.S. Army's Yakima facility. The "Hueys" are Vietnam-era helicopters that are noisy, slow and characterized by a lot of vibration. The military plans to phase in UH60 Blackhawks in 1989. Compared to the "Hueys," the dual-jet-engine Blackhawks are larger inside, faster and more quiet. A representative of MAST has indicated that it is possible the plans to phase-in the Blackhawks may be altered (Greenawalt, 1986).

MAST is a training program for military medics, and as such is designed to support military capabilities and operations. In times of peace, MAST personnel develop and maintain patient care skills and are trained by both

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

civilian and military personnel, including physicians. New personnel entering the MAST unit are graduates of the military basic training program and also of advanced training programs in which they are taught military occupational skills. Serving in the MAST program and communicating and working with civilian hospitals allows recruits to continue Emergency Medical Technician (EMT) training.

MAST patient transport missions may be requested by anybody. MAST flys with EMTs and without advanced life support (ALS) and, therefore, no drugs unless the condition of the patient warrants that the helicopter pick up a physician/paramedic team from either Madigan Army Medical Center, a local hospital, or an emergency rescue program. MAST does not pick up the medical transport team at Children's. When a newborn is transferred by MAST to Children's, Madigan supplies the physician team (on an as available basis) to accompany the baby. Madigan had two pediatric staff and two neonatal fellows; however, as of July 1, 1986, Madigan no longer has neonatal fellows.

For those hospitals willing to supply their own physicians for MAST flights, understaffing during the physician's absence could exist for the referring hospital. Because MAST must return as quickly as possible to their base, they do not fly physicians, paramedics, or other civilian personnel back to the originating site unless that site is on the return flight path. Thus, the referring hospital will be without the services of the physicians involved in the transport until they are able to return. Other medical personnel may need to fill in for the medical team involved in the transport. On missions to Seattle hospitals, MAST will fly physicians back to Madigan, as long as they are ready to go quickly, because Madigan is on the MAST return flight path.

In 1985 Fort Lewis-based MAST flew approximately four hundred missions. Approximately 70% of these missions were field-site pickups and the remainder were hospital transfers. Transports were evenly divided between civilian and military personnel. From 1983 to date, MAST transported 29 patients to Children's; 12 of the patient missions to Children's were interhospital transfers (Kranz, 1986). These transfers occurred days or hours after the onset of the illness or injury.

MAST has a civilian advisory committee, chaired by Dr. Jay Kranz, a Seattle surgeon. The committee purchases equipment with State Department of Transportation monies and donations. Purchased equipment includes an incubator and three radios and installation kits; the latter was provided to enhance communications between the helicopter and emergency room staffs. Dr. Kranz independently reviews MAST transports for appropriateness.

Airlift Northwest

After nearly ten years of transporting critically ill children by commercial carrier and charter flights, Children's joined with three other regional medical centers (University of Washington Hospital, Harborview Medical Center, and Providence Medical Center) to form Airlift Northwest. The four-year-old Airlift Northwest is a Seattle-based airborne patient transport service designed to support the regional medical referral system and specifically to make specialized critical care accessible to patients throughout the Pacific Northwest and Alaska. Airlift Northwest provides

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

medically outfitted, ventilator-equipped turboprop jet and rotary winged aircraft, with a medical team of ICU physicians and ICU nurses to resuscitate and provide proper medical care to patients who are being transported. Patients requiring tertiary care generally will be transported to appropriate care facilities of one of the four members of the Airlift Northwest consortium. Airlift also will transport patients to non-consortium hospitals.

Airlift Northwest is a cooperative venture among the four public and private member institutions, with Harborview serving as the primary administrative arm of the consortium. Each of the three associate institutions has a contract with Harborview. The contract characterizes the airlift program and organizational structure, the roles of support personnel, the sharing of equipment, the allocation of costs and distribution of revenues, indemnification, record-keeping, services extended to non-participating hospitals, and provisions for amendment and termination of the contract (Childs, 1986b).

The turboprop jet, a Cheyenne III, is used for the transport of patients who are located more than 120 miles from Airlift Northwest's King County Airport (Boeing Field) base. This fixed wing aircraft is always used to transport patients from Alaska and for the majority of missions flown east of the Cascade Mountains in Washington, and elsewhere (Idaho and Montana) in the four-state referral area. Airlift also will accept missions to other states. Two other Cheyennes and a Sabreliner provide back-up capabilities in the event the primary Cheyenne III is unavailable.

In order to more effectively transport patients from areas in the Puget Sound region that are not easily accessible by ground transportation and not served efficiently by fixed wing, Airlift Northwest added a helicopter service in May of 1985.

The helicopter that Airlift Northwest operates is a twin-engine Agusta A109 Mark II helicopter, one of the fastest and quietest helicopters manufactured. The helicopter's specifications are listed in Table 4.

Standard medical equipment on Airlift Northwest's helicopter includes the following:

- 2 patient stretcher rack
- Patient oxygen system with two 50 psi oxygen outlets
- Compressed air system with one 50 psi air outlet
- Patient suction system with continuous and intermittent regulator capabilities
- 115 volt electrical system with 2 wall-mounted outlets in cabin
- Overhead lighting with high intensity halogen lamp
- Overhead IV hooks
- Double lock narcotics safe
- Lifepak 5 cardiac monitor/defibrillator
- Holter infusion pumps
- Doppler

The helicopter also can carry a 160-pound isolette unit (with ventilator) for the transport of neonates and babies. This isolette unit is

powered by the aircraft electric system while in the helicopter or by its self-contained battery pack. Additional medical equipment can be carried to provide the specific support necessary to individual patients.

The medical transport team of ICU physicians and nurses are based at Harborview, except for the pediatric team, which is based at Children's. When not flying, the pediatric medical transport team members work in the ICU at Children's. The transport team is medically trained and also receives a two-day orientation from Airlift pilots on helicopter operations and safety procedures. This safety orientation is maintained through biannual training.

Airlift Northwest annually transports hundreds of patients by aircraft. Table 5 indicates the frequency of use in previous fiscal years, in the current year and projections for the next ten years. From 1981 through mid-1985, Children's destined patients represented one-third of the total number of Airlift's fixed-wing transports.

With respect to Children's-destined patients, the Airlift Northwest helicopter transit service provides intensive care support to a number of critically ill or injured patients. Table 2 describes Airlift helicopter transports to Children's through mid-June 1986. This table identifies the date, time, origination of flight and the age, condition of patient, admitting unit, and discharge data or status. Approximately 63% of the children transported directly to Children's were newborns. Only one patient was older than three years old.

A Review of the Authority of Federal, State, Local and Private Agencies with Respect to Air Ambulance Service and Helistop Siting

This section highlights key jurisdictional issues with respect to emergency helicopter transport.

A review of the missions of various public and private agencies indicate that there is no single agency with jurisdiction regarding the siting of a helistop and the operation of an emergency airborne patient transport service. Rather, there are a number of agencies that have specific, defined authority. These agencies include the Federal Aviation Administration, the State of Washington's Department of Social and Health Services and the Seattle City Council, which is supported by the Department of Construction and Land Use and the Seattle-King County Department of Public Health.

In addition, there are a number of agencies that provide support of an informal and/or advisory nature. Among these agencies are the Washington Department of Transportation, Puget Sound Health Systems Agency, the Seattle Area Hospital Council, the Washington State Medical Association, American Society of Hospital-Based Emergency Air Medical Services, and the National Emergency Medical Services Pilots Association.

Federal Aviation Administration (FAA)

The FAA is a federal regulatory agency charged with the promotion of aviation safety. As such it provides programs certifying pilots and

[1] July 1-June 30 fiscal year.

[2] Fixed wing service began February 1982.

[3] Rotary service began in May 1985. The total number of patients transported to Children's including landings outside the emergency room, and landings with ground transports from Graves Field, Boeing Field, Harborview Medical Center.

[4] "... [these forecasted] numbers may well turn out to be significantly higher or lower than reality... These numbers are considered 'ballpark' figures from which actual volumes may deviate significantly" (Childs, 1986a).

Note: The number of transports reflects the total number of patients transported and does not reflect all flight segments for the pickup of medical transport team pickup and delivery of patient and return of the helicopter to base.

Source: Childs, 1986a, 1986b.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ensuring that aircraft are operated in a manner consistent with established regulations. There are no specifications for the construction of helistops. Rather, there are guidelines for the construction contained in an Advisory Circular, "Heliport Design Standards."

Helicopter operations are subject to specific FAA regulations, including Parts 61, 91, and 135. Parts 61 and 91 of these regulations pertains to General Rules for Aviation and to the qualifications of pilots and airmen, and equipment specifications. Generally, helicopters are given more latitude in their operations than fixed wing aircraft.

The establishment of a helistop facility requires the proponent to file Form 7480, which identifies the proposed approach and departure paths. The FAA will review the form and either approve or deny the request for flight path approval. It is important to note that the FAA does give pilots discretion in deviating from the flight path; they will investigate complaints but would generally not take action on a complaint unless the pilot was operating in an inherently unsafe manner (Benedict, 1986). Children's submitted a form 7480 to FAA on February 14, 1985. Because the proposed flight path has been revised, an updated application will need to be submitted.

State of Washington Department of Social and Health Services (DSHS)

Health planning in the State of Washington is performed both on a statewide as well as on a subregional basis. The DSHS is the designated health planning agency for the state. Its duties include needs assessment, planning, evaluation, implementation of the state health plan, and administration of the Certificate of Need program.

Certificate of Need Program. The state Certificate of Need program is a process for reviewing the following: construction, development or establishment of new health care facilities; significant capital expenditures; changes in number or distribution of beds; acquisition of major medical equipment; and the provision of new institutional health services.

A recent amendment to the Washington Administrative Code (248-19-230(1)(b)), effective March 30, 1986, specifies that helistops are subject to review:

> (i) The specific services subject to review under this subsection are limited to:
>
> (A) Air ambulance services licensed under chapter 18.73 RCW including a change between fixed wing and rotor aircraft. This includes, but is not limited to, acquisition of aircraft or construction of landing facilities...
>
> (ii) The services listed in subsection (1)(b)(i) of this section are subject to review under any one of the following circumstances:
>
> ...(F) The establishment of a new or different landing site for an air ambulance service.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

With respect to the proposed construction of a helistop at Children's, DSHS has determined that a Certificate of Need review is not required because the regulations specifically requiring a Certificate of Need were issued after Children's received a ruling that it was not subject to Certificate of Need review (Chestnut, 1986b).

Emergency Medical Services. The State of Washington, through RCW 18.73, amended, provides statewide emergency medical services (EMS) program planning with funding and guidelines to continue EMS systems development and improvement. Key functions of the EMS Division of DSHS are to prescribe minimum requirements for equipment (including ambulances) and personnel engaged in prehospital EMS, to establish EMS system standards, and to evaluate program development, expansion and improvements. The Washington Administrative Code (248-17-135) provides specifics on air ambulances. The Washington Administrative Code (248-18-285) also provides specific regulations for the provision of emergency care services:

> "Emergency care services. The hospital shall have a well defined system for providing emergency care services. The nature and scope of the hospital's emergency care services should be in accord with the community's needs and the hospital's capabilities.
>
> (1) The hospital shall provide the following basic, outpatient emergency care services.
>
> (a) Assessment of a person's condition to determine the nature, acuity, and severity of the person's immediate medical need.
>
> The condition of each person, who comes or is brought to the hospital for emergency medical care, shall, upon arrival, be assessed by a registered nurse, physician, or physician's assistant for the purpose of determining the nature and urgency of the person's medical need and the timing and place of the person's care and treatment.
>
> (b) Immediate diagnosis and treatment of any life threatening cardiac arrythmia, respiratory insufficiency or shock.
>
> (c) Appropriate transfer or referral of a patient who needs medical care services not provided by the hospital. Prior to transfer of an emergency patient to another health care facility, the hospital shall:
>
> (i) Perform the emergency procedures needed to minimize aggravation of the patient's condition during transport to the other health care facility; and
>
> (ii) Ascertain that the means by which the patient is to be transported to the other health care facility are suitable for the patient."

Currently, the EMS Division has no direct authority with respect to the proposed Children's helistop, except for equipment and personnel being certified to meet State standards. The Systems Development Administrator of the EMS Division staffs the Washington State Medical Association's EMS Standards Committee's Subcommittee on Air Ambulances (see below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

City of Seattle - Land Use

The City of Seattle guides land use through its comprehensive plan and land use policies and regulates land use through its Land Use Code. As a major medical center, Children's is designated a major institution and, as such, is subject to Seattle's Major Institutions Policy and specific regulations contained in the Major Institutions Chapter (23.48) of the Seattle Municipal Code (SMC).

The purpose of Seattle's Major Institutions Policy (SMC 23.16.10) "is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods adjacent to institutions." A series of nine implementation guidelines (plus one guideline specific to the University of Washington) provides the basis for considering the institutions' needs in conjunction with those in the surrounding area. Relevant policies include the following:

Implementation Guideline 4 - Institutional Classifications

f. Mitigate adverse impacts associated with the use of the proposed facility so that the location of parking and the routing of traffic do not create serious noise, safety problems or blighting influences on the surrounding area.

g. Reduce adverse impacts of light and glare.

i. Promote safety for those living, working and visiting the area.

Helistops are conditional uses that are permitted in Major Institutions subject to the following provisions of the SMC:

23.48.05 Conditional Uses

A. Helistops

1. A helistop may be permitted as a Council conditional use if the Council finds that:

   a. The helistop is needed to save lives;

   b. The helistop is located so as to minimize impacts upon surrounding residential property;

   c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

2. The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas.

This EIS is designed to fulfill the SEPA requirements of the Conditional Use Permit. With respect to the specific findings of medical need necessary to secure a conditional use permit, DCLU requested that Dr.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Nicola, the Director of Seattle King County Department of Public Health, assist DCLU in the medical need determination. The issue is independent of the SEPA process and the EIS. (For the convenience of the reader, Dr. Nicola's report is appended to this EIS.) The other conditional use issues, including restricted use, sensitive siting and alternative locations are addressed in subsequent chapters of this EIS.

Seattle-King County Department of Public Health

As a joint City/County agency, the Seattle-King County Department of Public Health serves all residents of King County. The Department operates health centers throughout the County, numerous satellite clinics in schools and community centers, a regional center for tuberculosis control, and a sexually transmitted disease control program and clinic located at Harborview Medical Center. The agency provides health services for the jail, vital statistics information, and operates the public health laboratory.

The Department includes the Divisions of Alcoholism and Substance Abuse, Emergency Medical Services, and the Medical Examiner. The Division of Emergency Medical Services plans, develops and administers paramedic services outside of Seattle, and assists fire departments to improve emergency medical services.

The Department has also provided expertise to the City of Seattle's Department of Construction and Land Use regarding the issues of medical need and noise and vibration associated with siting a helistop at Children's.

Washington State Department of Transportation

The Washington Department of Transportation has the responsibility of providing statewide planning services, enhancing safety and funding transportation improvements. The Division of Aeronautics deals specifically with air transportation, by participating in statewide transportation planning, assisting in the enforcement of FAA Regulations, investigating aircraft accidents, providing search and rescue support for missing General Aviation aircraft and providing funding for public aviation facilities. The Department does not have specific authority with respect to the siting of a helistop at Children's or the operation of the helicopter service (Hamilton, 1986).

Puget Sound Health Systems Agency

Puget Sound Health Systems Agency (PSHSA) is a non-profit, quasi-public corporation that was founded in 1976 for the purpose of assisting in implementing the (National) Health Planning and Resource Development Act. PSHSA is actively involved in health planning throughout its health service area: the ten counties of northwestern Washington. PSHSA also assists DSHS in review of Certificate of Need applications and offers services to companies, hospitals and other clients in research, data collection and analysis, education, health program development and policy analysis.

The responsibility of all Health Systems Agencies in the state, including PSHSA, is:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"...the provision of effective health planning for its health service area and the promotion of health services, manpower, and facilities which meet identified needs, and reduce documented inefficiencies..." (RCW 70.38.085)

To that end, PSHSA assembles and analyzes data; establishes, annually reviews and, as necessary, amends a health system's plan and implementation plan; prepares recommendations to the Department of Social and Health Services with respect to new institutional health services proposed within its service area; and periodically reviews institutional and home health services offered in its service area.

PSHSA has recently submitted a (revised) proposal to the Seattle-King County Department of Public Health and another proposal to the State Emergency Services Office to investigate the key issues surrounding the development of helicopter transport in the region and in the state. The goal of the State project is to develop a state plan and implementation strategies that will integrate air ambulance services with the EMS system. The State of Washington has withdrawn its commitment to participate in the development of this proposal (Nicola, 1986b). Specific project objectives under the statewide proposal are:

- Assess the current status of air ambulance services in Washington State and describe the development trend of this service in other locations across the nation.
- Identify and assess current and projected problems and needs with respect to air ambulance services.
- Establish goals for development of this service and criteria for evaluation, including WSMA user guidelines.
- Identify and assess a series of alternative State policies to meet identified problems and needs.
- Evaluate and select from among various options available a set of policies and a plan for development of air ambulance services in the state of Washington that integrates and coordinates these services with the EMS System. (PSHSA, 1986)

The original purpose of the proposed Seattle-King County project was to supplement the overall State plan with an air ambulance services plan and implementation strategy for the King County area. The objectives of the supplement were as follows:

- Monitor development of the statewide air ambulance plan, and review and comment on various aspects of the plan during its evolution.
- Conduct an inventory and analysis of air ambulance services in King County and present as input into development of State plan.
- Conduct a King County needs assessment regarding air ambulance services, including the development of a need projection model, and make recommendations regarding its adoption to the statewide steering committee.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. Analyze the state plan to determine if more specific policies and a more specific plan should be adopted in Seattle-King County.

. Develop strategies to implement the state plan and local alternatives in Seattle-King County and work with local agencies on implementation. (PSHSA, 1986)

At this time, the status of the PSHSA proposal is unclear (Nicola, 1986b).

American Society of Hospital Based Emergency Air Medical Services and National Emergency Medical Services Pilots Association

The American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS) and the National Emergency Medical Services Pilots Association (NEMSPA) are voluntary organizations that were established within the EMS helicopter industry to provide organization and guidance to the industry. These organizations do not have legal authority to impose regulations except to the extent that a hospital or helicopter operator must meet their guidelines in order to be accepted as members. As a result of the relatively high number of EMS helicopter accidents in 1985, ASHBEAMS and NEMPSA leaders met in February of 1986 and agreed that uniform guidelines and standards were needed in the industry. A first draft of the guidelines is expected to be available in the summer of 1986. According to Nina Merrill of ASHBEAMS, the guidelines and standards will address three primary issues:

. Creating a training program for hospital administrators in the aviation-related aspects of EMS helicopter programs in order to educate non-aviation personnel on aviation safety issues.

. Providing additional aviation safety orientation to air and ground medical crews that are involved with the transfer of patients.

. Recommending the requirement that EMS helicopter pilots undergo (a yet undetermined) amount of continuing pilot education every year. This continuing education requirement would be in excess of existing FAA regulations, which require one test flight every year to determine that the pilot is still capable of flying the aircraft.

These guidelines are being developed primarily to bring some of the smaller operations into conformance with unofficial standards to which major vendors within the industry already conform (Merrill, 1986).

Washington State Medical Association

The Washington State Medical Association is a trade organization that represents medical doctors in the state. Physician members voluntarily serve on committees that include, among others, the EMS Standards Committee, which has a subcommittee that is specifically addressing issues involving air ambulance services. The subcommittee is focusing on several issues (Pinkers, 1986; Cvitanovic, 1986) that will enable the creation of "User Guidelines" for the use of helicopter services:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. Medical indications, procedures, appropriate skills of personnel to administer procedures and guidelines for selection of the most suitable transport vehicles for prehospital (field) transports.

. Medical indications, procedures, appropriate skills of personnel to administer procedures and guidelines for selection of the most suitable transport vehicles for interhospital transports.

. Procedures and capabilities for flight crews.

. Coordination between air and land services considering:

- the need to have land units financially survive,
- the development of land-air transfer points to reduce total flight time,
- the effect of medical crew/patient origin on patient outcome.

Key principles of these user guidelines are that helicopters are a useful, but expensive, instrument of patient care and that care protocols must be designed to enable MAST to continue to operate in western Washington (Pinkers, 1986). It is anticipated that the Subcommittee on Air Ambulance Medical Standards will have a preliminary report submitted to the full committee during the summer of 1986.

Washington State Hospital Association

The Washington State Hospital Association is an independent trade organization that represents approximately 90% of the hospitals in the state. The Association activities include advocacy, education and lobbying of both the legislature as well as regulatory agencies. The Association is not directly involved in the issue of emergency airborne transport services (Mero, 1986).

Seattle Area Hospital Council

The Seattle Area Hospital Council is a trade organization that represents the major hospitals in King County and southern Snohomish County. The purpose of the Council is to provide a forum for issue identification, discussion, and collective action that is responsive to the needs expressed by member hospitals in their continued efforts to discharge their individual and collective responsibilities. The Council is not directly involved in the issue of emergency airborne transport services (Nell, 1986).

III. DESCRIPTIONS OF THE PROPOSED ACTION AND ALTERNATIVES

This section states the sponsor's objectives, identifies how alternative helistop locations were developed and screened, characterizes the process used to project the estimated number of patients transported by helicopter to Children's and the associated number of flights, and provides a detailed description of the proposed action and alternatives, including descriptions of the helistop and flight paths.

Sponsor's Objectives for the Proposed Action

The proposed action is the construction of a helistop outside the Emergency Room of Children's Hospital and Medical Center (Children's). The helistop would be used as a landing area for a helicopter transporting critically ill patients to Children's. The objectives of the proposed action are:

- to make specialized medical expertise available to critically ill patients in the least amount of time
- to minimize transport time from place of patient pickup to the Emergency Room entrance of Children's
- to minimize the number of patient transfers that could result in patient destabilization
- to construct a helistop and operate the helicopter service so as to minimize potential environmental impacts in a manner that would not sacrifice proper patient medical treatment

Overview and Location

The 25-acre Children's Hospital and Medical Center campus is located at 4800 Sand Point Way N.E., Seattle, Washington, along a portion of the western edge of the Laurelhurst neighborhood. The campus is less than one mile east of the University of Washington campus (Figure 2, Vicinity Map.) The campus boundary on the northwest is Sand Point Way N.E. to and along N.E. 50th Street south along 44th Avenue N.E. to and along N.E. 47th Street to and south along 45th Avenue N.E. to N.E. 45th Street, to approximately 42nd Avenue N.E., if extended, and north to Sand Point Way N.E. (Figure 3, Campus Map).

Children's campus generally slopes downward to the west and south. It is landscaped and provides a sense of open space to the area. Principal access to the campus is via a signalized intersection with Sand Point Way N.E. The principal drive--Penny Lane--winds generally east to west and provides access to the various entrances to the medical center building and parking areas. The principal structural feature of the hillside campus is the medical center building, which contains the medical facilities and equipment. A parking garage contains four levels of parking: three for staff, and one for patients and visitors. There are two primary paved surface parking areas and several smaller parking areas that provide additional parking for visitors, service vehicles and medical staff. A

permit application has been filed to construct a five-level medical office building north of the main structure.

The proposed helistop pad would be located approximately 120 feet north of the Children's Emergency Room entrance and approximately 115 feet northwest of the proposed Medical Office Building. North of the site is Penny Lane and the parking structure; east of the site is the driveway to the Emergency Room entrance and parking lot; west of the site is the service driveway that provides access to the loading dock and temporary oxygen tank (Children's recently has received a building permit to relocate the oxygen tank into the interior of the medical center complex). A brick, natural gas meter house is located approximately 48 feet northwest of the pad (Figure 4).

The neighborhood consists primarily of single-family residences, with densities ranging from one dwelling unit per 9,600 square feet (primarily along the Lake Washington shoreline) to the maximum single-family density of one unit per 5,000 square feet to the northwest of Children's campus. South and east of the hospital there is a large area zoned for one unit per 7,200 square feet, with a number of smaller, non-conforming lots in this area. One block east of the campus is the Laurelhurst Elementary School. A half block southeast of the Children's campus is the Battelle Memorial Institute research campus.

There are several multifamily residential and commercial uses concentrated along both sides of Sand Point Way N.E. and the Burke-Gilman Trail. Multifamily densities range from medium density, Lowrise 3 developments to low density, Lowrise 2 developments. In the area near the hospital, there are multifamily developments immediately to the north and west of the hospital. Laurelon Terrace, with many elderly occupants, is adjacent to the campus on the west. To the northwest of the hospital, there is a Planned Unit Development that includes a mixture of single-family, multifamily and open space uses. Commercial uses in the area include an Albertson's Supermarket just north of the Burke-Gilman Trail at 40th Avenue N.E., a medical/dental office building and a bank/office building at Sand Point Way N.E. and 40th Avenue N.E., and several small retail shops along the south side of Sand Point Way N.E. and N.E. 45th Street.

Open space in the area is provided by two playgrounds, a cemetery, and the Burke-Gilman Trail, a pedestrian and bicycle path that runs approximately parallel to Sand Point Way N.E. through most of the project area. The Laurelhurst Playground is located immediately to the southeast of the southeast corner of the Children's campus. The Burke-Gilman Trail passes within a quarter mile of the hospital across Sand Point Way N.E. Additional open space is provided by schoolyards, churchyards, and the Battelle campus.

The proposed action is the construction of a secured, concrete helistop outside the Emergency Room entrance of Children's. Transports would be limited to critically ill patients, as determined by the referring physician/medical team in consultation with Airlift Northwest and/or Children's medical personnel. Initially, approximately ten patients would be transported to Children's each month. Over time, these numbers would increase. For the purpose of this EIS, it is estimated that by 1990 a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

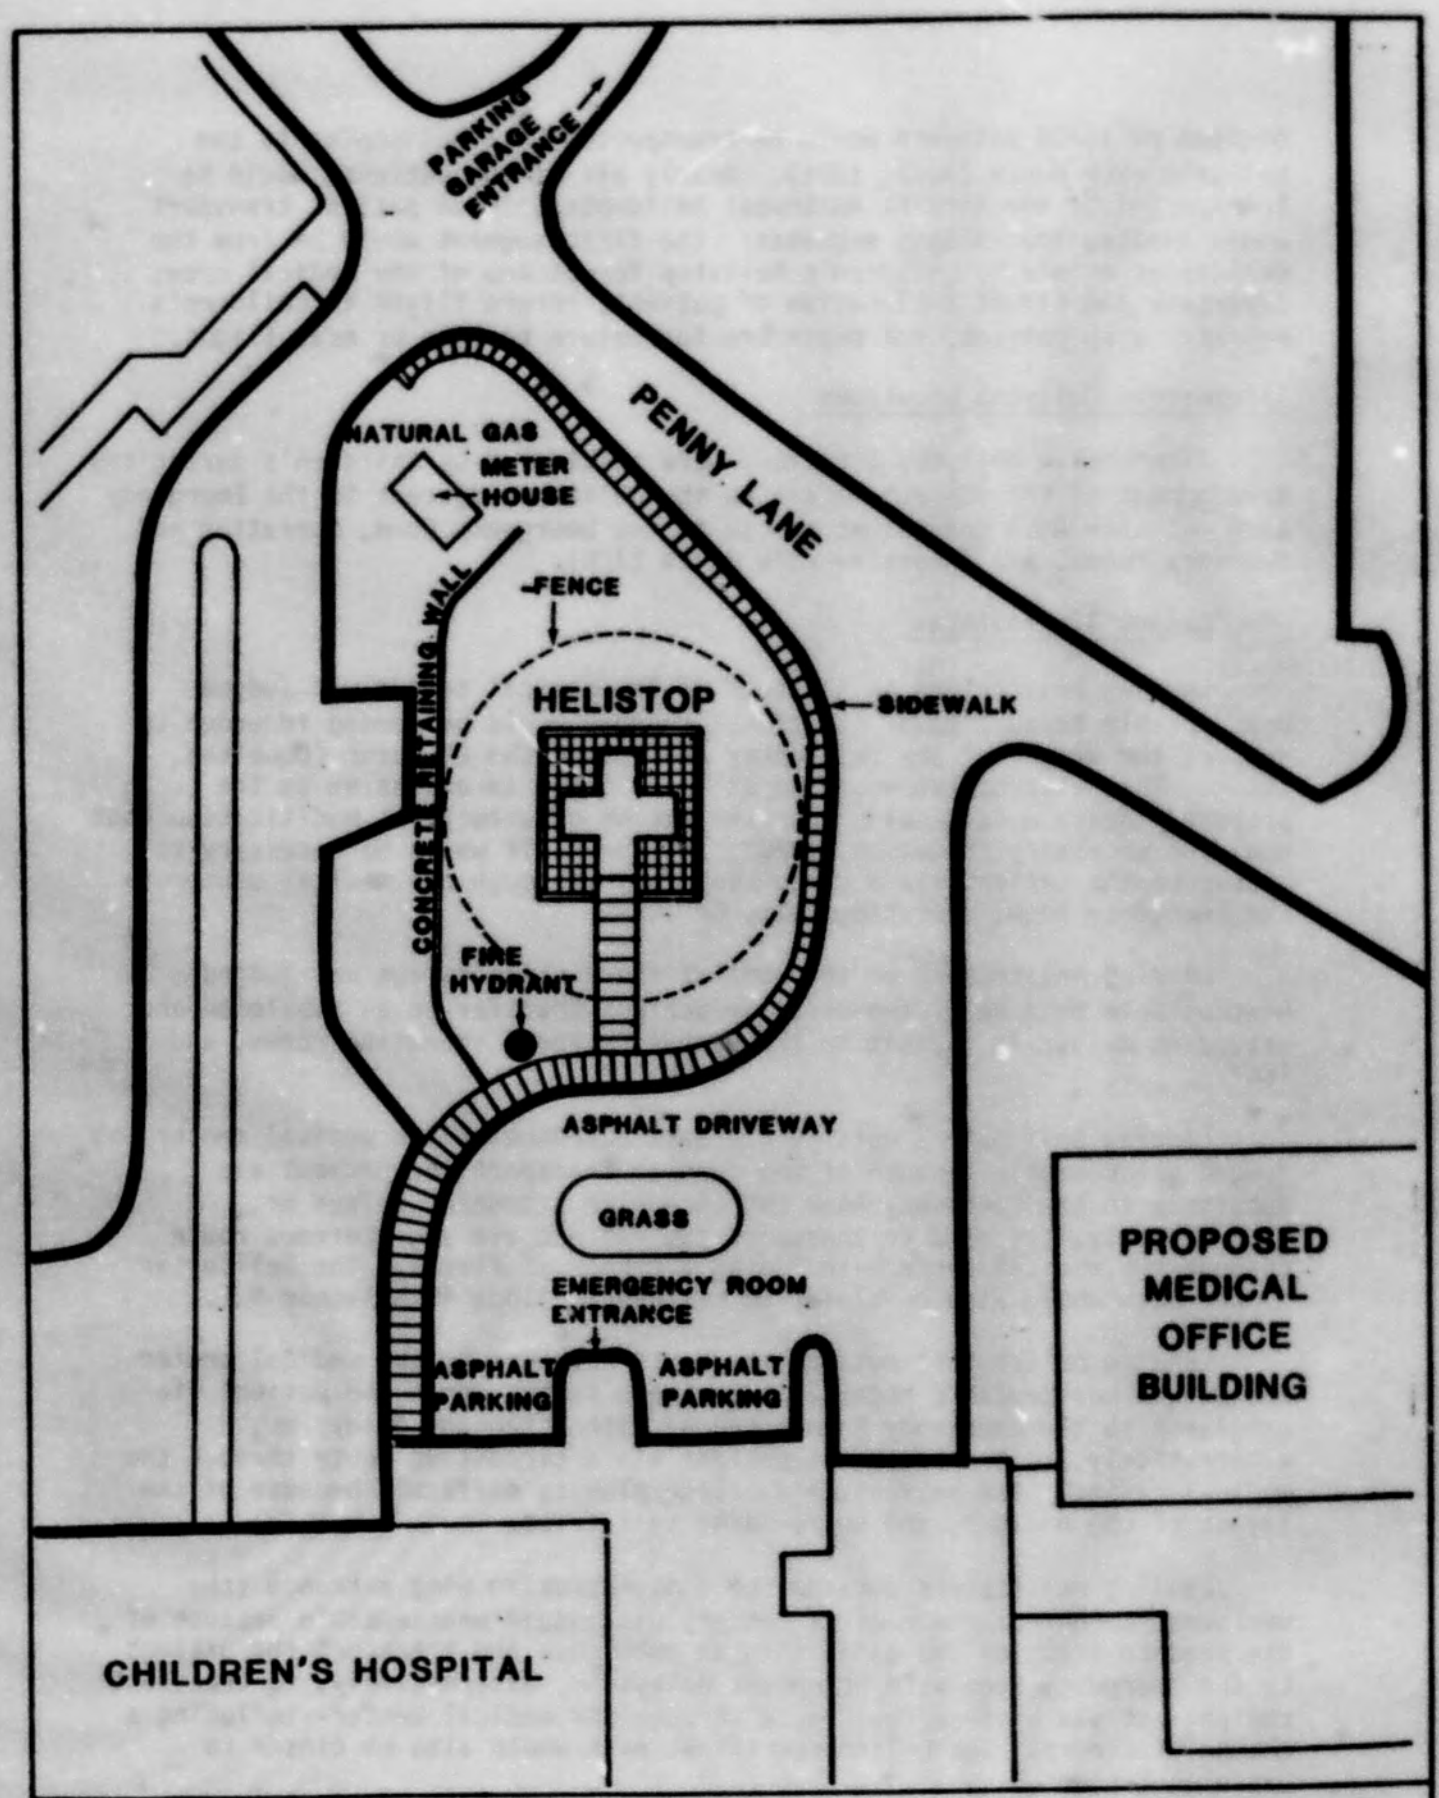

FIGURE 4

CHILDREN'S HELISTOP SITE

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

maximum of 15-20 patients would be transported by a helicopter to the helistop each month (Neff, 1986). Nearly all of the patients would be transported by the Airlift Northwest helicopter. Each patient transport would involve four flight segments: the first segment would be from the helicopter origin to Children's helistop for pickup of the medical crew; departure and flight to location of patient; return flight to Children's helistop with patient; and departure for return to base or next flight.

Alternative Helistop Locations

Alternative helistop locations were considered by Children's during the development of the concept of siting the helistop adjacent to the Emergency Room entrance with convenient access to the Emergency Room, operating and recovery rooms, and intensive care units (ICU).

Campus Alternatives

Landing helicopters on the roof of the medical center was judged unacceptable because major structural changes would be needed in order to support the weight of the helicopter and extend the elevator (Donelson, 1986). This alternative would be at least twice as expensive as the proposed location, depending upon the extent of structural modification that would be necessary (Donelson, 1986). Moreover, it would be necessary to transport the patient via a circuitous route through the medical center to the Emergency Room, operating room, or ICUs.

Landing helicopters on the roof of the parking garage was judged unacceptable because of the need for patient transfer to an ambulance and attendant delays in transit to the Emergency Room, operating rooms, and ICUs.

Landing helicopters outside the east entrance to the medical center was judged unacceptable because of the need to transport the patient via ambulance to the Emergency Room entrance with attendant delays or, alternatively, the need to transport the patient via a circuitous route through the medical center--including a change of floors. The helicopter flight path would also be closer to residences along 45th Avenue N.E.

Landing helicopters outside the south entrance to the medical center was judged unacceptable because of the need to transport the patient via ambulance to the Emergency Room entrance with attendant delays or, alternatively, to transport the patient via a circuitous route through the medical center. The helicopter approach also is difficult because of the layout of the building and surrounding tall trees.

Landing helicopters outside the administrative wing entrance (the northwest corner of the medical center) was judged unacceptable because of the need to transfer the patient to an ambulance and transport the patient to the Emergency Room with attendant delays or, alternatively, to transport the patient via a circuitous route through the medical center--including a change of floors. The helicopter flight path would also be closer to Laurelon Terrace.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Landing helicopters on one of the surface parking lots was judged unacceptable because of the need to transfer the patient to an ambulance for transport to the Emergency Room entrance with attendant delays. Moreover, the helistop and helicopter flight paths would be closer to residences to the east.

From a safety perspective, flat surfaces, such as rooftops, generally present the least accident risk during landing due to an absence of vertical obstructions. Rooftops, however, are less safe in the unlikely event of engine failure due to the structure's height and lack of a uniform surface on which to make an emergency landing. The other Campus Alternatives discussed above are all considered to be somewhat less safe than the proposed action due to their proximities to obstructions, their locations in topographically depressed areas, or their proximities to residential or educational land uses (Hill, 1986). The significance of the safety distinctions are believed by the pilots to be negligible (Hill, 1986).

Off-Campus Alternatives

The principal off-campus helistop locations that have been suggested include University of Washington's Intramural Field, sharing a helistop with University Hospital, Sand Point, sharing Harborview's helistop, sharing radio/television station helistops and bringing patients to Boeing Field. As part of the EIS scoping process, two off-campus alternatives were selected for detailed analysis: a helistop at the Intramural Field and a shared helistop with the University Hospital.

The Intramural Field helistop alternative involves the construction of a secured, concrete helistop or the designation of an unsecured landing area at Intramural Field. A maximum of 15-20 Children's-destined, patients would be brought to the helistop or landing location each month. Each patient would involve four flight segments--similar to the proposed action--plus ground transport of the patient to Children's.

The University of Washington is proposing the approval of a secured helistop already constructed on the roof of its expansion wing. A maximum of 15-20 Children's-destined, critically ill patients would be brought to the helistop each month; additional flights would involve University Hospital-destined patients. Each patient would involve four flight segments--similar to the proposed action--plus roof-to-ground and ground transport to Children's.

With the objectives of needing to minimize transfers and attendant transport time, the proposed project location was judged to be the most suitable for landing critically ill patients. Moreover, the helistop is located near the central portion of the campus; such a location meets the objective of minimizing off-site impacts without sacrificing patient care.

The Proposed Action

Demolition, Site Development and Improvements

The proposed helistop site is located at a landscaped site called "the Kitchen Garden." The garden would be relocated to a new site on campus.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Three taller trees and shrubbery that exist in the helistop area would be removed--some of the smaller shrubs would be transplanted elsewhere on campus. Prior to tree removal, Children's would require the contractor to implement standard erosion control measures (such as installing hay bales, plastic sheets, etc.) to minimize construction-related erosion.

Following clearing, a new concrete retaining wall would be constructed along the western edge of the site. Approximately 410 cubic yards of earth would be imported to the helistop site, where it would be used to raise the western portion of the site to the (base) level of the eastern portion of the site. The fill would be removed from other (as yet unspecified) locations on Children's campus.

The helistop would be constructed of concrete shaped into a "plus" sign. The two arms of the "plus" would be approximately 30 feet long and ten feet wide (see Figure 4). This concrete helipad would be within a 40 foot square grasscrete area (alternating one foot square areas of grass and concrete) that, in turn, would be within a 45 foot radius circular area. The concrete pad and grasscrete surface would delineate the pad and provide stable support for the helicopter. The concrete center of the pad would be marked with a 4x7.5 foot, red "H" that would designate the helistop from the air. A 2.5 to 3.5 foot tall fence with locked gate would surround the circular area. An approximately 40 foot long concrete walk would link the helipad to the existing sidewalk.

The helistop would require the construction of 1,610 square feet of concrete (impervious) surface. Forty eight hundred square feet would be sodded and 6,540 square feet, according to the Landscape Plan, would be landscaped in juniper, azalea, and other low shrubbery. Blue star juniper would be planted along the outside of the fence and, in time, would partially obscure the fence.

The helistop would be equipped with ground lights that would be turned on for emergency nighttime landings. These lights would meet minimum FAA standards and would not have any off-site spillage because of the absence of horizontal throw. In effect these pilot-preferred lights "glow," rather than emanate direct ray lights (Hill, 1986). The shrubbery and positions of the medical center building and parking garage would prevent any helistop safety lighting creating glare off-site.

Signs warning motorists of the possibility of helicopter operations would be posted on Penny Lane and, if necessary, on Sand Point Way N.E. No aviation fuel would be stored on campus.

Number of Transports and Flights

Children's projects that initially ten patients per month would be transported by helicopter directly to Children's. Children's also estimates that in the future up to 15-20 critically ill patients could be transported directly to the medical center by helicopter each month. Each patient transport involves four separate flight segments: one for the pickup of the specialty pediatric transport crew, the second for departure with transport crew, the third segment delivering the patient, and the fourth for return to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

base or next operation. Thus, there could be a maximum of 60-80 overflights (flight segments) per month. Based on data from existing flights (Table 2), it is estimated that 20% of the flights would occur in nighttime hours (10 p.m.-7 a.m.). The worst-case estimate of 15-20 patients is for the year 1990 and exceeds Airlift Northwest's projections (see Table 5). The worst-case estimate is derived by Children's medical and planning staff by assuming that the Airlift helicopter patient transports will increase at the rate of 10% per year from 1987 through 1990. This figure is greater than the projected patient population increase of 5.6% from 1985-1990 in the primary and secondary service area (Hunter, 1986) and reflects an anticipated continuing trend in referring physicians using Airlift. Thus, by 1990, there would be an average of 13 transports per month based on existing capabilities and use. This figure is consistent with Airlift's projections. In addition, Children's anticipates that there could be one to two MAST patient transports that would be made by either MAST "Hueys" or by Airlift or other air ambulance carrying patients that would previously have been carried by MAST aircraft. The remaining five to six patient transports reflect several factors that are difficult to predict with any reliability but that, nevertheless, could influence the number of patient transports: breakthroughs in medical technologies; growth in population of adolescents; inability to predict disasters--such as toxic spills, nuclear facility accidents, earthquakes; increased poverty that results in increase in premature births (Neff, 1986); or changes in the hospital referral patterns or the capabilities of Children's or of other community hospitals (Nicola, 1986b). Initially, an average of ten critically ill patients would land at the proposed helistop each month; however, as physicians in outlying areas become more familiar with Airlift Northwest services Children's projects that they will become more likely to use Airlift for the interhospital transport of critically ill patients.

The Seattle-King County Department of Public Health (Nicola, 1985) estimates a maximum of ten critically ill patients a month should currently be transported by helicopter to Children's. This estimate is based on a review of Airlift Northwest flight/medical logs, interviews of transport and other physicians. Nicola estimates that three or four would have a clear medical need for direct transport to Children's Emergency Room entrance--such that delays or transfers could affect patient outcome (Nicola, 1986); however, this estimate is not definitive (Nicola, 1986b). The difference between the maximum (10) and the clear medical need cases (3-4) are the (6-7) patients whose condition at time of referral was appropriate for helicopter transport (as determined by the attending physician and/or medical team) but who in retrospect were determined not to have need for helicopter transport directly to the Emergency Room doors (Nicola, 1985).

Airlift Northwest confirms that with their existing service they can fly a maximum of 80-90 helicopter transports a month, and, assuming that Children's share of 17% of all helicopter flights remains constant (see Table 5), that a maximum of 15-20 transports for Children's-destined patients is a reasonable estimate (Childs, 1986).

Children's is obligated by state requirements (WAC 248.18.285) to treat all patients brought to the hospital: the hospital construes this statute to mean that no helicopter transporting an emergency patient can be refused permission to land at the proposed helistop, if constructed, or elsewhere on the campus grounds.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In order to ensure that the patients brought by helicopter to Children's are critically ill, consistent with the provisions of Section 23.48.05 of the Seattle Municipal Code, representatives of Children's are meeting with MAST personnel in order to develop landing and communications guidelines. As a policy, Children's will encourage only critically ill MAST transports patients that are destabilizing or at risk of destabilizing, as determined by on-board medical personnel, to land at the helistop. Any MAST flights to Children's, however, would not involve four flight segments, as there would be no pickup of the pediatric medical crew at Children's.

Helicopter Operations

The process of transporting a patient to Children's may be considered by separating the operation into a series of discrete steps. The following description is designed to provide the reader with an overview of the process and does not constitute the full array of operational or medical procedures that would be involved in a patient transport by helicopter. There is a difference in the process depending on whether the patient is in the field, or is the subject of either a pre-arranged or unscheduled interhospital transfer. There are also distinctions between private air ambulance services and the military (MAST) service. For illustrative purposes, an unscheduled Airlift Northwest interhospital transfer to Children's is profiled.

- The system is activated by an attending physician contacting Airlift Northwest's physician and/or Medical Director.
- The patient's medical profile is described and the attending physician, referral hospital and landing area are identified.
- The Airlift Northwest Medical Director and/or physician assesses whether helicopter transport is warranted and, if so, provides the referring physician with an estimated time of arrival (ETA).
- The helicopter pilot is alerted, as is the pediatric medical crew, which is based at Children's. (Because of distinct treatment requirements, there are separate medical crews for adult and child patients). The helicopter takes off.
- Children's secures the area surrounding the helistop and stops traffic on adjacent Penny Lane--only ambulances and medical staff on emergency call are allowed to pass into the secured area.
- Approximately six minutes after the helicopter leaves Boeing Field it lands at the proposed Children's helistop. Following two minutes to shut down the rotor, it takes approximately two minutes to load medical crew (physician and flight nurse), and equipment. Following loading, the aircraft takes off. In some situations, loading of medical crew and equipment would occur without the rotor being shut down.
- The helicopter arrives at the referring hospital's designated landing area or helistop. The patient may be at the landing area and prepared for flight or the medical crew may have to go to and prepare

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

the patient. Elapsed time could be as little as three minutes for the former or two hours for the latter. Transfer by ground ambulance from the referring hospital to the helicopter may or may not be involved.

. The medical crew monitors the patient en route and administers medication and/or other care as needed. En route the helicopter contacts Children's and relays medical condition and needs, and flight information (e.g., ETA).

. Again, the helistop area is secured prior to ETA.

. The helicopter arrives and shuts down the engines at the proposed Children's helistop, where a ground team assists in disconnecting monitoring systems, unloading the patient and wheeling the transport gurney to the Emergency Room door, approximately 40 yards away. After retrieval of equipment, the pilot restarts the engines and after an estimated total ground time of three to six minutes returns to Boeing Field.

Thus, each patient transported by Airlift typically involves four segments: first, to pick up the pediatric medical crew at Children's; second, to fly the medical crew to the patient; third, to fly the patient and medical crew to Children's; finally to return to base or the next operation. Those flights in which a patient is first transported to Boeing by fixed wing already have a pediatric medical crew in attendance. Consequently, there usually would be no need to pick up a crew at Children's, and, therefore, no need for two of the four flight segments.

Flight Path - General

For all construction alternatives, with the helistop at Children's, Intramural Field and UW Hospital, the flight path would be comparable for flying into the vicinity. Only the individual approach and departure routes would be different. Flight path information in this section is based on the approaches and departures that have been recently designed by Airlift Northwest pilots. Final approach and departure routes will require FAA approval pursuant to Airspace Review; however, the FAA allows the pilot to deviate from flight paths (Benedict, 1986). In selecting flight paths, the Airlift Northwest helicopter pilots are sensitive to safety, reducing patient transport time, and noise considerations. In general, when and where possible, the pilots avoid flying over hills, over or near densely populated areas, or at altitudes less than 1000 feet (Hill, 1986). Typical altitudes are in excess of 2,000 feet (Hill, 1986).

In general north-south flights would follow the I-5 corridor. When headed from the south, flights would turn toward Children's once past Capitol Hill. When headed from the north, flights would turn toward Children's when approximately even with the southern end of Green Lake. Flights from the east would generally pass south of Webster Point and north of Madison Park, before turning north over Union Bay and entering the final approach. Flights from the west would generally pass between Magnolia/Queen Anne and Ballard/Fremont and turn toward Children's once past I-5 (see Figure 5, Generalized Flight Paths).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FIGURE 5
GENERALIZED FLIGHT PATHS

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The land uses in the areas over which Airlift Northwest helicopters would primarily fly vary considerably, ranging from urban freeway to commercial to residential.

Actual flight paths could be different depending on meteorological and patient conditions, and specific origin of the flight. The helicopter would not be used during adverse weather conditions. For daytime flights, the FAA minimum standards must be met: the helicopter is not used if there is less than a 300-foot ceiling or less than one-half mile visibility. Airlift pilots also have the option to use the company's guidelines of a 500-foot ceiling or less than one-mile visibility. The helicopter, as a company policy, does not fly in winds in excess of 40 knots (Hill, 1985, 1986).

Flight Path - Approach and Departure to Children's Helistop

Two final approach-departure paths into the Children's helistop would be used by Airlift Northwest. A primary approach-departure path would be used under most wind conditions, a secondary approach-departure path would be used during northwesterly winds that are in excess of approximately 17 knots. Based on surface wind data for Sand Point this latter situation is expected approximately 0.2% of the time, and would be most likely to occur during the winter months (U.S. National Climatic Center, 1982). For either the primary or secondary approach-departure a "noise abatement" profile would be followed.

The primary approach to the Children's helistop (see Figure 6) would originate approximately at the intersection of N.E. 45th Street and Union Bay Place at an altitude of 1,000 feet. At that approximate point, the pilot would decelerate from approximately 160 to 120 knots but not reduce altitude. The pilot would maintain the 1,000-foot altitude and airspeed for approximately the next 1,500 feet, while staying within the general N.E. 45th Street/Sand Point Way N.E. corridor. Approximately southwest of the intersection of Sand Point Way N.E. and 40th Avenue N.E., the landing gear would be extended and the pilot would begin to descend at a rate estimated at 1,500 feet per minute. The helicopter would continue northeast along Sand Point Way N.E., decelerating to a speed of approximately 74-80 knots prior to the turn onto the Children's campus and final approach. As illustrated in the profile of the noise abatement approach-departure path in Figure 7, the rate of descent decreases considerably in the final stages of the approach. The helicopter would enter the Children's campus north of the main entrance and while approximately over the parking garage at an altitude of 100 feet turn south toward the helistop. Under most wind conditions, the helicopter would then make its final descent to the helistop directly from the north. In the case of infrequent strong easterly winds (less than one-tenth of one percent of all winds) the helicopter would turn more tightly over the main entrance and approach the pad more from the west. In the case of strong westerly winds (also less than one-tenth of one percent of all winds) the helicopter would make a wider turn over the parking garage and approach the pad more from the east.

The helicopter generally would land on the helistop facing south. For medical crew pickup and patient discharge, the helicopter typically would shut down its engines on the helistop. In departing, the helicopter would rise to approximately 35 feet, turn counter-clockwise toward the north and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

climb rapidly so as to be at approximately 500 feet when over the parking garage. The departure path would be over the same area but at a higher altitude than the approach paths, so that at the end of the climb (at the point of commencing deceleration on the inbound flight) the helicopter would be at 2000 feet (see Figures 6 and 7).

The secondary approach to the Children's helistop would be used only in conditions of strong winds (above 17 knots) from the northwest quadrant. This approach would be from the northeast and also would use the noise abatement profile (see Figures 6 and 7). This approach would originate just north of the intersection of 55th Avenue N.E. and Windermere Road and would proceed in a direct line to the Children's helistop. The profile of the final descent would be similar to that explained under the primary approach, above.

The departure characteristics of the secondary route would reflect the secondary approach path in terms of the area over which the helicopter would fly, and the primary departure path in terms of altitude (see Figures 6 and 7).

Ground Activities - Patient Transport to the Emergency Room Entrance

Once at the helistop, the medical crew on board the helicopter would be assisted by ground-based medical personnel after the engines are shut down. The critically ill patient would be removed from the helicopter. Electrical monitoring systems that were connected to the patient while in the helicopter would be disconnected, the patient would then be transferred to a gurney and wheeled to the Emergency Room entrance. Neonates or babies in isolettes, which have self-contained ALS systems, could be transported directly to the ICU from the helicopter. Total elapsed time from helicopter touchdown to the patient entering the hospital building is estimated at three minutes. After the patient enters the Emergency Room entrance, the pilot would restart engines and depart. (If the patient is transported in an isolette, the pilot will usually wait for the isolette to be returned.)

The delivery of critically ill patients to the Children's Emergency Room entrance minimizes both the transport time for patients and the need to transfer patients from one mode of transport to another. This is the objective of the Proposed Action. The reduced transport time to the advanced services offered at Children's, and the avoidance of additional transfers minimizes the risk of the patient destabilizing during transit and allows advanced treatment to commence at the earliest possible time. This time savings can reduce suffering, decrease hospital stay time and, in the most severe cases, can mean the difference between life and death.

It should be noted that although transport guidelines for referring physicians may provide guidance in determining the appropriate mode of transit, it is ultimately the attending physician or medical team members who makes the decision to transport by helicopter and where to fly. The risk of exposing a patient to destabilizing circumstances must be evaluated by the attending medical team (Nicola, 1986), and the appropriate medical response (to land at Children's or not) made.

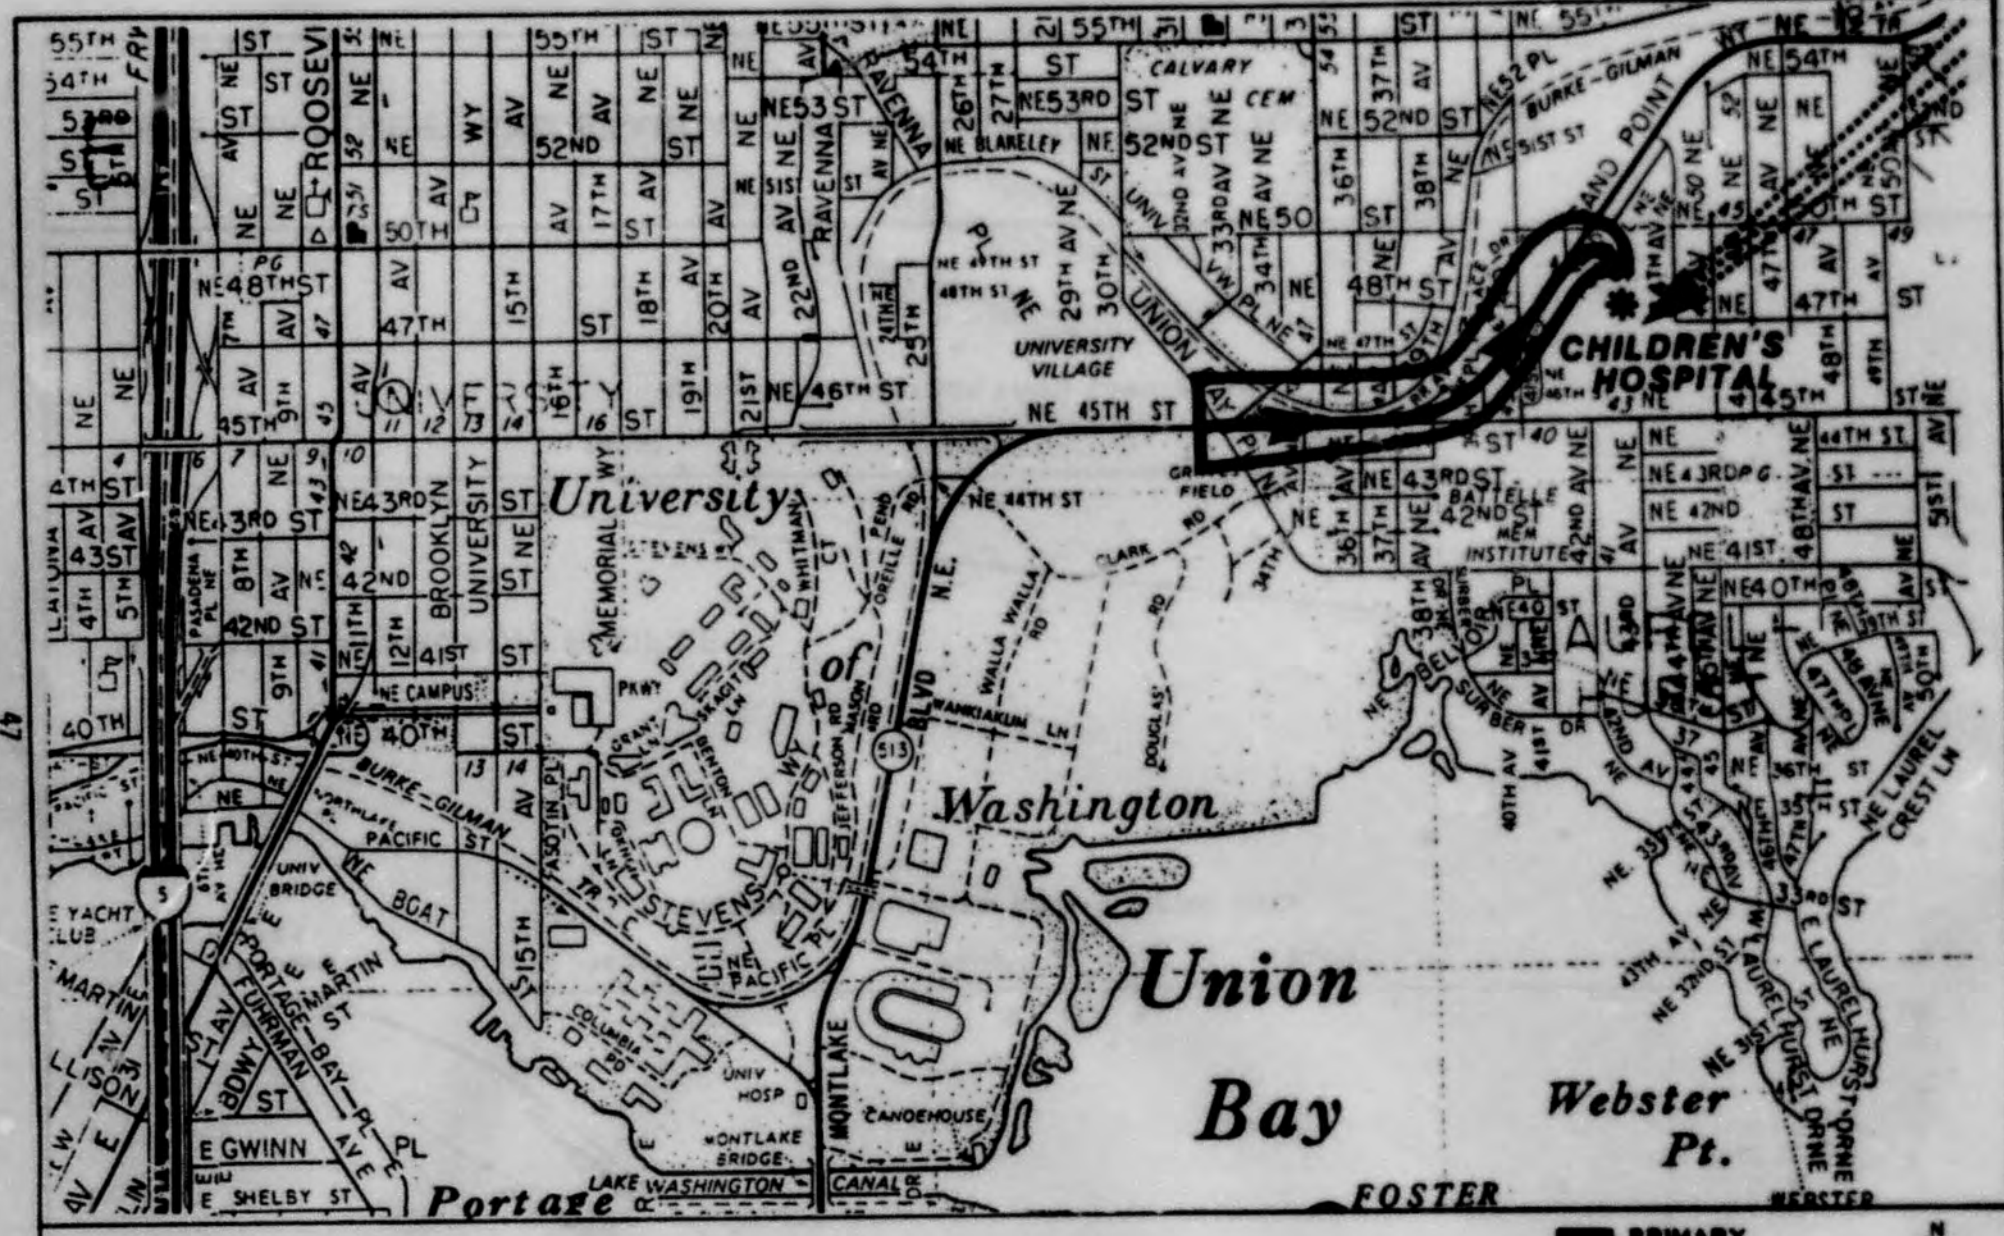

FIGURE 6

PRIMARY AND SECONDARY APPROACH AND DEPARTURE PATHS TO CHILDREN'S HELISTOP

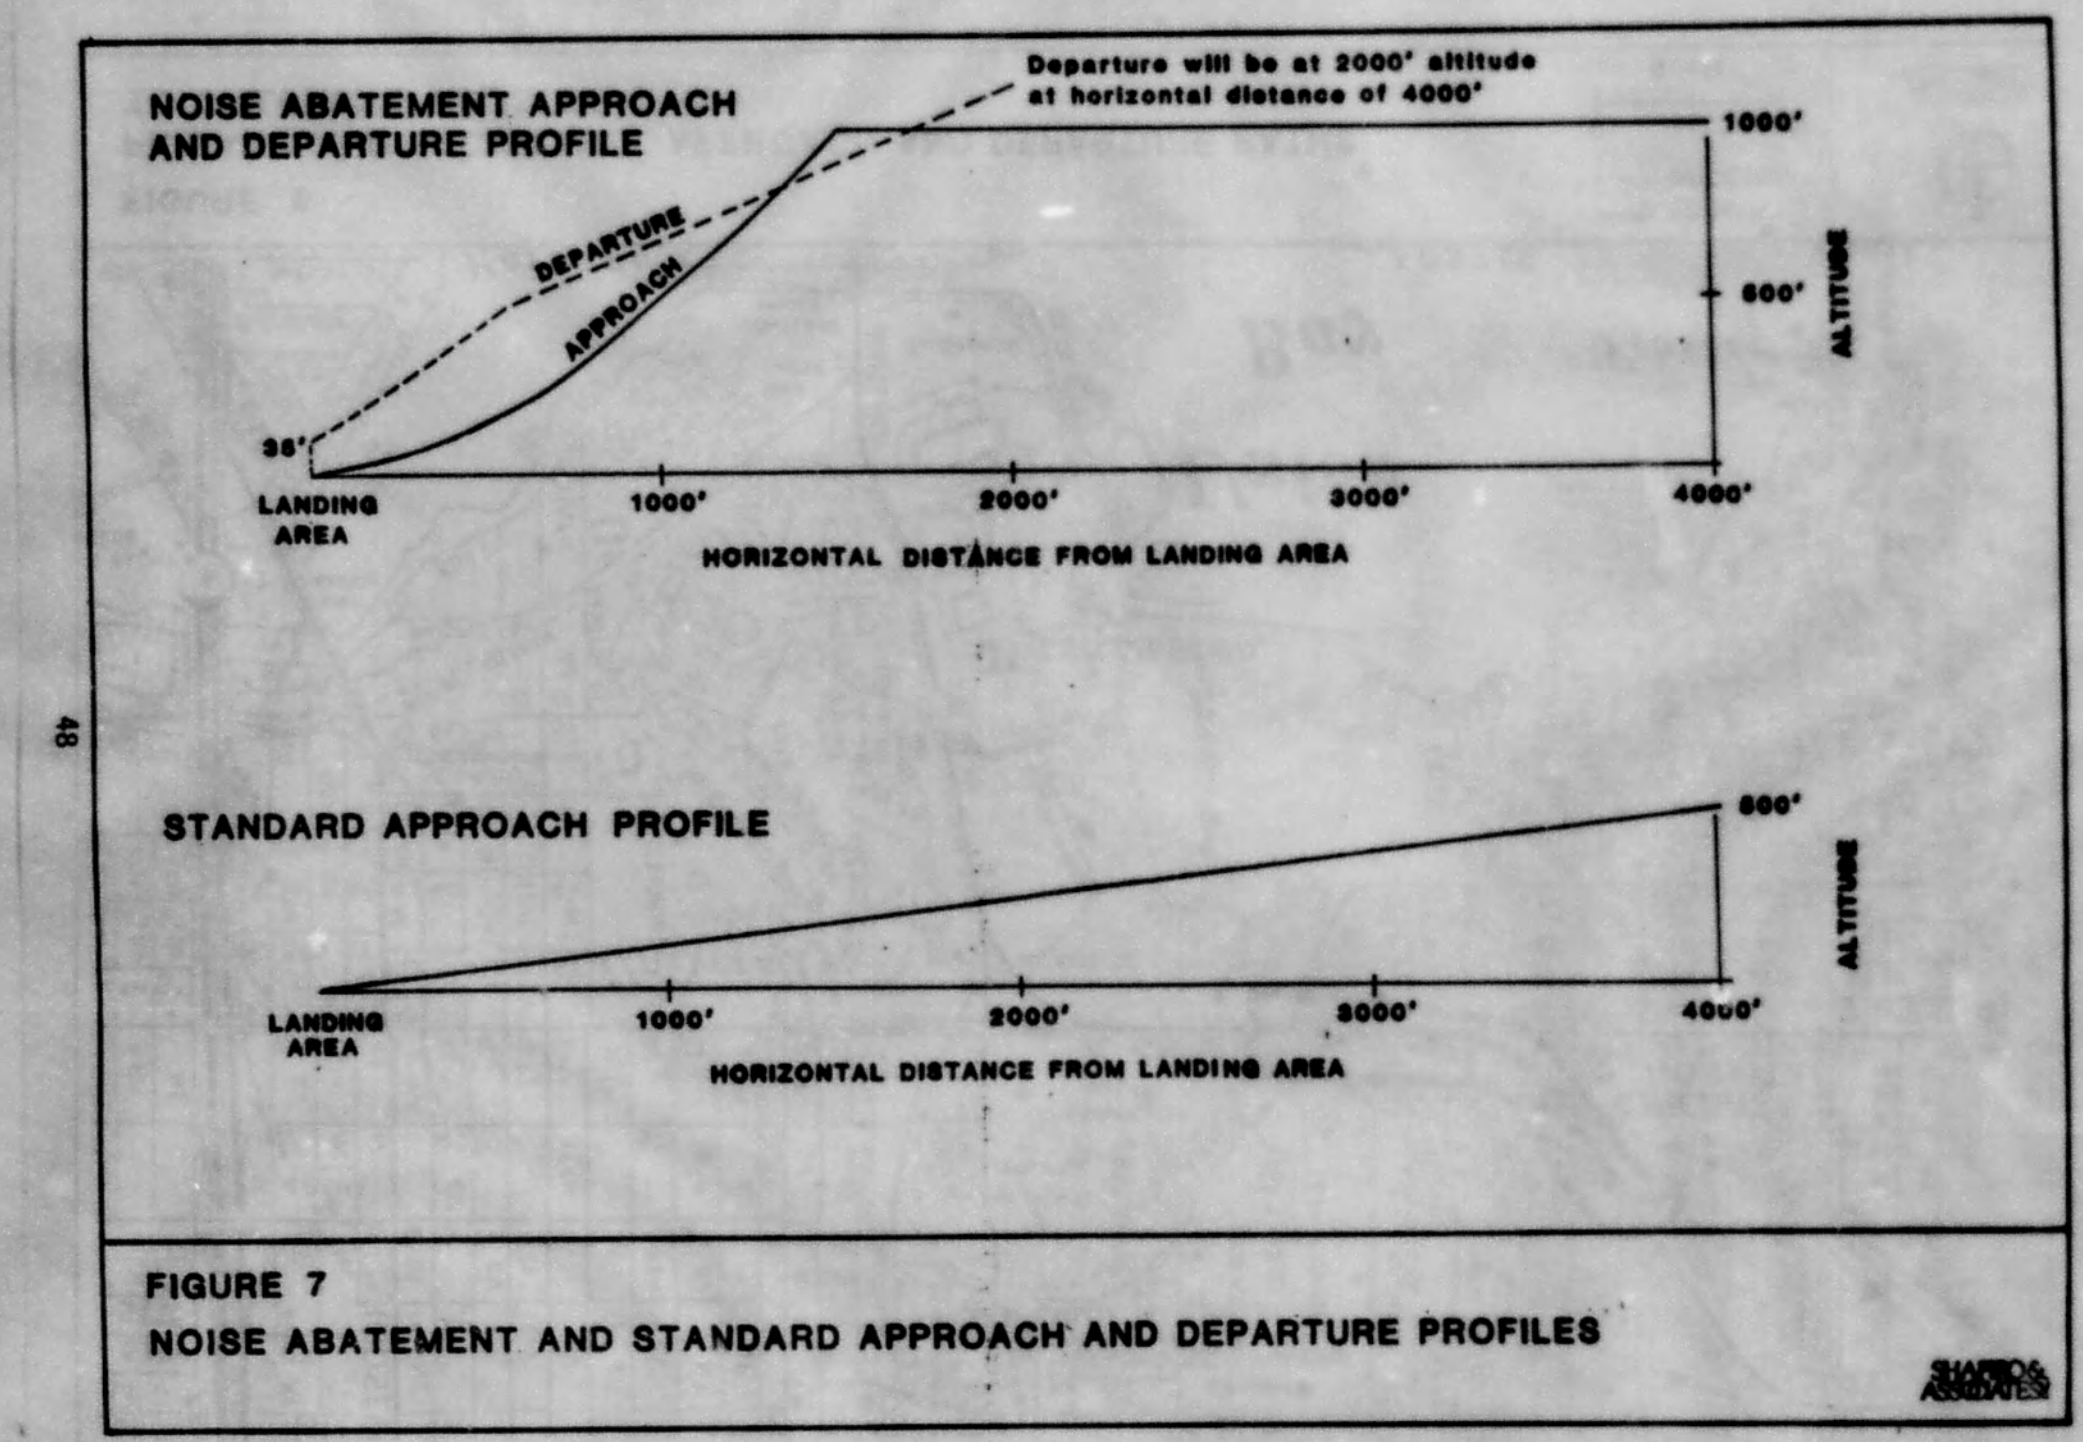

FIGURE 7
NOISE ABATEMENT AND STANDARD APPROACH AND DEPARTURE PROFILES

Mitigation Measures that are a Part of the Proposed Action or Alternatives

As part of the Proposed Action, the proponent has agreed to implement measures that will reduce the adverse impacts associated with the project. During construction the contractor will be required to implement erosion control measures. Children's is moving the location of its oxygen tank, thereby minimizing that potential hazard. The helistop will incorporate a fire-prevention system. No aviation fuel will be stored on campus. The helistop is fenced for security, and procedures for controlling vehicular and pedestrian traffic have been developed with responsible personnel trained. Warning signs will be posted on Penny Lane. The helistop will be landscaped. "Glow" rather than direct beam landing lights will be used--these lights will only be turned on during nighttime use. Engines normally will be shut down during medical crew pickup and patient delivery.

Flights will be limited to those associated with critically ill patients. Children's and Airlift have actively participated in the development of communications guidelines to ensure communication from air-to-ground is facilitated. As a policy, Children's will only encourage destabilizing patients on MAST transports to land at the helistop.

Airlift's flight path has been designed to reduce, as far as practicable, flight over sensitive properties--with general flight paths following I-5, water bodies and arterials. The primary approach and departure path has been redesigned so as to minimize impacts on adjacent properties. A noise abatement flight path--involving flying higher for a longer period during approach and departure--will be used.

Airlift Northwest guidelines on acceptable weather conditions are more restrictive than those of the FAA. In addition, Airlift has personnel levels (pilots per aircraft) that exceed NEMSPA/ASHBEAMS levels, a minimum experience requirement and ongoing certification for pilot hiring that exceeds ASHBEAMS requirements, and ongoing training for pilots and medical team personnel that addresses the guidelines and standards that are being developed by ASHBEAMS and NEMSPA.

Children's has agreed in principle to the development and participation on a review panel composed of physicians and others involved in helicopter transport in order to examine the appropriateness of individual flights, to enhance air-land communications, and to improve operations.

Descriptions of Alternatives to the Proposed Action

Intramural Field Helistop Alternative

The Intramural Field Helistop Alternative is distinguished by the construction of a fenced, lighted, helistop similar to that design proposed for Children's but without perimeter landscaping. The helistop would be located near the University of Washington's Intramural Field, off Union Bay Place N.E., approximately one road mile from Children's Emergency Room entrance (see Figure 8). Purchase, lease or permission to use the property would need to be acquired from the University of Washington. The University has indicated its opposition to a fenced, concrete helistop constructed on

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

any of its Intramural Fields (Trask, 1986). Electricity for landing lights also would need to be extended to the site.

The Intramural Field Helistop Alternative also differs from the proposed action in terms of the helicopter's final approach and departure routes, in the pick-up of the medical crew at the Intramural Field (or Harborview) and in the need to transfer the patient to ground ambulance for transport to the Children's Emergency Room entrance.

The Intramural Field site is located in the midst of the University of Washington Athletic Field complex just east of the University Campus, south of N.E. 45th Street, and west of the Laurelhurst neighborhood. The primary land use surrounding the site is athletic fields and parking lots. The University Village shopping mall is located north of the site, across N.E. 45th Street, with residential uses to the north, east, and west of University Village. The University of Washington Campus is located to the west of the site, the Laurelhurst neighborhood to the east.

Flight Path. The flight path to the general vicinity of the Intramural Field Helistop, whether for pick up of the medical crew or for unloading the critically ill patient, would follow that path described under Flight Path - General, above. Two primary and one secondary final approach and departure paths have been proposed by the pilots of Airlift Northwest. Final paths would need to be approved by the FAA.

The two primary approaches to the Intramural Field Helistop site are a linear approach from the southeast and a curved approach from the southwest (see Figure 8). These alternatives would involve 1-2 minutes less flight time per segment, depending upon point of origin, than that required under the proposed action. The southwesterly approach would be used when flying from the south or west; the southeasterly approach would be used when flying from points to the east. The southwesterly approach would originate just northwest of the Montlake Bridge and fly over Husky Stadium and the athletic fields. The southeasterly approach would originate just north of Foster Island, north of the University of Washington Arboretum and fly over the University of Washington athletic fields.

The secondary approach would be employed only in times of winds in excess of 17 knots from the northwest quadrant. This approach would fly over the University of Washington campus before making a final approach from the northwest. All three of these approach patterns could also serve as departure routes depending upon the destination of the flight.

In that Airlift Northwest would use a standard approach (as opposed to a noise abatement approach) for any of these approach patterns, the helicopter would begin its final approach at an altitude of 500 feet. Approximately 4,000 feet from the landing zone the pilot would begin his/her descent and decelerate from 160 to approximately 120 knots (see Standard Approach Profile in Figure 7). The descent would continue uniformly at a rate of 175 feet per 1,000 feet of horizontal distance until touchdown at the helistop. The average speed during the final approach would be approximately 40 knots.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

FIGURE 8

PRIMARY AND SECONDARY APPROACH AND DEPARTURE PATHS TO INTRAMURAL FIELD HELISTOP

The departure would involve vertical lift to an altitude of 35 feet, turning and ascending along one of the routes designated as an approach path depending on flight destination. The ascent rate would be approximately half that proposed for the proposed action: an altitude of 1000 feet would be achieved at a distance of 4000 feet from the helistop.

Ground Activities - Patient Transport to the Children's Emergency Room Entrance. Once the helicopter with medical crew and patient has landed, the pilot typically would shut off engines. A ground-based medical crew with ambulance and driver would meet the aircraft and assist the helicopter's pediatric medical crew in preparing the critically ill patient for transport. This process could involve some or all of the following steps:

- any of the helicopter monitoring systems that were connected directly to the patient while in the helicopter may have to be disconnected (Patients in isolettes would need to be disconnected from aircraft systems and the battery pack connected.);
- the patient must be transferred from the helicopter into the ambulance and may have to be reconnected to support systems in the ambulance; the patient would face the greatest risk of advanced life support systems disconnecting during this transfer;
- the patient may require stabilization before the ambulance can leave the soccer field;
- the patient and medical team would be driven from the helistop to the Children's Emergency Room entrance; and,
- the patient's support systems would have to be disconnected at the hospital for final transfer from the ambulance to the emergency room.

The transfer process, depending on life support system and stabilization needs, and the ground travel time, depending on traffic, could result in a minimum of ten minutes or as long as 20-30 minutes elapsing before the patient is in the hospital (Andrews, 1986). The 15-minute transfer process (for an isolette) is comprised of two minutes helicopter cool down, eight to nine minutes transfer out of the helicopter across the field to the waiting ambulance and stabilization in the ambulance, three minutes transit time from the parking area to the Emergency Room entrance and one minute unloading at Children's; transfer of a child not in an isolette is easier and requires an estimated ten minutes (Andrews, 1986). This transfer process exposes the patient to the risk of destabilizing. For transport of patients on a gurney or in the isolette, the transfer is more difficult because if any IVs are inadvertently disconnected, then reconnection must be made and stabilization must occur prior to the ambulance leaving for Children's. Exposure to adverse weather and/or field conditions increase the potential for destabilization (Andrews, 1986).

The Seattle-King County Department of Health concluded that "there will be a small number of cases at (both Children's and University Hospitals) where the ability to land at the hospital may be life-saving" (Nicola, 1985). Delays in treatment of other patients, while perhaps not a life or death situation, could result in suffering, the need for prolonged

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

treatment, permanent disability or other unfavorable outcome. Examples of these other situations include patients with impaired breathing, diaphragmatic hernia, aspiration of a foreign body, cardiac irregularities, near drownings and vascular collapse from general infections. (Neff, 1986)

Because this alternative involves a minimum of ten minutes of additional transit time for ground transport, the transfer of the patient from the helicopter to the ambulance, and then out of the ambulance at Children's, as well as the possibility of disconnection/reconnection/ disconnection of advanced life support systems, this alternative does not meet the proponent's objective to minimize transport time and the number of transfers.

University Hospital Helistop Alternative

The University of Washington has proposed using the helistop located on the roof of the new wing to the University Hospital. The purpose of the helistop is to allow critically ill patients (high risk obstetrical patients, premature infants with respiratory distress, cardiac patients, etc.) destined for University Hospital to be transported directly from the helicopter to the University Hospital, thereby saving time and the need for potentially destabilizing patient transfers involved with patient transports from other landing locations. This alternative proposes that the University Hospital, also a member of the Airlift Northwest consortium, share the use of the University Hospital Helistop with Children's. For patient care and liability reasons, it is unlikely that the University Hospital would allow Children's-destined patients to be landed on the helistop on the roof of the hospital (Goertzen, 1986; Shawcroft, 1986).

The University Hospital Helistop has been designed as a 3,300-square-foot area on the roof of the Hospital's new east wing. The structure has been built to accommodate helicopter landings. The flight path and requirements for patient transfer are different than those proposed for either the Children's or Graves Field helistop Alternatives.

The University of Washington Hospital Annex is located on the southern boundary of the University of Washington Campus, immediately northwest of the Montlake Bridge. The hospital is surrounded primarily by the University of Washington Campus, which is located to the north, northeast, and east of the site. There are other University oriented uses to the west of the site, with some commercial activity along N.E. Boat Street, west of the site. To the southeast of the site immediately south of the Montlake Cut of the Lake Washington Ship Canal is an area of single-family residences and the Seattle Yacht Club. Portage Bay lies to the southwest of the site.

Flight Path. The flight path is more compact and the flight would generally be of slightly shorter duration (except for the southeasterly approach to the Intramural Field) than the approaches to either the proposed Children's or Intramural Field Helistop Alternatives. Moreover, the rooftop location decreases the total helicopter descent distance.

The two approach and departure routes for the University Hospital Helistop would be from the northeast and slightly south of due east (see Figure 9). The northeasterly approach would originate above the University

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

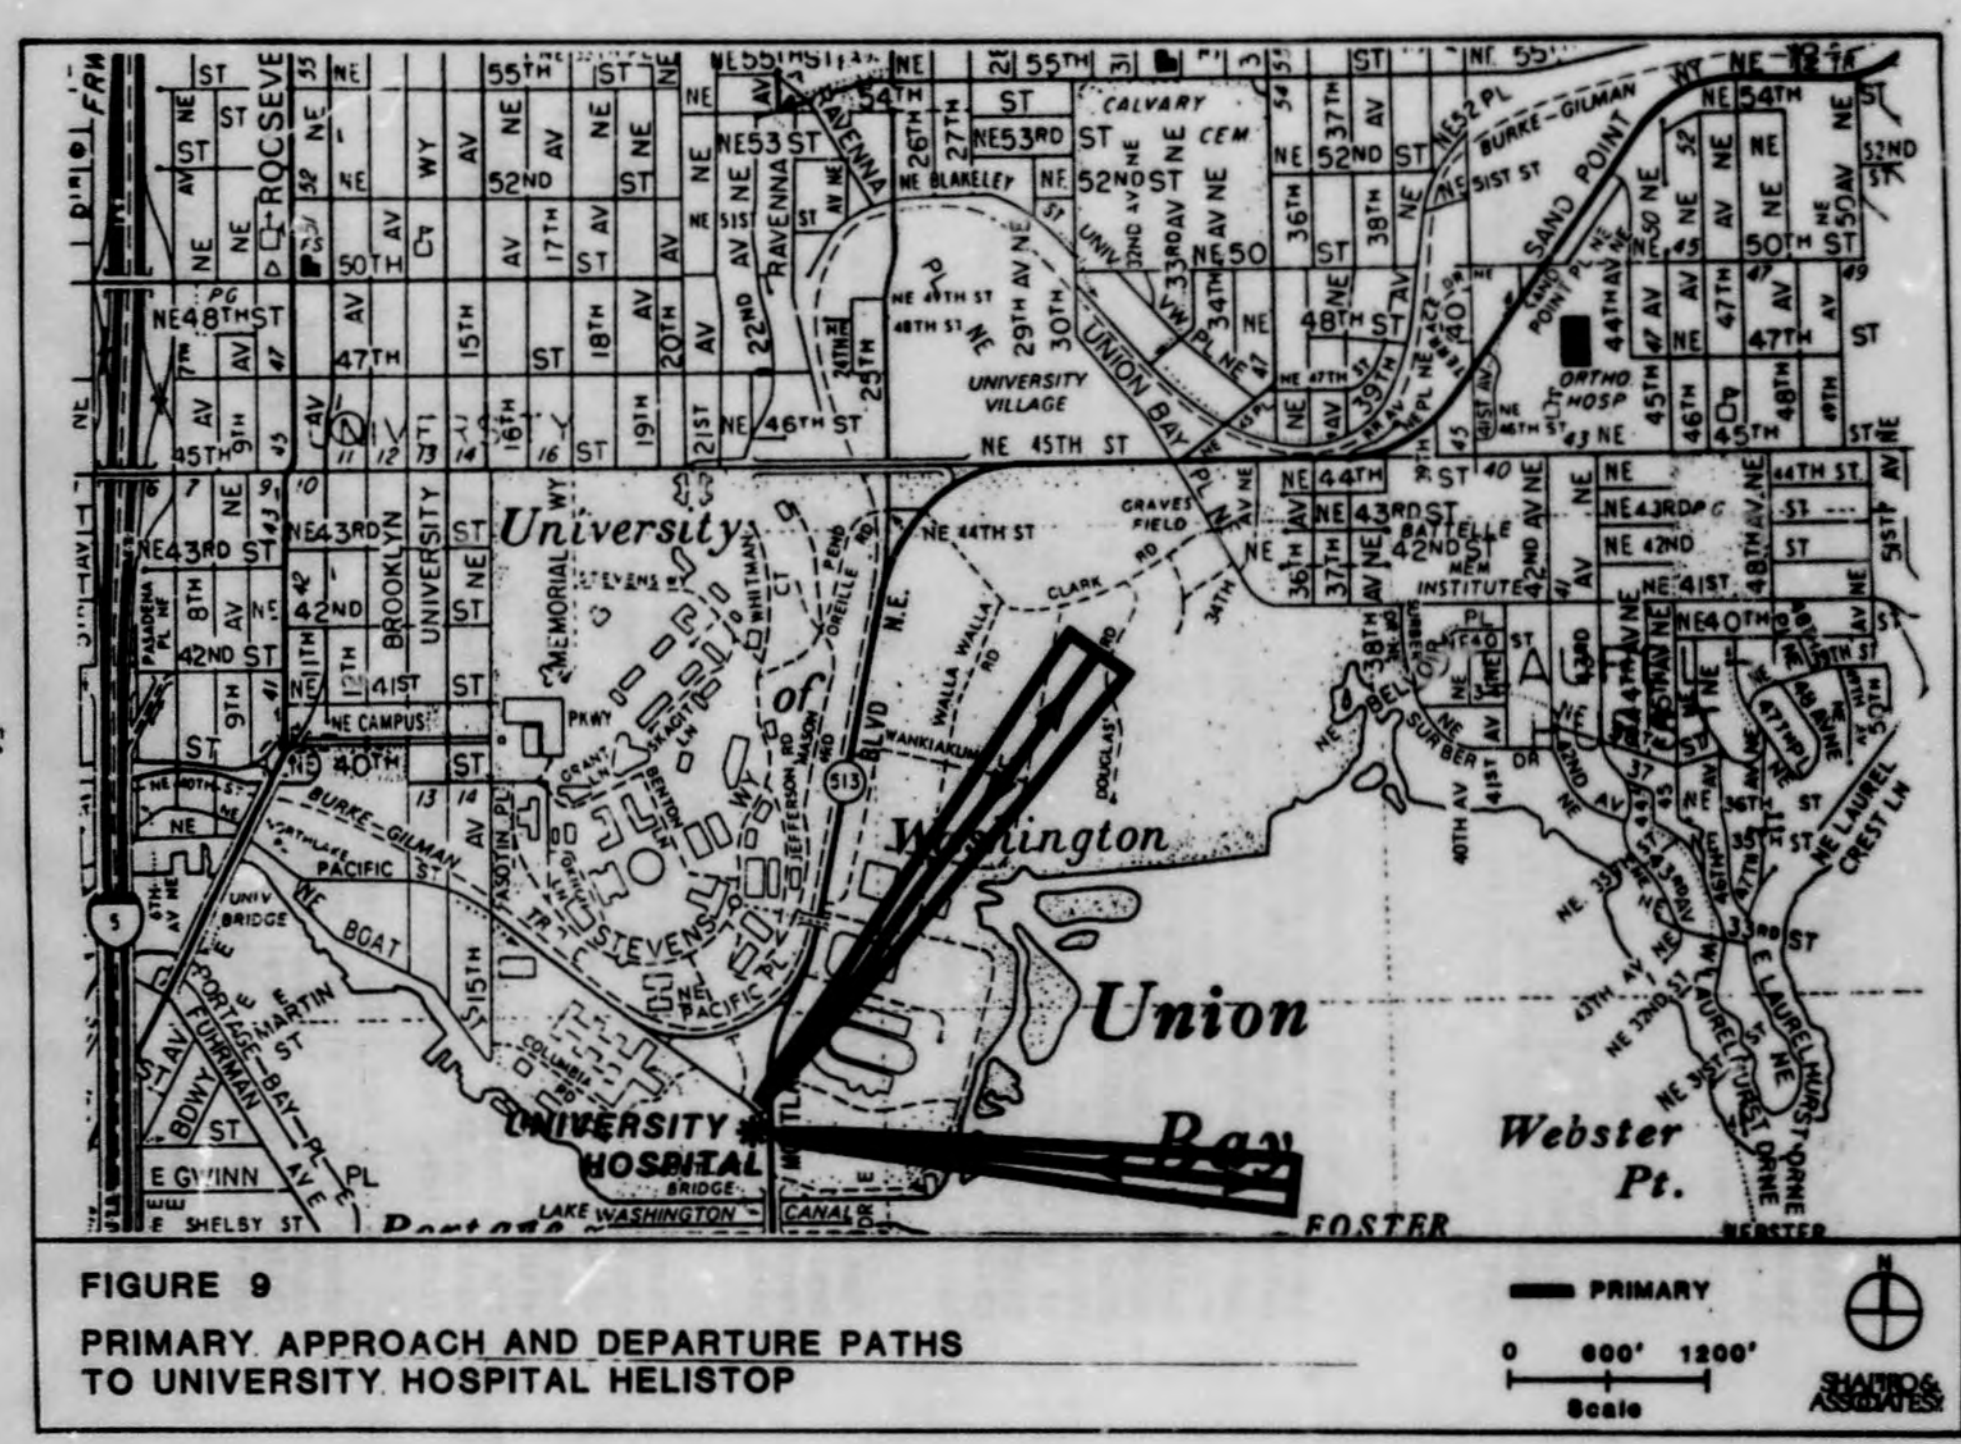

FIGURE 9

PRIMARY APPROACH AND DEPARTURE PATHS TO UNIVERSITY HOSPITAL HELISTOP

of Washington athletic fields, near Intramural Field, and fly over Husky Stadium and Hec Edmundson Pavillion. The easterly approach would begin over Union Bay at a point slightly north of Foster Island. Due to the limited size of the landing area and the proximity of the hospital building to the pad, the helicopter would be unable to turn around over the pad, rendering it unable to depart in the same direction from which it approached (Hill, 1986). Thus, the helicopter would have to approach from one of the indicated directions, and depart from the other on every flight. Following liftoff, any flight path could be followed after the helicopter clears the building.

As with the approaches to the Intramural Field site, Airlift Northwest would approach the University Hospital helistop at a standard approach angle, as described above.

Ground Activities - Patient Transfer to the Children's Emergency Room Entrance. Once the helicopter, with medical crew and patient has landed, the pilot would shut off engines. A ground-based crew would meet the aircraft and, with the helicopter's pediatric medical crew, prepare the patient for transport. The patient would be transported via elevator down five floors through University Hospital to the Hospital's Emergency Room. The patient's medical crew would be met by ambulance and transported to Children's. The patient could need the disconnection of monitoring systems and reconnection in the ambulance and then disconnection of the system at the Children's Emergency Room entrance. The patient would face the risk of ALS systems disconnecting and destabilizing during these transfers.

The approximately two mile trip from the University Hospital to Children's would include travel along N.E. Pacific Street, N.E. Pacific Place, Montlake Boulevard N.E. and then onto N.E. 45th Street and Sand Point Way N.E. Traffic at the intersection of N.E. Pacific Place and Montlake Boulevard N.E. is likely to be congested during commuter hours and on event days at Husky Stadium, Hec Edmundson Pavillion or on campus. Compared to the Intramural Field Helistop Alternative, the elevator travel time and the additional road travel time is estimated to add seven minutes to the total patient transport time to the Children's Emergency Room entrance, but could be slightly shorter, or decidedly longer under extreme traffic conditions. Thus, it is estimated that from the time of landing on the roof of University Hospital, it would take a minimum of 17 minutes for a patient to arrive at Children's. If the patient is in an isolette, it would take a minimum of 22 minutes. Any manipulation of life support systems or need for restabilization would add to this travel time total. The risk to the patient would be greater than that for the Intramural Field Alternative. The need for transfer of the critically ill patient from the University Hospital rooftop, through the hospital to an ambulance and transport to the Children's Emergency Room entrance conflicts with the proponent's objectives for minimizing transfers and transport time.

Limited Landing - No Construction of the Proposed Action or Alternatives

The Limited Landing Alternative is characterized by no construction of a helistop at Children's or Intramural Field or use of the University Hospital's helistop, if its use is approved by the Seattle City Council. Critically ill patients who otherwise would be transported to Children's by

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

an Airlift Northwest helicopter would be off-loaded at Harborview or Boeing Field, transferred to a ground ambulance and driven (Code Red) to Children's. MAST helicopters would probably continue to land at the Intramural Field. There would, however, be continued limited landings in the driveway area outside the Children's Emergency Room entrance.

Prior to the ambulance departing from either Harborview or Boeing Field, critically ill patients would need to be disconnected from the support and monitoring systems in the helicopter, transferred to an ambulance, reconnected and, possibly restabilized. Ambulance travel time from Harborview Helistop to Children's averages 15 minutes; from Boeing Field to Children's, 25 minutes (Andrews, 1986). Actual transit time may be shorter or longer, depending on traffic conditions, and is likely to be lengthened or complicated during commute hours, during delays due to traffic backing up with Montlake Bridge openings, during events at the University, Seattle Center or other locations in Seattle, or during construction that affects traffic on I-5, SR-520, Montlake Boulevard or Sand Point Way N.E. Thus, total minimum elapsed time for transit from landing at Harborview or Boeing Field to a patient entering Children's Emergency Room entrance would be 20 minutes or 30 minutes, respectively, with an additional five minutes if the patient is in an isolette.

The helicopter's pediatric medical crew could judge, in consultation with Children's medical staff and/or Airlift's Medical Director, that patient and/or traffic conditions warrant the critically ill patient being landed at Children's in the driveway area outside the Emergency Room entrance. It is estimated that three to four patients a month could need to be landed for medical reasons at the Children's Emergency Room entrance (Nicola, 1986). These patients typically would be destablizing while in flight and/or those patients whose transport time could adversely influence the patient outcome. An additional, unknown number of patients would need to be transported to the Children's Emergency Room entrance area landing zone in order to avoid exposing the patient to a severe risk of destabilizing or of a potential adverse outcome due to a delay in receiving treatmert at Children's.

In instances in which landings occur outside the Children's Emergency Room entrance, it would be necessary to secure the landing zone area. This would be accomplished by security and/or other personnel from Children's. The flight approach to this landing zone area is similar to that for the proposed helistop, however, it is different in the final approach off Sand Point Way N.E. where the flight path is altered to avoid the tall trees to the north of the landing area. Rather than turning directly onto the hospital grounds just north of the main entrance, the helicopter would turn to the northwest near the intersection of Sand Point Way N.E. and N.E. 47th Street. The pilot would make a wide 180 degree turn toward the hospital grounds while over an open field to the northwest of the Sand Point Way N.E./N.E. 47th Street intersection at an altitude of approximately 500 feet. It would then approach the hospital from the northwest and turn to the southwest over the west edge of the parking garage. It would then fly to a point directly west of the landing area before making a final descent from the west. Because of the tall trees in the area of the proposed helistop, the actual landing would be from the west.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In instances in which MAST helicopters land at the Intramural Field, it would be necessary to secure the landing zone area, which would be approximately the same location as the helistop site under the Intramural Field Helistop Alternative. This procedure involves security and/or medical personnel from Children's and/or the University controlling athletes, passersby and onlookers. The flight path in and out of the Intramural Field would be identical to that described under the Intramural Field Helistop Alternative. Muddy conditions on the field could also expose the patient to risk of complication in the event that attendant(s) slip during transport and jostle connecting lines to the ALS systems. An ambulance also has become stuck in the mud at this site.

Because of the additional transport time and need for potentially destabilizing transfers, the Limited Landing Alternative does not meet the proponent's objectives.

No Action - No Construction of the Proposed Action or Alternatives

Under a No Action Alternative, no helistop would be constructed at either Children's campus or the University of Washington's Intramural Field. Additionally, Children's-destined patients being transported by helicopter would not be permitted to land at the University Hospital Helistop, if approved, or in the driveway area outside the Children's Emergency Room entrance.

Children's-destined patients flown by helicopter would need to land either at Boeing Field or Harborview Hospital and transported by ambulance to Children's. As described in the Limited Landings Alternative, the total minimum elapsed time for transit from landing at Harborview or Boeing Field to a patient entering Children's Emergency Room entrance would be 20 or 30 minutes, respectively, with an additional five minutes if the patient is in an isolette.

It is Children's position that the Hospital is obligated by State Administrative Code (WAC 248-18-285) to provide basic emergency care services. The Hospital construes the administrative regulations to mean that it cannot prohibit a helicopter from landing on the campus even if by doing so the Hospital would be in violation of applicable land use laws and regulations. Moreover, the Hospital believes that the standard of care created by helicopters now landing at Children's cannot be diminished without violating the provision of Section 7.70.040 of the Revised Code of Washington, which establishes thresholds for assessing whether the health care provider has exercised expected care, skill and learning.

Because of the additional transport time and need for potentially destabilizing transfers, the No Action Alternative does not meet the proponent's objectives.

Comparison of Environmental Impacts of Alternatives

Implementation of the Proposed Action or Build Alternatives would cause environmental impacts of varying degree. The important potential impact areas have been identified through the scoping process and are addressed in this document. These elements include noise and vibration; aircraft safety;

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and the potential for the project to establish a precedent (cumulative impact).

Implementation of the proposed action would involve the creation of noise and vibration to which area residents would be exposed. Noise impacts would not be as great at the Intramural Field Helistop Alternative because residential areas are further from the proposed helistop location. Similarly, noise impacts on Montlake residents would not be as great for helicopter transports under the University Hospital Helistop Alternative. The Limited Landings Alternative involves some noise at Children's from landings and takeoffs, which would be particularly annoying to residents to the west and also involve noise at off-campus landing locations. The No Action Alternative is characterized by noise at Harborview or Boeing Field. Any alternative except the Proposed Action could involve ambulance siren noise.

The risk of aircraft accident is statistically possible under any alternative, including no action. The construction of a structurally sound, secured, lighted landing area increases the safety of takeoffs and landings but does not negate the risk. The potential for non-aircraft property damage or personal injury is probably the least under the secured Intramural Field Helistop Alternative followed by either Children's or the hospital helistop locations.

Approval of the Proposed Action or Alternatives is not expected to have an impact on the number of Emergency Helistops constructed in the region.

Benefits and Disadvantages of Reserving Implementation of the Proposed Action for the Future

The benefits of reserving implementation of the Proposed Action includes the near-term avoidance of environmental effects associated with project implementation: the preservation of the tall trees on the site; minimizing the number of helicopter flights landing at Children's and thereby reducing the exposure of area residents to noise and vibration, and reducing the risk of a helicopter accident.

Disadvantages of delaying project implementation include delay of up to 35 minutes in some critically ill patients receiving treatment offered only at Children's. This delay could cause unfavorable outcomes for the critically ill patients.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

IV. AFFECTED ENVIRONMENT, SIGNIFICANT IMPACTS AND MITIGATING MEASURES

In this chapter, analyses of environmental impacts that were deemed important through the scoping process are presented. These elements are: helicopter safety, and noise and vibration. For each of these elements, the proposed action is analyzed through a review of existing conditions, a description of probable impacts and impacts of the alternatives where such impacts differ substantially from those of the proposed action, and an identification of possible mitigating measures that are beyond those measures included as part of the proposed action or alternatives. An assessment of cumulative impacts also is included in this chapter, as is a summary of impacts that apparently cannot reasonably be mitigated.

HELICOPTER SAFETY

Introduction

This section presents information on helicopter safety. The characterization examines both general aviation (non-military) helicopter service for the years from 1976 to 1981, and Emergency Medical Service related helicopter service from 1972 through 1985. Trends in helicopter safety are also explored qualitatively.

Primary sources for this study are reports by the National Transportation Safety Board, which is the federal agency with the responsibility of maintaining accident statistics on air and ground transportation, and articles in periodicals dealing with helicopter safety and helicopter ambulance safety. In addition, personal interviews were conducted with recognized authorities in the field of hospital aviation safety, a rotorcraft safety specialist from the Federal Aviation Administration (FAA) and a helicopter pilot from Airlift Northwest, the EMS helicopter service consortium of which Children's is a member.

The National Transportation Safety Board (NTSB) maintains comprehensive statistics on accidents involving U.S. General Aviation, and publishes them annually in the Annual Review of Aircraft Accident Data. NTSB statistics for general aviation have not yet been published for the years 1982-1985, so this review is limited to 1975-1981. Data from other sources for the years since 1981 are also presented.

Helicopter Accident Frequency Trends

Between 1975 and 1981, there was a decrease of almost 60% in the rate of helicopter accidents as measured in number of accidents per 100,000 flight hours. As shown in Table 6, the number of accidents per year remained relatively stable, yet the number of total flight hours increased almost 150%. Therefore, over the seven year period, the number of accidents per 100,000 flight hours decreased steadily from 27.31 to 11.16.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 6

Accident Frequency For All Helicopters
(1975-1981)

Year	Number of Accidents	Elapsed Time	Accidents/ 100,000 hours
1975	266	947,000	27.31
1976	249	1,103,000	22.57
1977	247	1,170,000	21.11
1978	285	1,397,000	20.40
1979	267	1,522,000	17.54
1980	263	1,891,000	13.91
1981	257	2,303,000	11.16

Note: Includes turbine-powered helicopters

Source: National Transportation Safety Board, 1981.

One of the primary reasons for this increase in helicopter safety has been the increased use of turbine-powered engines and the corresponding decreased use of less dependable piston engines (Collett, Benedict, and Hill, 1986). Of the roughly 170 helicopters currently in use in nationwide air ambulance services, only one piston-powered helicopter is still in use (Collett, 1986); therefore, statistics on turbine powered helicopters generally are more representative of EMS helicopters. Unless otherwise noted, all NTSB statistics cited in the remainder of this report refer to turbine-powered helicopters.

As shown in Table 7, turbine-powered helicopters have shown a similar decrease of approximately 60% in the number of accidents per 100,000 flight hours over the same seven year period with a 1981 figure of 5.48 accidents per 100,000 flight hours. The annual number of accidents in turbine-powered helicopters nearly [illegible]ubled between 1975 and 1981, but the number of flight hours more tha[illegible]drupled. In comparing Table 6 and Table 7 it is evident that with the [illegible]tion of 1979, turbine-powered helicopters have consistently [illegible]een more than twice as safe as all helicopters.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 7

Accident Frequency For All Turbine-Powered Helicopters
(1975-1981)

Year	Number of Accidents	Hours Flown	Accidents/ 100,000 hours
1975	47	351,000	13.39
1976	39	423,000	9.22
1977	56	599,000	9.35
1978	60	631,000	9.51
1979	80	663,000	12.07
1980	80	1,172,000	6.83
1981	78	1,424,000	5.48
Totals	440	5,263,000	8.36

Source: National Transportation Safety Board, 1981.

NTSB does not compile statistics specifically regarding EMS helicopter flights, but some data have been gathered by those in the helicopter and EMS fields. Howard Collett, publisher of Hospital Aviation magazine, and Nina Merrill, Executive Director of the American Society of Hospital-Based Emergency Air Medical Services (ASHBEAMS) have assembled data on all EMS-related accidents since the first helicopter ambulance service was started at St. Anthony's Hospital in Denver in 1972.

Since the Denver program was started, there have been a total of 57 accidents involving EMS helicopter flights. Although actual figures on the total number of air ambulance flight hours have not been kept, Collett used estimated average trip time per patient figures to determine that, from 1972 through 1985, EMS helicopter accidents have occurred at an approximate rate of 18 times per 100,000 flight hours. Some specific data have been compiled for the years 1980-1985 by the National EMS Pilots Association. These data indicate an accident rate of 22.9 accidents per 100,000 flight hours (see Table 8). The data also note that during the period from 1980-1985, the EMS helicopter accident rates peaked in 1982 at a rate of 29.3 accidents per 100,000 flight hours, decreased to 18.5 accidents per 100,000 flight hours over the next two years,and then rose to 20.7 during 1985.

Table 8

ACCIDENT FREQUENCY FOR EMS HELICOPTERS

Year	Number of Accidents	Number of Patients Transported	Accidents* per 100,000 Flight Hours	Average Number of Patients Between Accidents
1980	3	16,500	18.2	5,500
1981	6	23,000	26.1	3,833
1982	9	30,700	29.3	3,411
1983	7	37,900	18.5	5,414
1984	9	48,600	18.5	5,400
1985	15	62,000	20.7	4,133
Totals	49	218,700	22.9	4,463

*Based on a worst-case industry multiplier of 60 in-flight minutes per patient (Collett, 1986).

Source: Collett, 1986.

During the 1970s, many early EMS pilots were commercial pilots who branched out into EMS service: Many were "private rural pilots who wanted to relive the adrenalin rush of military helicopter service and expand the usage of their civilian aircraft businesses. Often their advertisements in the telephone yellow pages would list their aerial services as emergency medical, tourist, charter, cargo, and even crop dusting" (Reich and Kania, 1985). As the early industry organized (ASHBEAMS formed in 1980) and established safety standards, the number of these part-time operators declined, with a resultant improvement in safety.

Although industry experts acknowledge that 1985 was a particularly unsafe year, the data in Table 8 suggest fluctuations in EMS helicopter safety since the industry began to experience rapid growth in 1981. An article discussing the recent (1985) rash of accidents suggests that one reason for the accidents is the pilots' willingness to fly in adverse weather when other commercial helicopter pilots would not fly. As stated by Paul Procter, a business flying editor for Aviation Week and Space Technology, "Those guys absolutely hate the thought of losing a patient because they can't fly" (Ver Berkmoes, 1986).

EMS helicopters are frequently called in for particularly hazardous field pickups in locations that ground ambulances would have a difficult time reaching. Even on relatively routine EMS flights, the pilots often land in unfamiliar surroundings in makeshift landing areas in the field. Thus, EMS helicopters may never reach the same safety levels associated with general aviation. It should be noted, however, that the added risk associated with these types of flights is generally limited to the field and not designated landing pads (see Accident Potential with Respect to Phase of Flight, below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Nonetheless, there is an awareness in the industry that EMS helicopter safety can continue to improve. In an attempt to increase safety, ASHBEAMS and the National Emergency Medical Services Pilots Association (NEMSPA) are in the process of developing standards on pilot training, staffing, and operations protocols. (Aviation Week and Space Technology, 1986).

Fatal Accidents Involving Helicopters

General Aviation. As illustrated in Table 9, total fatal accidents declined from 1.71 fatal accidents per 100,000 flight hours in 1975 to 0.63 per 100,000 flight hours in 1981. The 73 fatal accidents identified in Table 9 account for a total of 139 fatalities during the seven year period. Of these, eight were ground fatalities (persons not in the helicopter at the time of the accident).

Table 9

FREQUENCY OF FATAL ACCIDENTS FOR ALL TURBINE-POWERED HELICOPTERS (1975-1981)

Year	Number of Fatal Accidents	Hours Flown	Fatal Accidents/ 100,000 hours
1975	6	351,000	1.71
1976	8	423,000	1.89
1977	8	599,000	1.34
1978	11	631,000	1.74
1979	13	663,000	1.96
1980	18	1,172,000	1.54
1981	9	1,424,000	.63
Total	73	5,263,000	1.39

Source: National Transportation Safety Board, 1981.

EMS. In 14 years, there have been 17 fatal accidents (causing 46 deaths) involving EMS helicopters, resulting in an accident rate of approximately 6.5 fatal accidents per 100,000 flight hours, which is considerably higher than that of general aviation. Only two of these fatal accidents, however, have involved "major vendors" (defined as vendors serving three or more hospitals) [Collett, 1986], which represents an accident frequency of approximately 0.66 fatal accidents per 100,000 flight hours for major carriers--a 14-year total that is comparable with the safest year for general aviation, according to the NTSB figures. There has never been a ground fatality in an EMS helicopter accident. (Collett, 1986)

Accident Potential with Respect to Phase of Flight

General Aviation. The NTSB study identifies the location of helicopter accidents relative to the heliport or airport for 1981 only. These figures are available only for all helicopters (piston and turbine-powered). As shown in Table 10, more than half of the two hundred fifty seven accidents

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in 1981 (54%) occurred further than one mile from the airport or heliport. The second most frequent occurrence (22%) was at the site of an airport. 2.3% of the accidents occurred on heliports. Four percent of all accidents occurred within one mile of the heliports or airport.

EMS. Of the 57 EMS helicopter accidents that occurred through 1985, two ocurred on the host hospital's landing area. (Both of these occurred when engines failed during takeoff from the landing area and takeoff had to be aborted. There were no injuries or deaths on either occasion.) There is no specific data available on the exact distance from the hospital of the other 55 accidents. Nina Merrill of ASHBEAMS was aware of only one other accident that occurred within one mile of the hospital; Tom Einhorn of NEMSPA thought that there may have been two or three. In either case, it appears that the great majority of EMS helicopter accidents have occurred in the field or en route at a distance of greater than one mile from the host hospital.

Reasons stated for the locations of these accidents include the pilot's lack of familiarity with the landing area, poor visibility at field landing areas, the panicky behavior of those on the ground attempting to guide the pilot, and the frequent need to land on marginally safe landing areas. The fact that the largest single cause of EMS helicopter accidents is flying into wires or obstacles (see "Causes of Accidents" section below) supports this assertion. In familiar landing areas, pilots and support teams know the locations of wires and obstacles and are careful to avoid them. At an

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

unfamiliar pickup point in the field, unknown wires present a more serious danger (Collett, Merrill, Poulton, Hill, Benedict).

Causes of Accidents

General Aviation. The NTSB uses 14 different designations for types and causes of helicopter accidents, including "hard landing, collision with wires or poles, engine failure or malfunction," etc. (see Table 11) In 1981 the largest number of accidents (42%) were caused by engine failure or malfunction. Seventy-two percent of these accidents caused either minor or no injury. The other most frequent causes of accidents were "controlled" collisions with the ground and collisions with wires or poles (each causing 10.3% of all accidents). Both of these categories caused higher percentages of fatal and serious injury accidents. Nonetheless, even among turbine-powered craft, which have relatively dependable engines, engine failure or malfunction was the single leading cause of serious injury or fatal accidents. No data are available on twin engine helicopters.

Table 11

GENERAL AVIATION, TURBINE-POWERED HELICOPTER
ACCIDENTS IN 1981 BY TYPE AND CAUSE

EMS. Similar, although more general data have been assembled on causes of EMS helicopter accidents (see Table 12). The single greatest cause (32%) of EMS helicopter accidents has been striking wires or obstacles. (58% of this type of accident resulted only in damage to the craft, but no injuries.) The second leading cause of EMS helicopter accidents has been power loss or other mechanical failure, which has accounted for 26% of these

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

accidents. (The majority of this group of accidents (64%) caused no death or injury.)

Table 12

AIR AMBULANCE HELICOPTER ACCIDENTS BY CAUSE

The third leading cause of EMS helicopter accidents and by far the leading cause of fatal accidents is the loosely defined category "flew into ground," which accounts for 22% of all EMS aircraft accidents and more than half (53%) of the fatal accidents involving EMS aircraft. This designation was applied to accidents that occurred in poor visibility, when the helicopter hit the ground, and where there was no evidence of any mechanical failure. It is assumed that the causes of these accidents were pilots becoming disoriented by low visibility.

Time of Day (Light) and Weather Conditions

General Aviation. The NTSB report provides data on daylight and weather conditions for 1981 accidents, but does not provide that information specifically for turbine-powered helicopters. Therefore, the information in this section is based on all helicopters. The designations used by NTSB regarding weather conditions are limited to the "Visual Flight Rating" (VFR) and Instrument Flight Rating" (IFR) designations common to aviation regulation. These designations refer primarily to visibility, are not standardized, and do not necessarily account for other factors, such as wind. For example, in some areas of relatively flat topography, the ceiling and visibility limits that would trigger an IFR designation might be more permissive than in an area with greater topographic relief. Therefore, if ten different accidents occurred under VFR conditions, it is possible that the weather could have been different for each of the ten.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The statistics show that the majority (see Table 13) of helicopter accidents in 1981 occurred under VFR conditions. Although VFR conditions generally refer to better weather conditions than IFR conditions, this can be misleading. Most accidents occur under VFR conditions because far more pilots are qualified to fly under VFR conditions than those qualified for IFR flight (generally the more experienced pilots). One common situation is that a VFR rated pilot takes a helicopter out when the weather is good and when it turns bad, he/she is unprepared to deal with it. Many of the accidents that occur under conditions that are technically VFR, actually occur in poor weather (Stripling, 1986). The majority of accidents (88%) occur in daylight.

EMS. NEMSPA data indicate that approximately half of all fatal EMS helicopter accidents occurred at night, half during the day. Tom Ellnhorn of NEMSPA estimated that non-fatal accident records would be similar. Howard Collett, however, believed that a statistical analysis would show a greater percentage of non-fatal accidents occurring during daylight hours than at night.

Gene Hill, a pilot with Airlift Northwest, noted that under bad weather conditions, such as the fog that enveloped Seattle in December of 1985, the company does not fly at all. In fact, during that fog, Airlift Northwest refused to answer twenty calls over a two week period because they did not believe it was safe to fly. Additionally, it is company policy not to fly in winds in excess of 40 knots. Under marginal flying conditions, the company flies at the option of the pilot. In determining whether to fly or not, the pilot has the option of using FAA visibility criteria or more stringent Airlift Northwest guidelines. The FAA standards call for a minimum ceiling of 300 feet and minimum visibility of one-half mile; the Airlift Northwest guidelines are a 500-foot ceiling and one mile of visibility. The Airlift Northwest criteria were established specifically to give pilots the option of not flying if they were not comfortable flying in conditions that the FAA determined to be acceptable. In those cases of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

marginal weather conditions that the pilot decided to fly, they wouldn't land at Children's, but would land at Boeing Field or Sea-Tac, where the pilot could make an instrument controlled landing. Airlift Northwest would only land at Children's in conditions of good visibility.

Accidents by Make and Model of Helicopter

There are no assembled statistics available from NTSB on the makes and models of helicopters involved in accidents. However, Sue Godar, a marketing representative with Agusta, indicated that only one Agusta 109 had ever been involved in a fatal accident since the model was introduced in 1975. That accident involved two Agusta test pilots who were unable to maneuver out of a narrow dead-end canyon in the Italian Alps. According to Howard Collett, the Augusta 109 has been involved in two minor EMS related accidents. One occurred in Phoenix in 1983 and involved a blade slap against another helicopter while taxing at an airport. The other occurred in New Orleans in 1984 and involved an Augusta striking a parked, night camoflauged military helicopter, while performing a night landing at an airport. Neither of these accidents caused any fatalities or injuries.

Observations on Helicopter Safety

In addition to the empirical evidence presented in Tables 6 and 7, indicating a trend in greater safety in helicopter use over the seven years from 1975-1981, there is a general perception among sources in the industry, both EMS and general aviation related, that overall safety has improved and is continuing to improve. These sources offered several observations regarding this increased safety.

Gene Hill, the senior Airlift Northwest pilot, attributes improved helicopter safety, in part, to changes in the technology. He believes that the combined emergence of turbine-powered and twin-engine helicopters has eliminated most of the common equipment-related causes of accidents. Turbine engines are far more dependable than piston powered engines and, as a result, are used almost exclusively in professional flying today. Additionally, in a twin-engine craft, the likelihood of both engines failing at the same time is statistically remote. Illustrative of this point is the fact that the FAA no longer tests pilots of twin-engine helicopters for their ability to perform autorotation landings, which is the only way to land a single-engine craft with a failed engine.

Frank Benedict, a Seattle FAA inspector who certifies helicopter pilots, notes that another cause of improved helicopter safety is that the least safe type of flying, external load flying, has decreased. This type of flying involves carrying loads, such as logs or beams, suspended from the exterior of the craft.

Both Dr. Thomas Poulton, medical director of the St. Joseph Hospital Life Flight program in Omaha, Nebraska, a nationally recognized emergency medicine researcher, and Howard Collett have noted improvements in EMS flight safety. Dr. Poulton believes that most EMS programs are "extremely safe." He noted that a lot of early operators of air ambulance services were pilots who would use their helicopters to pick up patients as a sideline and frequently took unwarranted risks. He believes that most

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

programs operated by medium to large hospitals are professional and are safe. He speculated that some of the smaller programs operate on more restrictive budgets that might affect their judgments regarding which flights to take and which flights not to take.

Dr. Poulton's views are supported by Howard Collett's statistic that only two of the 17 fatal accidents that have occurred to date have involved "major vendors," which he defined as vendors serving three or more hospitals. He is of the opinion that the safety of these major vendors compares favorably with any sector of the helicopter industry. Although Collett believes that improvements in EMS safety have leveled off somewhat since 1982, he notes that the industry is committed to safety and that further improvements are likely in the future. This in part is reflected in the joint ASHBEAMS and NEMSPA convention that resulted in the agreement to establish more rigorous pilot guidelines and an aggressive training program (see ASHBEAMS and NEMSPA discussion in Chapter II).

The FAA considers air ambulance services as "Air Taxi" services in their permitting and licensing process. This type of use has to meet the requirements of more stringent regulations for the pilots, the companies, and the aircraft than other types of uses. First, the air taxi helicopters are examined and flight tested by the FAA at least annually, often more frequently. General aviation craft are rarely inspected more than every five years. Second, air taxi pilots undergo more stringent flight testing than general aviation pilots. FAA Inspector Benedict characterized the distinction by stating, "With general aviation pilots, we have to be convinced that there is no serious doubt as to their control over the aircraft. With air taxi pilots, there can be absolutely no doubt at all as to their full control over the aircraft at all times." Air taxi pilots are also required to have more flight hours than general aviation pilots, but Benedict noted that this is more stringently enforced in insurance company standards than in the FAA regulations. Gene Hill noted that Airlift Northwest has more stringent standards for pilots than either the FAA or the insurance companies.

Affected Environment

The Seattle metropolitan area is served by two major airports (Sea-Tac International Airport and Boeing Field), several smaller airports and airfields (including seaplane ports on Lake Union and Lake Washington, some of which are private docks along the shorefront), and several heliports.

Sea-Tac and Boeing Field receive all of the jet traffic in the area; the nearest other jet ports are Paine Field in Everett and McChord Air Force Base, southeast of Tacoma. General aviation fixed wing traffic is also handled at Sea-Tac and Boeing, as well as at smaller airfields in the area. Several commercial helicopter organizations are headquartered at Boeing Field. In addition to the helicopters based at Boeing Field, several local radio and television stations maintain their own helicopters for news gathering and traffic reporting purposes, and have heliports at their buildings, located in the Denny Regrade area.

Airlift Northwest, the organization that would be transporting nearly all patients to and from Children's, is headquartered at Boeing Field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There have been no accidents in the four and one half year history of Airlift Northwest. Since May of 1985, when Airlift Northwest began operation of the Augusta 109 helicopter, there have been 604 transports (through June 1986); no helicopter accidents have occurred.

Significant Impacts

General Impacts - All Alternatives

In assessing the potential for accidents associated with air ambulance service to Children's, several assumptions must be made regarding the number of flights and the average duration of these flights. Children's estimates that a maximum of 15-20 patients per month will be transported to Children's by helicopter. (See description of the derivation of the number of flights in the description of the Proposed Project).

Gene Hill of Airlift Northwest estimates, based on flight logs, the average total flight (engine) time to serve Children's is 48 minutes. The 48 minute average flight time per patient transport to Children's reflects a combination of interhospital and field transports as well as cases in which the helicopter is used for the final leg of a transport involving a fixed wing transport. A representative 48-minute flight can be into four segments (ground time not included):

1.	Boeing Field to Children's: medical crew pickup	6 minutes
2.	Children's to Patient	18 minutes
3.	Patient to Children's	18 minutes
4.	Children's to Boeing	6 minutes
		48 minutes

The 18-minute segment can be further broken down into one minute of approach/landing, one minute of departure and 16 minutes of flight time, which, assuming a speed of 160 knots, would be equivalent to covering a distance of approximately 49 miles. (It is important to note that the 48 minute average is lowered by flights where the patient is transported to Boeing by fixed wing and then on to Children's.)

Several different accident frequency figures are used to derive projections for different statistical accident frequencies for Children's air ambulance service (see Table 14). The results are presented as the statistical probability of an accident occurring on any given Children's flight; in other words, out of "x" number of 48-minute flights, one would be expected to result in an acident. The frequency of such accidents occurring on a Children's-destined flight would depend on the actual number of patients brought to Children's by helicopter. As a worst case scenario, the statistically probable number of years between acccidents on Children's-destined flights is presented, assuming a worst case forecast of 20 flights per month starting immediately and perpetuating indefinitely.

General accident calculations are based on accident rates for U.S. General Aviation (turbine-powered helicopters) for 1981 and for 1976-1981. Considering that the number of accidents per 100,000 flight hours decreased by more than half between 1976 and 1981 and there is reason to believe that

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TABLE 14

EXPECTED FREQUENCY OF ACCIDENTS
FOR HELICOPTERS TRANSPORTING PATIENTS TO CHILDREN'S

		ASSUMPTIONS				
		Accidents/ 100,000 Flight Hours	Flights/ Month	Minutes/ Flight	Probability of Accident	Statistical Frequency of Accidents (Expected (Number of Years Between Accidents)
1.	U.S. General Aviation, Turbine-Powered Craft, 1981	5.5	20	48	1 in 28,810	95
2.	U.S. General Aviation, Turbine-Powered Craft, 1975-1981	8.4	20	48	1 in 14,828	62
3.	Fatal Flights U.S. General Aviation, Turbine-Powered Craft, 1975-1981	1.4	20	48	1 in 89,928	338
4.	Ground Fatalities 1976-1981	.1	20	48	1 in 833,333	3,472
5.	EMS Related Accidents 1980-1985 (approximate)	22.9	20	48	1 in 5,459	22.7
6.	EMS Related Fatal Accidents 1972-1986 (approximate)	6.5	20	48	1 in 19,231	80
7.	"Major Vendor" EMS Related Fatal Accidents 1972-1986 (approximate)	.7	20	48	1 in 189,394	790

Source: Shapiro and Associates, Inc., text and tables from body of report.

this trend has continued (if one assumes piston-powered helicopters have been taken out of service and replaced by turbine-powered craft), the results based on the 1981 figures are probably more accurate, yet may still be too high. Since total figures from 1976-1981 represent a larger volume of data, however, assessments using this information were calculated.

Since there was no trend in fatality statistics from 1976-1981, average rates for the seven year period were used to estimate expected frequency of fatal accidents for flights transporting Children's patients. Ground fatality projections are based on the same seven year totals. Projections based on past EMS helicopter safety records using approximate figures generated by Howard Collett and Nina Merrill were also prepared. These calculations are based on total EMS related accidents from 1972-1985, EMS related fatal accidents over the same time period, and EMS fatal accidents involving "major vendors" for the same 14 years. No "major vendor" projections were made for overall accidents because the necessary base data have not been compiled. No "ground fatality" projections for EMS related accidents are presented since no ground fatalities have ever resulted from an EMS related accident.

To summarize the results (see Table 14) a worst case scenario was generated using the overall accident rate for EMS helicopters. Under this scenario, a flight involving a Children's-destined patient would have a statistical probability of an accident one in 5,459 transports. The accident could occur at any point on the four segments of each flight. If one assumes 20 flights per month, then the first accident would be statistically expected to occur every 23 years or before the year 2010. If one assumes that the accidents would occur in the flight in a manner comparable to EMS helicopters history, then 10% of the accidents would occur within one mile of the Children's helistop.

At any of the sites, helicopter operations could distract motorists and pedestrians along neighboring streets, and thereby be the indirect cause of an accident.

Children's Helistop Alternative

Regarding the proposed location of the Children's heliport, FAA Inspector Benedict believes that it is an extremely safe site (Benedict, 1986). He compared it to landing areas near the Seattle Center and downtown Seattle that are over busier streets and more congested conditions. He believes that the Children's site is far safer than such landing areas, which are already safe themselves.

A natural gas meter house is located approximately 48 feet northeast of the Children's helistop site. No other buildings are located within one hundred feet. Communication with representatives of Washington Natural Gas discloses that the current protection of the meter with a fence and a concrete structure is considered reasonable and adequate to prevent a fire in the event of a helicopter accident (Jainga, 1985). In the event of a major accident that results in the breach of the gas supply line, the natural gas would flare until shut off at the main valve across from Children's on Sand Point Way N.E.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Other Alternatives

It is not anticipated that any of the alternative helistop locations would be more safe from a helicopter accident frequency perspective than the others. The Airlift pilots have indicated that a secured, lighted helistop--whether on a roof or on the ground--is preferred to unsecured, unlighted open field landing. Because the area immediately surrounding the Intramural Field and the primary and secondary approach/departure paths are located in an undeveloped area, potential physical damage from a helicopter accident would be relatively less for that alternative. Any distinction in potential accident risk among the alternatives would reflect any (minor) differences in flight time, with a no action alternative involving the least flight time, followed by University Hospital Helistop and Intramural Field Helistop.

All of the alternatives to constructing a helistop at Children's involve transport of patients and attending medical crew to Children's by ambulance. Although there is a risk of accident from transport by this mode, no statistics were available based on contacts with ambulance services, EMS agencies, the NTSB, insurance companies or other potential sources.

Mitigation Measures

Children's could contact Washington Natural Gas to discuss the possibility of receiving the necessary equipment and training to enable Children's personnel to shut off the main gas supply valve. This would allow any natural gas flare to be extinguished more quickly in an emergency situation.

Signs could be posted warning of helicopters operating in the vicinity of the helistop so as to inform them of potential distractions.

NOISE AND VIBRATION

Introduction

This chapter discusses noise and vibration impacts of the proposed helistop. The chapter was prepared by Towne, Richards & Chaudiere, Inc.

The report Helipad Noise Evaluation Children's Orthopedic Hospital (Seton, Johnson & Odell [SJO], 1985), prepared as part of the environmental checklist for this proposal, is a partial basis for the noise and vibration analysis. Data from Federal Aviation Administration (FAA) documents, from Airlift Northwest, and from other sources were also used to evaluate and supplement the SJO analysis.

Sound Level Descriptors and Criteria

Descriptors

Sound levels are measured in decibels, abbreviated dB. Environmental noise is measured as A-weighted sound level in decibels, often abbreviated dBA or dB(A) to denote the A-weighting. The A-weighting is a frequency-dependent level adjustment that is based on the sensitivity of human hearing at various sound frequencies and takes into account the human ear's lack of sensitivity to low frequencies.

Table 15 shows A-weighted sound levels associated with various noise sources and conditions.

The dBA measurements scale is a logarithmic rather than a linear scale, and is therefore not directly proportional to the energy or loudness of the noise. The smallest noticeable increase in noise is usually considered to be about 3 dBA, which is a doubling of sound energy. A doubling of judged loudness occurs for each 10 dBA increase in level. For example, 80 dBA is judged to be twice as loud as 70 dBA and four times as loud as 60 dBA. The increase in loudness of various sound level increases is judged as follows:

Sound level increase, dBA	Judged loudness increase
0 to 2	Barely perceptible
3 to 5	Noticeable
10	Doubling of loudness
20	Quadrupling of loudness

For evaluating the effect of noise on people, one must consider both the level, time of day, and duration of the noise. Noise descriptors that are based on the average sound energy have in the past ten years been found to be the best indicators of noise impact and community response, regardless of whether the noise is steady (such as a freeway) or fluctuating (such as local traffic and aircraft). Community noise, therefore, is often measured as an equivalent or average sound level, Leq, which is the level of a steady sound tnat contains the same acoustical energy as the fluctuating noise over a given time period.

* Approximate sound levels of intermittent aircraft flyovers in Seattle area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Noise over 24 hours is measured as day-night average sound level, Ldn, which is the Leq over 24 hours with a 10 dBA penalty included when averaging the Leq for nighttime hours of 10 p.m. to 7 a.m., because of the greater noise sensitivity during nighttime. For locations exposed to intermittent aircraft noise, it is common for governmental agencies to use the yearly Ldn based on an average number of daily aircraft operations during the year to determine the average or long-term impacts of the aircraft noise. The Ldn based on a particular day or condition can also be used to evaluate short-term impact. Ldn is the most widely accepted noise descriptor in the U.S. The descriptor is used by the U.S. Environmental Protection Agency (USEPA), the U.S. Department of Housing and Urban Development (USHUD), and the FAA to evaluate noise impact and land use compatibility. Ldn noise criteria are based on studies of activity interference (speech and sleep), annoyance, and community reaction.

The highest instantaneous sound level occurring during a given time period is called maximum sound level, Lmax. The Lmax descriptor can provide information about intermittent sound levels from particular noise sources, and the amount of noise fluctuation.

Individual aircraft events are also measured as sound exposure level, SEL, which is the level of a steady one-second sound that would contain the same amount of sound energy as the entire event. The SELs of individual aircraft events are used to compute the overall Leq and Ldn.

Although the A-weighted sound level and the Leq and Ldn noise descriptors are currently considered the best overall measures of noise, there are other factors that may affect sensitivity to noise. Impulse noise associated with helicopter blade slap tends to distinguish the helicopter noise from other noise sources. (This blade slap noise is primarily a characteristic of helicopters with two-bladed rotors, whereas 90% of the flights to Children's would be by helicopters having four-bladed rotors and modifications to control blade slap noise.) Research to determine whether an adjustment should be made to the sound level based on the impulsivity of the helicopter sound has led to conflicting results. The current position of the FAA and the International Civil Aviation Organization (ICAO) is that an impulsivity adjustment is unnecessary to properly certificate aircraft and adequately assess human response.

Criteria

There are no local, State or Federal noise regulations specifically for helistops. The following is a discussion of existing noise standards and guidelines, and of noise effects.

Seattle Noise Ordinance. The Seattle Noise Ordinance (City of Seattle, 1977) exempts "sounds originating from aircraft in flight, and sounds which originate at airports and are directly related to flight operations." The ordinance also exempts "sounds created by emergency equipment and emergency work necessary in the interests of law enforcement or of the health, safety or welfare of the community." Exempt sound sources can also not be considered a public nuisance noise or public disturbance noise. Based on these exemptions, noise from aeromedical helicopters and from ambulance sirens would not be considered subject to the Seattle Noise Ordinance.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

United States Environmental Protection Agency (USEPA) Noise Guidelines. Day-night average sound levels, Ldn, affecting residential, hospital and educational activity can be evaluated using USEPA noise guidelines (USEPA Region 10, 1975). Significant impacts on these activities are considered to exist if exterior Ldn is 65 dBA or above. The guidelines consider overall noise increases due to a project of 0 to 5 dBA to cause slight impact, 5 to 10 dBA significant impact, and over 10 dBA very serious impact.

United States Housing and Urban Development (USHUD) Noise Standards. USHUD has established Ldn noise standards for USHUD-assisted projects and actions (USHUD, 1979). The USHUD standards are cited only as an additional reference, since this project is not USHUD-assisted. Ldn 65 dBA or less is "acceptable." Ldn exceeding 65 dBA but not exceeding 75 dBA is "normally unacceptable," and special approvals, environmental review and sound attenuation are required. Ldn exceeding 75 dBA is "unacceptable," and special approvals, environmental review and sound attenuation are required.

FAA Land Use Compatibility Criteria. The FAA (FAA, 1984) has developed land use compatibility criteria based on Ldn as shown in Table 16. The criteria basically consider residential or hospital land use to be not compatible where the yearly Ldn is 65 dBA or above, unless outdoor to indoor sound level reductions are 5, 10 or 15 dBA over standard construction sound level reductions of 20 dBA. All land uses are considered to be compatible where the yearly Ldn is below 65 dBA.

Sleep Interference. The probability of sleep disturbance from noise varies depending on the level and duration of the noise, stage of sleep, individual exposed, and adaptation. Intermittent indoor sound levels (up to a few minutes duration) above 70 dBA have a significant probability of causing sleep interference. Intermittent levels of 40 to 70 dBA are generally considered to have some potential for causing sleep interference. Continuous sound (for example, from air conditioners or fans) causes sleep interference above 35 to 45 dBA. Sleep interference can also occur at lower sound levels, although the probability of sleep disturbance diminishes significantly at the lower levels. Adaptation to a particular sound level or noise source is a factor in determining sleep interference. This factor can generally not be simulated in laboratory studies. Age is also a factor, with the elderly and children in certain age groups being more susceptible to awakening. Intermittent indoor sound levels up to about 55 dBA are generally not considered to cause impact, based on collated data such as shown in Figure 10. More conservative data from studies conducted in schools and hospitals, as shown in Figure 11, indicate a sleep interference threshold of 40 dBA, with probabilities of awakening from maximum sound levels of 50 dBA as 10%, 60 dBA as 20%, and 70 dBA as 30%.

Motor vehicle noise is the primary cause of sleep interference in residential areas. In typical residential areas, there is a relatively steady background sound level from distant traffic. Higher sound levels from local traffic events are superimposed on this background. Typical intermittent sound levels at the 30- to 50-foot setback of a residence would be similar to those that have been identified in national surveys (USDOT, 1978). At 31 miles per hour (50 kph) and 49 feet (15 m), the "national energy mean emission levels" of various vehicle categories are as follows:

(Numbers in parentheses refer to notes.)

* The designations contained in this table do not constitute a Federal determination that any use of land covered by the program is acceptable or unacceptable under Federal, State, or local law. The responsibility for determining the acceptable and permissible land uses remains with the local authorities. FAA determinations under Part 150 are not intended to substitute federally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise compatible land uses.

KEY TO TABLE

SLUCM	Standard Land Use Coding Manual.
Y (Yes)	Land Use and related structures compatible without restrictions.
N (No)	Land Use and related structures are not compatible and should be prohibited.
NLR	Noise Level Reductinn (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.
25, 30, or 35	Land used and related structures generally compatible; measures to achieve NLR or 25, 30, or 35 must be incorporated into design and construction of structure.

NOTES FOR TABLE

(1) Where the community determines that residential uses must be allowed, measures to achieve outdoor to indoor Noise Level Reduction (NLR) of at least 25 dB and 30 dB should be incorporated into building codes and be considered in individual approvals. Normal construction can be expected to provide a NLR of 20 dB, thus, the reduction requirements are often stated as 5, 10 or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year round. However, the use of NLR criteria will not eliminate outdoor noise problems.

(2) Measures to achieve NLR of 25 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(3) Measures to achieve NLR of 30 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(4) Measures to achieve NLR of 35 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(5) Land use compatible provided special sound reinforcement systems are installed.

(6) Residential buildings require an NLR of 25.

(7) Residential buildings require an NLR of 30.

(8) Residential buildings not permitted.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Vehicle Category	Sound Level, dBA
Heavy truck	80
Medium truck	74
Automobile	62

Noise emissions from buses are similar to medium or heavy trucks. Noise emissions are several dBA higher when vehicles are accelerating. Typical maximum sound levels in residential areas are, therefore, between about 75 and 85 dBA due to occasional noisy vehicles. Where there is a significant amount of traffic, such as at residences adjoining Sand Point Way N.E., maximum levels between 80 and 90 dBA are common (TRC, 1982).

Outside to inside sound level reductions are about 25 dBA in the Northwest. Residential interior maximum sound levels due to occasional motor vehicles are typically 50 to 60 dBA, which can cause occasional sleep interference. With windows partly open, interior sound levels are typically 10 dBA higher, or about 60 to 70 dBA, and there is greater probability of sleep interference.

Ambulance sirens are another noise source that is occasionally present near Children's. The sirens produce between 90 and 106 dBA at 50 feet, depending on their power rating and orientation (Federal Signal Corp., 1986). The sirens, therefore, are capable of causing interior sound levels significantly above the sleep intereference thresholds.

In evaluating the sleep interference potential of the Children's helistop, it is important to consider those noise sources that are already present, and whether there would be a significant increase in intermittent and average sound levels.

Health Effects of Noise. The only clearly established health hazard of noise is hearing loss. State and Federal occupational noise exposure limits based on hearing loss are 90 dBA for eight hours exposure, or higher levels up to 115 dBA for shorter exposure periods.

Based on animal studies involving prolonged exposure to high sound levels, health effects other than hearing loss have been postulated. Between 1977 and 1980, several studies to identify possible adverse health effects on residents in high noise environments, such as neighborhoods adjoining Los Angeles International Airport, however, have been inconclusive. At the present time there is little valid scientific basis for claiming direct health impacts from aviation noise.

Noise-Induced Structural Vibration. Detectable vibration of portions of building structures can occur if exterior sound pressure levels in the low frequencies below 100 Hz (100 cycles per second) are above 65 to 80 dB, as discussed in the SJO report. Short-duration sound pressure levels above approximately 120 dB are considered to cause annoying rattles and fright (U.S. Department of the Interior, 1980). Sound pressure levels from diesel truck drive-bys and general aviation aircraft flyovers are approximately in the 65 to 80 dB range, based on USEPA sound pressure level data (USEPA, 1971), but are well below 120 dB.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The vibration response of a particular structure depends on the construction type and the window size and type. Residence vibration studies have generally been based on structures in southern California and other parts of the southern United States. It is likely that residences in the Northwest, which typically provide about 5 to 7 dB more outside to inside sound level reduction than residences in Southern California (based on airport acoustic insulation studies), are also less susceptible to structural vibration.

Detectable buzzing or rattling of windows due to structural vibration can result in increased annoyance, but is not damaging to the structure unless the outside sound pressure levels are above approximately 134 dB (U.S. Department of the Interior, 1980). Studies of historic building structures near airports with high sound pressure levels from aircraft noise, including 104 dBA from the Concorde supersonic jet transport (Hershey, Kevala and Burns, 1975), have shown that exposure to normal weather (such as thunder or wind loads) produces a higher probability of breakage than vibration from the noisiest aircraft, the Concorde. The contribution of aircraft to structural damage was found to be insignificant. Since the helicopter sound levels received at residences near Children's would be significantly lower than those measured for the Concorde, there is not expected to be any likelihood of structural damage from the noise.

Short-duration sound pressure of these levels can cause rattling and movement of dishes and other lightweight objects.

Helicopter Noise Sources

The Children's helistop would primarily be used by Airlift Northwest. Airlift Northwest uses the Agusta A109 Mark II helicopter, which is turbine-powered. The A109 represents near-current low-noise helicopter design. The helicopter has four blades per rotor instead of two, which results in less of the impulsive blade slap noise that is commonly associated with two-bladed helicopters. The Mark II has additional aerodynamic noise reduction features such as a cap on the rotor head to reduce the air flow angle into the blades and thereby reduce blade noise, and a vortex generator to control blade slap noise. Sound level data for this helicopter were obtained from measurements made by SJO at Children's, from FAA test data, and from measurements made at Harborview Medical Center (King County, 1986).

The MAST helicopters are two-bladed turbine-powered Bell UH-1Vs and have a more impulsive noise than the Agusta because of blade slap. A-weighted sound levels of the two helicopters are not significantly different, although because of the blade slap, the MAST is perceived as being considerably noisier. Sound level data for the MAST helicopter were obtained from measurements at Harborview Medical Center.

The loading of the helicopters (gross vehicular weight) has a negligible effect on their noise emission, because power settings, flight paths and blade speed are negligibly or unaffected (Hill, 1986).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Affected Environment

Helicopter flight paths are described in detail in Section III of the DEIS. The primary approach to Children's would follow the N.E. 45th Street/Sand Point Way N.E. corridor east of Union Bay Place N.E., enter the Children's campus north of the main entrance, turn south approximately over the parking garage, and land at the helistop. Departures would follow a similar flight path, but at higher altitude.

The existing noise-sensitive land uses are single-family and multiple-family residences near the N.E. 45th Street/Sand Point Way N.E. corridor, including Laurelon Terrace apartments and Laurelhurst West; and single-family residences east of Children's, primarily along 44th Avenue N.E. between N.E. 47th and N.E. 50th Streets. Laurelhurst School, located 1,000 feet east of the helistop site, is also noise-sensitive.

Existing sound levels were described in the SJO report for five locations that had been selected in coordination with the Seattle/King County Department of Public Health and the City of Seattle Department of Construction and Land Use. The measurement locations (see Figure 3, Campus Map) and existing day-night average sound levels, Ldn, were as follows:

Location	Ldn, dBA
1. 4720-4724 44th Avenue N.E. (NE of Children's)	52
2. 4530 45th Avenue N.E. (E of Children's)	53
3. Laurelhurst West (near Sand Point Way N.E.)	68
4. Laurelon Terrace (set back from Sand Point Way N.E., W of helistop)	55
5. 4757 41st Avenue N.E. (near Sand Point Way N.E., near main entrance to Children's)	63

Existing maximum sound levels were not measured in the SJO study, due to the relatively small number of sound level readings taken at each location. As discussed previously, however, typical maximum levels in residential areas are between about 75 and 85 dBA due to occasional noisy vehicles. Near Sand Point Way N.E., maximum levels between 80 and 90 dBA occur from motor vehicle traffic. Along ambulance routes, sirens produce maximum levels between 90 and 106 dBA.

A secondary flight path to Children's would be from the northeast over a single-family residential area. This flight path would only have to be used during wind conditions that exist about 0.2% of the time.

The primary helicopter approach and departure paths to the Intramural Field are from the south over water, or from the southwest from the Montlake Cut. Noise-sensitive land uses include residences near the Montlake Cut. The secondary approach path to the Intramural Field is over the University of Washington campus and northeast campus dormitories, considered noise-sensitive land uses.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The two approaches to the proposed University Hospital helistop are from the east and northeast, over the University of Washington sports facilities. The proposed helistop would be located across the Montlake Cut from a noise-sensitive residential area.

Impacts

Proposed Action - Children's Helistop

Noise impacts of the Children's helistop were described in the SJO report. The report assumed 20 patient transports or 40 round-trip flights per month, 29 during daytime hours of 7 a.m. to 10 p.m., and 11 during nighttime hours of 10 p.m. to 7 a.m. Each flight would consist of an approach, landing, takeoff, and departure. Impacts could in fact be less than those described in the SJO report, because of fewer flights. Current estimates are that initially ten patients per month would land at the helistop, with the number eventually increasing to 15 to 20 per month. It has been assumed that there would be two flights to Children's for each patient, the first to pick up the medical crew and the second to deliver the patient. The assumed 20 patients/40 flights per month is therefore a "worst case" assumption.

The number of nighttime flights is expected to be less than assumed by SJO. Current data (Airlift Northwest, 1986) indicate that between 19% and 25% of flights occur during nighttime hours of 10 p.m. to 7 a.m., versus 28% assumed by SJO.

The SJO report's comparison of monthly day-night average sound levels, Ldn, with and without the proposed helistop, based on noise tests of the Agusta helicopter at Children's, is shown in Table 17.

Table 17

SETON, JOHNSON & ODELL EXISTING AND PREDICTED Ldn

		Monthly Ldn, dBA			
	Location	Existing	Helicopter (40 flights)	Combined	Increase
1.	4720-4724 44th Ave. N.E.	52	55	57	+5
2.	4530 45th Ave. N.E.	53	48	54	+1
3.	Laurelhurst West	68	50	68	0
4.	Laurelon Terrace	55	56	59	+4
5.	Across from main entrance	63	52	63	0

Source: Seton, Johnson & Odell, 1985.

The projected worst case noise increase of 5 dBA in Ldn is considered a slight impact according to USEPA noise guidelines (USEPA, 1975).

The highest maximum sound level of the helicopter was measured by SJO to be 84 dBA at the closest receptor location, 4720-4724 44th Avenue N.E. Typical interior maximum sound levels from helicopters were estimated to be about 55 dBA, assuming typical outdoor maximum levels of 80 dBA and an

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

outdoor to indoor sound level reduction of 25 dBA. This level was estimated to awaken 15% of a normal population sample. As indicated previously, intermittent levels up to about 55 dBA are generally not considered to cause impact. At the closest receptors, the maximum sound levels would be about 84 dBA exterior and 59 dBA interior. This 59 dBA level would cause about a 20% probability of awakening, based on Figure 11. With windows partly open, interior maximum levels would be about 10 dBA higher, or up to 69 dBA, causing a 30% probability of awakening according to Figure 11. This probability of awakening is about 5-10% higher than for the estimated existing condition without helicopters, which is maximum levels of 60 to 65 dBA interior with windows partly open. Significant impacts (interior levels above about 70 dBA and also significantly exceeding existing maximum levels) are not expected to occur.

Based on discussions with Airlift Northwest concerning noise considerations, the primary flight path for Children's has been modified to allow a more gradual and direct turn into Children's than was used in the SJO noise tests, instead of the sharp turn that was previously made north of the intersection of Sand Point Way N.E. and N.E. 50th Street. The portion of the new flight path near the helistop would also be farther east of the Laurelon Terrace apartments, resulting in about 7-9 dBA lower maximum levels from helicopters than for the current flight path.

Maximum and day-night average sound levels were calculated for the new flight path using FAA noise test data for the Agusta A109 Mark II (FAA, 1985). The FAA data provides Lmax and SEL readings at the centerline and several side distances for various approach, takeoff, level flyover and hover operations. In addition to an average monthly Ldn, a "worst one-day" Ldn was also calculated, assuming two daytime and two nighttime flights. Results of the calculations are shown in Table 18.

The helicopter Ldns shown in Table 18 are considered to represent the "worst case" cumulative impact condition, as discussed previously.

The calculated monthly Ldn from helicopters are relatively close to those of SJO (see Table 17) at Locations 2, 4 and 5, but are lower at Locations 1 and 3, presumably because of differences in the flight path (affecting distance and exposure time) and possibly a difference in the helicopter altitude used to calculate levels at Location 3, Laurelhurst West. The helicopter Ldns shown in Table 18 are consistent with a current measured helicopter Ldn of 48 dBA 450 feet from the helistop at Harborview Medical Center (King County, 1986).

The calculated highest Lmax of 84 dBA at the closest residences is identical to the level measured by SJO.

The predicted sound levels are not expected to cause significant impact (interior Lmax above 65 dBA with windows closed, Ldn above 65 dBA due to helicopters, or more than 5 dBA increase in overall monthly and worst one-day noise). At all locations, the calculated monthly Ldn from helicopters would be less than the existing Ldn, resulting in a 3 dBA or less noise increase. There would, however, be increased sleep interference affecting Laurelon Terrace, residences west of the Children's main entrance that are not near Sand Point Way N.E., and the closest residences northeast

**The "existing worst one-day Ldn" in Table 18 was assumed to be the existing Ldn measured by SJO plus 3 dBA, since the existing Ldn varies from day to day depending on the traffic conditions and local activities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of the proposed helistop site. At these locations, interior Lmax from helicopters are likely to be several dBA above the currently existing Lmax from motor vehicles (up to 59 dBA predicted versus 50 to 55 dBA estimated existing). Assuming about 25% of the flights occur at night, there would initially be about two nighttime flights per month (one patient being transported), increasing to 10 per month under the "worst case" assumptions.

Because the rise in noise would be gradual, startle effects associated with rapid noise increases from sources such as blasting or sonic booms would not occur.

There would be slight noise impacts affecting Laurelhurst School. During landings and takeoffs, there would be brief exterior sound levels (FAA, 1985) of up to 72 dBA at the second story and 62 dBA at the first story and playgrounds, which are shielded by residential structures. The interior maximum sound levels would be about 47 dBA with windows closed and 57 dBA with windows open at the second story, and 37 dBA with windows closed and 47 dBA with windows open at the first story. These levels are approximately similar to sound levels currently caused by motor vehicle drivebys.

There would be sleep interference impacts several times per month affecting hospital patients whose rooms are exposed to helicopter noise. Maximum exterior sound levels at the portion of buildings closest to the helistop would be about 94 dBA. Interior maximum sound levels would be about 69 dBA with windows closed, which is considered to be the typical nighttime condition. These levels would cause about a 30% probability of awakening, based on Figure 11. Maximum sound levels would, however, be less than for the Limited Landings Alternative, since the helistop would be farther from the hospital building.

Low-frequency sound pressure levels from helicopters were estimated in the SJO report and found to be approximately similar to the levels at which perceptible structural vibrations are considered possible. The levels are also, however, similar to those that typically occur from diesel trucks and general aviation aircraft flyovers, as discussed previously. The estimated levels are significantly below levels that are considered to cause fright or structural damage.

The probability of structural vibration would be less than for the current flight path required by the Limited Landings Alternative. The helicopters must currently approach and depart west of the Children's emergency entrance in order to avoid existing trees, and must therefore fly close to Laurelon Terrace. Under the Proposed Action, maximum sound pressure levels at Laurelon Terrace due to helicopters would be reduced by about 7-9 dB.

Flights by the MAST helicopters would produce A-weighted sound levels almost identical to those of the Agusta, based on measurements at Harborview Medical Center (King County, 1986). The MAST helicopter noise would, however, be more noticeable than that of the Agusta because of more blade slap, as discussed previously.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There are no known adverse health effects associated with the predicted helicopter sound levels for the neighborhood around Children's.

There would be temporary noise impacts from intermittent construction noise during the two-month construction period, primarily affecting hospital patients whose rooms face the construction site. The noise would occur from trucks delivering about 400 cubic yards of fill material, grading and compaction of the site, and pouring of the Grasscrete surface. These activities would be limited to daytime hours. The Seattle Noise Ordinance (City of Seattle, 1977) contains stringent limits on construction noise received in residential areas during nighttime hours of 10 p.m. to 7 a.m. on weekdays and 10 p.m. to 9 a.m. on weekends. The daytime construction noise is not expected to affect residential areas because of the distance to these areas.

The following is a summary of impacts. The summary is consistent with the findings of the SJO report:

- Although the helicopter noise would be noticeable, it is not expected to cause significant impact during daytime hours due to its infrequent short-term nature and the relatively moderate sound levels that would be received at residences.

- Helicopter flights during sleeping periods could cause awakening probability of about 15-20% at the closest, line-of-sight residences and 30% at the closest hospital patient rooms.

- The impact of the monthly helicopter noise exposures as measured by Ldn would not be significant compared to the currently existing Ldn, although Ldn would increase by 3 to 5 dBA at residences closest to the helistop.

- Structural vibrations due to helicopter flights are not expected to be significant.

Intramural Field Helistop Alternative

The Intramural Field Alternative is not expected to result in noise impacts from helicopters when the primary approach and departure paths are used. There would, however, be impacts on student dormitory residents and possibly noise interference with class lectures on the few occasions when the secondary approach path over the University of Washington campus would be used.

This alternative would result in ambulance sirens occasionally being used between the Intramural Field and Children's. The sirens are approximately as loud as the helicopters, producing about 90 to 106 dBA at 50 feet and 86 dBA at 500 feet. Residences along Sand Point Way N.E., including the Laurel Village University of Washington housing, Laurelhurst West, portions of Laurelon Terrace, and several other single- and multiple-family residences, would experience higher maximum sound levels from ambulances than from the helicopters associated with the Proposed Action. The closest single-family residences to the east of Children's along 44th Avenue N.E., and patient rooms near the northern part of

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's, would experience lower maximum levels than under the Proposed Action, assuming that the ambulance sirens are not used within the hospital property.

University Hospital Helistop Alternative

The University Hospital alternative would result in slight helicopter noise impacts affecting residents south of the Montlake Cut. These impacts would be several dBA less than those described previously for residents closest to the Children's helistop, because of greater distance from the flight path.

This alternative would also result in the occasional use of ambulance sirens during transport between University Hospital and Children's. As indicated above, the ambulance sirens would produce higher maximum sound levels at residences along Sand Point Way N.E. than would helicopters, but lower levels at single-family residences to the east of Children's and at the northern hospital rooms.

Limited Landings Alternative

Under the Limited Landings Alternative, helicopter flights to Children's are expected to continue as they currently do in response to critical care emergencies, resulting in occasional noise impacts. Although there would be fewer flights than under the Proposed Action, these current operations are potentially more disruptive per event than the Proposed Action for residents of the Laurelon Terrace apartments, since the helicopter must approach and depart west of the Children's emergency entrance in order to avoid existing trees. This flight path results in exterior maximum sound levels of about 91 to 93 dBA at the closest Laurelon Terrace apartments, based on FAA data (FAA, 1985) and measurements at Harborview Medical Center (King County, 1986) versus 14 dBA for the Proposed Action. Interior sound levels would be up to about 68 dBA with windows closed and 78 dBA with windows open, causing potentially significant sleep interference impacts.

This alternative would also result in the occasional use of ambulance sirens during transport from Boeing Field or Harborview Hospital.

No Action Alternative

Under the No Action Alternative, noise impacts associated with helicopter approaches and departures would be limited to the area around Harborview Hospital and Boeing Field. In addition, there would be occasional use of ambulance sirens during transport from Boeing Field or Harborview.

Mitigating Measures

The following are proposed mitigating measures that are incorporated into the Proposed Action:

- The helistop would primarily be used by a modern, multi-blade helicopter representing near-current low-noise technology.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

. The proposed flight paths would keep the helicopter at high altitude above Sand Point Way N.E.

. The helicopter would use a noise abatement approach and departure that minimizes disturbances to residences.

. The helistop location maximizes ground distances to residences, and is shielded on the south by the hospital structure.

The following additional mitigating measure is possible:

. The medical crew could be picked up at a location other than Children's, resulting in a 50% reduction in the number of flights to Children's. The monthly and worst-day Ldn from helicopters as shown in Table 17 would then be reduced by 3 dBA, resulting in slightly lower noise increases. This measure, however, could result in noise impacts from ambulance sirens as discussed previously, and from helicopters near the alternative pick-up location.

A concrete wall noise barrier around the helistop would not be effective, since it would not shield helicopters in flight, and could be a safety hazard. Such a barrier, therefore, is not recommended.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CUMULATIVE IMPACTS

The potential for Children's helistop approval establishing a precedent for the siting of helistops at other Seattle-area hospitals was determined to be an issue through the scoping process.

There are several factors that discourage the improper use and proliferation of helicopter services in Seattle. First, the land use criteria used by the City of Seattle for the evaluation of applications for institutional helistops limit the use of helistops to those situations involving life-threatening emergencies. While local and community hospitals in the region are capable of treating most life-threatening emergencies, some patients with particularly complex or severe presenting conditions will need to be referred to the more sophisticated level of services and capabilities offered only at certain tertiary care hospitals and medial centers. As noted in Nicola's findings (1985), there are situations in which even seemingly minor delays in transporting a patient to Children's, one of these tertiary referral centers, could result in an adverse patient outcome. In Seattle, many hospitals are involved in treating critically ill patients who are facing life-threatening emergencies; however, only a few of these institutions serve as tertiary care centers that offer specialized services to the region and that are routinely and appropriately involved in treating specific life-threatening emergencies that generally cannot be treated by local hospitals. In Seattle, these referral centers and their areas of particular medical expertise are:

Children's - Neonatal/Pediatric Medical and Surgical Emergencies
Harborview - Trauma, Burn Emergencies
Providence - Adult Cardiac Emergencies
University - Neonatal and Adult Medical (including Cardiac) Emergencies

Harborview currently has a helistop; helicopters are landing at Children's and Harborview, with Children's having submitted an application for a helistop and University having received a Certificate of Need and being in the process of preparing an application for a helistop permit. No other Seattle hospitals are deemed likely candidates for helistops (Nicola, 1986). Based on a survey of Seattle-area medical institutions, Ballard Community Hospital, St. Cabrini Hospital, Group Health Cooperative, Northgate General Hospital, Northwest Hospital, Pacific Medical Center, Providence Medical Center (a member of the Airlift Consortium that shares the Harborview Helistop), Swedish Hospital and Medical Center, West Seattle Community Hospital, and Virginia Mason Clinic do not currently plan a helistop. These medical institutions represent all the major hospitals in the City of Seattle.

In order to receive a conditional use approval, any medical institution must demonstrate that the helicopter is needed to save lives. Although it is conceivable that the non-centrally located hospitals (Ballard, Northgate, West Seattle) could have occasion for patients to be transported from the hospital due to extraordinary circumstances (such as severe traffic congestion), it is unlikely that a dedicated helistop would be warranted.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Approval of the Proposed Action is not expected to have an impact upon the number of helicopter services. Rather, the creation of Airlift Northwest by a consortium of specialty, regional referral medical institutions was designed to avoid the proliferation of air ambulance services and to provide critically ill patients with the appropriate level of medical service. Any new helicopter services used expressly for emergency medical transport would require Certificate of Need approval from the State Department of Health Services.

Under PSHSA's current policies, Children's would be included in a regional emergency helicopter transportation program (Thompson, 1986). The recognized need for coordinating helicopter ambulance service has prompted the Puget Sound Health Systems Agency (PSHSA) to propose the development of guidelines for the siting of helistops and to develop policy options for integrating helicopter services with statewide EMS planning efforts. The Airlift Northwest service is consistent with PSHSA's policy statement, and, in fact, probably served as the model for the "consortium" discussion in that position paper. The establishment and operation of helistops at Children's, Harborview and University Hospitals (the member institutions of the Airlift Northwest consortium) is a logical extension of the provision of this helicopter service to the tertiary care, referral centers located in Seattle.

The Washington State Medical Association's guidelines for patient transport are expected to be available by the end of the summer; these guidelines can assist decision-makers in assessing the need for a particular institution to be served by a helistop.

The State Department of Social and Health Services (DSHS) evaluates hospital proposals for substantial change in service, with helistops clearly defined in the regulations as a substantial change. The Certificate of Need process is the formal procedure used to evaluate the need of a proposed facility or helicopter service. Any Certificates of Need applied for by Seattle hospitals would be examined by PSHSA, consistent with its role as a (public) health systems agency with review authority. It is presumed that only those institutions with a demonstrated need for a helistop would be granted DSHS approval.

The City's land use review process, the Washington State Medical Association's guidelines for patient transport, the (probable) development of guidelines for integrating the helicopter service into the regional EMS system, and the State's Certificate of Need program are expected to prevent the inappropriate development of helistops and helicopter services.

Mitigating Measures

A conditional use permit could be granted for a defined period pending a defined relationship to the existing regional and state EMS system and final development of criteria by the Washington State Medical Association's EMS Committee. As proposed by Dr. Nicola, helistop use could be reviewed for appropriate medical use in six months (Nicola, 1985).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

SIGNIFICANT IMPACTS THAT CANNOT BE MITIGATED

The risk of helicopter accidents is a potentially significant impact that cannot be entirely mitigated. No matter what location a helicopter flies into or out of, there is an attendent risk of accident and potential for personal injury or physical damage. The probability of an accident at a helistop increases with the number of transports.

Noise and vibration is not a significant impact based on regulatory criteria; however, it is recognized that helicopter noise could and probably would be disruptive of some adjacent residents' lives.

DEC 5 - 1985
DEPT OF CONSTRUCTION & LAND USE

December 4, 1985

Beatrice Ryan, Interim Director
Department of Construction and Land Use
400 Municipal Bldg.
Seattle, WA 98104

Dear Ms. Ryan:

This letter is in response to your request of August 30, 1985 for an opinion about the medical need for the Children's Orthopedic Hospital (COH) to establish a helipad on hospital grounds.

In order to review the complete facts of this issue, I have spoken with numerous physicians, administrators, community residents, and former patients. I have reviewed the medical literature on emergency medical services delivered by helicopter, viewed a simulated transport/helicopter landing at Graves Field and near the COH proposed helipad site, examined helicopter and transport equipment, held a public hearing October 24, 1985 in the City Council chambers from 6:00 to 9:00 p.m., (written testimony attached), toured the COH facility, reviewed Airlift Northwest logs and individual patient charts.

Existing Pediatric Emergency Medical Services System in Seattle

Pediatric and neonatal emergencies within Seattle which are hospitalized are generally admitted at one of the 19 neonatal intensive care (NICU) beds or 17 pediatric intensive care beds (PICU) at Children's Orthopedic Hospital or one of the 19 neonatal intensive care unit beds at the University of Washington Medical School Hospital. The only other NICU beds in the region are the 12 beds at Mary Bridge Children's Hospital in Tacoma; the only other pediatric or neonatal intensive care beds in the State are located in Spokane. All pediatric surgery in the region is currently done at Children's. Pediatricians and neonatologists from within the State and from surrounding states (Alaska, Montana, Idaho) generally use COH and the UW as referral centers for the most seriously ill children or neonates requiring tertiary specialty care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Personal health care can, in general, be subdivided into three functional levels: a primary level, where the health care system is entered and basic services received and where all health services are mobilized and coordinated; a secondary level, represented by ambulatory services of a specialist nature and inpatient services provided in a community hospital-type facility; and the tertiary level, which includes the highly complex and sophisticated services available only at a "medical center" (Alberta Parker, "The Dimensions of Primary Care" in Primary Care: Where Medicine Fails, 1974, New York, John Wiley and Sons).

The University of Washington has a program which admits high-risk mothers so that low birth weight babies do not have to be transported between hospitals. This method of delivering high-risk mothers has been found to substantially reduce the morbidity and mortality associated with the delivery of low birth weight babies (Hickok, D. et al., "Decreased Mortality of Very Low Birthweight Infants After Maternal Transport," Department of Obstetrics and Gynecology, University of Washington School of Medicine, unpublished paper.)

But even with an excellent maternal transport program, there will still be individual patients who deliver small birthweight babies at small community hospitals throughout the State, where the infant needs to be stabilized and transported to a tertiary care hospital. Even though the UW is the hospital generally designated for the care of premature low-birthweight infants, its beds are frequently full and patients are referred to COH. The same pediatric medical staff, including interns and residents, deliver services at both COH and UW. In addition to small birthweight babies who have undeveloped lungs and intestines and require intensive support for survival and growth, there are transfers from hospitals around the State to COH for pediatric surgery or acute infection. Trauma patients generally go first to the region's trauma center, Harborview Medical Center, but may be transferred to COH for follow-up after surgery and stabilization.

This referral pattern exists regardless of transportation mode.

Helicopter Transport

There are existing guidelines and standards for patient care while being transported (Guidelines for Perinatal Care, "Interhospital Care of the Perinatal Patient," American Academic of Pediatrics and American College of Obstetricians and Gynecologists, 1985) but there are no standard published guidelines for which mode of transportation to use on a given patient or, for example, which criteria a patient should have to be transported by helicopter versus ambulance. The State Medical Society's EMS Committee is working on the delineation of medical necessity or medical reasonableness for medical transport and under Dr. Lothar Pinker's direction are hoping to have guidelines published in six months (see attached letter). There are some generalities that all the experts agree on.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Over 150 miles it is most timely, stable and economic to use fixed-wing aircraft, so most interstate transports occur in fixed wing. Between 100 and 150 miles, rotary-wing aircraft or helicopters appear most appropriate, so regional out-of-County transfers appear to be the general rule. Less than 70 miles, depending on geography, ground transport is the generally agreed preference.

The key to any transportation of sick people is the stabilization of the patient, making sure that vital signs are stable and that the general physical condition is not deteriorating. One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse to the community hospital to stabiiize a deteriorating baby. Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to a baby's heart and lungs, and check the stability of its condition. There appears to be a balance between amount of transport time required and possibility of deterioration.

There are several studies in the literature that assess the severity of illness and injury in pediatric air transport. In one study, Mayer and Wallie prospectively evaluated 636 patients transported over 79 months of service to a regional children's center. Of these patients, 57.5% were transported by helicopter. Eighty-one percent of patients were taken to surgery or admitted to the intensive care unit immediately on arrival at the regional children's hospital. Overall mortality was 9%; a trauma score was used to classify patients (Ann. Emerg. Med. 1984 Feb.; 13(2):108-11). At Johns Hopkins, Dr. Columbani et al reviewed 267 children over a one-year period; 46% of patients arriving directly from the injury scene were delivered by helicopter. Fourteen of seventeen deaths resulted from head injury; a more aggressive approach to the management of brain trauma was advocated (J. Pediatric Surg. 1985 Feb.; 20(1):8-13). Other areas reviewed include a Hawaiian MAST system (Hawaii Med. J. 1984 Jun.; 43(6):200,202,204); a Kansas perinatal system (Respir. Ther., Mar.-Apr. 1985, 15(2):47-50, ISSN 0048-7392.

Another study evaluating air transport in a rural EMS system looked at 569 patients with multisystemic injuries. The emergency helicopter service was rated, utilizing strict specific guidelines as either essential, helpful, or not a factor in the preservation of life. The helicopter was essential to 16.5% and helpful to 10.9% of patients. In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Baxt et al. looked at a group of 1,273 blunt trauma patients who were treated and transported from the site by seven different hospital-based rotorcraft aeromedical emergency care services and saw a 21% reduction in expected mortality ($p<.05$) in five of the seven services. There is some debate about methodologic errors in the study. An editorial in the same journal issue (Annals Em. Med. 1985 Sept.; 14:9; 859-61) states that

> The effectiveness of aeromedical evacuation of battlefield casualties is well established; the transfer of this technology to the civilian setting is a logical event. Its effectiveness for civilian trauma care should be based on the following three principles: 1) early field resuscitation; 2) rapid transport; and 3) delivery to the hospital best suited to admit and treat the patient definitely and without delay. As Baxt and colleagues point out, helicopter emergency medical service (HEMS) patients may benefit from a highly integrated team effort at the receiving trauma center that is the direct or indirect result of a program but for which the helicopter (unless distance is a factor) is the least important component. This is a strong argument for the concept of regional trauma care that concentrates multiply injured patients in trauma centers organized to best care for them. The potential role of HEMS in making regional trauma care a reality should be explored by EMS systems.

My conclusions from the literature review are that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on your question at issue, the current Graves field site versus the hospital site 3-5 minutes away.

Current Data

COH admits approximately 1,000 patients per month in 200 regular beds and 36 intensive care beds (previously described) In August of 1985 82 patient admissions were ambulance transports to the emergency room, 34 were prearranged newborn ground transports, 30 were prearranged fixed-wing transports, and 6 were prearranged rotary transports. On an annual basis, there are 400-450 ground neonatal transports through the neonatal team; 80-85% of these transports go to COH, the rest to UW. During fiscal 1985 (a one-year period ending June 31) 279 patients were transported by air: 148 into intensive care units (see Attachment 1). Thirty-nine percent of these patients were under one month of age; 16% were greater than five years of age (see Attachment 2). Seventy-one percent (197) had peripheral intravenous lines, 27% (76) were intubated, and 2% (6) were undergoing CPR (see Attachment 2).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE,
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

I also reviewed the detailed flight logs of Airlift Northwest for August, 1985. There were 52 fixed-wing flights with 859 average miles per flight; 18 (54%) flights were out of State; all flights were out of County; 30 flights were to (or from) COH. There were 34 rotary-wing flights from Airlift Northwest averaging 110 miles: no flights were out of state; all but one of the flights were out of County (a motor vehicle accident to Harborview from South King County); 6 flights to COH.

Recommendations

It is my professi nal opinion that there are hospital transfers to COH where 3 to 5 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small. The criteria for helicopter transport in these cases would include the previous comments on distance, stable clinical condition during transport, severe injury or illness requiring tertiary center treatment (rather than secondary or community hospital level), and a strong possibility of decompensation (severe clinical deterioration) during transport. The most important part of the transport, in most cases, will be in getting a specially trained team out to community hospitals around the State.

In most cases, one single site near Graves Field would be adequate for both the University of Washington and COH; however, there will be a small number of cases at each hospital where the ability to land at the hospital may be life-saving. From the transport physicians I have talked to, about 5-10% of all transported children might fall into that category.

The number of children transported by air into COH for any given month may be 30 to 40 and based on the above criteria and clinical estimates, 3 to 4 of these patients may have a medical need for helicopter transport to the doors of the hospital.

The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any number would have to include an additional number of patients whose condition at time of referral was appropriate for air transport but who over time were determined not to have need of helico transport as essential. There also needs to be some flexibility for seasonal variation in disease.

Taking into account these factors, I would estimate ten expected helicopter transports for critically ill pediatric patients per month as an upward bound for COH.

I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use, rather than a hospital-by-hospital provided service. A consortium of hospitals providing helicopter services such as the one in Airlift Northwest is

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

certainly a most sensible approach and will make it easier to establish a systematic approach to provision of these services. We are, however, just beginning to integrate helicopter transport into our EMS system. Once a technology is made available to the medical community, it quickly becomes a standard of care for medico-legal reasons.

Until there is a defined systematic integration of these services on a County-wide (or regional or State-wide) basis, I would recommend that the permit granted be a conditional use permit pending a defined relationship to our existing State EMS system and final development of criteria by the Washington State Medical Association's EMS Committee, and that helistop use be reviewed for appropriate medical need in six months. Appropriate use could be monitored by review of individual patient records by an outside panel which includes recognized EMS/pediatric experts as well, perhaps, as out-of-County reviewers. The Health Department would offer our consultation services for that purpose. and I believe it might also be useful to ask the Department of Social and Health Services, Division of Health's Emergency Medical Services Program, and the Washington State Medical Society's EMS Committee for consultation assistance. If a helistop were being used for purposes outside those expressly permitted, I believe it would be appropriate to revoke the permit at the end of the six months.

I hope that these observations and recommendations will assist you in your permit procedure deliberations; please let me know if any comments need further clarification. My thanks to your staff, to a wide variety of health professionals involved in delivery care, to the staff and administration at COH, to the community residents of Laurelhurst, and to a number of other interested individuals who helped me to reach a better understanding of the emergency medical services delivered to infants and children in our community and the many factors which affect those services.

Sincerely,

Bud Nicola MD

OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT
OF PUBLIC HEALTH

24 October 1985

Dr. Bud Nicola
Director, Public Health, King County
7th Floor
400 Yesler Way
Seattle, Wa 98104

Dear Bud,

I'm enclosing copies of some correspondence dating 1983 dealing with pediatric transport costs and times. The last figures on the second page are difficult to read, but the actual amount is $1463. These are 1983 dollars and represent air to ground transportation and ground to hospital. The figures for the helicopter are grossly different and while as I understand it from Dr. Copass, they do not charge the full cost to the patient, somebody has to pay the $2 - $3000 actual costs for those transports. I'm also enclosing the guidelines for perinatal care Chapter 8. Lastly, the reference that I had made was the pamphlet published by the neonatologist at the University entitled, Immediate Care and Transport of the Sick Newborn by Bethany Farris,RN and William E Truog, MD.

As we discussed, the actual deliniation of medical necessity or medical resonableness for helicopter is very scarce. We have made a start of it, at a State level, and may succeed in this in the next six months or so. The next meeting of the WSMA committee on EMS Standards will be in December and dealing with this subject.

If the preponderance of evidence suggests to you that a helipad should be permitted at COH, May I make the following suggestion. Since data is so sparce and since the Children's personna is so aggressive and resistant to review, I really think we need more data. I suggest that individual patient records should be reviewed for medical necessity by an outside panel which includes some people well established in emergency medical services fields as well perhaps out of County reviewers. I would also suggest a conditional use permit, for six to nine months, that would enforce this kind of record keeping and permit a retrospective judgment about the medical necessity for helicopter transport as well as gathering data on frequency

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of use, etc. If these items all seem appropriate, then an additional conditional use permit would be issued. If the preponderance of data suggested inappropriate use, then denial of an extension might be a reasonable course of action in the future.

I do not envy you your King Solomon role in "dividing up the baby" but the results of your efforts will be quite helpful on a full State basis.

Sincerely yours,

L.H. Pinkers, M.D. FACS

Re: INFANT TRANSPORTS: AIR VS. GROUND

While on call for the Hotline, I have been asked to arrange the transport of high risk infants to Seattle from hospitals that are outside the usual driving range of the COHMC-UW infant transport service, such as Bellingham (89 miles). I have found that the quickest way to move the patient to Seattle is for the referring hospital to assemble their own transport team (usually a nurse and respiratory therapist). Occasionally this is not possible and a ground or air transport team from Seattle is required. In the attached analysis, I have compared three modes of infant transport by compiling data from Sue Engman, Lori Kitchin, and some phone calls of my own. The total elapsed time required is given first. The second column is relevant when the patient requires stabilization by the Seattle team prior to leaving the referring hospital. The third column is relevant if the time "in transit" (outside either hospital) must be kept as brief as possible. Costs are included in the last column.

It is my hope that these data will help others who often wonder, "how long does it take?" and "how much does it cost?"

Guidelines for Perinatal Care, American Academy of Pediatrics and American College of Obstetricians and Gynecologists, 1983.

Chapter 8

Interhospital Care of the Perinatal Patient

The transport of pregnant women, mothers, and neonates between hospitals is a recognized and essential component of modern perinatal care. As noted in Chapter 1, transportation is one of the systems approaches to obstetric and newborn care. There are three types of patient transport: maternal-fetal, neonatal, and return.

Maternal-fetal transports involve pregnant women who are to be admitted for delivery, unlike obstetric consultations, which involve ambulatory evaluation without admission. Neonatal transports usually employ a team to evaluate and stabilize the neonate's condition, as well as to provide care when indicated. Return transports take patients back to their original or local hospital for further care when the problems that required transport have been resolved. Return transports should be recognized as an important benefit to the individual patient and system.

The Committee on the Fetus and Newborn of the American Academy of Pediatrics has established a policy on Level II neonatal units, stating that "Level II neonatal units must have ongoing liaison with a Level III neonatal intensive care unit." That firm support for a network can logically be extended to all perinatal services. The referral of high-risk mothers, as well as sick newborns, to regional centers for care has a positive impact on local perinatal care and makes it necessary to set guidelines for regional perinatal networks. The rising costs of care, the ascending expectations of consumers, and the constraints on spending are relevant considerations in a movement toward firmer guidelines for interhospital care of the perinatal patient.

Interhospital transport and care of high-risk perinatal patients make it reasonable to expect that every patient in a region will be cared for in an appropriate manner. A successful program of interhospital care should incorporate the following components:

1. Risk identification, which includes active anticipation of needs that will require the movement of patients in order to provide optimum care
2. Recognition that patient care is a continuous process
3. Local physicians who know the resources that are available and how to gain access to them
4. Physicians at all levels who have the knowledge and skills needed to identify the high-risk patient, to evaluate the patient's condition, and to stabilize and prepare the patient for transfer
5. An organized, appropriate, and available interhospital transport service
6. A political and economic environment that provides support for the interhospital transport system
7. Data collection and analysis for purposes of monitoring and evaluating the program

From the moment a perinatal problem is recognized, to the point of its resolution and follow-up, there should be a continuum of care. Because disease processes do not become static while a patient is being transferred, management is necessary during transport. The objective of interhospital care thus becomes the provision of the maximum degree of care possible within the constraints imposed by a moving ambulance, its restricted space, and its lack of support facilities (e.g., laboratory, blood bank, and radiology services).

INDICATIONS FOR TRANSPORT

The circumstances in which patients are transported vary according to the distribution of care facilities in each region. The decision should be made by the initial physician and a consultant, both of whom should be well-informed of the resources at each center. In general, transport should be considered when the resources immediately available to the maternal, fetal, or neonatal patient are not adequate to deal with the patient's actual or predicted medical or surgical complications.

The following patient conditions require more specialized care and may require patient transfer. The specific values are to be considered guidelines only. They will vary with individual patient needs or institutional capabilities.

I. Maternal Conditions
   A. Obstetric complications
      1. Premature rupture of membranes (at less than 34 weeks' gestation or less than 2000 g expected birth weight)
      2. Premature labor (at less than 34 weeks' gestation or less than 2000 g expected birth weight)
      3. Any condition creating the probability of birth at less than 34 weeks' gestation or less than 2000 g expected birth weight
         a. Severe preeclampsia or other hypertensive complication
         b. Multiple gestation
         c. Intrauterine growth retardation
         d. Third trimester bleeding
         e. Rh isoimmunization
         f. Premature dilation of the cervix
   B. Medical complications
      1. Infections in which the degree or nature of maternal illness may result in premature birth
         a. Hepatitis
         b. Pyelonephritis
         c. Influenza
         d. Pneumonia
         e. Other febrile or hypermetabolic conditions
      2. Severe organic heart disease, functional class III or IV
      3. Poorly controlled diabetes mellitus
      4. Thyrotoxicosis
      5. Renal disease with deteriorating function or increased hypertension
      6. Drug overdose
      7. Miscellaneous severe illnesses
   C. Surgical complications
      1. Trauma requiring intensive care or surgical correction beyond the capabilities of local facilities or where the procedure may result in the onset of premature labor
      2. Acute abdominal emergencies at less than 34 weeks' gestation or with a fetus weighing less than 2000 g
      3. Thoracic emergencies requiring intensive care or surgical correction

II. Neonatal Conditions
   A. Gestation less than 34 weeks or weight less than 2000 g
   B. Neonatal sepsis or infection

C. Respiratory distress and metabolic acidosis persisting after 2 hours of age
D. Neonatal blood loss
E. Hypoglycemia
F. Hemolytic disease of the newborn
G. Neonates of mothers taking hazardous drugs
H. Neonates of diabetic mothers
I. Neonatal seizures
J. Sepsis or meningitis
K. Congenital malformations requiring surgical care or observation
L. Shock or asphyxia persisting beyond 2 hours
M. Neonatal cardiac disorders with persisting cyanosis
N. Progressive, increasing respiratory distress syndrome
O. Any neonatal condition requiring ventilatory support for more than 1 hour
P. Neonates needing more than routine observation or care

THE ORGANIZED APPROACH TO TRANSPORT

The provision of adequate life support during the transport of critically ill mothers and neonates requires considerable knowledge, skill, experience, and specialized equipment not readily available in all hospitals. Many perinatal centers that provide Level III services have developed transport systems for their service regions because only experience with a large number of patients can maintain the skills required for care during transport. The referring staff can help the mother and neonate most by calling for assistance as soon as the need for transport becomes apparent and by using the time before transport to stabilize the patients and prepare for transport. This practice ameliorates the immediate problems and reduces the time that the transport team must be in the referring hospital.

In certain circumstances, it is reasonable for the referring physician to manage the transfer personally. Maternal-fetal transports are frequently conducted in this fashion. The procedure whereby transport originates at the referring hospital, frequently termed one-way transport, functions effectively in some locations; however, two-way transport systems, which operate from a base at the center, are more common. Any transport procedure is acceptable if the guidelines given here are utilized and its goals and objectives are attained.

Informal, poorly organized interhospital care is hazardous. In order to avoid compromising the patient, to ensure a predictable response for transportation requests, and to provide the highest quality of care, the approach to transport must be logical and organized. When the number of patients who require interhospital care is small, efforts to monitor and maintain the skill levels of the team become even more important. It is advisable in such instances to consider the consolidation of care programs.

An interhospital care system has five identifiable components: (1) organization, (2) communications, (3) personnel, (4) equipment, and (5) transport vehicles.

Organization

Interhospital care should be available 24 hours/day, in a program with defined response time and minimum capabilities of personnel. The director should be a specialist in maternal-fetal medicine or neonatal medicine, or a board-certified pediatrician or obstetrician with a special interest in these subspecialty areas. The director's responsibilities are:

1. Quality control of patient care through regular case review
2. Personnel training and supervision
3. Development and utilization of patient care protocols
4. Development and utilization of record-keeping systems and subsequent collation and evaluation of data for analysis
5. Review of operational aspects, e.g., response times, effectiveness of communications, and equipment maintenance

Communications

The transfer of a patient from one hospital to another and from one care team to another requires a reliable communications system. It is essential that the referring physician provide the receiving physician with specific clinical information on the patient being referred. For a maternal patient, the following information should be included:

Reason for admission
Age
Date of last menstrual period
Estimated date of confinement
Gravida, para, and abortion
Relevant health problems
Perinatal history

Blood type
Results of amniocentesis
Reasons for transfer
Therapy administered, including drugs
Intake and output

For a neonatal patient, the following information should be included:

Gestational age and weight
Perinatal history
Temperature
Color
Hematocrit
Oxygen requirement and blood gas levels
Respiratory activity (particularly presence of apnea or need for assisted ventilation)
Blood glucose or Dextrostix
Pertinent radiologic findings
Reasons for transfer
Therapy administered, including drugs

This information allows the receiving facility to prepare for the patient's stabilization, transfer, and admission. Appendixes F and G contain sample record formats for information that can be provided conveniently by telephone. For large service areas, toll-free lines should be established by the referral center for referring physicians and families. In metropolitan areas or over short distances, direct hotlines may link referring obstetric units and nurseries to the center. These lines should be open 24 hours/day and should be well publicized throughout the service region. The liaison between the referring and the receiving centers should include telephone or radio communication during stabilization and transfer.

Appropriate historical data should accompany the patient. This information should include appropriate laboratory data and x-rays. In most neonatal transports, 10 ml clotted maternal blood to be used for cross-matching purposes should be obtained and should accompany the transport team. Cord blood and the placenta may be helpful in certain clinical situations, such as multiple gestation or intrauterine growth retardation.

Dispatching services should provide rapid coordination of vehicles and personnel, as well as communication links between referring and receiving hospitals and the transfer team. Referring physicians should be given an estimated arrival time to allow them to arrange for laboratory studies on which to base therapy in transport and ensure their availability at the time of transport. The receiving hospital should also be given an estimated arrival time to allow the staff to prepare for the patient's arrival. When flights must connect with ground ambulances, it is desirable for a single dispatching center to coordinate the movements of all vehicles. The complexity and sophistication of the dispatching operation vary considerably with the nature of the service.

Personnel

The interhospital care team members should have the collective expertise sufficient to provide the necessary supportive care for a wide variety of emergency conditions in high-risk mothers and neonates. Team members may be drawn from appropriately trained physicians, registered nurses, respiratory therapists, and emergency medical technicians. One member should usually be a physician or registered nurse. Neonatal nurse-clinicians are often specifically identified with this role. In addition to being highly knowledgeable in care and procedures for perinatal patients, transport personnel should be thoroughly familiar with transport equipment; any malfunction en route must be managed without the assistance of hospital maintenance staff.

Equipment

Powered equipment should have "stand alone" capability, i.e., it should be battery-operated. Batteries should have sufficient power to operate the equipment for the duration of the transport if no alternative power source is available. Furthermore, critical equipment should be adaptable to 12- and 24-volt DC and 110-volt AC power for use in a hospital or ambulance.

In addition to equipment for monitoring, resuscitation, and support of both mother and neonate, a transport kit containing essential drugs and special supplies should be continuously available during stabilization and transfer of the patient. A list of equipment and drugs that should be included in a transport kit is found in Appendix H.

Transport Vehicles

The main concern during transport is to maintain optimum care. The choice of a ground or air ambulance is based on distance from one hospital to another and facilities available to support the patient during

the transfer. Ground ambulances are most useful for distances up to 80–100 miles of flat terrain in low traffic density areas. Beyond 100 miles, aircraft may be faster or less expensive, even though ground ambulances provide more direct transfer between regional centers. The pressurization of aircraft is an important consideration during management, since adequate oxygen levels of the mother and fetus or newborn must be ensured.

Helicopters are used in some areas to transport patients up to a few hundred miles or to reach patients in difficult terrain or high traffic density areas. Helicopters are not pressurized, are generally noisier and more confined, and have less range than fixed wing aircraft, however. These limitations should be considered whenever a helicopter is used.

TRANSPORT PROCEDURE

Evaluation

The patient's condition should be carefully evaluated at the referring hospital, both in regard to the primary diagnosis and the presence of complicating conditions. Steps should be taken to correct these conditions to the extent possible prior to transfer.

Stabilization

Transport of the maternal patient may require hemodynamic stabilization; the initiation of tocolytic agents, anticonvulsants, or antihypertension agents; or demonstrated arrest or diminution of active labor. Patients with active bleeding, rapidly progressive preeclampsia, and rapidly progressive labor should not be transported until appropriate medical management has been initiated and, in the opinion of the medical team, the possibility of acute crisis or delivery in transport is significantly diminished. In some situations, maternal transport may not be advisable; it may be preferable to coordinate neonate transport in such a fashion that the transport team arrives at the referring hospital immediately prior to or shortly after the birth. Transport teams may, by prior agreement between the referring physician and the dispatch center, participate in the initial stabilization at birth. In the fully stabilized neonate, temperature, blood gas levels, blood pressure, tissue perfusion, and blood glucose level are normal. Complete stabilization of a newborn is not always possible, but transport of an extremely unstable newborn is contraindicated.

Although there have been no controlled trials, experience indicates that stabilization prior to departure is probably the most critical aspect of interhospital care because it minimizes subsequent deterioration in an environment that may not permit detection or treatment of problems.

Medicolegal Concerns

There are many legal considerations in perinatal transport. Many details are not well defined, but all involved parties, including the referring hospital and personnel, the receiving hospital and personnel, and commercial ambulance and aircraft charter corporations, assume responsibilities. As spokesperson for the transport team, the physician should thoroughly explain to the patient or the parents of the newborn the patient's condition and reasons for transfer. Informed consent for transfer, admission, and care should be obtained. The newborn should be clearly identified.

Perinatal transport teams are involved in very special transport situations, and prior attention to potential legal problems is advised. In most situations, the institution that employs the team is responsible for its actions, and professional duties are performed under the direction and authority of a physician-director at the receiving hospital. Many hospitals consider neonates admitted to their institution while en route and under the care of the transport team. Physician-directors and hospital administrators should recognize the potential administrative or legal problems that may arise in certain situations, for example, when transport teams cross one or more state lines during a transport.

The referring physician preferably should remain at the hospital until the neonatal transport team arrives and should be there while the team is present in order to ensure complete communication. The patient must pass from the official care of the referring physician to that of the transport team at some point; the departure of the transport team from the physical premises of the referring hospital might be considered the official point of transfer of responsibility. Individual hospitals and regions should investigate the use of transfer agreements, which might include granting of emergency privileges to members of transport teams.

The referral center should receive a report on the patient's condition prior to departure. In the case of newborn transport, the mother and father should be offered the opportunity to see and touch the neonate before the transfer, even if the neonate is in a transport incubator or on a respirator. In addition, an instant picture of the

neonate may be taken for the family prior to transport. This has proved particularly helpful when parents and their neonates are to be separated for a long period or when the mother is recovering from a cesarean delivery and may not remember the time spent with the neonate prior to transport. The family of the patient should also receive written information about the receiving hospital, names of staff members, visiting hours, telephone numbers, and places to stay in the vicinity of the hospital. Brochures about the hospital can be helpful. A desire to breast-feed should be reinforced, and the mother should be taught how to express milk until nipple feeding becomes possible. Early attention to family needs and concerns at this critical time can reduce anxiety and ease the transition to a new medical center.

Records are essential for the continuing care of the patient and for the evaluation of the referral transport process. Records should include the following information:

- Patient's name
- Referring hospital
- Receiving hospital
- Referring physician
- Attendants' names and professional status
- Mode of transport
- Time data, including arrival at the referring hospital, departure, ground or air ambulance time, and arrival at the receiving hospital
- Patient's age, weight, gestational age, and sex
- Diagnosis and condition
- Procedures performed
- Medication administered
- Periodic vital signs
- Special comments

PATIENT CARE IN TRANSIT

A well-stabilized patient requires little or no intervention during transport. The patient should be under continuous observation, however. The key factors to be monitored in the maternal patient include blood pressure, uterine contractions, cervical dilation, fetal heart rate ultrasonography, deep tendon reflexes, infusion rate of intravenous fluids, and the administration of tocolytic agents or anticonvulsants. For the

newborn, temperature, respiration, heart rate, blood pressure, color, activity, and oxygen concentration should be monitored frequently by noninvasive means. A neutral thermal environment should be maintained. It may be necessary to monitor other parameters as well, such as the blood glucose level. Monitoring of blood gases during transport is feasible with the availability of portable transcutaneous monitoring.

The patient, attending personnel, and all equipment should be safely secured in the transport vehicle. Although it may be necessary to respond rapidly to an emergency, high-speed ground travel greatly increases the risk of accidents. In the majority of cases, there is little need for excessive speed if the patient is stabilized.

RECEIVING AND COMPLETING TRANSFER

The receiving staff should be prepared to deal with any unresolved problems or emergencies. The patient's history and clinical status, as well as all the plans for current management, should be communicated directly by the transport personnel. Therapies provided during transport should not be changed unless the transport team is consulted.

Family members are extremely anxious when a patient is transferred. If they have not been able to accompany or follow the patient, they should be called as soon as possible after the transfer and given a report on the patient's condition. The referring physician and the nursing staff at the referring hospital should also be informed about the patient's arrival at the receiving hospital and the patient's progress on a continuing basis thereafter.

The transfer is not complete until equipment on the transport vehicle has been restocked and prepared for the next call. Reusable equipment that has come into contact with the patient should be appropriately sterilized or decontaminated.

OUTREACH EDUCATION AND THE REGIONAL TRANSPORT SYSTEM

Since interhospital care of the high-risk perinatal patient requires the cooperation and coordination of many skilled persons, outreach education efforts should include discussions of the regional transport system. Outreach education can be used to reinforce that cooperation and coordination.

Outreach education related to transport should focus on the following objectives:

1. Informing perinatal care providers in the region of the specialized resources available to them through the perinatal network
2. Assisting primary physicians in developing their abilities to anticipate complications, to identify high-risk perinatal patients, and to stabilize these patients before transport
3. Facilitating effective quality assurance through the continuing education of perinatal care providers
4. Establishing 24-hour consultation and referral sources
5. Promoting a regionalized care system designed to ensure high-quality care to all patients in a cost-efficient fashion

PLANNING AND EVALUATION

The planning of the perinatal transport system requires the participation of both those who will use the service and those who will provide it. The creation of regional advisory councils with representatives from the various perinatal programs facilitates planning and evaluation, as such a group can identify and verify the particular region's needs for interhospital perinatal transport and the specific characteristics of the service that should be designed in response to those needs. The characteristics of the successful system, as described earlier, can be used as a guide for program development and subsequent evaluation. Other criteria should be considered in planning and evaluating the transport system:

1. Availability: Does the system provide all services that may be needed by the perinatal patient?
2. Accessibility: Is the capacity to "connect" the patient quickly and appropriately with the services needed ensured? Do those who will need the services know where to go to get them?
3. Responsiveness: Is there a mutual commitment from referring care providers and specialized care providers to honor and accommodate each other's special needs as they may arise?
4. Effectiveness: Are perinatal patients being given the appropriate care in the appropriate setting? Do care users, physicians and patients, and care providers regard the perinatal transport service as useful and effective?

As basic as these questions may appear, their answers are often assumed without testing. The purpose of the evaluation of the system is to collect the evidence that will confirm that the system provides high-quality care to high-risk mothers and neonates.

Final Environmental Impact Statement

Volume I

Department of Construction and Land Use

APPELLANT
DEPARTMENT ✓
APPLICANT
FILE # 3020
Final
3

April 1991

The intent and purpose of this final environmental impact statement is to satisfy the procedural requirements of the State Environmental Policy Act (RCW 43.21c) and City Ordinance 114057 as amended. This document is not an authorization for an action, nor does it constitute a decision or a recommendation for an action: in its final form it will accompany recommended actions and will be considered in making the final decision on the proposal.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Seattle
Department of Construction and Land Use

Dennis J. McLerran, Director
Norman B. Rice, Mayor

April 25, 1991

Final Environmental Impact Statement
Master Use Permit No. 8405870
4800 Sand Point Way N.E.
Children's Hospital and Medical Center Helistop

This document has been prepared in compliance with the State Environmental Policy Act (RCW 43.21C) and the Seattle SEPA Ordinance, Chapter 25.05, SMC. Copies of this document are available for public review at the Master Use Information and Notification Center, 408 Seattle Municipal Building and the following branches of the Seattle Public Library:

Downtown Branch - 1000 4th Avenue, Seattle 98104
Governmental Research Assistance Library - 3rd Floor, Seattle Municipal Building, Seattle 98104
North East Branch - 6801 35th Avenue N.E., Seattle 98115
University Branch - 5009 Roosevelt Way N.E., Seattle 98105

Copies of the document are also available at the University of Washington Suzzallo and Health Sciences Libraries.

A limited number of copies for public distribution are available at the Land Use Information Center, 684-8467.

This Final Environmental Impact Statement (EIS) includes a new alternative to the original proposal which was developed in response to comments. Under this alternative, the majority of the helicopter flights with patients destined for Children's Hospital would land at the University of Washington's Intramural Field or Harborview Medical Center. A minority of the flights, with the most critical patients destined for Children's Hospital, would land on the Children's Hospital Laurelhurst campus.

The EIS does not include a transcript of the public hearing on the Draft EIS. After review of the comments submitted on the Draft EIS, DCLU determined the issues were sufficiently covered by the responses to the written comments.

The Department of Construction and Land Use will issue a recommendation on whether to grant, condition, or deny the project described above no sooner than seven days after the date of this document. A public hearing for citizens to comment on the proposal and recommendation will be scheduled at that time.

An equal employment opportunity affirmative action employer
Seattle Department of Construction and Land Use 400 Municipal Building Seattle Washington 98104

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The final decision will be made by the Seattle City Council. Notice of the decision will be published either on a Monday or a Thursday in the Daily Journal of Commerce. Notice of the decision will also appear in the Department's twice weekly Land Use Information Service bulletin and will be mailed to those who request a copy of the decision.

Sincerely,

Rebecca R. Herzfeld

REBECCA HERZFELD
Director
Land Use Division

City of Seattle
Department of Construction and Land Use

Prepared in Compliance with

The State Environmental Policy Act of 1984
Chapter 43.21C, Revised Code of Washington

SEPA Rules, Effective April 4, 1984
Chapter 197-11, Washington Administrative Code

Seattle SEPA Ordinance,
Ordinance 114057, effective August 14, 1988, as amended
by Ordinance 114090, effective August 16, 1988.
Chapter 25.05 Seattle Municipal Code

Date of Issue: April 25, 1991

NOTICE: THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IS DUE TO THE QUALITY OF THE DOCUMENT.

FACT SHEET

Title and Description	The Proposed Action is for approval of a Council Conditional Use Permit to allow development of a helistop at the Kitchen Garden site outside the Emergency Room entrance of Children's Hospital and Medical Center (Children's). Implementation of the Proposed Action would allow critically ill and injured children to be brought by helicopter to Children's. Alternatives to the Proposed Action include: the use of an existing helistop at University of Washington's Intramural Field, sharing the University of Washington Medical Center's rooftop helistop, both of which involve ground transport of patients to Children's; an alternative involving limited landings at Children's Hospital, which would not require construction of the Proposed Action or alternatives; and landing of helicopters at Boeing Field and/or Harborview with ground transport to Children's and only a few helicopter flights (with destabilizing patients) landing on the grassy area outside Children's Emergency Room entrance. A new alternative (designated the Preferred Alternative) is presented in this Final EIS. Under the Preferred Alternative the majority of Children's-destined patients would land at the Intramural Field (or Harborview) with the most critical patients landing at the Kitchen Garden helistop at Children's. A No Action Alternative is characterized by all flights landing at Boeing Field or Harborview, with ground transport of patients to Children's.
Action Sponsor	Children's Hospital and Medi[illegible]l Center 4800 Sand Point Way N.E. Seattle, Washington 98105
Approximate Date of Implementation	Construction would be completed within approximately two months of approval.
Lead Agency	City of Seattle Department of Construction and Land Use

FACT SHEET (Continued)

Issue Date of Final EIS	April 25, 1991
Public Agency Review and Response	Information on the availability of this Final EIS will appear in the Seattle Daily Journal of Commerce and will be included in the Department of Construction and Land Use (DCLU) Information Bulletin; notice also will be posted within the Department of Construction and Land Use. The Department invited suggestions on items to be covered in the scope of this document. These letters are on file in the Department and are available for review there.
Approximate Date of Final Action	Forty five days from date of issuance of the Final EIS.
Action by Lead Agency	Recommendation to the Hearing Examiner to grant, conditionally grant, or deny the project.
Type of Agency Decisions	Council Conditional Use to grant, conditionally grant, or deny permits for the proposed project; grading permit; FAA approval.
Cost to Public	Copies of this Final EIS have been printed and made available for reference at the Seattle Public Library, Downtown, Northeast and University Branches, University of Washington Library, and the Governmental Research Assistance Library. Until the supply runs out, some free copies of this Final EIS are available at the Department of Construction and Land Use. Additional copies are available from the Land Use Review Section, Department of Construction and Land Use, at the cost of production ($.25 first page, $.10 each additional page).

ELEMENTS OF THE ENVIRONMENT

Following is a list of Elements of the Environment as set forth in Chapter 25.05.444 of the Seattle Municipal Code. Items marked "Discussed" are discussed in this document, on pages specified in the preceding Table of Contents. Items marked "Not Discussed" have impacts deemed to be non-significant, for reasons briefly stated thereafter.

A. Natural Environment

1. Earth

a. Geology	Not discussed; no unusual conditions exist on this urban site.
b. Soils	Not discussed; no unusual conditions exist on this urban site.
c. Topography	Not discussed; no unusual conditions exist on this urban site.
d. Unique Physical Features	Not discussed; no unique physical features exist on this urban site.
e. Erosion/Enlargement of Land Area (Accretion)	Not discussed; construction-related erosion would not be significant.

2. Air

a. Air Quality	Not discussed; helicopter emissions would not be significant.
b. Odor	Not discussed; helicopter emissions not expected to generate significant odor.
c. Climate	Not discussed; construction of helistop and operation of helicopter would not result in significant impact. Weather influencing aircraft operations discussed.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3.	WATER	
	a. Surface Water Movement/ Quantity/Quality	Not discussed; no surface water on site.
	b. Runoff/Absorption	Not discussed; amount of impervious surfaces would not be significant.
	c. Floods	Not discussed; not applicable to this urban site.
	d. Groundwater Movement/ Quantity/Quality	Not discussed; not applicable to this urban site.
	e. Public Water Supplies	Not discussed; water consumption of proposal expected to have no impact on overall City of Seattle supply.
4.	Plants and Animals	
	a. Habitat for and Numbers or Diversity of Species of Plants, Fish or other Wildlife	Not discussed; currently only usual urban birds or small mammals can reasonably be expected on site.
	b. Unique Species	Not discussed; none exist on site.
	c. Fish or Wildlife Migration Routes	Not discussed; not applicable to site.
5.	Energy and Natural Resources	
	a. Amount Required/Rate of Use/Efficiency	Not discussed; insignificant amounts of energy would be consumed.
	b. Source/Availability	Not discussed; energy requirements would have insignificant effect on overall supplies.
	c. Nonrenewable Resources	Not discussed; the only use of resources would be for normal building materials, and energy requirements.
	d. Conservation and Renewable Resources	Not discussed; no significant impacts on conservation and renewable resources.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

	e. Scenic Resources	Not discussed; no significant impacts on scenic resources.
B.	Built Environment	
	1. Environmental Health	
	a. Noise	Discussed
	b. Risk of Explosion	Discussed; under Traffic Hazards (Helicopter Safety).
	c. Releases or Potential Releases to the Environment Affecting Public Health, such as Toxic or Hazardous Materials	Not discussed; proposal involves no significant hazard in this area.
	2. Land and Shoreline Use	
	a. Relationship to Existing Land Use Plans and to Estimated Population	Discussed; Conditional Use Criteria and Relevant Major Institutions Master Plan policies are examined.
	b. Housing	Not formally discussed; noise impact and aircraft safety impacts on housing are discussed.
	c. Light and Glare	Not discussed; increase in light and glare determined to be non-significant. Project-related lighting is discussed under description of Proposed Action.
	d. Aesthetics	Not discussed; proposal involves no significant changes to aesthetic character.
	e. Recreation	Not discussed; no significant effect on recreation resources would be generated.
	f. Historic and Cultural Preservation	Not discussed; no affected historic or cultural resources have been identified.
	g. Agricultural Crops	Not discussed; small therapeutic garden on-site would be relocated.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3. Transportation	
a. Transportation Systems	Not formally discussed; the Proposed Action by its nature would alter the transport of critically ill and injured patients destined for Children's; discussed under Introduction, Description and Traffic Hazards (Helicopter Safety).
b. Vehicular Traffic	Not discussed; proposal not expecte to have significant impact on vehicular traffic.
c. Waterborne, Rail and Air Traffic	Not discussed; proposal would generate relatively insignificant amount of air traffic, which is quantified in description of Proposed Action. Aircraft safety is discussed.
d. Parking	Not discussed; not applicable to site or Proposed Action.
e. Movement/Circulation of People or Goods	Not discussed; proposal would not have significant impact on movement/circulation of people or goods.
f. Traffic Hazards	Discussed
4. Public Services and Utilities	
a. Fire	Not discussed; existing and future services not significantly affected. Fire suppression equipment is described.
b. Police	Not discussed; existing and future services not significantly affected.
c. Schools	Not formally discussed; school enrollment not significantly affected. Noise impact and aircraft safety impacts on nearby schools are discussed.
d. Parks or Other Recreational Facilities	Not discussed; not applicable to site.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

e.	Maintenance	Not discussed; owner would contribute taxes to pay for maintenance of public systems.
f.	Communications	Not discussed; Proposed Action not expected to disrupt communications.
g.	Water/Stormwater	Not discussed; project would be served by existing system with minimal upgrade, if any.
h.	Sewer/Solid Waste	Not discussed; project would not require sanitary sewer or generate solid waste.
i.	Other Governmental Services or Utilities	Not discussed; provision of energy discussed in energy section; demand for government services would be small.

EXECUTIVE SUMMARY

INTRODUCTION

This Environmental Impact Statement (EIS) examines the University District and Laurelhurst neighborhoods of northeast Seattle and the potential impacts associated with construction and operation of the proposed Children's Hospital and Medical Center Helistop.

The Proposed Action is the approval of a Council Conditional Use Permit to allow development of the helistop located on the campus of the Children's Hospital and Medical Center (Children's) at the northeast corner of Sand Point Way N.E. and N.E. 47th Street. The Children's campus is located in the Laurelhurst neighborhood, less than one mile east of the University of Washington. The Children's campus is situated on a west-facing hillside and consists of one large hospital building and a detached parking garage along the north edge of the campus boundary. The sponsor of the project is the Children's Hospital and Medical Center.

The sponsor's objective in developing the proposal is to create a landing pad for helicopters transporting critically ill and injured children and adolescents to Children's. The specific objectives of the Proposed Action are to minimize patient transport time, and to minimize the number of potentially destabilizing patient transfers from the place of patient pickup to the Emergency Room entrance at Children's.

In conducting a review of the regulatory authority of federal, state and local agencies, it was determined that there is no single entity that has comprehensive authority over all elements of the proposal. The Federal Aviation Administration regulates pilots, aircraft, flight paths and provides guidelines for the construction of helistops. The Washington State Department of Health (DSHS) previously regulated air ambulance services. The DSHS' Certificate of Need Program does not apply to helistops. Through the Council Conditional Use Permit process, the City of Seattle regulates the siting of helistops on the campuses of major institutions, such as Children's.

Since the 1970s, critically ill and injured patients have been transported by helicopter to Children's. During the early 1980s Children's became a member of a tertiary care (advanced medical) consortium that established Airlift Northwest, an air ambulance service based in Seattle. Initially providing only fixed-wing transport, Airlift Northwest began to offer helicopter transport services in April 1985.

The number of Airlift Northwest helicopter transports of patients destined for Children's has grown to an average of approximately 17 per month. The patients who are transported by helicopter originate primarily from throughout western Washington. A small percentage of patients are flown from outside the area to Boeing Field via fixed wing and then are flown by helicopter to Children's.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The most critical patients (an average of 3-4 patients per month) currently are being brought by the Airlift Northwest helicopter to a landing area immediately outside the Emergency Room entrance on Children's campus. The majority of the remaining patients land at the Intramural Field on the University of Washington campus and then are transported by ambulance to Children's. A few additional patients are landed at either Harborview's helistop or at Boeing Field and then are transported to Children's by ambulance.

DESCRIPTION OF THE PROPOSED ACTION AND ALTERNATIVES

The Proposed Action would relocate portions of the existing "Kitchen Garden" to a new site(s) on campus and would remove assorted shrubbery prior to grading and construction of the helistop. The proposed helistop pad would be located approximately 142 feet north of the Emergency Room entrance, somewhat southwest of the parking garage and in the central portion of Children's campus. The 40-foot-square helistop would be marked by a large red "H" and would be surrounded by a fence 30 inches tall. The helistop would be identified from the air by the red "H" and at night by ground lights that would be turned on for emergency landings.

The future number and types of patient transport missions are subject to a degree of uncertainty. Transport mission data indicate that the initial growth has subsided, such that within some fluctuations there is currently an average of 17 transport missions to Children's per month. Projections for 1995 indicate that on the average 15-21 patients per month will warrant transport by helicopter, although advances in medical technology, catastrophic events or other factors could influence this use forecast. The numbers of patients warranting transport may be more or less than the numbers used in this document to characterize the proposal and alternatives, and to calculate the expected impacts.

The majority of patient transports would be performed by Airlift Northwest, (with one helicoptor based at Harborview and one based at Boeing Field), although flights could occur by other air ambulance services, U.S. Army MAST helicopters, or private helicopters. Most transport missions for Children's-destined patients would involve three flight segments: departure (of the helicopter and transport team) from the helicopter base to the location of the patient; transport of the patient to Children's helistop; and return to base for dispatch to the next mission. This description differs from that contained in the Draft EIS, which indicated a total of four flight segments would be involved. It is now assumed that most transport teams would be based either at Harborview or Boeing Field, which are the bases of Airlift Northwest's helicopters; thus, it ususally would not be necessary to pickup the medical crew at Children's or the Intramural Field and one flight segment would be eliminated. However, certain cases still could require pickup of a specialized medical crews at Children's or the Intramural Field prior to departure and flight to the location of the patient. In those cases the patient transport mission would involve a total of four flight segments. It also should be noted that under inclement weather conditions requiring pilots to fly under instrument flight rules,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

helicopters would land at Boeing Field rather than at Children's, the Intramural Field or Harborview, because these locations cannot support radar-controlled landings. Table S-1 identifies flight segments associated with the Proposed Action and alternatives.

Nearly all of the flights to Children's would approach from the southwest, along Sand Point Way N.E., before turning to the south over the parking garage and making final approach to the helistop from the northwest. In rare conditions of strong winds from the northwest quadrant, the helicopter would approach and land from the northeast (final flight paths would be approved by the FAA).

The time from helicopter landing to the patient entering the Emergency Room (ER) would be approximately four minutes. Once the patient is inside the Emergency Room, essential medical information is passed from the aircraft medical team to the ER staff, and medical equipment is retrieved, the pilot would restart the engines and depart. The helicopter would follow approximately the same flight path as the approach, but with greater altitude.

There are five alternatives to the Proposed Action discussed in the EIS. Flight segments associated with each transport mission under the Proposed Action and alternatives are identified in Table S-1. The University of Washington Intramural Field Helistop Alternative would consist of using the helistop or an improved helistop at the northwest corner of the University's Intramural Activities (IMA) Sportsfield #2. The helistop would receive an identical number of Children's-destined missions and flights as the Proposed Action. As with the Proposed Action, up to three flight segments could be associated with each typical patient transport mission (see Table S-1). Patients landing at the Intramural Field Helistop would be transferred to a ground ambulance for the trip to Children's Emergency Room. Total patient transfer and transport time for the one mile trip from the helicopter to the Children's Emergency Room would be a minimum of seven minutes, an average of ten minutes, and a maximum of 20 minutes.

The University of Washington Medical Center Helistop Alternative is not under consideration by the University at this time, although the alternative is carried forth in this EIS. This alternative would consist of using the existing helistop on the roof of the Medical Center's East Wing, as well as approval from the University of Washington to use the helistop for the landing of Children's-destined patients. As with the Intramural Field Helistop Alternative, this alternative would receive a similar number of Children's-bound patients as the Proposed Action, in addition to an undetermined number of University of Washington-destined transports. As with the Proposed Action, up to three flight segments could be associated with each patient transport mission (see Table S-1). As with the Intramural Field Helistop Alternative, this alternative would require the transfer of Children's-destined patients to a ground ambulance for the transport to Children's. Total transfer and transport time from the University of Washington Medical Center Helistop to Children's Emergency Room is estimated at a minimum of 11.5 minutes, an average of 16 minutes and a maximum of 40 minutes. The project sponsor currently is not pursuing this alternative.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The third alternative examined in this Final EIS is the Limited Landings Alternative under which the majority of Children's-destined patients would be flown to Children's with the remainder flown to Boeing Field and/or Harborview Hospital, stabilized, and transferred to a ground ambulance for transport to Children's. As with the Proposed Action, up to three flight segments could be associated with each patient transport mission (see Table S-1). Minimum transport time for patients landing at Harborview is 15.5 minutes, witn an average transport time of 22 minutes and maximum time of 47 minutes. For Boeing Field, minimum, average and maximum transport times are 19.5, 26, and 57 minutes, respectively.

A fourth alternative examined in the Final EIS was not specifically analyzed in the Draft EIS. It was developed in response to comments received on the Draft EIS and is considered the Preferred Alternative. This alternative is characterized by the most critical patients (an average of approximately 3-5 per month in 1995) landing at a secured, paved helistop constructed at the Kitchen Garden Site on the Children's campus. The remaining patients would land primarily at the Intramural Field Helistop, if allowed, or at Harborview with the patients being transported from the landing site to Children's by ground ambulance. As with the Proposed Action, up to three flight segments could be associated with each patient transport mission (see Table S-1). This alternative, which was suggested by residents of the Laurelhurst neighborhood, provides a balance between noise impacts and helicopter accident risk, without inordinately sacrificing proper patient care. In the event that landings are not permitted at the Intramural Field, Children's Medical Director, Dr. Neff, has suggested that proper patient care would be sacrificed unless the majority of patients were allowed to land at Children's Kitchen Garden Helistop. This Preferred Alternative is supported by Children's Hospital and Medical Center.

The final alternative is the No Action Alternative under which all Children's-destined patients would be flown to Boeing Field and/or Harborview Hospital, stabilized there, and transferred to a ground ambulance for transport to Children's. As with the Proposed Action, up to three flight segments could be associated with each patient transport mission (see Table S-1). No landings would be allowed on the Children's campus.

The potential for positive patient outcomes is expected to be most favorable under the Proposed Action and Preferred Alternative, with the patients exposed to greater risk under the Intramural Field Helistop Alternative, the University of Washington Medical Center Helistop Alternative, the Limited Landings Alternative and the No Action Alternative.

ENVIRONMENTAL IMPACTS OF THE PROPOSED ACTION AND ALTERNATIVES

Through the mandatory scoping process, two elements of the environment were identified as warranting analysis in the EIS. These elements are Noise and Vibration, and Helicopter Safety. "Cumulative Impacts" was added as a scoped element because of the possibility that the Proposed Action could serve as a precedent for the development of other helistops and/or air ambulance services in Seattle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TABLE S-1
FLIGHT SEGMENTS ASSOCIATED WITH EACH TRANSPORT MISSION

ACTION OR ALTERNATIVE	FLIGHT SEGMENTS			
PROPOSED ACTION	Base to Patient (1) Patient to Children's (2) Children's to Base			
UNIVERSITY OF WASHINGTON INTRAMURAL FIELD HELISTOP ALTERNATIVE	Base to Patient (1) Patient to Intramural Field (2) (Ground transport of patient to Children's) Intramural Field to Base			
UNIVERSITY OF WASHINGTON MEDICAL CENTER HELISTOP ALTERNATIVE	Base to Patient (1) Patient to Medical Center (2) (Ground transport of patient to Children's) Medical Center to Base			
LIMITED LANDINGS ALTERNATIVE	Base to Patient (1) Patient to Base (2) (Ground tranport of patient to Children's)	and	Base to Patient (1) Patient to Children's (2) Children's to Base (Note: Only destabilizing patients would be transported using this flight sequence)	
PREFERRED ALTERNATIVE	Base to Patient (1) Patient to Intramural Field (2) (Ground transport of patient to Children's) Intramural Field to Base	and/ or	Base to Patient (1) Patient to Base (2) (Ground transport of patient to Children's)	and Base to Patient (1) Patient to Children's (2) Children's to Base (Note: Only the most critical patients would be transported using this flight sequence)
NO ACTION ALTERNATIVE	Base to Patient (1) Patient to Base (2) (Ground transport to patient to Children's)			

NOTES:
(1) Because most transport teams would be based at Harborview or Boeing Field, it usually would not be necessary to pick up a specialized medical crew at Children's or the Intramural Field. However, certain cases could require such pickup prior to departure to the location of the patient, in which case the patient transport mission would involve an additional flight segment. Base is either Harborview or Boeing Field, since Airlift Northwest has one helicopter at each location.
(2) During inclement weather conditions requiring pilots to fly under instrument flight rules, helicopters would land at Boeing Field rather than at Harborview, Children's or the Intramural Field, because these locations cannot support radar-controlled landings.

The worst case impact of monthly helicopter noise exposures would increase the existing, 24-hour ambient levels of 55-58 dBA by 3-5 dBA at residences closest to the helistop. An evaluation of noise and vibration impacts expected to be caused by the Proposed Action indicates that the helicopter noise would be noticeable, but it would not exceed the Environmental Protection Agency's recommended impact criteria. During sleeping periods, helicopter flights could cause varying degrees of disturbance to 15-30% of the people sleeping at the closest, line-of-sight residences. Structural vibrations due to helicopter flights are not expected to be significant, although some area residents have reported helicopter-induced vibrations. These vibrations could cause movement of small household objects, such as dishes, in the residences nearest the flight path. The Intramural Field Helistop Alternative would not be expected to create substantial noise impacts when the primary approach and departure paths are used, although some impact could occur to the occupants of the University of Washington dormitories and classrooms when a secondary path over the University of Washington is used. The University of Washington Medical Center Helistop Alternative would result in noise impacts for residents south of the Montlake Cut; however, due to a slightly greater distance of the receptors from the flight path, these impacts would be slightly less than those impacts expected for residents in the vicinity of the Children's Helistop. Under the Limited Landings and Preferred Alternatives, helicopter flights and resultant noise levels are expected to remain at current levels, resulting in occasional impacts. Under the No Action Alternative, there would be no noise impacts from helicopter operations at Children's nor its vicinity; however, there would be increased noise levels at Boeing Field and Harborview. Any alternatives to the Proposed Action could result in ambulance sirens being used between the landing area and Children's. These sirens are approximately as loud as the helicopter.

Helicopter safety impacts associated with the Proposed Action would be comparable to those associated with the Intramural Field Helistop Alternative and the University of Washington Medical Center Helistop Alternative. The differences among the three would be the probable location of potential helicopter accidents. Based on available data from the National Transportation Safety Board, the Association of Air Medical Services and the publisher of The Journal of Air Medical Transport (formerly Hospital Aviation magazine), the worst case expected statistical frequency of a helicopter accident for one of the proposed helistops would be one in every 14,184 transports, which, assuming an average of 20 patient transports a month, translates to a worst case of an accident occurring approximately once every 59.1 years. Such an accident could occur anywhere along the flight path. Since the number of helicopter flights in the area would be less under the No Action Alternatives than any of the other alternatives, the resulting helicopter safety impacts on the University/Laurelhurst area would be expected to be less as well, with the potential for impacts displaced to the other approach and departure locations, i.e., Boeing Field and Harborview Hospital. Under the Preferred Alternative safety impacts would occur with 3-5 landings per month at the Children's campus, with the greater risk to the areas around Harborview and the Intramural Field. The approach and departure to a paved, second helistop at the Kitchen Garden Site is safer

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

than the grassy landing area outside the Children's Emergency Room entrance.

In addition to helicopter safety, there are safety issues associated with the natural gas meter house located near the site of the Proposed Action and ground ambulance transport. In the event of a helicopter accident on the Children's site that breached the natural gas supply line, the natural gas would flare until shut off at the main valve across from Children's on Sand Point Way N.E. Under the Intramural Field Helistop Alternative, the University of Washington Medical Center Helistop Alternative, and the Limited Landings and No Action Alternatives, patients destined for Children's would require ground transport from the Intramural Field, the University of Washington Medical Center, Boeing Field, and Harborview Hospital, respectively, creating the possibility of traffic accidents that would not exist under the Proposed Action.

The potential for cumulative impacts associated with the action alternatives centers around the likelihood of helistops proliferating at additional Seattle-area hospitals. The City of Seattle has regulations that may discourage the improper use and proliferation of helicopter services in Seattle. The land use criteria used by the City of Seattle to evaluate helistop applications can limit the use of helistops to those facilities that can demonstrate that the helistop is needed to save lives. Although most hospitals can and do save lives, there are only a few tertiary care centers with some critically ill or injured patients who are dependent upon air ambulance transport. (Only a few Seattle area hospitals that serve as tertiary care centers, offering specialized services to the region, are routinely involved in treating life-threatening emergencies that are referred from other hospitals and physicians in the region.) Therefore, the few hospitals in the Seattle area that can demonstrate the need or unique medical services and capabilities would be the only likely candidates for helistops. Of those tertiary care centers, Harborview already has a helistop; Providence Medical Center uses the helistop at Harborview; and the University of Washington Medical Center is continuing to use their helistop at the Intramural Field.

Chapter 1
Introduction

I. INTRODUCTION

The purpose of tnis Final EIS is to provide decision-makers, regulatory agencies, and interested citizens with the following: a review of pertinent background information; a description of the construction and operation of a proposed helistop that would allow critically ill and injured patients to be brought by helicopter directly to Children's Hospital and Medical Center (Children's); a description of alternative means of transporting critically ill and injured patients by helicopter to Children's; and an analysis of the potential impacts and mitigation associated with the Proposed Action and alternatives.

This document is organized into four primary chapters: Background Information; Description of the Proposed Action and Alternatives; Affected Environment, Impacts, and Mitigating Measures; and responses to comments on the Draft EIS.

The chapter on background information is intended to provide the reader with a context for the consideration of the Proposed Action. The chapter profiles the provision of general health care and describes the medical services offered by Children's; describes the conditions of patients who have been and would be transported to Children's by helicopter; characterizes the transport of critically ill and injured patients--highlighting the role of helicopter transport; and reviews the authority of various public and private agencies with respect to the helistop construction approval and the provision of emergency helicopter transport services.

The chapter on the Proposed Action and Alternatives identifies the sponsor's objectives, describes the process used to identify potential helistop sites, explains the derivation of the number of anticipated flights, and for each alternative characterizes flight operations and flight paths, and describes the transfer of the patient from the helicopter to the Emergency Room entrance at Children's.

The chapter on the Affected Environment, Impacts, and Mitigating Measures provides a detailed analysis of the elements of the environment that were determined to be significant during the scoping process. These elements are noise and vibration, emergency transport safety, and cumulative impact.

Although the issue of medical need is not within the scope of this Final EIS, it is a requirement of the City Council's Conditional Use Permit and, therefore, is related to this proposal. At the request of the Seattle Department of Construction and Land Use, a report on medical need issues was prepared by Dr. Nicola, while Director of the Seattle-King County Health Department. Dr. Nicola's report is appended to this document (Appendix A) for reference purposes only.

Chapter II

Background Information

II. BACKGROUND INFORMATION

HEALTH CARE SERVICES

Overview

The provision of medical services can be considered from the perspective of the age of the patient: neonatal (less than one month old), children, adults, and the elderly. Each of these stages in life development requires attention to specific physiological and psychological conditions. Neonatology is the specialized branch of medicine that deals with children less than one month old, and pediatrics is the specialized branch of medicine that deals with the development, care and diseases of children. Both neonatal and pediatric medical services are offered by Children's, whose mission is to provide treatment to patients from birth to 21 years old.

The provision of medical services also can be considered at the level of care required to adequately treat specific medical conditions. The three levels of care include: primary, which is offered by all hospitals; secondary, which provides more advanced care capabilities; and tertiary, which generally is provided by medical specialists. Tertiary care is the most advanced of the medical care services.

The evolution of medicine has been characterized by increasing both the sophistication of medical professionals and the capabilities of support equipment. The complexities of the medical system are reflected in the emergence of numerous specialty disciplines within the medical profession. In simple terms, patients with complex illnesses or injuries are now commonly referred to specialists who have the particular expertise and equipment for their effective treatment. Because of the relative infrequency of need of their expertise (on a per capita basis), medical specialists are generally affiliated with regional medical centers located in populated areas, with patients coming from the surrounding urban center, as well as from rural and remote areas (Nicola, 1986). This aspect of the provision of health care is referred to informally as the regional medical referral system.

Infant and Pediatric Care in the Northwest

Tertiary care is defined, by Children's and the University of Washington Medical Center, as those services necessary to deal with illnesses characterized by complex patho-physiologic processes. Tertiary care requires continuous management from the presentation of an illness to its resolution. Complex illnesses may present numerous conditions, such as severe congenital anomalies, multiple organ system trauma, prematurity in newborns, poisonings, and neuropsychiatric disorders (Neff, 1985). The most effective management of these illnesses requires integrated diagnostic and therapeutic services provided by multiple specialists.

In the Pacific Northwest, many clinics, hospitals, and medical centers offer pediatric services. However, the only pediatric tertiary care centers in the state are: Children's Hospital and Medical Center and Harborview

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Medical Center in Seattle; Mary Bridge Children's Hospital in Tacoma; and Sacred Heart Medical Center and Deaconess Medical Center in Spokane. In Idaho, the only pediatric tertiary care center is St. Lukes Regional Medical Center in Boise; in Oregon, Emmanuel Medical Center in Portland.

Of these pediatric tertiary care centers, Children's is the largest medical center and is equipped and staffed to offer full service, tertiary care for children. Children's is an integral component of the informal regional health care network. For example, Children's has five of the nine Board-certified pediatric surgeons in Washington, Alaska, Montana and Idaho. These surgeons offer a variety of capabilities, including bone marrow and kidney surgery. Much of the pediatric surgery in the four-state region is currently performed at Children's.

Illustrative of the regional service that Children's offers is the distribution of the geographic origin of its patients. In 1986, Children's admitted 7,945 inpatients and 68,002 outpatients. As Table 1 indicates, 52% of these patients were from King County; 23% from Snohomish, Pierce, and Kitsap Counties; 12% from other counties west of the crest of the Cascades; 9% from east of the Cascades; 2% from Alaska; 1% from Montana; and the remainder from other states and countries. The distribution of patient origins in Children's 1986 fiscal year is displayed graphically in Figure 1.

Children's is an example of pediatric concentration in the area of tertiary care services, and it is recognized as the regional, tertiary referral center for children in the Pacific Northwest. Based on data provided by Children's, a summary of 1984-1985 cases indicates that, of the 621 Children's patients affiliated with the Blue Cross system, 64% were categorized as unique cases (defined as patients diagnosed with illness or medical need common to no other or one other patient affiliated with the Blue Cross system). This information conveys the uniqueness of the types of cases treated by Children's.

Key sections of the Children's Hospital and Medical Center are their Infant Intensive Care Unit (IICU) and their Pediatric Intensive Care Unit (PICU). The types of patients admitted to Children's 19-bed IICU include: premature newborns with respiratory distress; asphyxiated newborns; newborns with major congenital anomalies; newborns requiring major surgeries (for correction of diaphragmatic hernias, gastroschisis, onphalocele, etc.); and infants with sepsis or meningitis.

Neonatal emergencies in the Puget Sound area are generally admitted to Children's or to the Neonatal Intensive Care Unit (NICU) at the University of Washington Medical Center, which has 32 beds, to the 25-bed NICU unit located at Tacoma General Hospital, or an NICU at Madigan Army Medical Center (Nicola, 1987). Swedish Hospital has 24 NICU beds, according to a 1988 newspaper article (Rhodes, 1988). The only other neonatal intensive care beds in the state are located in Spokane. (It should be noted that the NICUs and IICUs are similar medical units; their distinction is that NICUs are physically associated with obstetric units.) There are an average of 450 occupied pediatric beds (excluding NICU beds) in the state of Washington; one-third of these are located at Children's.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The University of Washington Medical Center high-risk obstetrical program uses the University of Washington Medical Center's NICU beds so that most low birthweight babies born at the University of Washington Medical Center do not have to be transported between hospitals. Even with an effective maternal transport program, there are mothers who deliver low birthweight babies in community hospitals; many of these babies need to be stabilized and transported to a tertiary care hospital. There is a system, administered by the Division of Neonatal and Respiratory Diseases of the Department of Pediatrics of the University of Washington School of Medicine that determines the most appropriate medical institution (University Medical Center or Children's) to which low birthweight babies born in outlying hospitals should be transported. The factors that go into the decision include patient diagnosis, bed availability and the availability of appropriate staff to care for the patient. Because it is preferrable to transport the mother prior to the delivery of known high risk infants, University of Washington Medical Center's NICU cares primarily for infants delivered at University of Washington Medical Center. Although the majority of infant transports are to Children's, infant transports are made to both hospitals.

Pediatric medical emergencies in the Puget Sound region that require hospitalization are generally admitted to the Pediatric Intensive Care Unit (PICU) of Children's, which has 17 beds, or to the six-bed PICU at Mary Bridge Children's Hospital in Tacoma. There also are six to ten PICU beds located at both Deaconess Medical Center and Sacred Heart Medical Center in Spokane. Children's, through its formal affiliation agreement, is the pediatric teaching hospital for the University of Washington's School of Medicine, which does not have a PICU.

The types of patients admitted to Children's PICU include: near drownings; myocarditis; smoke inhalation; meningitis; and shock, precipitated by any cause.

Tacoma General and Mary Bridge have a wide range of pediatric specialties represented on their staff, and handle most neonatal and pediatric emergencies, generally referring only those patients requiring sophisticated pediatric surgery, such as cardiac surgery, to Children's or University of Washington Medical Center (Nicola, 1987).

Traumatized and severely burned children in the Puget Sound region generally first go to the region's recognized trauma center, Harborview Medical Center, but may be transferred to Children's for follow-up after surgery and stabilization. (Harborview Medical Center is a County institution that is administered by the University of Washington.) Children's is not a trauma center, as it does not meet all criteria necessary to be so designated; however, the hospital does treat some trauma cases.

EMERGENCY TRANSPORT OF PATIENTS

A key element of the regional medical referral system is the transport of the critically ill or injured patient to the referral hospital, where appropriate care can be administered. This referral may occur either for a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

patient in a clinic or hospital who needs the services offered by a more sophisticated and/or specialized medical facility, which is termed an interhospital transport, or for a patient in the "field" (home, work, play or the scene of an accident), which is termed a pre-hospital transport.

The Emergency Medical Service (EMS) system refers to the extension of medical services to critically ill and injured patients and, if necessary, the transport of these patients to appropriate medical facilities. Children's defines critically ill or injured patients as those patients who might die or become seriously damaged unless appropriate treatment is received immediately (Neff, 1986).

The State of Washington's Department of Health coordinates EMS planning for the entire state. The EMS transport system in the central Puget Sound region is comprised of Medic One units, Fire Department aid units, private ground ambulance, military and private helicopter services, and the specific emergency medical services offered by area hospitals. In King County, the King County EMS Division (of the Seattle-King County Department of Public Health) coordinates the EMS system.

Transporting critically ill and injured children to Children's has long been a service offered by the hospital. Sending a specially trained transport team to referral hospitals has ensured specialized medical care at the referring hospital and en route, and it increases the potential for better outcomes for the patients brought to Children's. The Children's/ University of Washington Medical Center pediatric ground transport team has been in operation about ten years and currently brings more than 300 transports per year by ambulance to the intensive care units and emergency rooms at both hospitals.

Under emergency conditions, the interhospital transport of patients may occur by ambulance, by helicopter, by fixed wing aircraft, or by a combination of these modes. In November 1986, the American Academy of Pediatrics' Committee on Hospital Care published general guidelines on the transport of pediatric patients. These guidelines indicate that the factors of greatest importance in selecting mode of transport are: (1) the optimal interhospital transport time indicated by the nature and severity of the patient's clinical condition; (2) carrier and personnel availability; (3) the region's geography; (4) weather and traffic conditions; and (5) cost. If a patient's condition is unstable (deteriorating because of irregular heart beat, respiration or other vital function), even a minimal shortening of transport time to the receiving hospital by one mode of transportation rather than another may be lifesaving (American Academy of Pediatrics, Committee on Hospital Care, 1986).

The Washington State Medical Association's EMS Standards Committee has developed guidelines to assist in the selection of appropriate modes of transport. (See discussion under Washington State Medical Association, below.) Because a patient's presenting conditions may be complex and the attending medical personnel are best able to observe and synthesize the medical data with which they are presented, it is the opinion of the Seattle-King County Department of Public Health that any recommendations regarding the selection of appropriate transportation mode be used as guidelines and not as standards (Nicola, 1986).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Interhospital Transport

The Washington State Medical Association's EMS Committee has recommended general criteria for interhospital air ambulance use, including the requirement for critical care en route that otherwise would not be available; the time and critical nature of the injury or illness; and the need to minimize time out of the hospital; and alternate travel modes being unavailable or undesirable. In addition, the conditions of patients warranting air ambulance interhospital transport have been identified by the committee. These recommendations have been attached to Dr. Bud Nicola's updated report, which is included in Appendix A to this Final EIS.

Pre-Hospital Transport

Pre-Hospital transport refers to the transport of injured or ill patients from non-hospital settings to hospitals or other medical centers. King County coordinates the delivery of certain emergency medical services throughout the County. The King County EMS system is a layered system response program: local Fire Departments' Aid Service, staffed by an Emergency Medical Technician (EMT), responds to all calls. EMTs have a minimum of 81 hours of training, while paramedics, who are trained to perform emergency work in the field, have at least 1,500 hours of training. Thus, paramedic units are dispatched to the more severely injured or ill patients in the field, including patients facing life-threatening medical situations. In King County, seven area hospitals provide medical control to paramedics (please refer to discussion below regarding medical control):

Auburn General	Auburn
Evergreen General	Kirkland
Harborview Medical Center	Seattle
Highline Community	Burien
Overlake	Bellevue
Northwest	Seattle - Shoreline
Valley Medical Center	Renton

Volunteer medic units also are located in Carnation, Duvall, Enumclaw, Issaquah and on Vashon Island (Call, 1986b).

Paramedics operate as an extension of the physician services offered at the base hospital. Unless otherwise stipulated by the patient or patient's physician, paramedics will recommend transport of those patients requiring advanced treatment to the closest facility that provides the appropriate level of care. To that end, the King County Medical Society, the King County Emergency Medical Society, the King County Emergency Medical Services Coordinating Council and EMS Division of the Seattle-King County Department of Public Health have developed a classification of hospitals according to the services that they provide. The King County EMS Division has prepared a Patient Distribution Guide to assist field and base hospital medical staff in determining the appropriate medical center for treating the patient. The King County Medical Society has assumed responsibility for periodically updating the Guide.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Patient Distribution Guide classifies Children's as a Group A, Group B, and Group E hospital. The Group A hospitals, of which there are 25, are characterized by the following services (Seattle-King County Department of Public Health, Emergency Medical Services Division, 1978):

- 24-hour Emergency Room Physician, trained in resuscitative measures
- Intensive Care Unit, staffed and operated at all times
- Coronary Care Unit, staffed and operated at all times
- Laboratory and X-ray unit services available at all times
- Major sub-specialty services available (on call) within one hour of notification

The 15 Group B hospitals satisfy the criteria for categorization as Group A and also have a neurosurgeon "actively involved with the hospital and [who] will examine and operate on patients in that hospital if it becomes necessary" (King County Department of Public Health, Emergency Medical Services Division, 1978).

Only Harborview Medical Center is categorized as either a Group C (operating room staffed 24 hours a day) or Group D (intensive burn patient care) hospital.

Group E hospitals are subgrouped into specialized services, including alcohol, psychiatric, neonatal, cardiac bypass and hyperbaric treatment. Only two hospitals in King County - Children's and University - offer neonatal services, while Children's is one of six designated hospitals that can perform cardiac bypass surgery. Although not a formal subgroup, pediatric emergencies served by the EMS system involving critically ill or injured patients are generally referred to Children's (Call, 1986b). In 1985, there were a total of 141 patients who were served by the County's EMS system and subsequently transported to Children's--two of these by helicopter (Call, 1986b). In 1986, a total of 183 patients were transported to Children's through referral by King County Medic Units, including 13 transports by helicopter (Call, 1987). Additional EMS ground transports were made by the Seattle Fire Department, which provides comparable services in incorporated Seattle.

The County's EMS Division has established guidelines for paramedics in South King County in order to assist in selecting air or ground transport for critically ill patients (Call, 1986a). The underlying principle in the consideration of pre-hospital air transports is that the helicopter provides a rapid method for getting the appropriate medical help to the patient, not that the patient gets to the hospital quickly (Call, 1986a). The following guidelines are used by EMS paramedics in South King County in order to assess the need for helicopter transport (Call, 1986a):

"1. Must be an extremely ill patient [such] that the arrival at a hospital capable of providing specialized care will immediately save their life or reverse their medical deterioration. Examples of presenting medical problems that would most likely indicate use of a helicopter in order to expedite transport of a patient are as follows:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a. Gunshot wound with vitals of blood pressure (BP) less than 80 and heart rate (HR) over 120 with possible respiratory problems

b. Aneurysm (aortic) with BP less than 100 and dropping, or other internal bleeding signs requiring immediate intervention

c. Major medical problems in a pediatric patient where time is critical for survival of the mother and/or baby

d. Multiple injuries that indicate bleeding of such a nature that the patient is in danger of bleeding out within minutes

e. Obstetrical problems that require immediate medical intervention and that are not generally handled at local hospitals

f. Major head injuries

"2. Time must be the major consideration when using a helicopter. Overall, the time discussed means the helicopter must be able to reach the designated receiving hospital in less time than the paramedic unit could reach the hospital if they scooped and ran. The time on scene is always a major concern and under no circumstances should there be a delay at the scene waiting for a ride from the helicopter. If a patient is committed to a ground vehicle, under most circumstances transportation should continue in the vehicle to avoid unnecessary delays or interruption in treatment by the ground vehicle.

"3. Generally, a helicopter should only be used in areas in eastern and southeastern King County when the patient must be transported for specialized care to a distant hospital such as:

Harborview Medical Center	- Major trauma, head injuries, burns
Children's Hospital and Medical Center	- Pediatric medical emergencies that would be delayed by ground transportation
University of Washington Medical Center	- Obstetrical emergencies

"4. Permission to use any helicopter by a paramedic must be obtained from the medic unit's base hospital physician.

"5. Helicopters should only be requested when there are qualified emergency medical personnel on scene who can evaluate the patient's needs. Paramedics should be responsible for requesting helicopter transport as they are usually the most qualified medical personnel. While in route to an accident, it may be appropriate for paramedics to consult with EMTs on scene regarding the patient's condition.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"6. Under no circumstances should paramedics request dispatch centers to get comparative estimated time of arrival from MAST and Airlift Northwest. The paramedics are expected to make a decision regarding which helicopter transport service can best serve the needs of the patient, and to request it. If the first service of choice is not available, then the second helicopter service should be requested."

THE MEDICAL RATIONALE FOR THE USE OF HELICOPTERS IN THE TRANSPORT OF PATIENTS IN WESTERN WASHINGTON

During the Korean conflict, it was recognized that the helicopter's ability to land nearly anywhere and then to transport the patient rapidly to Mobile Army Surgical Hospitals (MASH) greatly increased the ability of wounded soldiers to receive medical treatment. During the Vietnam War, the airborne MASH teams provided rescue, medical stabilization, and evacuation to approximately one million military and civilian personnel. Postwar studies on the application of military helicopters in a civilian context provided the basis for the development of medevac operations that were inaugurated by the Maryland State Police in 1969. The first civilian helicopter ambulance service in the United States was initiated in 1972 at Saint Anthony's Hospital in Denver. By 1988, this concept had expanded to include 135 hospital-based helicopter ambulance services with more than 30 other programs not operated by hospitals (Collett, 1988a).

Although many outlying hospitals are equipped and staffed to respond to emergency medical conditions, there are situations when the severity of the conditions warrant treatment at a tertiary care center. For examples, pediatric surgeons and pediatric plastic surgeons are most capable of performing surgery on severed arteries, dialysis may be required to treat severe toxic shock, and other conditions are best served by the recognized medical specialists that work in the infant and pediatric intensive care units.

It is important to emphasize that not all patients in these medical situations warrant helicopter transport to the Emergency Room entrance; that is a decision properly made by the referring physician in consultation with the advanced care unit or by the transport physician (Nicola, 1986).

The role of helicopter transport is generally described in a statement from the Puget Sound Health Systems Agency:

"Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

"Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care en route can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

"Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services" (Puget Sound Health Systems Agency, 1985).

Patients who are transported to Children's by helicopter are in critical condition. Critically ill and injured patients who are brought to Children's include but are not limited to near-drownings, premature births, severe injuries, overwhelming infections, and ingestion of toxic substances. Appendix D (formerly Table 2 in the Draft EIS) presents data on the medical conditions of patients who were transported directly to Children's by Airlift Northwest helicopter from the time their helicopter transport service was initiated through March 1989.

According to Children's, two main objectives in a helicopter transport system are to reduce the time before appropriate advance treatment can begin and to decrease patient manipulation.

Critical Time Saved

Surgical emergencies, as well as overwhe'ming infections, near drownings, and trauma, are some of the conditions that require immediate, advanced medical intervention. Since delay in the initiation of advanced treatment may affect patient outcome, transport time has a direct bearing on the patient's prognosis. For the most critical patients, every moment lost increases mortality (Neff, 1986). Table 2 compares the time hypothetically involved in transporting and transferring an infant and equipment from Enumclaw to Children's Emergency Room via helicopter and by ground ambulance. For illustrative purposes, it is assumed Airlift's helicopter based at Harborview is used; Airlift also has a helicopter based at Boeing Field. The table indicates that a helicopter transport could save as much as one hour and twenty-six minutes, compared to a transport by ground ambulance for the sample case shown.

Decreased Patient Manipulation

Whenever a patient is loaded or unloaded during an emergency transport, there are risks associated with patient handling. Two major risks are the possibility of critical life support tubes and intravenous lines becoming dislodged, and the consequences of a lowered body temperature (hypothermia), especially for patients in an isolette.

Isolettes are self-contained units that incorporate advanced life support systems. The replacement of dislodged breathing tubes and intravenous lines is more difficult for infants and children than for adults because of the size of the tubes and lines, and the size of the child's esophogus and veins (Kilian, 1987b). If an isolette that keeps a transported infant warm is opened to replace a tube that has been jostled, there is a risk that the child will become hypothermic if the outside temperature is below the ideal temperature of approximately 91°F (Neff, 1986). The hypothermic infant will try to breathe faster due to increased oxygen needs, which only results in more heat loss. An accumulation of acid in the blood

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

is also associated with hypothermia, which can contribute to the rupture of a premature infant's fragile blood vessels in the brain, which, in turn, can cause brain damage or brain death.

Discussion of Medical Need

The City of Seattle's Department of Construction and Land Use requested that Dr. Nicola, during his tenure as the Director of the Seattle-King County Department of Public Health, provide expertise in the assessment of medical need for the proposed Children's helistop. Dr. Nicola prepared recommendations based on a review of the literature, discussions with transport physicians, a review of helicopter flight logs, public hearing testimony and discussions with knowledgeable individuals both in and out of the region (Nicola, 1986). Dr. Nicola's original findings were appended to the Draft EIS. Based on comments received on Dr. Nicola's original report, DCLU requested that Dr. Nicola update his examination of medical need. This updated report is appended to this Final EIS.

In Dr. Nicola's review of the literature examining the situations warranting helicopter transport, there are several cited studies that relate severity of illness to the need for transport. The majority of the documentation addresses the effectiveness of helicopters in transporting trauma patients. However, there are several studies that address children transported by helicopter.

One study revealed that, over a six and one-half year period, 81% of the patients transported by helicopter to a regional children's hospital were admitted to the ICU or were taken to surgery (overall mortality of 9%) (Ann. Emerg. Med., Feb. 1984; 13[2]:108-11). A second study demonstrated that nearly half of the 267 children arriving directly from the injury scene were delivered by helicopter (overall mortality of 6%) (J. Pediatric Surg., Feb. 1985; 20[1]:8-13).

A third study cited in Dr. Nicola's report evaluated air transport of 569 patients in a rural EMS system and, using un form guidelines, determined that helicopter transport was essential to 16.5%, helpful to 10.9%, and not a factor to the preservation of life in 54.7% of the cases. "In spite of rapid evaluation and maximal intervention, . . . 17.9% of the patients died. The group for which air transport was judged 'not a factor' (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8)" (Nicola, 1987).

A fourth study examined helicopter transports in Michigan and, using a Trauma Intervention Scoring System, determined that nearly two-thirds of the patient transports were thought to be medically necessary both at the time of the transport as well as in retrospect; the remaining third were almost

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 2

COMPARISON OF ELAPSED TIME FOR TRANSPORT OF A PATIENT
BY GROUND AMBULANCE AND BY HELICOPTER FROM ENUMCLAW TO CHILDREN'S

Mode	Transport Step	Time (in Minutes)
GROUND	. Dispatching	3
	. Private ambulance to Children's for pickup of equipment and pediatric transport team	16
	. Travel from Children's to Enumclaw Emergency Room (ER), including transfer of equipment from ambulance to Enumclaw ER	65
	. Stabilization of patient (see Note [3])	20
	. Patient loading	3
	. Return trip from Enumclaw to Children's	65
	. Patient unload and transport to Children's ER	1
	TOTAL TRANSPORT TIME:	173
	TOTAL TRANSFERS: 2 (2 hours and 53 minutes)	
HELICOPTER	. Dispatching; aircraft preparation (see Note [2])	10
	. Air travel from Harborview to Enumclaw ER, including transfer of equipment to Enumclaw ER (see Note [4])	24
	. Stabilization of patient (see Note [3])	20
	. Patient loading	3
	. Air travel from Enumclaw to Children's Helistop (see Note [5])	26
	. Patient unload and transport to Children's ER (see Note [6])	4
	TOTAL TRANSPORT TIME:	87
	TOTAL TRANSFERS: 3 (1 hour and 27 minutes)	

Transporting an infant via helicopter from Enumclaw to Children's would save approximately one hour and 26 minutes compared to ground transport.

Notes:

[1] Table updated in 1991.

[2] It is assumed that Airlift's helicopter based at Harborview is used; Airlift also has a helicopter based at Boeing Field. Dispatching time would vary between 5 and 10 minutes, assuming the medical transport team is in-house (at Harborview). In the event that a specialized transport team configuration is required and/or an isolette is needed, then the dispatching time could be as long as 27 minutes.

[3] Stabilization varies between 20 and 90 minutes, depending on the patient's condition and whether specialized care not available at the referring facility must be administered by the transport team.

[4] Travel from Harborview to Enumclaw ER includes the following: air travel from Harborview to Enumclaw helistop (15 minutes); helicopter shutdown and transfer of equipment to ambulance (3 minutes); ground travel from helistop to Enumclaw ER and transfer of equipment to ER (6 minutes).

[5] Travel from Enumclaw ER to Children's includes: ground travel from Enumclaw ER to helistop and transfer of patient to helicopter (8 minutes); air travel from helistop to Children's Helistop (18 minutes).

[6] Includes 3 minutes for patient preparation, while aircraft shuts down, and 1 minute for transfer.

Sources: Shepard Ambulance, 1987; Childs, 1987 and 1991a.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

equally divided among those patients whose flights were thought to be appropriate at the time of flight, but were later found not to be medically necessary, and those patient transports that were found to be not necessary (Annals Em. Med., Jan. 1986; 15[1]:79-80).

A fifth study examined seven hospital-based helicopter transport medical emergency services that treated and transported 1,273 blunt trauma patients. The study indicated there was a 21% reduction in expected morbidity in five of the seven services; however, there is some debate about the methodologic soundness of the study (Nicola, 1985). The authors noted that the data must be viewed with caution and further suggested that predicted reduction in total trauma-related mortality may be more directly correlated to experienced medical teams reaching a patient than to the transport of a stabilized patient by helicopter rather than by ground transport (Annals Em. Med., Sept. 1985; 14[9]:859-61).

Dr. Nicola's review of literature concluded:

> ". . . that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting helicopter versus ground ambulance transport but do not help in predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, do not clearly shed any statistical light on (DCLU's) question (of the appropriate location for siting Children's helipad)." (Nicola, 1985 and 1987)

Dr. Nicola's review of the literature and case histories of patients transported by helicopter to Children's resulted in the determination that: "In most cases, Harborview or [the University of Washington's Intramural] Field would be adequate sites for most patients transported by helicopter to Children's; however, there will be a small number of cases where the ability to land at the hospital may be life saving" (Nicola, 1987).

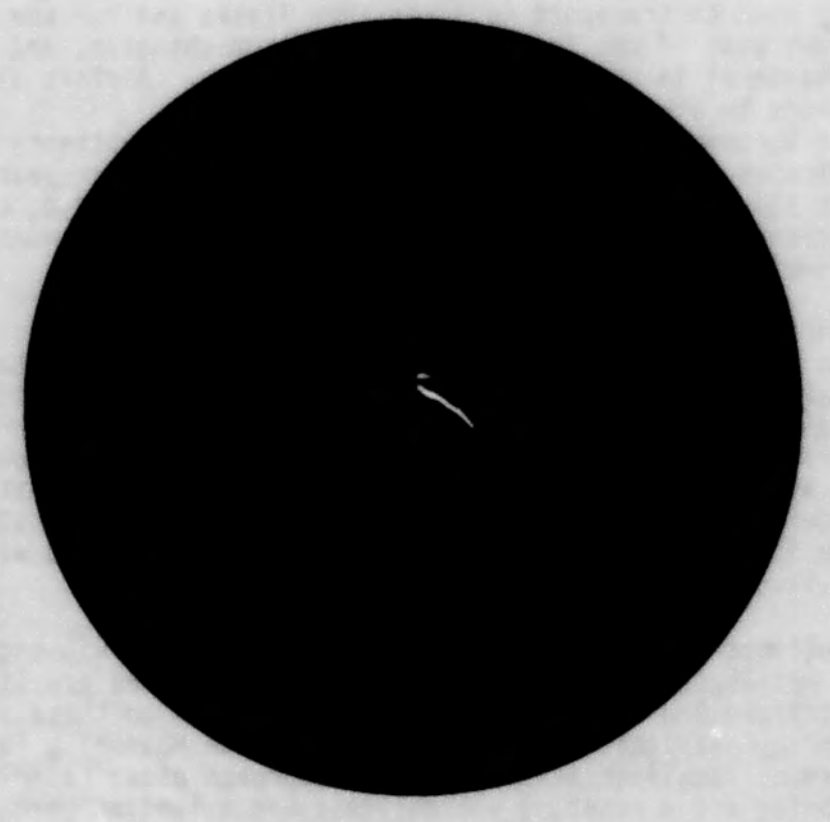
Dr. Nicola also concluded that of the 15 to 20 patients that Children's Hospital estimates would be transported to Children's by helicopter each month, an estimated four or five "may have a medical need for helicopter transport to the doors of the hospital" (Nicola, 1987). (A discussion of the number of flights is presented later in this chapter and also in more detail in Chapter III.) The outcome of these patients may be adversely affected by a ten minute delay in receiving treatment in the hospital (Nicola, 1987).

Dr. Nicola further noted that "the literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any number of transports to the doors of Children's would have to include an additional number of patients whose condition at time of referral was appropriate for air transport . . ., but who over time were determined not to have need of helicopter transport as essential. There also needs to be some flexibility for seasonal variation in disease" (Nicola, 1987).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

HELICOPTER EMERGENCY MEDICAL SERVICES
IN THE PUGET SOUND AREA

In 1990, there were three carriers that transported 227 Children's-destined patients by helicopter. As Figure 2 indicates, nearly 88% of these patients were transported by Airlift Northwest. Other carriers included Military Assistance to Safety and Traffic (MAST), and Med-Flight. Two other carriers, the Coast Guard and the Navy, did not transport any Children's-destined patients by helicopter. Only those patients transported by Airlift Northwest landed at Children's. Patients transported by other carriers landed at the Intramural Field helistop. During 1986, the percentage of total transports by Airlift Northwest was about 80%. In 1987 the percentage increased to 95%, then dropped to 86% in 1987 and 89% in 1989.



Airlift Northwest

After nearly ten years of transporting critically ill and injured children by commercial air carrier and charter flights, Children's Hospital joined with three other regional medical centers (University of Washington Medical Center, Harborview Medical Center, and Providence Medical Center) to form Airlift Northwest. Started in 1982, Airlift Northwest is a Seattle-based air ambulance service designed to support the regional medical referral system and specifically to make specialized critical care accessible to patients throughout the Pacific Northwest and Alaska. Airlift Northwest provides medically outfitted, ventilator-equipped, jet and rotary winged aircraft, with teams of medical specialists to resuscitate and provide proper care to patients who are being transported. Patients are taken to the receiving hospital designated by the referring physician. Patients requiring tertiary care generally will be transported to appropriate care facilities of one of the four members of the Airlift Northwest consortium. Airlift also will transport patients to hospitals that are not members of the consortium.

Airlift Northwest is a cooperative venture among the four public and private member institutions, with Harborview serving as the primary administrative arm of the consortium. An Inter-Hospital Agreement between the four hospitals characterizes the program and organizational structure, the roles of support personnel, the sharing of equipment, the allocation of costs and distribution of revenues, indemnification, record-keeping, services extended to non-participating hospitals, and provisions for amendment and termination of the agreement (Childs, 1986b). A copy of the contract is on file with DCLU. At one time Airlift Northwest was negotiating a contract with Multicare (Mary Bridge Children's Hospital) to become an Associate Member of Airlift Northwest. It is expected that an agreement will be signed in the near future, although Multicare's membership status is not expected to alter existing referral patterns (Childs, 1989c). In addition, St. Joseph's Hospital in Tacoma and Virginia Mason and Swedish Hospital of Seattle have become Associate Members (Childs, 1991).

Harborview, as the administrative arm of the consortium, contracts with Seattle Jet Center to provide fixed-wing aircraft, pilots, mechanics, and fuel for Airlift Northwest. Airlift Northwest's jet used for the transport of patients who are located more than 120 miles from the King County Airport (Boeing Field) base. In addition to a Citation 500 "Eagle" aircraft, Air

Figure 2 **Frequency of Use of Helicopter Services Transporting Patients to Children's Hospital in 1990.**

SHAPIRO & ASSOCIATES

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

lift dedicated a Learjet 35A in May 1990 to be used for patient transport. Other similar aircraft are available as backup, both at Seattle Jet Center and Boeing Field, as well as elsewhere within the area. These fixed-wing aircraft are used to transport patients from Alaska and for the majority of missions flown east of the Cascade Mountains in Washington, and elsewhere (Idaho and Montana) in the four-state referral area. Airlift also will accept missions to other states.

Airlift Northwest annually transports hundreds of patients by aircraft. Table 3 indicates the frequency of use in previous calendar years; projections through 1995 also are presented. From 1982 through 1990, Children's-destined patients represented an average 30.7% of the total number of Airlift's fixed-wing transports.

In order to transport patients more effectively from areas in the Puget Sound region that are not easily accessible by ground transportation and not served efficiently by fixed-wing, Airlift Northwest added a helicopter service in April 1985 consisting of one full-time (24 hours per day) helicopter. Harborview contracts with Hospital AirTransport to provide the rotary-wing aircraft, pilots, and mechanics to Airlift Northwest. A second, medically-equipped helicopter became available "half-time" in 1988; this aircraft and its transport team are based at Boeing Field and will be available fill-time (24 hours per day) in May 1991.

Both helicopters operated by Airlift Northwest are twin-engine Agusta 109 Mark II helicopters. The helicopters' specifications are listed in Table 4. Airframe and avionics systems that are used on these aircraft include: Loran C navigation computers and Distance Measuring Equipment (DME) receivers; localizer and glide slope approach aids; radar altimeter; air conditioning and a rotating searchlight; and a landing gear configuration using wheels (Childs, 1991b; Collett, 1991c).

Standard medical equipment on Airlift Northwest's helicopters includes the following:

- 2 patient stretcher rack
- Patient oxygen system with two 50 psi oxygen outlets and portable oxygen tanks
- Compressed air system with one 50 psi air outlet
- Patient suction system with continuous and intermittent regulator capabilities and portable suction unit
- 115 volt electrical system with 2 wall-mounted outlets in cabin
- Overhead lighting with high intensity halogen lamp
- Overhead IV hooks
- Double lock narcotics safe
- Lifepak 5 cardiac monitor/defibrillator
- Intravenous infusion pumps
- Doppler
- Oxygen saturation monitor
- Pacemaker generator
- Obstetric doppler
- Pediatric and adult pneumatic anti-shock trousers
- Non-invasive and invasive pressure monitor
- Advanced Cardiac Life Support (ACLS)/Advanced Trauma Life Support (ATLS) medication and supplies.

1995[c/d]	630	161	2,050	212

[a] Fixed-wing service began February 1982.

[b] Rotary service began in April 1985. The total number of patients transported to Children's includes landings outside the emergency room, and landings with [illegible]ound transports from the Intramural Field, Boeing Field, and Harborview Medical Center.

[c] "These numbers are considered 'ballpark' figures from which actual volumes may deviate significantly" (Childs, 1991).

[d] Children's-destined fixed-wing transports for 1991-1995 are based on the average percentage of Children's-destined transports relative to total transports for the years 1988-1990. The average percentage for fixed-wing was 25.56%. For 1992 and 1995 Children's-rotary transports, the projection is based on Carona's analysis (1991); estimates for 1991 and 1993-1994 were not projected.

[e] N/P: Not Projected.

Notes: The number of transports reflects the total number of patient transports and does not reflect all flight segments for the pickup of medical transport team (if necessary), the pickup and delivery of the patient, and the return of the helicopter to base.

The number of transports has been revised from the Draft EIS. In addition, all figures are now based on calendar year totals rather than fiscal year totals.

Only transports by Airlift Northwest are shown. Transports by other carriers are not included.

Sources: Actual number of transports from Childs, 1991; estimates from Childs, 1991 and Carona, 1991.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The helicopters also can carry a 160-pound isolette unit (with ventilator) for the transport of neonates. The isolette unit is powered by the aircraft electric system while in the helicopter or by its self-contained battery pack. Additional medical equipment can be carried to provide the specific support necessary to individual patients.

Possible transport team members for Airlift Northwest include approximately 40 flight physicians and nurses who are trained and experienced in a variety of specialty branches of medicine, such as pediatrics, treatment of infectious diseases, treatment of burns, and neonatology. The medical transport team for a given mission is selected based on the particular medical needs of the patient. Although formerly based at Boeing Field, one Airlift helicopter and its transport teams now is based at Harborview. A second half-time helicopter, which will become available full-time in May 1991, along with its transport teams is based at Boeing Field. A standard transport team configuration is one pediatric/neonatal-specialty flight nurse and one adult-specialty flight nurse. Transport team members on a particular mission may require the expertise of a medical professional (or team) who is not at the helicopter base but rather at another location. Currently, if the medical professional (or team) is located at Children's, then he/she/they either reports to the helicopter base or is picked up by Airlift Northwest at the University of Washington's Intramural Field. The flight nurses are medically trained in altitude and flight physiology, and stabilization and transport of critically ill and injured patients. This orientation process takes approximately three months. The medical teams also receive a two-day orientation from Airlift pilots on helicopter operations and safety procedures. Safety issues also are addressed during quarterly Airlift Northwest meetings and, if warranted, during staff meetings.

The number of missions by Airlift Northwest helicopters has exceeded Airlift Northwest's projections that were presented in the Draft EIS. For the years 1986 through 1990, the total number of transports projected in the Draft EIS were 57.0 per month (1986), 60.0 per month (1987), 61.0 per month (1988), 62.0 per month (1989), and 63.0 per month (1990). The actual number of transports per month in those years by Airlift Northwest and the percent increase over Draft EIS projections were 59.1 (4% increase), 84.4 (41% increase), 107.8 (77% increase), 112.7 (82% increase), and 123.4 (96% increase).

Of the total transports for 1986 through 1990, the Draft EIS also projected the number of transports that would be destined for Children's Hospital. These projections included: 9.7 per month (1986), 10.2 per month (1987), 10.3 per month (1988), 10.5 per month (1989), and 10.8 per month (1990). The actual number of Children's-destined patient transports per month by Airlift Northwest in the same years and the percent increase over Draft EIS projections were 10.3 (7% increase), 15.0 (47% increase), 13.5 (31% increase), 17.7 (68% increase), and 16.1 (49% increase).

Figure 3 illustrates the monthly number of Airlift Northwest helicopter transports to Children's from the time the service began in April 1985 through December 1990. Figure 3 also includes a 12-month trend line, which

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

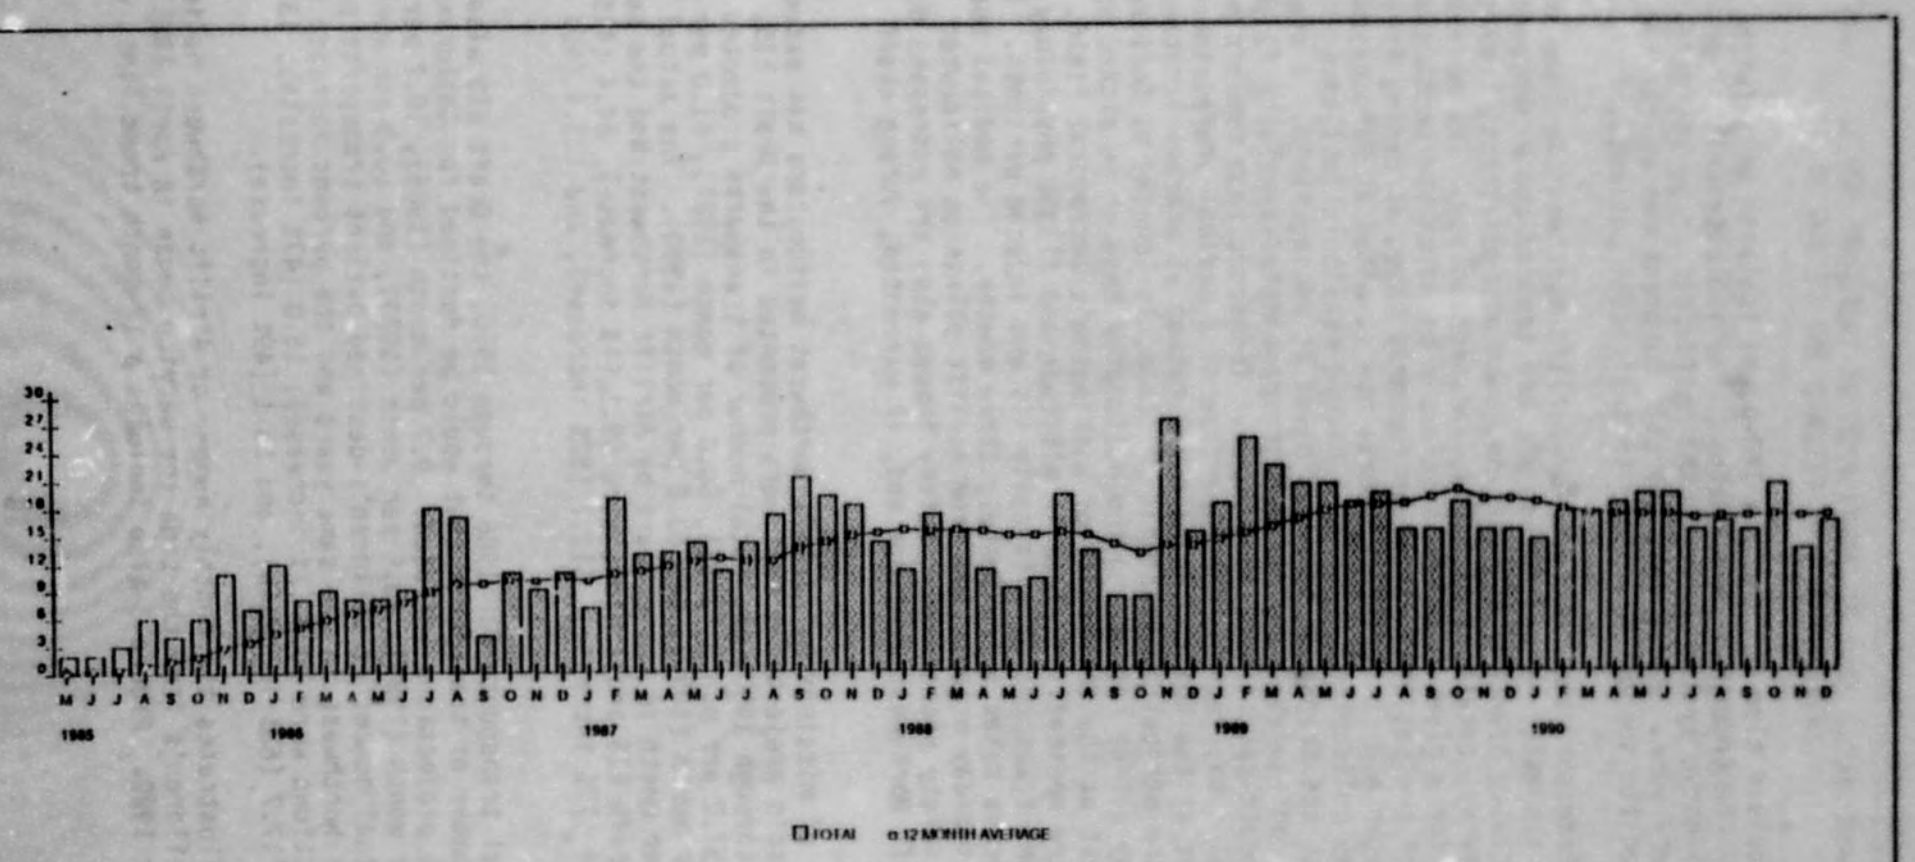

Figure 3

Airlift Northwest Transports of Patients to Children's Hospital and Medical Center (May 1985 - Dec 1990)

Source: Childs, 1987-1991.

illustrates average numbers of flights over a longer period and thereby tends to compensate for the month-to-month fluctuations. From this illustration, several trends are apparent. First, there is a considerable amount of variation in the number of transports that occur on a month-to-month basis. From the trend line it is evident that during Airlift Northwest's first 15 months of service, there was growth in the number of transports. This initial growth was followed by a trend toward a stable number of transport missions (on the average) for a period of approximately one-half year. This stable period was followed by a period of growth that was not nearly as great as the initial growth rate. Since this second period of growth ended in approximately January 1988, the average number of missions, as evidenced by the trend line, was relatively stable at 13-15 missions per month through mid-1988. This stable period was followed by a slight decline. Then, in November 1988, the greatest number of patient transports to Children's (27) to date occurred. This was followed by a third period of growth that ended in December 1989. Since then, the 12-month average number of missions has ranged between 15 and 18 Children's-destined transports per month.

Because of the increase in the actual number of missions from the Airlift Northest projected number of missions presented in the Draft EIS, Children's commissioned a study to forecast the number of missions expected for the transport of patients by Airlift Northwest helicopter to Children's. This study, which is available for review at DCLU, concluded that the projected (1995) number of patient transports exceeded Airlift Northwest's earlier forecasts; however, they confirmed the forecasted use (15-20 patient transports per month) identified by Dr. Neff, the Medical Director of Children's, in the Draft EIS. Table 3 identifies the historic and projected use of Airlift Northwest helicopters for the transport of patients to Children's.

With respect to Children's-destined patients, the Airlift Northwest helicopter transport service provides intensive care support to a number of critically ill or injured patients. Appendix D describes Airlift helicopter transports of those patients whose conditions were severe enough to warrant landing outside the emergency room at Children's through March 1989. This table identifies the date, time, origination of flight, the age and condition of patient, admitting unit, and discharge data or status. Approximately 29% of the children transported directly to Children's were newborns. Approximately 17% of the patients were more than three years old.

In September 1989, the Medical Director of Airlift Northwest approved standing orders for landing at Children's and issued a medical justification form, which the medical transport team must complete and submit to the Medical Director following a Children's landing. The form provides for the justification for landing a patient at Children's. As specified in the standing orders, a landing at Children's is authorized by the Medical Director of Airlift Northwest if during the transport of a critically ill or injured child any of the following clinical conditions occur: unstable airway; inability to ventilate/oxygenate; inability to maintain adequate cardiac output; inability to maintain adequate cerebral bloodflow; or the persistence of unstable vital signs despite heroic attempts to control them (Childs, 1990).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

MAST

Military Assistance to Safety and Traffic (MAST) is responsible for the emergency transport of all military personnel and their dependents within 100 nautical miles of Fort Lewis. Military personnel and their dependents must use MAST, unless a private airlift service is arranged and paid for by them or the military. MAST will fly civilians in areas where there are no civilian transport programs or where civilian programs do not have the appropriate equipment to respond (e.g., a mountain rescue) or when civilian programs are unavailable because they already are on a mission. MAST units accept missions according to the following criteria: (1) life and death emergencies; (2) loss of limb or eyesight; (3) undue suffering; and (4) only accessible transport due to terrain, etc. The MAST program is intended to supplement the available emergency medical services and not to compete with private enterprise.

MAST helicopters transfer patients from accident sites or hospitals to Harborview, Children's, and other hospitals in Seattle, and to Multicare (Mary Bridge Children's Hospital) and St. Joseph in Tacoma. The MAST program in Puget Sound is based at Fort Lewis where six "Huey" helicopters are located; a seventh "Huey" is located at the U.S. Army's Yakima facility.

The "Hueys" are Vietnam-era helicopters that are noisy, slow and characterized by a lot of vibration.

MAST patient transport missions may be requested by physicians, law enforcement officials, or other responsible officials. The helicopters are equipped with medical supplies and configured with the capability to transport three litter and two ambulatory patients plus a crew of four (two instrument-certified pilots, a crew chief, and a medic). The helicopter's specifications are identified in Table 4.

MAST is a training program for military medics, and as such is designed to support military capabilities and operations. In times of peace, MAST personnel develop and maintain patient care skills and are trained by both civilian and military personnel, including physicians. New personnel entering the MAST unit are graduates of the military basic training program and also of advanced training programs in which they are taught military occupational skills. Serving in the MAST program and communicating and working with civilian hospitals allows recruits to continue Emergency Medical Technician (EMT) training.

MAST flys with EMTs and without advanced life support (ALS) and, therefore, without drugs unless the condition of the patient warrants that the helicopter pick up a physician/paramedic team from either Madigan Army Medical Center, a local hospital, or an emergency rescue program. For patients being transported to Children's, MAST does not pick up the medical transport team at Children's. When a newborn is transferred by MAST to Children's, Madigan supplies the physician team (on an as-available basis) to accompany the baby. Madigan has two pediatric staff. However, as of July 1, 1986, Madigan no longer has neonatal staff.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

For those hospitals willing to supply their own physicians for MAST flights, understaffing at the referring hospital could occur during the physician's absence. Because MAST must return as quickly as possible to their base, they do not fly physicians, paramedics, or other civilian personnel back to the originating site unless that site is on the return flight path. Thus, the referring hospital will be without the services of the physicians involved in the transport until they are able to return. Other medical personnel may need to fill in for the medical team involved in the transport. On missions to Seattle hospitals, MAST will fly physicians back to Madigan, as long as they are ready to go quickly, because Madigan is on the MAST return flight path.

In 1985, Fort Lewis-based MAST (54th Medical Detachment) flew approximately 400 missions. Approximately 70% of these missions were field-site pickups (pre-hospital transfers) and the remainder were interhospital transfers. Transports were evenly divided between civilian and military personnel. In 1986, MAST transported 18 patients to Children's (Madden, 1987). It is estimated MAST transported 17 patients each year to Children's in 1987 and 1988, while in 1989 and 1990, 19 and 20 patients, respectively, were transported (Bradley, 1991). The majority of these patients were landed at the Univeristy of Washington Intramural Field and transported by ground ambulance to Children's.

MAST's civilian advisory committee, has been chaired by Bill Peterson, since April 1990.

Med-Flight

Med-Flight is a state-licensed, hospital-based airmedical transport program sponsored by St. Joseph Hospital in Bellingham. Its primary service area is the four northwest counties of the state - Whatcom, Skagit, Island and San Juan. Med-Flight's helicopter, an MBB-105, is a single-pilot aircraft with room for two litter patients, a nurse, and a medic. The specifications of the aircraft are identified in Table 4. The aircraft is equipped with life support systems, drugs, and a ventilator. In most cases, Med-Flight responds to calls initiated by physicians; however, public safety authorities, such as representatives of a fire department or a law enforcement agency, can initiate an emergency flight. In extreme situations, Med-Flight will respond to calls transmitted by marine radio. Med-Flight transported 29 patients by helicopter to Children's between 1985 and 1989: one in 1985; four in 1986; seven in 1987; nine in 1988; and eight in 1989 (Robinson, 1987 and 1991). It is estimated Med-Flight transported 6-10 patients to Children's in 1990 (Robinson, 1991). The majority of the patients flown to Children's did not land at the Children's campus.

Navy

The Navy's airmedical operations, which are based at Whidbey Island, respond to situations involving life-threatening emergencies in an area stretching from Ocean Shores, Washington, to the Canadian border, and from the inland waters of the Puget Sound to the Cascades. The Navy flies the SH 3D, the specifications of which are identified in Table 4. The SH 3D

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

carries a crew of five, including two pilots, a first crewman, a rescue swimmer, and an in-flight medical technician. The helicopter can accommodate up to three litter patients and is supplied with basic equipment, such as a cardiac monitor, suction, splints, oxygen, and a delivery pack. Most Navy operations involve evacuations from the scene of an emergency with the objective of transporting the patient to an adequate medical care facility as quickly as possible. Because Navy helicopters do not carry drugs or sophisticated medical equipment, they are primarily used for "scoop and run" missions. However, interhospital transfers from Whidbey Naval Hospital to military hospitals at Bremerton or Madigan, or to Seattle area hospitals, also are performed. The Naval Search and Rescue (SAR) unit at Whidbey Island is one of only three SAR units worldwide authorized to perform high altitude (7,000 feet or more) rescue operations. The vast majority of the Navy's patients are active or retired military personnel and their dependents; civilian rescue operations are performed only when the Navy is the last resort. The Navy transported ten patients by helicopter to Children's in 1985; eight in 1986; zero in 1987; one in 1988; one in 1989; and zero in 1990 (Harmon, 1987; Reeves, 1990; Mirabal, 1991). None of these patients landed at the Children's campus.

Coast Guard

The U.S. Coast Guard station at Port Angeles responds to life-threatening emergency medical calls from the Strait of Juan de Fuca north to the Canadian border and in Puget Sound south to Tacoma. Airmedical operations are conducted up to 50 miles off the coast. Inland operations are infrequent. The Coast Guard flies the HH 52A, a two-pilot helicopter accommodating one attendant and up to three litter patients. The specifications of this aircraft are identified in Table 4. The helicopters are supplied with basic medical equipment, including a medevac bag, oxygen, a heart monitor, and a defibrillator. This equipment is intended to stabilize a patient until he/she can be provided with care at a hospital. A hospital or physician can request Coast Guard emergency helicopter service. Calls, in which a clear threat to life exists, receive an immediate response. When there is a question as to the gravity of a person's condition, the Coast Guard duty physician makes the decision as to whether to send a helicopter to the scene. The Coast Guard does not perform interhospital transports or similar services. There is no record of Coast Guard transports to Children's (Johnson, 1990 and 1991).

A REVIEW OF THE AUTHORITY OF FEDERAL, STATE, LOCAL AND PRIVATE AGENCIES WITH RESPECT TO AIR AMBULANCE SERVICE AND HELISTOP SITING

This section highlights key jurisdictional issues with respect to emergency helicopter transport.

A review of the missions of various public and private agencies indicates that there is no single agency with jurisdiction regarding the siting of a helistop and the operation of an emergency airborne patient transport service. Rather, there are a number of agencies that have

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

specific, defined authority. These agencies include the Federal Aviation Administration, the State of Washington's Department of Health, and the Seattle City Council, which is supported by the Department of Construction and Land Use, and the Seattle-King County Department of Public Health.

In addition, there are a number of agencies and organizations that provide support of an informal and/or advisory nature. Among these agencies are the Washington Department of Transportation, the Seattle Area Hospital Council, the Washington State Medical Association, the Association of Air Medical Services, and the National Emergency Medical Services Pilots Association.

Federal Aviation Administration (FAA)

The FAA is a federal regulatory agency responsible for the promotion of aviation safety. As such, it provides programs certifying pilots and ensuring that aircraft are operated in a manner consistent with established regulations. The FAA has no regulations for the construction of private helistops. Rather, there are guidelines for their construction contained in an Advisory Circular, "Heliport Design."

Helicopter operations are subject to specific FAA regulations, including FAR Parts 61, 91, and 135. FAR Parts 61 and 91 of these regulations pertain to General Rules for Aviation and to the qualifications of pilots and airmen, and equipment specifications. FAR Part 135 deals with regulations for air taxi and commercial operations, which includes operations of helicopter ambulance services. Generally, helicopters, because of their ability to hover, change direction quickly, and change altitude with minimal horizontal movement, are given more latitude in their operations than fixed-wing aircraft.

A relevant component of these regulations is the requirement that while operating under Visual Flight Rules (VFR), a helicopter must maintain an altitude of at least 300 feet, except in the vicinity of the landing and take-off area. It also prohibits operating under VFR when visibility is less than one-half mile. Helicopter operations also are restricted by FAR Part 135 during icing conditions. Finally, during normal weather conditions, EMS pilots are limited to eight hours of flight time during a 24-hour period.

It is important to note that the FAA does give pilots discretion in deviating from the flight path. They will investigate complaints; however, the FAA generally would not take action on a complaint unless the pilot was operating in an inherently unsafe manner (Benedict, 1986). Section 135.19 of the Federal Aviation Administration Regulations relating to Air Taxi Operators and Commercial Operators states the following:

"(a) In an emergency involving the safety of persons or property, the certificate holder may deviate from the rules of this Part relating to aircraft and equipment and weather minimums to the extent required to meet that emergency."

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The FAA considers air ambulance services as "Air Taxi" services in their permitting and licensing process. This type of use has to comply with more stringent regulations for the pilots, the companies, and the aircraft than other types of helicopter uses. First, the air taxi helicopters are inspected by the FAA at least annually and often more frequently. General aviation craft are rarely inspected more than every five years. Second, air taxi pilots undergo more stringent flight testing than general aviation pilots. FAA Inspector Benedict characterized the distinction by stating, "With general aviation pilots, we have to be convinced that there is no serious doubt as to their control over the aircraft. With air taxi pilots, there can be absolutely no doubt at all as to their full control over the aircraft at all times." Air taxi pilots are also required to have more flight hours than general aviation pilots. However, Benedict's opinion is that this is more stringently enforced in insurance company standards than in the FAA regulation.

The establishment of a helistop facility requires the proponent to file with the FAA Form 7480, which identifies the proposed landing area and the approach and departure paths. The FAA reviews the form and either approves, revises, or denies the request for flight path approval. Children's submitted a Form 7480 to the FAA on February 14, 1985 with a revised submission on August 9, 1989. The request was approved with an expiration date of December 31, 1990. A request for extension was submitted November 12, 1990 and an extension to December 31, 1991 was approved November 19. 1990 (Chamberlain, 1990; Katz, 1990).

The Federal Aviation Administration has developed a design guide to help in the construction or improvement of heliports. For a private use heliport, such as Children's, the FAA criteria are guidelines rather than regulations. The design guidelines consider takeoff and landing area, touchdown pad and surrounding area, and obstructions within the aircraft approach area.

The consistency of the helistop proposed by Children's with the FAA cri[illegible]ia is discussed in more detail in Chapter IV.

[illegible] of Washington Department of Health

Health planning in the State of Washington is performed on a statewide basis. The Department of Health is the designated health planning agency for the state. Its duties include needs assessment for tertiary care services, planning, evaluation, and administration of the Certificate of Need program. The Department of Health was created in 1989, and it now administers programs formerly under the Department of Social and Health Services (DSHS) and health related programs formerly administered by the Department of Licensing (Pugh, 1991).

Certificate of Need Program

The Certificate of Need Program is a process for reviewing certain specified health care services or facilities. Air ambulance programs

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

established by hospitals were subject to review as new tertiary care services under a regulation issued by the Department of Health that was repealed in 1986. Helistops are not subject to Certificate of Need review.

Emergency Medical Services Program

The State of Washington, through RCW 18.73, amended, provides statewide emergency medical services (EMS) program planning with funding and guidelines to continue EMS systems development and improvement. Key functions of the EMS Division of the Department of Health are to prescribe minimum requirements for equipment (including ambulances) and personnel engaged in pre-hospital EMS, to establish EMS system standards, and to evaluate program development, expansion and improvements. The Washington Administrative Code (248-17-135) provides specific regulations of air ambulance services. The Washington Administrative Code (248-18-285) also provides specific regulations for the provision of emergency care services:

"Emergency care services. The hospital shall have a well defined system for providing emergency care services. The nature and scope of the hospital's emergency care services should be in accord with the community's needs and the hospital's capabilities.

(1) The hospital shall provide the following basic, outpatient emergency care services.

(a) Assessment of a person's condition to determine the nature, acuity, and severity of the person's immediate medical need.

The condition of each person, who comes or is brought to the hospital for emergency medical care, shall, upon arrival, be assessed by a registered nurse, physician, or physician's assistant for the purpose of determining the nature and urgency of the person's medical need and the timing and place of the person's care and treatment.

(b) Immediate diagnosis and treatment of any life threatening cardiac arrythmia, respiratory insufficiency or shock.

(c) Appropriate transfer or referral of a patient who needs medical care services not provided by the hospital. Prior to transfer of an emergency patient to another health care facility, the hospital shall:

(i) Perform the emergency procedures needed to minimize aggravation of the patient's condition during transport to the other health care facility; and

(ii) Ascertain that the means by which the patient is to be transported to the other health care facility are suitable for the patient."

Currently, the EMS Division has no direct authority with respect to the proposed Children's helistop, except for equipment and personnel being certified to meet State standards. The Systems Development Administrator of the EMS Division staffs the Washington State Medical Association's EMS Standards Committee's Subcommittee on Air Ambulances (see below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard of Care. According to the State of Washington, Title 7, RCW 7.70.040, hospitals must adhere to an accepted standard of care in providing their services to the public. Accordingly, the following "shall be necessary elements of proof that injury resulted from the failure of the health care provider to follow the accepted standard of care:

1) The health care provider failed to exercise that degree of care, skill, and learning expected of a reasonably prudent health care provider at that time in the profession or class to which he belongs, in the state of Washington, acting in the same or similar circumstances;

2) Such failure was a proximate cause of the injury complained of."

Children's argues that the provision of helistop facilities at the hospital to accommodate the most critically ill and injured transport patients is essential in providing an accepted standard of care to the public.

Puget Sound Health Systems Agency

The Puget Sound Health Systems Agency (PSHSA) was a non-profit, quasi-public corporation that was founded in 1976 for the purpose of assisting in implementing the (National) Health Planning and Resource Development Act. The PSHSA is no longer an active entity.

City of Seattle - Land Use

The City of Seattle guides land use through its comprehensive plan and land use policies, and regulates land use through its Land Use Code. As a major medical center, Children's is designated a major institution and, as such, is subject to Seattle s major institutions policies.

The original major institutions policies were adopted on July 6, 1981 (Resolution 26579; Seattle Municipal Code (SMC) 23.16.010) and the Land Use Code on April 25, 1983 (Ordinance 111100 and 111101; SMC 23.48). Within major institutions' boundaries, helistops are allowed as a Council conditional use, if the Council finds that (SMC 23.48.005):

"a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property;
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies."

Further, this section of the Land Use Code states: "The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas."

As new development occurred and master plans were prepared under the original major institutions policies (1981) and Land Use Code (1983),

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

concerns with the implementation of the policies and code were raised by the major institutions and citizen groups in neighboring communities. In response to these concerns, the major institutions policies were revised in Resolution 28081 adopted March 26, 1990, as amended by Resolution 28191 adopted June 25, 1990.

Application for construction of the Children's helistop was filed with the Department of Construction and Land Use and the Draft EIS on the Children's helistop proposal was issued prior to adoption of the revised major institutions policies.

This EIS is designed to fulfill the SEPA requirements of the Conditional Use Permit. With respect to the specific findings of medical need necessary to secure a conditional use permit, DCLU requested that Dr. Nicola, the former Director of Seattle-King County Department of Public Health, assist DCLU in the medical need determination. (For the convenience of the reader, Dr. Nicola's updated report is appended to this Final EIS.) Although a land use discussion was not required to be incorporated into the EIS, the subject was covered in the Draft EIS and is addressed in this Final EIS, as well as assembled into responses to comments on the Draft EIS that are presented in Chapter V of this Final EIS. The other conditional use issues, including restricted use, sensitive siting and alternative locations also are addressed in this EIS.

Seattle-King County Department of Public Health

As a joint City/County agency, the Seattle-King County Department of Public Health serves all residents of King County. The Department operates health centers throughout the County, numerous satellite clinics in schools and community centers, a regional center for tuberculosis control, and a sexually transmitted disease control program and clinic located at Harborview Medical Center. The agency provides health services for the jail, vital statistics information, and operates the public health laboratory.

The Department includes the Divisions of Alcoholism and Substance Abuse, Emergency Medical Services, and the Medical Examiner. The Division of Emergency Medical Services plans, develops and administers paramedic services outside Seattle, and assists fire departments to improve emergency medical services.

The Department also has provided expertise to the City of Seattle's Department of Construction and Land Use regarding the issues of medical need and noise and vibration associated with siting and operating a helistop at Children's.

State of Washington Department of Transportation

The Washington Department of Transportation has the responsibility of providing statewide transportation planning services, enhancing safety and funding transportation improvements. The Division of Aeronautics deals specifically with air transportation, by participating in statewide trans-

NOTICE: THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IS DUE TO THE QUALITY OF THE DOCUMENT.

portation planning, assisting in the enforcement of FAA Regulations, investigating aircraft accidents, providing search and rescue support for missing General Aviation aircraft and providing funding for public aviation facilities. The Department does not have specific authority with respect to the siting of a helistop at Children's nor the operation of the helicopter service (Hamilton, 1986).

Association of Air Medical Services and National Emergency Medical Services Pilots Association

The Association of Air Medical Services (AAMS), formerly the American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS), and the National Emergency Medical Services Pilots Association (NEMSPA) are voluntary organizations that were established within the airmedical community to provide organization and guidance to the industry. These organizations do not have legal authority to impose regulations except to the extent that hospitals or helicopter operators comply with their guidelines in order to be accepted as members.

As a result of the relatively high number of EMS helicopter accidents in 1985, AAMS and NEMSPA leaders met in February 1986 and agreed that uniform guidelines and standards were needed in the industry.

AAMS adopted both fixed-wing and helicopter standards in January 1987. The ten rotorcraft standards were developed as guidelines, and are intended to assure the quality of patient care and the safety of both crew and patients. These standards address aircraft; medical flight crew capabilities; staffing; training; mission preparedness; capabilities of receiving hospitals; program review; integration of programs with existing EMS systems and interhospital transfer networks; communications; and education. The guidelines and the consistency of the Airlift Northwest program with these guidelines also is discussed in Appendix B of this Final EIS. Airlift Northwest joined AAMS in September 1990 The Seattle Jet Center and Hospital AirTransport are associate members of AAMS.

In June 1987, NEMSPA finalized its safety guidelines for pilots, aircraft, and operations of EMS helicopters. The guidelines address minimum experience and qualifications of pilots; minimum initial pilot training; minimum recurrent pilot training; aircraft type and equipment; minimum staffing requirements; duty time limitations; Visual Flight Rules Weather Minimums; medical staffing on board the aircraft; and safety programs for the member programs. The consistency of the Airlift Northwest program with these guidelines are identified in Appendix B of this Final EIS.

In addition to AAMS and NEMSPA there are other industry organizations that have become active in the promotion of aeromedical safety. These organizations include the Helicopter Association International, the National Flight Nurses Association, and National Flight Paramedics Association.

Washington State Medical Association

The Washington State Medical Association is a trade organization that represents medical doctors in the state. Physician members voluntarily

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

serve on committees that include, among others, the EMS Standards Committee, which has a subcommittee that specifically addresses issues involving air ambulance services.

The EMS Standards Committee's Subcommittee on Air Ambulance Services has submitted to the Department of Health a set of air ambulance protocols to be used by the air ambulances that operate in the state. A set of these protocols has been appended to Dr. Nicola's updated report, which appears in Appendix A of this Final EIS. The protocols set forth policies that include criteria for use of pre-hospital air ambulance services; criteria for non-use of air ambulances; and present examples of patient medical conditions that would warrant the use of an air ambulance. The protocols also address the use of air ambulances for interhospital transports, including the following general criteria:

1. Requirement for critical care en route that is not otherwise available.

2. Time critical injury or illness.

3. Need to minimize the patient's time out of the hospital.

4. Alternate modes of travel are unavailable or undesirable.

As in the case of pre-hospital transfer protocols, the criteria for interhospital transports identifies those special patient medical conditions that warrant the use of an air ambulance.

In concert with the development of these protocols, the Department of Health has drafted proposed amendments to the sections of the Washington Administrative Code (248-17-020,135,136,137,138) that address the licensing, personnel and equipment requirements, and selection and use of an air ambulance service. According to Howard Farley of the Department of Health, the amendments are in draft form, and public hearings will be scheduled after the parties reach a consensus on the proposed language (Farley, 1990).

Washington State Hospital Association

The Washington State Hospital Association is an independent trade organization that represents approximately 90% of the hospitals in the state. The Association's activities include advocacy, education and lobbying of both the Legislature as well as regulatory agencies. The Association is not directly involved in the issue of emergency airborne transport services (Mero, 1986).

Seattle Area Hospital Council

The Seattle Area Hospital Council is a trade organization that represents the major hospitals in King County and southern Snohomish County. The purpose of the Council is to provide a forum for issue identification, discussion, and collective action that is responsive to the needs expressed by member hospitals in their continued efforts to discharge their individual and collective responsibilities. The Council is not directly involved in the issue of emergency airborne transport services (Nell, 1986).

Chapter III

Description of the Proposed Action and Alternatives

III. DESCRIPTIONS OF THE PROPOSED ACTION AND ALTERNATIVES

This chapter states the sponsor's objectives, describes how alternative helistop locations were identified and screened, characterizes the process used to project the estimated number of patients transported by helicopter to Children's and the associated number of missions, and provides a detailed description of the Proposed Action and alternatives, including descriptions of the helistop and flight paths.

One alternative that was evaluated in the Draft EIS, the University of Washington Medical Center Helistop Alternative, is not being considered by the University of Washington at this time. However, to retain consistency with the content of the Draft EIS, this alternative has been included in this document. Where appropriate, the status of this alternative is noted in the text.

This chapter also describes an alternative that was not described in the Draft EIS. This new alternative, or Preferred Alternative, is characterized by the most critical patients landing at the Kitchen Garden helistop at Children's campus. All other (less critical) patients that are being transported by helicopter to Children's would land either at Harborview and/or the University of Washington's Intramural Field Helistop, if permitted, and would then be taken to Children's via ambulance.

Because the Preferred Alternative incorporates components of other alternatives that were analyzed in the Draft EIS, it was determined by DCLU that a Supplemental Draft EIS would not be necessary. Chapter IV of this Final EIS does incorporate an assessment of the impacts associated with the Proposed Action, the Preferred Alternative, as well as other alternatives. Chapter V, which contains responses to comments received or the Draft EIS, also addresses the Preferred Alternative, where appropriate.

SPONSOR'S OBJECTIVES FOR THE PROPOSED ACTION

The Proposed Action is the construction of a helistop at the Kitchen Garden site outside the Emergency Room of Children's Hospital and Medical Center. The helistop would be used as a landing area for helicopters transporting critically ill and injured patients to Children's. The sponsor's objectives for the Proposed Action are:

- to make specialized medical expertise available to critically ill and injured patients in the least amount of time;
- to minimize transport time from place of patient pickup to the Emergency Room entrance of Children's; and
- to minimize the number of patient transfers that could result in patient destabilization.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

OVERVIEW AND LOCATION

The 23-acre Children's Hospital and Medical Center campus is located at 4800 Sand Point Way N.E., Seattle, Washington, along a portion of the western edge of the Laurelhurst neighborhood. The campus is less than one mile east of the University of Washington campus (see Figure 4, Vicinity Map).

The campus boundary on the northwest is Sand Point Way N.E. to and along N.E. 50th Street, south along 44th Avenue N.E. to and along N.E. 47th Street, to and south along 45th Avenue N.E., to and along N.E. 45th Street to approximately 42nd Avenue N.E., if extended, and north to Sand Point Way N.E. (see Figure 5, Campus Map).

The Children's campus site generally slopes downward to the west and south. It is landscaped and provides a sense of open space to the area. Principal access to the campus is via a signalized intersection with Sand Point Way N.E. The principal drive - Penny Drive - winds generally west to east and provides access to the various entrances to the medical center building and parking areas. The principal structural feature of the hillside campus is the medical center building, which contains the medical facilities and equipment. A parking garage contains four levels of parking: three for staff, and one for patients and visitors. There are two primary paved surface parking areas and several smaller parking areas that provide additional parking for visitors, service vehicles and medical staff.

The southern edge of the proposed helistop pad would be located approximately 142 feet north of the existing Emergency Room entrance doors and approximately 144 feet northwest of the top of the parapet of the Medical Pavilion. North of the site is Penny Drive and the parking structure; east of the site is the driveway to the Emergency Room entrance and parking lot; west of the site is the service driveway that provides access to the loading dock. A brick, natural gas meter house is located approximately 38 feet northwest of the northern edge of the proposed pad (see Figure 6).

The surrounding neighborhood consists primarily of single-family residences, with densities ranging from one dwelling unit per 9,600 square feet (primarily along the Lake Washington shoreline) to the maximum single-family density of one unit per 5,000 square feet to the northwest of Children's campus. South and east of the hospital there is a large area zoned for one unit per 7,200 square feet, with a number of smaller, non-conforming lots in this area. One block east of the campus is the Laurelhurst Elementary School, with Laurelhurst Playfield. A half block southeast of the Children's campus is the Battelle Memorial Institute research campus. Four blocks east of the Children's campus is the Villa Academy; with St. Bridget's Church located north of N.E. 50th Street at 49th Avenue N.E., to the south of the school.

There are several multifamily residential and commercial uses concentrated along both sides of Sand Point Way N.E. and the Burke-Gilman Trail. Multifamily densities range from medium density, Lowrise 3 developments to lower density, Lowrise 2 developments. In the area near the

Children's Helistop Site

The helistop would be floodlit by groundlights located at helipad corners. In addition there are ten ground lights around the helipad perimeter. There is one fire extinguisher located on either side of the gate.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

hospital, there are multifamily developments immediately to the north and west of the hospital. Laurelon Terrace, with predominantly elderly occupants, is adjacent to the campus on the west. To the northwest of the hospital, there is a Planned Unit Development that includes a mixture of single-family, multifamily, and open space uses. Commercial uses in the area include an Albertson's Supermarket north of the Burke-Gilman Trail at 40th Avenue N.E., a medical/dental office building and a bank/office building at Sand Point Way N.E. and 40th Avenue N.E., and several small retail shops along the south side of Sand Point Way N.E. and N.E. 45th Street.

Open space in the area is provided by two playgrounds, a cemetery, and the Burke-Gilman Trail, a pedestrian and bicycle path that runs approximately parallel to Sand Point Way N.E. through most of the project area. The Laurelhurst Playground is located immediately to the southeast of the southeast corner of the Children's campus. The Burke-Gilman Trail passes within a quarter mile of the hospital across Sand Point Way N.E. Additional open space is provided by schoolyards, churchyards, and the Battelle campus.

The Proposed Action is the construction of a secured, concrete helistop outside the Emergency Room entrance of Children's. At the time of the issuance of the Draft EIS, an average of approximately ten patients were being transported by Airlift Northwest helicopter to Children's each month. Over time, these numbers have increased (as illustrated in Figure 3), such that in 1990 there was an average of 16 patient transports per month by Airlift Northwest. In 1990 MAST and Med-Flight transported an (maximum estimated) average of 2.5 patients/month to Children's. For the purpose of this Final EIS, the number of transports is expected to remain constant at 15-21 patients per month through 1995 (Neff, 1989). Nearly all of the patients would be transported by Airlift Northwest helicopter.

The decision to transport a patient to a receiving hospital is the decision of the referring physician who is in consultation with the receiving hospital. The determination of the most appropriate mode of travel for the critically ill or injured patient - whether by ground ambulance or by helicopter - also is the responsibility of the referring physician. In order to provide assistance to the physician in making an appropriate selection of mode of travel, a set of guidelines has been drafted by the Washington State Medical Association. These guidelines are briefly discussed in the previous chapter of this document.

It is important to note that Airlift Northwest does not assist the referring physician in making the decision of transport mode. Once a decision has been made by the referring physician to transport the patient by Airlift's helicopter, the aircraft's pilot has the ultimate authority for the mission. It is the pilot's responsibility to ensure the safety of the crew, patient(s), public, and aircraft. The pilot makes the final determination of whether the helicopter will fly or not fly on a particular mission.

In general, most of the transport missions for Children's-destined patients would involve three flight segments. This description differs from that contained in the Draft EIS, which indicated a total of four flight

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

segments would be involved. With the basing of most transport teams at Harborview and Boeing Field, it usually would not be necessary to pick up the medical crew at Children's or at the Intramural Field. The first segment would be from the helicopter base (Harborview or Boeing Field) to the location of the patient, the second would be the transport segment to Children's with the patient; and the final segment would be the return to the helicopter base for dispatch to the next mission. Thus, one flight segment described in the Draft EIS would be eliminated.

A patient transport mission, however, still could involve four flight segments: departure from the helicopter base to Children's helistop or the Intramural Field for pickup of a specialized medical crew; departure and flight to the location of the patient; return flight to Children's helistop with patient; and departure for return to base or the next mission. Based on historical data on Airlift Northwest flights of Children's-destined patients, it is estimated that approximately 1% to 3% of the missions would require the pickup of the medical transport crew at the Children's Helistop or the Intramural Field (Childs, 1987). It also should be noted that during inclement weather conditions requiring pilots to fly under instrument flight rules helicopters would land at Boeing Field, since Children's does not support radar-controlled landings.

ALTERNATIVE HELISTOP LOCATIONS

Alternative helistop locations were considered by Children's during the development of the concept of siting the helistop adjacent to the Emergency Room entrance with convenient access to the Emergency Room, operating and recovery rooms, and intensive care units (ICUs).

Campus Alternatives

Landing helicopters on the roof of the medical center was judged unacceptable because major structural changes would be needed in order to support the weight of the helicopter and extend the elevator (Donelson, 1986). This alternative would be at least twice as expensive as the proposed location, depending upon the extent of structural modification that would be necessary (Donelson, 1986). Moreover, it would be necessary to transport the patient via a circuitous route through the medical center to the Emergency Room, operating room, or ICUs.

Landing helicopters on the roof of the parking garage was judged unacceptable because of the need for patient transfer to an ambulance and attendant delays in transit of the patients to the Emergency Room, operating rooms, and ICUs. The flight path would take the helicopter over residences to the north of Sand Point Way N.E. and N.E. 50th Street.

Landing helicopters outside the east entrance to the medical center was judged unacceptable because of the need to transport the patient via ambulance to the Emergency Room entrance with attendant delays or, alternatively, the need to transport the patient via a circuitous route through the medical center - including a change of floors. The helicopter flight path also would be closer to residences along 45th Avenue N.E., as well as to the nearby elementary school.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Landing helicopters outside the south entrance to the medical center (illustrated as the core building in Figure 5) was judged unacceptable because of the need to transport the patient via ambulance to the Emergency Room entrance with attendant delays or, alternatively, to transport the patient via a circuitous route through the medical center including a change of floors. The helicopter approach also is more obstructed because of the layout of the building and surrounding tall trees, and would result in the helicopter flying closer to residences along N.E. 45th Street.

Landing helicopters outside the administrative wing entrance (the northwest corner of the medical center) was judged unacceptable because of the need to transfer the patient to an ambulance and transport the patient to the Emergency Room with attendant delays or, alternatively, to transport the patient via a circuitous route through the medical center - including a change of floors. The helicopter flight path also would be closer to Laurelon Terrace.

Landing helicopters on one of the surface parking lots (see Figure 5) was judged unacceptable because of the need to transfer the patient to an ambulance for transport to the Emergency Room entrance with attendant delays. Moreover, the helistop and helicopter flight paths would be closer to residences to the east, particularly along 44th Avenue N.E. and 45th Avenue N.E.

From a safety perspective, flat surfaces, such as rooftops, generally present the least accident risk during landing due to an absence of vertical obstructions. Rooftops, however, can be less safe in the event of engine failure due to the structure's height and lack of a uniform surface on which to make an emergency landing. The other Campus Alternatives discussed above are all considered to be somewhat less safe than the Proposed Action due to their proximities to obstructions, their locations in topographically depressed areas, or their proximities to residential or educational land uses (Hill, 1986). The significance of the safety distinctions are believed by the Airlift Northwest pilots to be negligible (Hill, 1986).

Off-Campus Alternatives

The principal off-campus helistop locations that have been suggested include sharing University of Washington's Intramural Field helistop, sharing a rooftop helistop with University of Washington Medical Center, using the helistop at Sand Point Naval Air Station, sharing Harborview's helistop, sharing radio/television station helistops, and landing patients at Boeing Field. As part of the EIS scoping process, three off-campus alternatives were selected for detailed analysis: the helistop at the Intramural Field; a shared rooftop helistop with the University of Washington Medical Center (an alternative that is not under consideration by the University at this time); and use of either Boeing Field or Harborview (the No Action Alternative).

The Intramural Field Helistop Alternative involves the use of an existing landing area at the Intramural Field. Improvements may be made at this location in the future. In 1988, a total of 206 medical helicopter landings occurred at the Intramural Field, of which 124 (about 10 per month)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

were Children's-destined patients (University of Washington, 1990). In 1989, a total of 249 landings occurred, of which 178 (about 15 per month) were Children's-destined patients (University of Washington, 1990). In 1995 an estimated average of 15 to 21 Children's-destined patients would be brought to the Intramural Field each month plus patients being transported to the University Medical Center. Each patient transport mission normally would involve three flight segments - similar to the Proposed Action - plus transfer of the patient into an ambulance and ground transport of the patient to Children's. (An additional segment could occur if the medical transport team is picked up at Children's or the Intramural Field prior to departing to the location of the patient.)

The University of Washington Medical Center has, in the past, considered using a helistop that has been constructed on the roof of its expansion wing; however, this option is not currently under consideration. Under this alternative, an estimated average of 15 to 21 Children's-destined, critically ill or injured patients would be brought to the University of Washington Medical Center helistop each month in 1995; additional flights would involve University of Washington Medical Center-destined patients. (Refer to the discussion of the Intramural Field for number of Children's-destined patients landed in 1988 and 1989.) Each patient transport would involve three flight segments - similar to the Proposed Action and Intramural Field Alternative - plus roof-to-ground transfer and transfer of the patient into an ambulance for transport to Children's. (An additional segment could occur if the medical transport team is picked up at Children's or the Intramural Field prior to departing to the location of the patient.)

With the objectives of minimizing transfers and transport time, the Proposed Action location was judged by the project sponsor to be the most suitable from a medical perspective for transporting critically ill or injured patients. Moreover, the proposed Kitchen Garden Helistop is located near the central portion of the campus: such a location minimizes off-site noise impacts without sacrificing patient care.

THE PROPOSED ACTION

Demolition, Site Development, and Improvements

The proposed helistop site is located at a landscaped site called the "Kitchen Garden." Portions of the existing garden would be relocated to a new site(s) on campus. Three taller trees that existed at the time of the preparation of the Draft EIS have been removed. Several other trees on the north side of Penny Drive also would be removed.

Following clearing, a new concrete retaining wall would be constructed along the western edge of the site. Approximately 500 cubic yards of earth would be imported to the helistop site and used as fill to raise and level the site to the final design elevations. The fill would be removed from other (as yet unspecified) locations on Children's campus.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The helistop would consist of a concrete pad and a grass unobstructed area (see Figure 6). The concrete pad would be a 40 by 40 foot concrete area that, in turn, would be within a 48-foot radius, circular unobstructed area of grass. The concrete pad would provide stable support for the helicopter. The center of the concrete pad would be marked with a white cross, with arms 30 feet long and 10 feet wide. The center of the cross would be marked with a 6x10-foot, red "H" that would designate the helistop from the air. A 30-inch tall fence with locked gate would surround the circular area. An approximately 45-foot-long concrete walk would link the helipad to the existing sidewalk.

The helistop would require the construction of approximately 2,050 square feet of concrete (impervious) surface for the helipad and walkway. Fifty seven hundred square feet would be sodded and approximately 2,500 square feet, according to the Landscape Plan, would be landscaped in juniper, azalea, and other low shrubbery along the outside of the fence. Other existing landscaping would be retained.

The helistop would be equipped with ground lights that would be turned on for nighttime landings. These lights would meet minimum FAA standards and would not have any off-site spillage because of the absence of horizontal throw. In effect these pilot-preferred lights "glow," rather than emanate direct rays of light (Hill, 1986). The shrubbery and positions of the medical center building and parking garage would reduce the potential for any helistop safety lighting to create light and glare impacts off-site. For flight safety, obstruction lights would be placed on the main hospital building, Medical Pavilion as well as on the parking garage. In addition a high intensity strobe light, which would flash 20 times per minute and be visible from 5-10 miles, would be turned on by the ground crew when a hospital-destined helicopter was approaching. The helistop also would have a glide slope indicator light. These special lights appear green to incoming pilots when the aircraft is approaching at a pre-designated, safe angle. The light appears yellow for aircraft that are too high and red if too low. Wind socks that indicate wind direction and speed also would be placed on the helistop and on the medical center rooftop.

Signs warning motorists of the possibility of helicopter operations would be posted on Penny Drive and, if necessary, on Sand Point Way N.E. No aviation fuel would be stored on campus.

Number of Transports and Flights

The worst-case estimate of patient transport missions presented in the Draft EIS was derived by Children's medical and planning staff by assuming that the Airlift Northwest patient transports by helicopter would increase at the rate of 10% per year from 1987 through 1990. As mentioned in the previous chapter, there has been a change in the number of Children's-destined patient transports by Airlift Northwest. In order to determine whether the increased number of transports to Children's represented a maturation of the Airlift Northwest program or some other explanation, a study was commissioned. The purpose of the study, which is available for review at DCLU, is to forecast the expected number of missions associated with the transport of patients by Airlift Northwest helicopter to Children's.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The forecast methodology examined the geographic service area of Airlift Northwest's pediatric transport program, determined the historic number of the service's pediatric flights, and based on population data obtained from the State, projected the annual number of patients that would be transported to Children's through 1995 (Carona, 1991). The forecast methodology applied a use-rate based projection method (Carona, 1991). The 1987 Washington State Health Plan adopts use-rate based methods for the projection of most hospital and acute medical services (Carona, 1989 and 1991).

This forecast methodology projected that in 1991 there would be 201 patients transported by Airlift Northwest helicopter to Children's. As presented in Table 3 of the previous chapter the number of missions will increase to 212 in 1995. When MAST and Med-Flight transports are included, these numbers are slightly greater (15-21) than the range of transports (15 to 20 patients per month in 1990) that was projected by Dr. Neff, the Medical Director of Children's, as presented in the Draft EIS. However, it should be noted that the Neff projection is for 1990, whereas the Carona projection is for 1995.

Children's estimates that in 1995 an average of 15 to 21 critically ill or injured patients could be transported to the medical center by helicopter each month (Neff, 1989). The majority of the patients would be transported by Airlift Northwest.

There may be situations that would result in an increase or decrease to this historic use-rate based projection. These additional patient transports reflect several factors that are difficult to predict with any reliability but that, nevertheless, could influence the number of patient transports: advances in medical technologies; growth in population of children; inability to predict disasters - such as toxic spills, nuclear facility accidents, earthquakes; increased poverty that results in the increase in premature births (Neff, 1986); changes in the hospital referral patterns or the capabilities of Children's or of other community hospitals (Nicola, 1986b); or addition of competing helicopter service (Nicola, 1987). It is conceivable that the number of patients warranting helicopter transport to Children's in 1995 could exceed the 15-21 per month average that has been projected. The number of transports also could decrease under some of these scenarios.

Children's is obligated by state requirements (WAC 248-18-285 [see Chapter II]) to treat all emergency patients brought to the hospital; the hospital construes this regulation to mean that no helicopter transporting an emergency patient can be refused permission to land at the proposed helistop, if constructed, or elsewhere on the campus grounds. The City contends that if the City of Seattle land use laws prohibit landings of helicopters on Children's campus, then the landings could only occur at authorized locations.

The reader should note that at the time of the preparation of the Draft EIS, the Airlift Northwest helicopter and pilots were based at Boeing Field. At that time medical transport teams also were based at Boeing Field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

However, for some transports, the patient's condition required specialty lead physicians and flight nurses who ordinarily were based at Harborview. (There are some medical transport team members based at Children's. The majority of the patients being transported at this time do not require their expertise.) In order to increase dispatch efficiency, Airlift began to base the helicopter operations out of Harborview in the spring of 1987. A second, medically equipped helicopter became available "half-time" (12 hours per day) in 1988; this aircraft and its transport team are based at Boeing Field and will be available full-time in May 1991. Thus, Airlift will have full-time helicopters based at both Harborview and Boeing Field.

As previously noted, each Airlift Northwest patient transport mission ordinarily involves three separate flight segments: one for the pickup of the patient, the second for delivering the patient, and a third for return to base or next mission. Four flight segments could occur if the medical transport team would have to be picked up at Children's or the Intramural Field. Thus, if there were 20 patient transports per month, there could be a maximum of 60 to 80 flight segments per month (with the lower estimate reflecting no separate flight to pick up the medical transport team and the higher total corresponding to pickup of the medical crew at Children's or the Intramural Field). During inclement weather requiring pilots to fly under instrument flight rules, helicopters would land at Boeing Field and patients would be transported to Children's by ground ambulance.

Based on data from existing flights (Appendix D), it is estimated that 18% of the flights would occur in nighttime hours (10:00 p.m. to 7:00 a.m.). For the purpose of these environmental analyses, it is assumed that 25% of the transports would occur in nighttime hours.

As a policy, Children's would discourage MAST transports from landing at the Children's campus helistop. Any MAST flights to Children's, however, would normally involve two or three flight segments, as there would be no pickup of the pediatric medical crew at Children's.

If the pending helistop application is approved, Children's representatives would meet with representatives of Med-Flight and other air ambulance services to establish procedures for accepting landings and the transported patients.

Helicopter Operations

The process of transporting a patient to Children's may be considered by separating the mission into a series of discrete steps. The following description is intended to provide the reader with an overview of the process and does not constitute the full array of operational or medical procedures that would be involved in a patient transport by helicopter.

There is a difference in the helicopter transport process depending on whether the patient is in the field, or is the subject of either a pre-arranged or unscheduled interhospital transport. There are also distinctions between private air ambulance services and the military (MAST, Navy, and Coast Guard) services. Interhospital transports by Airlift are

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

expected to constitute nearly all of the helicopter transports of patients to Children's. For illustrative purposes, an unscheduled Airlift Northwest interhospital transport to Children's is profiled. It is assumed in the following example that Airlift's full-time Agusta 109 helicopter, which is based at Harborview, is used. Airlift also has a part-time (12 hours per day) Agusta based at Boeing Field, along with the flight crew; this helicopter will be available full-time in May 1991.

- The system is activated by a referring physician or designee contacting Airlift Northwest's Medical Director or representative.

- The patient s medical profile is described and the attending physician, referral hospital, and landing area are identified.

- The Airlift Northwest Medical Director and/or representative provides the referring physician with an estimated time of arrival (ETA).

- The on-duty helicopter pilot is alerted, as are the on-duty flight nurses, which would be based at Harborview in this example. The helicopter takes off from its Harborview base approximately 5-10 minutes after receiving the initial request from the referring physician. If an isolette is required on the mission, the time before takeoff will be longer and could be as long as 27 minutes, if a transport team specialist is not in-house.

- The helicopter arrives at the referring hospital's designated landing area or helistop. The patient may be at the landing area and prepared for flight or the medical crew may have to go to and prepare the patient by administering specialized care that may not be available at the referring facility. Elapsed ground time could be as little as ten minutes for the former or one and one-half hours for the latter. Transfer by ground ambulance from the referring hospital to the helicopter may or may not be involved.

- The medical crew monitors the patient en route and administers medication and/or other care as needed. En route the helicopter contacts Children's and relays medical condition and needs, and flight information (e.g., ETA).

- Prior to ETA, Children's secures the area surrounding the helistop and stops traffic on adjacent Penny Drive.

- The helicopter arrives at the helistop and shuts down the engines. The patient is unloaded and wheeled to the Emergency Room door, approximately 142 feet away. After retrieval of any equipment and communication of essential medical information from the medical transport team to ER staff, the pilot restarts the engines and after an estimated total ground time of approximately 20-30 minutes (or longer, if the isolette is being retrieved) returns to Harborview.

Those missions in which a patient is first transported to Boeing Field by fixed-wing and then transported to Children's by helicopter (approxi-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

mately 1-2% of the helicopter transports to Children's) already have a pediatric medical crew in attendance. Consequently, there usually would be no need to pick up a specialty transport crew at Harborview or Children's. However, there would be three flight segments if the aircraft used is based at Harborview or two flight segments if the helicopter is based at Boeing Field.

Flight Path - General

Flight path information in this chapter is based on the approaches and departures that have been designed by Airlift Northwest pilots. Final approach and departure routes would require FAA approval pursuant to Airspace Review; however, the FAA allows the pilot to deviate from designated flight paths (Benedict, 1986). In selecting flight paths, the Airlift Northwest helicopter pilots comply with FAA regulations and are sensitive to safety, to reducing patient transport time, and to noise considerations. In general, when and where possible, the pilots avoid flying over hills and over or near densely populated areas (Hill, 1986). The minimum altitudes, specified in Airlift Northwest's operations manual, is 500 feet over congested areas and 800 feet at night, except for takeoff and landing (Childs, 1989).

For a helistop at Children's, the Intramural Field, or University of Washington Medical Center, the flight paths would be comparable for flying into the vicinity. Only the individual approach and departure routes would be different.

In general, aircraft from the north or south would follow the I-5 corridor. When coming from the south, aircraft would turn toward Children's once past Capitol Hill. When headed from the north, aircraft would turn toward Children's when approximately even with N.E. 45th Street. Aircraft from the east generally would pass south of Webster Point and north of Madison Park, before turning north over Union Bay and entering the final approach. Aircraft from the west would generally pass between Magnolia/Queen Anne and Ballard/Fremont and turn toward Children's once over Portage Bay (see Figure 7, Generalized Flight Paths).

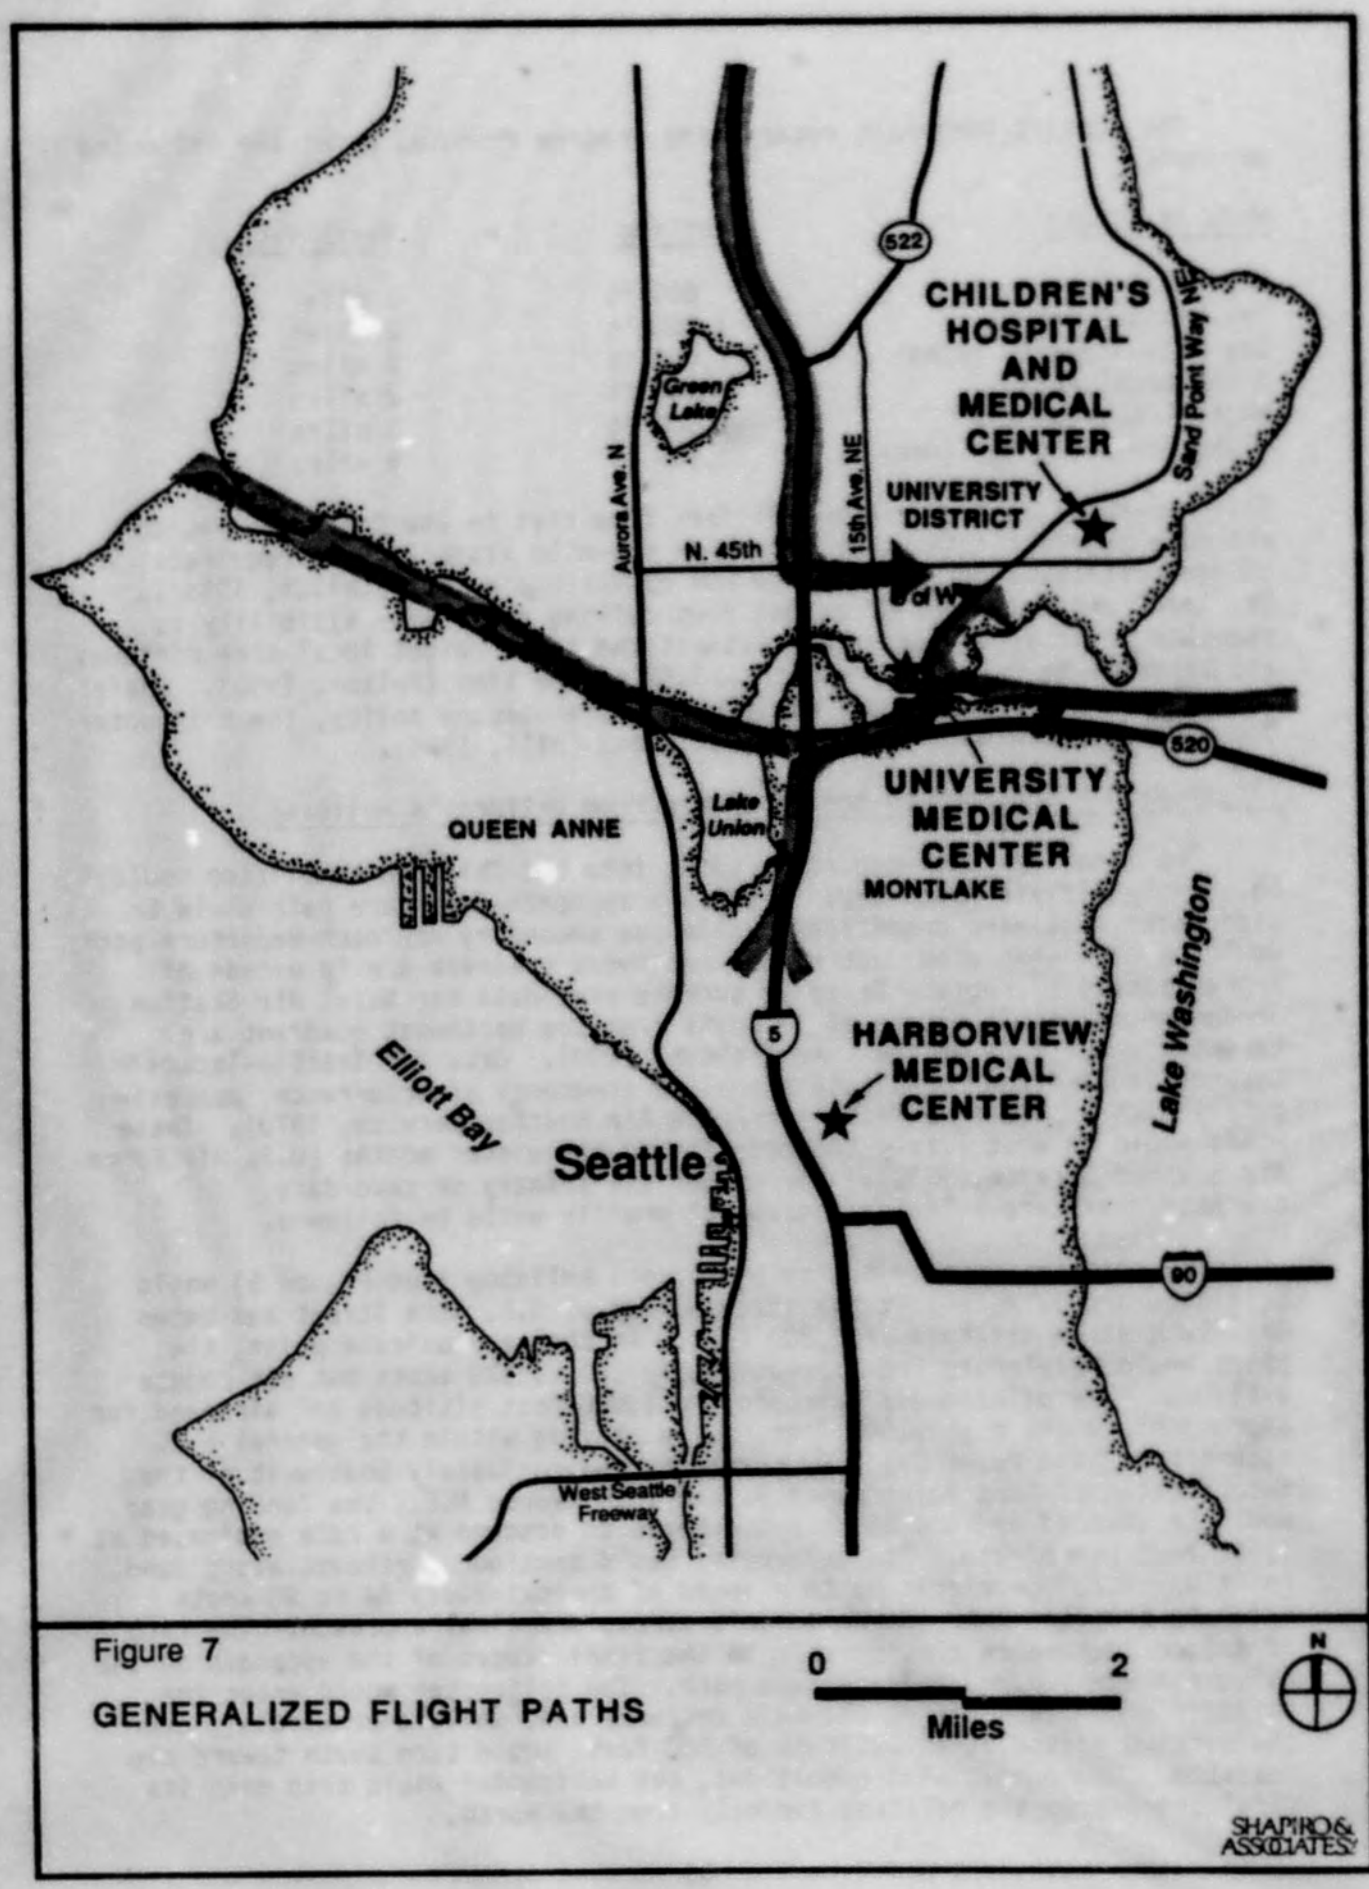
The land uses vary considerably in the areas over which Airlift Northwest helicopters would primarily fly. These land uses range from urban freeway to commercial to residential.

As allowed by the FAA, actual flight paths could be different, depending on meteorological and patient conditions and the specific origin of the patient being transported. The helicopter would not be used during adverse weather conditions.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Airlift Northwest rotary-wing program operates under the following minimums:

Mode of Flight	Ceiling	Visibility
Day Local Area	800 ft	1 mile
Day Cross-Country	1,000 ft	2 miles
Day Cross-Country (mtns)	1,000 ft	2 miles
Night Local Area	800 ft	2 miles
Night Cross-Country	1,000 ft	3 miles
Night Cross-Country (mtns)	2,000 ft	5 miles



This non-local daytime minimum differs from that in the Draft EIS, which stated a 500-foot ceiling or less than one-mile visibility is required. The change reflects a revision to the HAT operations policy (Childs, 1989d). Day local area minimums of an 800 foot ceiling and 1 mile visibility is expected to occur approximately 2.5% of the time. Night local area minimums are expected to occur approximately 3.5% of the time (Felton, 1990). (Refer to Appendix B for additional minimums.) As a company policy, the helicopter does not fly in winds in excess of 40 knots (Hill, 1986).

Flight Path - Approach to and Departure from Children's Helistop

Two final approach-departure paths into the Children's helistop would be used by Airlift Northwest. A primary approach-departure path would be used under most wind conditions, while the secondary approach-departure path would be used when winds out of the northwest quadrant are in excess of approximately 17 knots. Based on surface wind data for Naval Air Station Sandpoint, winds in excess of 17 knots from the northwest quadrant are expected about 0.6% of the time (Felton, 1990). Data for Seattle-Tacoma International Airport indicate a smaller frequency of occurrence, approximately 0.2% of the time (U.S. Air Force Air Weather Service, 1970). These winds would be most likely to occur during the winter months (U.S. Air Force Air Weather Service, 1970). For either the primary or secondary approach-departure a "noise abatement" profile would be followed.

The primary approach to the Children's helistop (see Figure 8) would originate approximately at the intersection of N.E. 45th Street and Union Bay Place at an altitude of 1,000 feet. At that approximate point, the pilot would decelerate from approximately 160 to 120 knots but not reduce altitude. The pilot would maintain the 1,000-foot altitude and airspeed for approximately the next 1,500 feet, while staying within the general N.E. 45th Street/Sand Point Way N.E. corridor. Approximately southwest of the intersection of Sand Point Way N.E. and 40th Avenue N.E., the landing gear would be lowered and the pilot would begin to descend at a rate estimated at 1,500 feet per minute. The helicopter would continue northeast along Sand Point Way N.E., decelerating to a speed of approximately 74 to 80 knots prior to the turn onto the Children's campus and final approach. The rate of descent decreases considerably in the final stages of the approach in the noise abatement approach-departure path. The helicopter would enter the Children's campus north of the main entrance and, while approximately over the parking garage at an altitude of 500 feet, would turn south toward the helistop. Under most wind conditions, the helicopter would then make its final descent to the helistop directly from the north.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

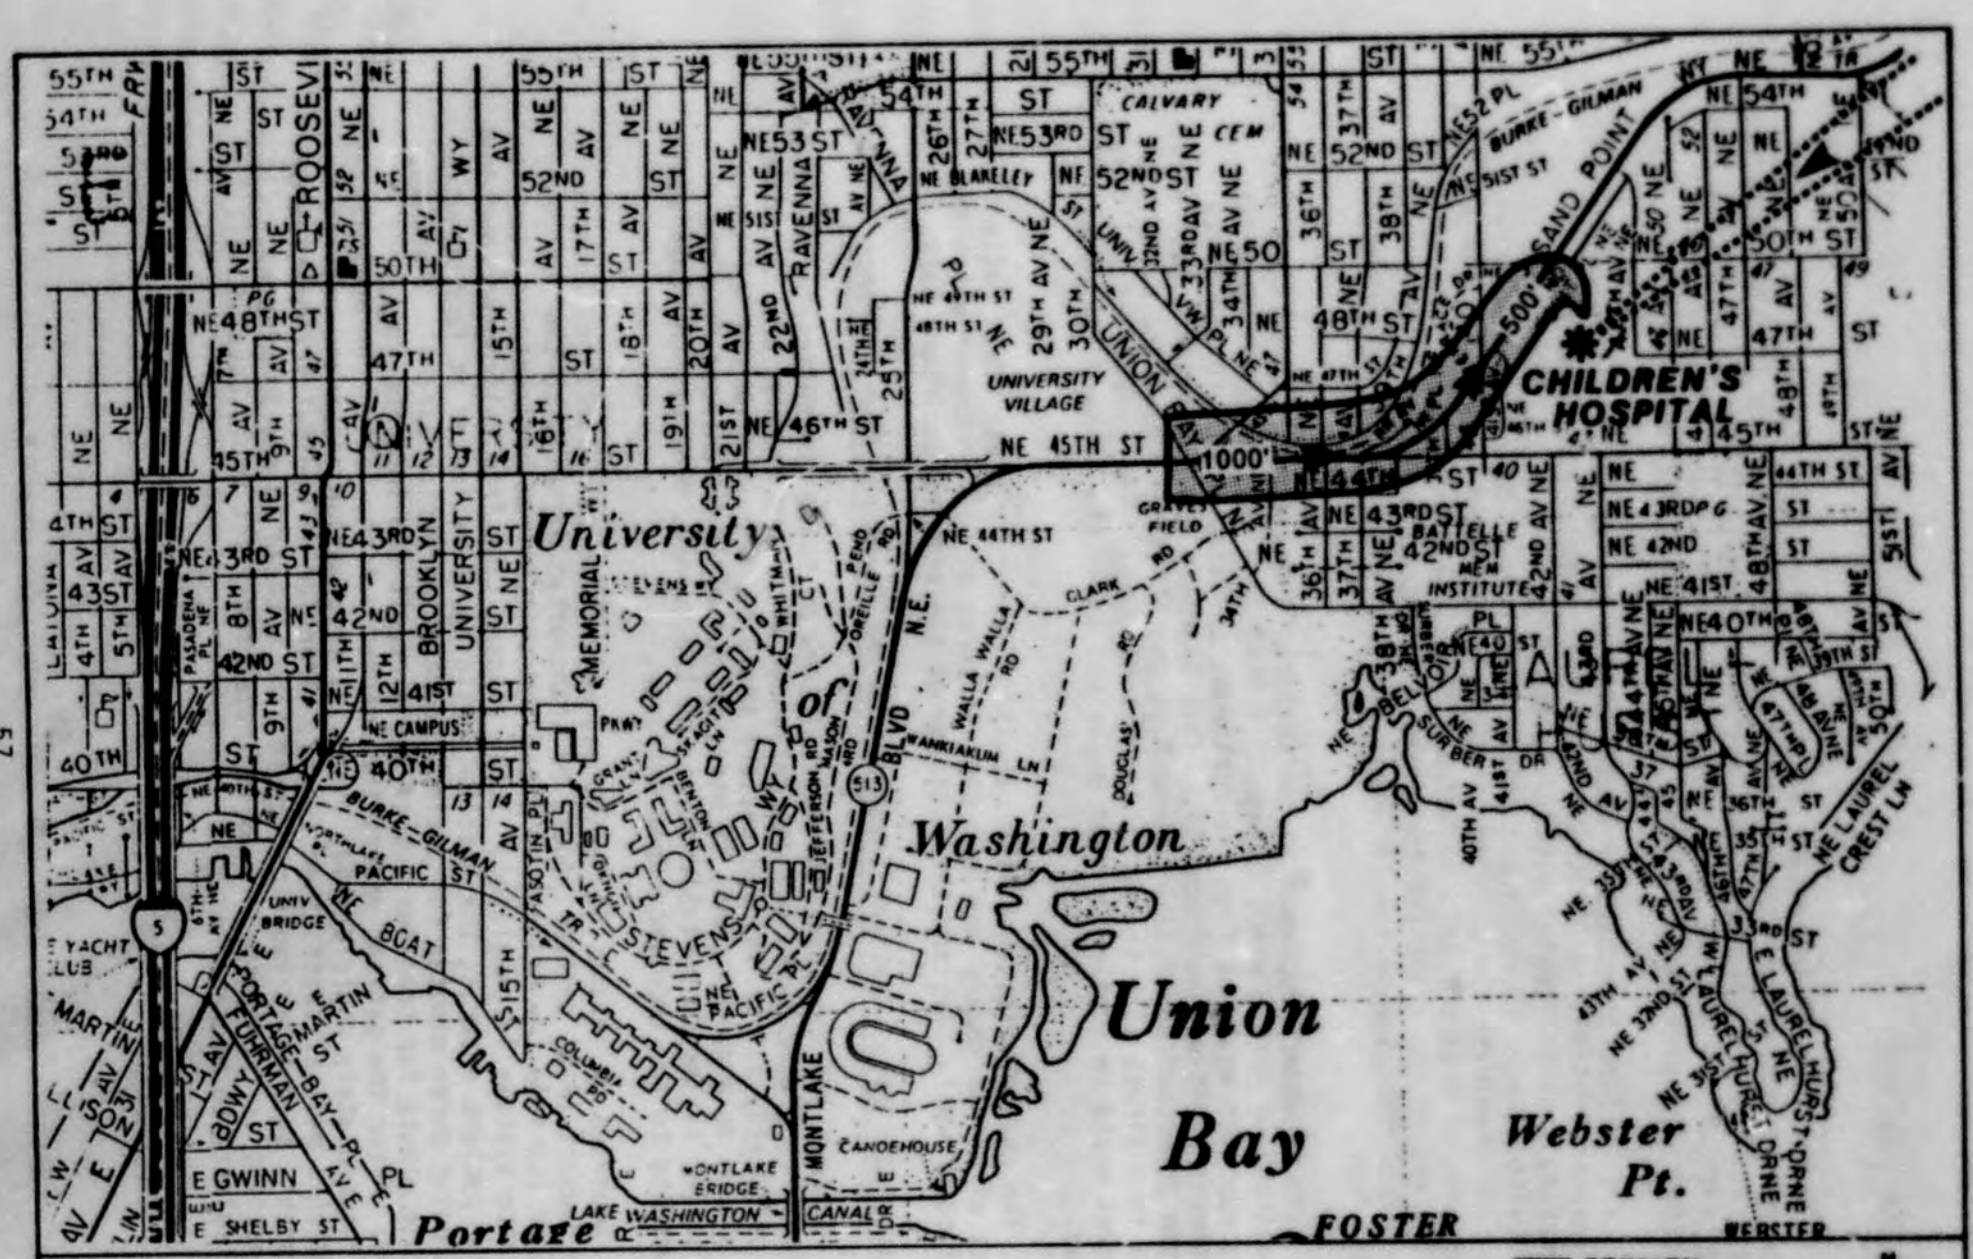


FIGURE 8

PRIMARY AND SECONDARY APPROACH AND DEPARTURE PATHS TO CHILDREN'S HELISTOP

In the case of infrequent strong easterly winds the helicopter would turn more tightly over the main entrance and approach the helistop more from the west. In the case of strong westerly winds (also estimated at less than one-tenth of one percent of all winds) the helicopter would make a wider turn over the parking garage and approach the helistop more from the east.

The helicopter generally would land on the helistop facing south. The helicopter typically would shut down its engines on the helistop. In departing, the helicopter would rise to approximately 35 feet, turn counter-clockwise toward the north and climb rapidly so as to be at approximately 500 feet when over the parking garage. The departure path would be over the same general area but at a higher altitude than the approach path, so that at the end of the climb (at the point of commencing deceleration on the inbound flight) the helicopter would be at an altitude of approximately 2,000 feet.

The secondary approach to the Children's helistop would be used only in conditions of strong winds (above 17 knots) from the northwest quadrant. This approach would be from the northeast and also would use the noise abatement profile (see Figure 8). This approach would originate just north of the intersection of 55th Avenue N.E. and Windermere Road and would proceed in a direct line to the Children's helistop. The profile of the final descent would be similar to that explained under the primary approach, above.

The characteristics of the secondary departure route would reflect those of the secondary approach path in terms of the area over which the helicopter would fly, and the altitude of the primary departure path.

Ground Activities - Patient Transport to the Emergency Room Entrance

Once at the helistop, the medical crew on board the helicopter would be assisted by ground-based medical personnel after the engines are shut down. The critically ill or injured patient would be removed from the helicopter and placed on a gurney, and, if used, oxygen would be changed from the helicopter system to portable oxygen on the gurney. The patient then would be wheeled to the Emergency Room entrance.

Neonates or infants in isolettes, which have self-contained Advance Life Support (ALS) systems, could be transported directly to the Emergency Room or ICU from the helicopter after the switch from helicopter systems to isolette systems is completed. Total elapsed time from helicopter touchdown to the patient entering the hospital building is estimated at four minutes (including three minutes for patient preparation during aircraft shutdown, and one minute for transfer out of the aircraft and into the Emergency Room). After the patient enters the Emergency Room, helicopter medical staff immediately would provide essential information about the patient to Children's medical staff as necessary. Transfer of medical information or equipment, such as an isolette, could take between 20 and 30 minutes. (If the patient is transported in an isolette, the pilot would usually wait for the isolette to be returned.)

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Mitigation Measures that are a Part of the Proposed Action

As part of the Proposed Action, the proponent has incorporated mitigation measures that would reduce the adverse impacts associated with the project. During helistop construction the contractor would be required to implement erosion control measures. Children's has moved the oxygen tank that previously was located west of the Kitchen Garden to a location inside the hospital structure. This relocation reduces the risk of a punctured oxygen tank fueling combustion in the event of an accident at the helistop.

The proposed helistop would incorporate a fire suppression system consisting of a minimum of one 60B:C fire extinguisher. (A fire hydrant is located adjacent to the helistop.) No aviation fuel would be stored on campus. Children's has been trained and is equipped in shutting off the natural gas supply line that serves the campus.

The helistop would be fenced for security. Procedures have been developed and responsible personnel trained for controlling vehicular and pedestrian traffic. Warning signs would be posted on Penny Drive. The helistop would be landscaped. "Glow" rather than direct beam landing lights would be used for the helistop; these lights would be operated only during nighttime use. A glide slope indicator light would be installed as part of the helistop. Additional safety lights would be installed on the Medical Pavilion, Medical Center, and parking garage. Engines normally would be shut down during medical crew pickup, if any, and patient delivery.

Missions would be limited to those associated with critically ill or injured patients. Children's and Airlift have actively participated in the development of communications guidelines to ensure communication from air-to-ground is facilitated. Children's has adopted a policy discouraging MAST helicopters or other air ambulances from landing at the helistop unless there is adequate two way communication available and the patient is unstable and might not survive or tolerate any further transport, delay, or transfer to another carrier. Children's would contact other vendors in the area as well as other services that could transport patients to Children's. The purpose of the contacts would be to inform the vendors and services: of the existence of the helistop; of restrictions on use; of the helistop's capabilities in terms of accommodating helicopters of different sizes; of flight path protocols; of protocols for communicating with the hospital; and of protocols for communicating with other helicopters in queuing situations.

Airlift's flight path has been designed to reduce, as far as practicable, flight over sensitive properties - with general flight paths following I-5, arterials and water bodies. The primary approach and departure path has been designed in order to minimize impacts on adjacent, nearby, and sensitive properties. A noise abatement flight path - involving flying higher for a longer period during approach and departure - would continue to be used.

Airlift Northwest guidelines on acceptable weather conditions are more restrictive than those of the FAA. In addition, Airlift has personnel levels (pilots per aircraft) that meet or exceed NEMSPA/AAMS levels, a

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

minimum experience requirement and ongoing certification for pilot hiring that exceeds AAMS requirements, and ongoing training for pilots and medical team personnel that address the majority of guidelines and standards that have been developed by AAMS and NEMSPA. Airlift Northwest's helicopter features medical and safety equipment that is consistent with the standards for such equipment established by NEMSPA and AAMS. (The reader is referred to Appendix B, which identifies the guidelines that have been developed by these two organizations as well as Airlift Northwest's consistency with these guidelines.) The design of the helistop proposed for Children's would comply with all local, state, and federal safety regulations with respect to the design helicopter (Agusta).

Children's has agreed to the development of and participation on a Medical Review Committee. The purpose of the Medical Review Committee would be to review compliance of the Kitchen Garden Helistop use with the Council Conditional Use Permit criterion that states that use of the helistop will be restricted to occurrences involving life-threatening emergencies. As presently conceived, the committee would examine the records of transports directly to Children's to determine their consistency with the criterion and, if appropriate, recommend corrective action. The Medical Director of Airlift Northwest would retain ultimate authority and responsibility for all Airlift Northwest missions. Additional review criteria could be added by the City as conditions for approval to any permit issued for the helistop.

As envisioned by the project sponsor, the five-member advisory committee would be chaired by the Director of the Seattle-King County Department of Public Health. Other members of the committee would include a representative of Children's, a representative of the Washington State Medical Association, a representative of the Washington State Society of Pediatrics, and a citizen appointed by the Mayor and confirmed by City Council. The City of Seattle could add members to the advisory committee, to include doctors not affiliated with Children's and citizens familiar with the medical issues involved. The committee's duration, as proposed, would be three years, unless extended by the Mayor and Council.

The committee's responsibilities would include developing written guidelines for determining whether helicopter transport to Children's campus involves a life-threatening emergency; conducting semi-annual reviews of transports to Children's campus to determine whether each transport involved a life-threatening emergency; reporting the committee's findings, including recommendations for actions to decrease the incidence of medically unnecessary helicopter landings at the Children's campus, if any; and developing procedures for ensuring that proceedings and results are open and available to the public to the extent allowed by the laws and administrative rules governing confidentiality of patient medical records.

A memorandum from the project sponsor discussing the committee's purpose, composition, responsibilities, staff support and funding, operations, reports and recommendations, and evaluation and duration is incorporated into this Final EIS as Appendix C.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It should be noted that in September 1989 the Medical Director of Airlift Northwest approved standing orders for landing at Children's and issued a medical justification form, which the medical transport team must complete and submit to the Medical Director following a Children's landing specifying the justification for landing. As specified in the standing orders, a landing at Children's is authorized by the Medical Director of Airlift Northwest if during the transport of a critically ill child any of the following clinical conditions occur: unstable airway; inability to ventilate/oxygenate; inability to maintain adequate cardiac output; inability to maintain adequate cerebral blood flow; the persistence of unstable vital signs despite heroic attempts to control them (Childs, 1990).

DESCRIPTIONS OF ALTERNATIVES TO THE PROPOSED ACTION

Intramural Field Helistop Alternative

The Intramural Field Helistop Alternative is the University of Washington Medical Center's existing helistop, and is referred to by the University of Washington as the University of Washington Medical Center East Campus site.

The Intramural Field site is located in the midst of the University of Washington Athletic Field complex just east of the University Campus, south of N.E. 45th Street, and west of the Laurelhurst neighborhood. The primary land uses surrounding the site are athletic fields and parking lots. The University Village shopping mall is located north of the site, across N.E. 45th Street, with residential uses to the north, east, and west of University Village. It is located near the University of Washington's Intramural Field, off Union Bay Place N.E., approximately one road mile from Children's Emergency Room entrance (see Figure 9).

Under this alternative, Children's would have to obtain approval from the University of Washington to jointly use this site, and a legal agreement between Children's and the University of Washington would be developed and signed. This use agreement currently is being developed.

The University does not plan to change the general location of the current helistop. However, improvements may be made to the site in the future in order to improve the safety of the landing site and facilitate its use during wet weather. Site improvements could include construction of a fence, lighting (requiring extension of electricity to the site), paving, installation of a fuel separation and holding tank (in case of a fuel spill), and a wind sock. The University has met with Children's to discuss potential design improvements.

The Intramural Field Helistop Alternative differs from the Proposed Action in terms of the need to transfer the patient to ground ambulance for transport to the Children's Emergency Room entrance and the final approach and departure routes of the helicopter. In instances where pickup of the medical crew at Children's or the Intramural Field is needed, there could be as many as 30-40 landings and takeoffs at the Intramural Field, for the 15

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

to 21 month transport missions (affiliated with Children's - not taking into account the transports associated with University of Washington Medical Center) projected to occur by 1995. Similar to the Proposed Action, landing at Boeing Field and ground transport of the patient to Children's could occur during inclement weather when pilots fly under instrument flight rules.

Flight Path

The flight path to the general vicinity of the Intramural Field Helistop would follow that path described under Flight Path - General, above. The flight path to the helistop would generally be of slightly shorter duration than flights directly to Children's. The approach and departure paths presented in this Final EIS differ somewhat from those presented in the Draft EIS. In order to avoid disturbing wildlife in the ecological area east of the Intramural Field, the flight paths from the south and east have been redefined to fly along Montlake Boulevard N.E. and also to fly at a higher altitude. Final paths would need to be approved by the FAA.

As illustrated in Figure 9, there are several approach and departure paths that would be used by Airlift Northwest helicopters flying into the Intramural Field Helistop.

From the east, the helicopter would pass south of Webster Point over Union Bay at an altitude of approximately 1,000 feet before descending into a turn south of Husky Stadium. Following Montlake Boulevard N.E., the helicopter would be at an altitude of approximately 500 feet when opposite the Stadium. Approximately at the point where the helicopter is past the Hec Edmundson Pavilion, it would turn northeast toward the helistop.

From the south and west, the helicopter would follow SR-520 at an altitude of 1,000 feet before turning north to follow Montlake Boulevard N.E. toward the helistop. The final approach would be identical to that described above for missions originating from the east.

From the north, the helicopter would fly along I-5, turning toward the east and descending from 1,000 feet to 500 feet along the N.E. 45th Street corridor. At the intersection of N.E. 45th with 25th Avenue N.E. the helicopter would turn toward the southeast and make its final descent into the helistop.

If winds out of the south exceed 17 knots, an alternative final approach route would be used by aircraft originating from the south, east, and west. Such aircraft would follow the same initial routes, but they would continue north on Montlake Boulevard to N.E. 45th Street, where a sharp turn would be made to allow for a southerly descent onto the helistop.

The departure would involve vertical lift to an altitude of 35 feet, turning and ascending along one of the routes designated as an approach path depending on the aircraft destination. The ascent rate would be comparable to that described for the Proposed Action.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Figure 9

Proposed Flight Paths for Intramural Field Heilstop

Ground Activities - Patient Transport to the Children's Emergency Room Entrance

Once the helicopter with medical crew and patient has landed at the Intramural Field Helistop, the pilot would shut down engines. A ground-based crew with ambulance and driver would meet the aircraft and assist the helicopter's pediatric crew in unloading the critically ill or injured patient for transport to Children's. Patient landing and preparation and transfer of the patient out of the aircraft into the ambulance would average six minutes (with a minimum of 4.5 minutes and a maximum of 13 minutes). Ambulance travel time from the Intramural Field Helistop to Children's averages two minutes (with a minimum of 1.5 minutes and a maximum of three minutes). Transfer out of the ambulance and into the Emergency Room would take between one and four minutes. The transfer process, depending on life support system and stabilization needs, and the ground travel time, depending on traffic, could result in an absolute minimum of seven minutes or as long as 20 minutes elapsing before the patient is in the hospital (Kilian, 1987b). For transport of patients on a gurney or in the isolette, or if the patient is intubated (using a breathing tube) the transfer is more difficult because if any IVs or tubes are inadvertently disconnected, then reconnection must be made and stabilization must occur prior to the ambulance leaving for Children's.

The transfer process also is made more complex when the patient is being hand-ventilated or is being administered treatment that requires the full attention of a transport team member (Kilian, 1987a). If the ambulance electricity or oxygen supply is used, the transfer and transport process will take longer (Kilian, 1987a). Exposure to adverse weather and/or field conditions increases the potential for destabilization (Andrews, 1986). The transfer process is summarized along with estimated minimum, average and maximum transfer times in Table 5. These transfer times are compared to those of other alternatives in Figure 11.

The Seattle-King County Department of Public Health concluded that "there are hospital transfers to Children's where 10 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small" (Nicola, 1987). Delays in treatment of other patients, while perhaps not a life or death situation, could result in suffering, the need for prolonged treatment, permanent disability or other unfavorable outcome. Examples of these other situations include patients with impaired breathing, diaphragmatic hernia, aspiration of a foreign body, cardiac irregularities, near drownings and vascular collapse from general infections (Neff, 1986).

Muddy conditions on the field also could expose the patient to risk of complication in the event that attendant(s) slip during transport and jostle connecting lines to the ALS System. Because of the uneven surface, there is the potential for attendant(s) to slip and fall during the transfer of a patient out of the helicopter (Kilian, 1987a; Childs, 1991a).

This alternative does not meet the proponent's objectives for all landings, because the alternative involves two additional transfers (in and out of the ambulance).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

University of Washington Medical Center Helistop Alternative

While not under consideration at this time, the University of Washington has proposed using the helistop located on the roof of the East Wing to the University of Washington Medical Center. If the University of Washington were to propose use of the helistop, its purpose would be to allow critically ill patients (high risk obstetrical patients, premature infants with respiratory distress, cardiac patients, etc.) destined for University of Washington Medical Center to be transported directly from the helicopter to the University of Washington Medical Center, thereby saving time and the need for potentially destabilizing patient transfers involved with patient transports from remote landing locations. The existing Intramural Field helistop would remain, if the University Medical Center rooftop helistop were to be used.

This alternative proposes that the University of Washington Medical Center, also a member of the Airlift Northwest consortium, share use of the rooftop helistop with Children's, if the helistop receives the applicable land use approvals. However, for patient care and liability reasons, it is unlikely that the University of Washington Medical Center would allow Children's-destined patients to be landed on the helistop on the roof of the hospital (Shawcroft, 1986).

For the purpose of environmental analysis it is assumed that the characteristics of transport missions for Children's-destined patients would be identical to the Proposed Action and the Intramural Field Alternative.

The University of Washington Medical Center Helistop has been designed as a 3,300-square-foot area on the roof of the hospital's new east wing. The structure has been built to accommodate the landings of aircraft that weigh less than 6,000 pounds, which would preclude MAST, Coast Guard, and Navy helicopters from landing (see Table 4 for specifications of helicopters). The flight path and requirements for patient transfer are different than those proposed for either the Children's or Intramural Field Helistop Alternatives.

The University of Washington Medical Center is located on the southern boundary of the University of Washington Campus, immediately northwest of the Montlake Bridge. The hospital is surrounded primarily by the University of Washington Campus, which is located to the north, northeast, and east of the site. There are other University-oriented uses to the west of the site, with some commercial activity along N.E. Boat Street, west of the site. To the southeast of the site immediately south of the Montlake Cut of the Lake Washington Ship Canal is an area of single-family residences and the Seattle Yacht Club. Portage Bay lies to the southwest of the site.

Flight Path

The flight path to University of Washington Medical Center's rooftop helistop is more compact and the flight would generally be of slightly shorter duration for flights from the south, east and west than the approaches to either the proposed Children's or Intramural Field Helistops. Moreover, the rooftop location decreases the total helicopter descent distance.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 5

STEPS AND THEIR TIME REQUIREMENTS FOR TRANSFERRING PATIENTS FROM THE INTRAMURAL FIELD HELISTOP TO CHILDREN'S EMERGENCY ROOM

Step	Time[1] Minimum	Typical	Maximum
The Life-Pak Monitor is changed from the monitor ledge to the gurney. Any of the helicopter-based systems (i.e., oxygen) that were connected to the patient while in the helicopter would have to be disconnected and the patient placed on portable oxygen. (For those patients in isolettes, there would be a need to be disconnected from aircraft electrical systems and switched to the isolette's battery pack. For isolette patients on high percentage oxygen, the team would disconnect the infant from the ventilator and hand-ventilate while the oxygen hoses were being changed from the aircraft to the isolette system.)	3 min.	3 min.	5 min.
The patient is transferred from the helicopter across the helistop to the awaiting ambulance, transferred into and secured in the ambulance, in which any support systems may have to be reconnected. The patient would face the greatest risk of advanced life support systems disconnecting during this transfer. See Note [2], below.	1.5 min.	3 min.	8 min.
The patient may require stabilization before the ambulance can leave the Intramural Field. See Note [2], below.	0 min.	-Average Not Possible-	
The patient and medical team would be driven from the helistop to the Children's Emergency Room entrance.	1.5 min.	2 min.	3 min.
Any support systems would have to be disconnected at the hospital for final transfer out of the ambulance and into the Emergency Room.	1 min.	2 min.	4 min.
TOTAL TRANSPORT TIME FROM INTRAMURAL FIELD TO CHILDREN'S	7 min.	10 min.	20 min.

Notes:

1 Time estimates for each of the steps assume that the patient is not transferred in an isolette, which may take longer, particularly if destabilization occurs.

2 Those patients who are in most critical condition likely are those that have IVs or monitoring devices connected, and/or that have CPR or hand-ventilation (forced respiration) being performed. The transfer of these patients typically is accompanied by two transport team members carrying the patient and at least one other transport team member administering care. The transfer of these critical patients is more complex, often more time-consuming, and more likely to have destabilization occur.

Sources: Childs, 1987; Shepard Ambulance, 1987, Shapiro and Associates, Inc., 1987.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In the past when the University of Washington Medical Center considered its rooftop helistop, there were discussions with Airlift Northwest that resulted in adjustments of the proposed approach and departure routes compared to those that were identified in the Draft EIS.

The revised flight approach to the University Medical Center Helistop from the north, south, or west would begin from a point along I-5. Depending on the location of the patient pickup site, the helicopter would head either north or south towards the University of Washington. If the approach along I-5 were from the south, the helicopter would turn east at approximately SR-520 (see Figure 10) at an elevation of about 1,000 feet. After crossing Montlake Boulevard N.E., it would turn north heading across the Ship Canal and then, reducing altitude to about 500 feet, it would head west over the Canoe House for the final approach from the east and descent onto the rooftop helistop.

If the approach along I-5 were from the north, the helicopter would turn east at N.E. 45th Street at an altitude of about 1,000 feet. The aircraft would then turn south at Montlake Boulevard N.E. (see Figure 10) and pass over Hec Edmundson Pavilion at an altitude of approximately 500 feet. The approach would continue south on Montlake Boulevard N.E. and N.E. Pacific Place, with the helicopter making the final descent to the helistop from the north.

An approach from the east would pass across Union Bay at an elevation of approximately 1,000 feet. In the vicinity of the Hec Edmundson Pavilion, the helicopter would descend to an altitude of about 500 feet and turn towards the south over Montlake Boulevard N.E. and N.E. Pacific Place for the final descent to the helistop.

The alternative flight path would follow the same initial route as the approach from the south and west, heading east along SR-520. After crossing Montlake Boulevard N.E., the helicopter would turn north across the Ship Canal and, descending to an altitude of about 500 feet, would turn west and then south around the Hec Edmundson Pavilion. The helicopter would then travel south over Montlake Boulevard N.E. and N.E. Pacific Place for the final descent onto the rooftop helistop.

When parked on the rooftop, all Airlift Northwest helicopters would face in a south to south-easterly direction.

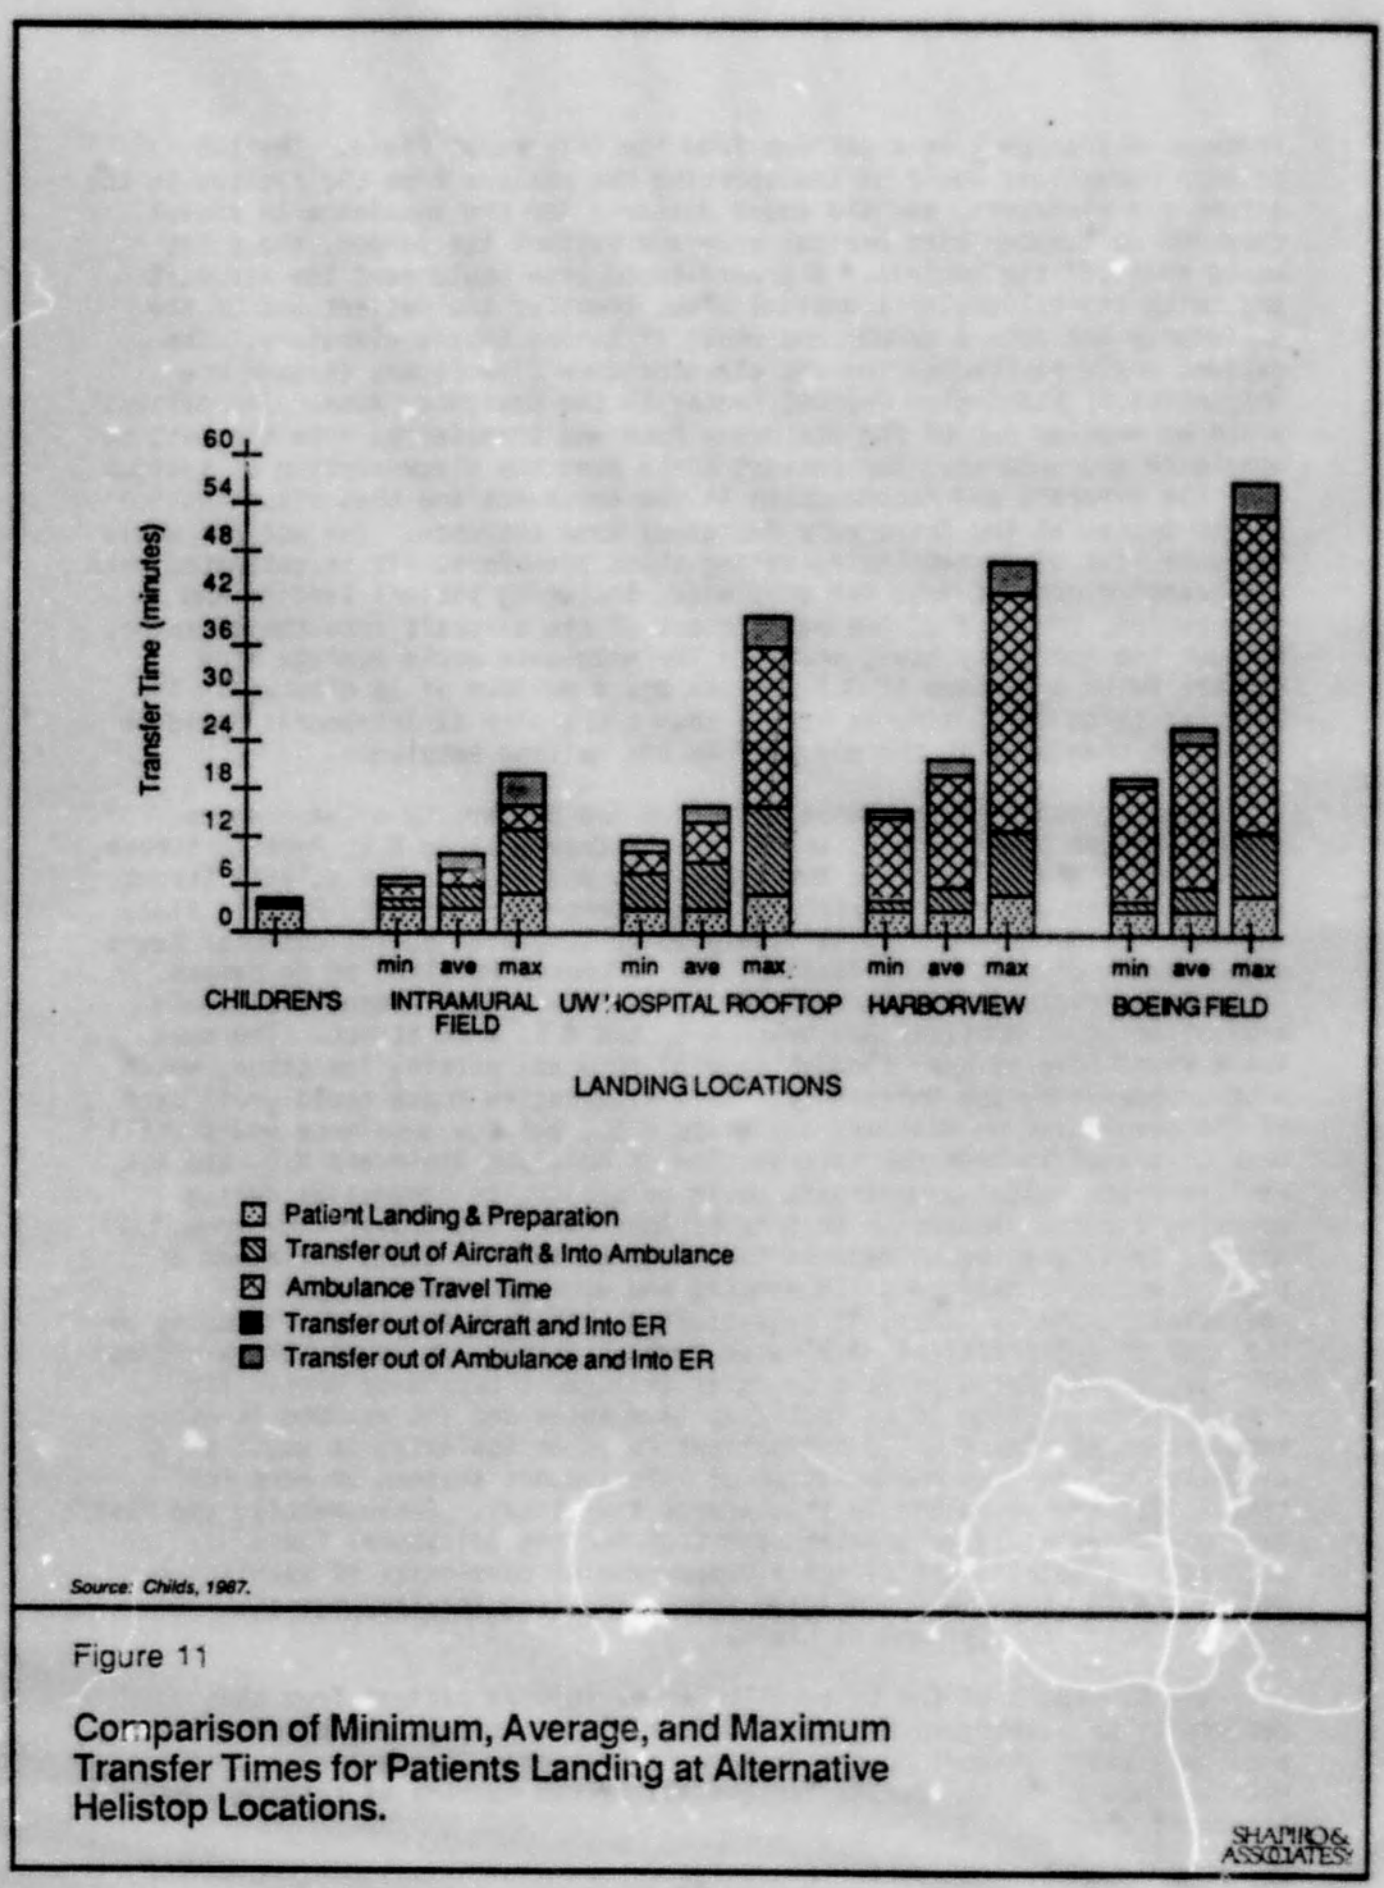
Due to the limited size of the landing area and the proximity of the Medical Center building to the pad, the helicopter would be unable to turn around over the pad, rendering it unable to depart in the same direction from which it approached (Hill, 1986). Thus, the helicopter would have to approach from one of the indicated directions, and depart from the other on every flight. Following liftoff, any flight path could be followed after the helicopter clears the building.

Ground Activities - Patient Transfer to the Children's Emergency Room Entrance

Generally, the process of transporting a patient from the University of Washington Medical Center Rooftop Helistop to Children's would resemble the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Figure 10



Proposed Flight Paths for University Medical Center Helistop

process in transporting a patient from the Intramural Field. The two primary exceptions would be transporting the patient from the rooftop to the ground via elevators, and the added distance for the ambulance to travel. Once the helicopter with medical crew and patient has landed, the pilot would shut off the engines. A ground-based crew would meet the aircraft and, with the helicopter's medical crew, transfer the patient out of the helicopter and onto a gurney and wheel it inside to the elevators. The patient would be transported via elevator down five floors through the University of Washington Medical Center to the Emergency Room. The patient would be wheeled out of the Emergency Room and transferred into the waiting ambulance and secured. The patient could need the disconnection of systems from the aircraft and reconnection in the ambulance and then disconnection of the system at the Children's Emergency Room entrance. The patient would face the risk of destabilizing during these transfers. It is estimated that the transfer process into the ambulance, including patient landing and preparation, transfer of the patient out of the aircraft into the elevator, through the Emergency Room, and into the ambulance would average nine minutes (with a minimum of 7.5 minutes and a maximum of 16 minutes). The transfer takes three minutes longer than a transfer at Intramural Field to allow for transport in the elevator to the waiting ambulance.

The approximately two-mile trip from the University of Washington Medical Center to Children's would include travel along N.E. Pacific Street, N.E. Pacific Place, Montlake Boulevard N.E. and then onto N.E. 45th Street and Sand Point Way N.E. Traffic at the intersection of N.E. Pacific Place and Montlake Boulevard N.E. is likely to be congested during commuter hours and on event days at Husky Stadium, Hec Edmundson Pavilion or on campus. Alternative routes exist through the University's East Campus that could avoid traffic on Montlake Boulevard N.E. and N.E. 45th Street. The ambulance would have to pass through several road and parking lot gates, which must be opened by the University. This alternative route could avoid part of the congestion on Montlake Boulevard N.E., but the ambulance would still have to travel through the intersection of Montlake Boulevard N.E. and N.E. Pacific Place, and the backroads would be subject to congestion during sporting events. According to Shepard Ambulance, the travel time from University of Washington Medical Center to Children's takes a minimum of three minutes, a maximum of 20 minutes and averages five minutes (Berschauer, 1987). Thus, it is estimated that from the time of landing on the roof of University of Washington Medical Center, it would take a minimum of 11.5 minutes for a patient to enter Children's Emergency Room. The average transfer time is estimated at 16 minutes and the maximum is estimated to be 40 minutes. If the patient is in an isolette, it would take slightly longer. Any manipulation of life support systems or need for restabilization would add to this travel time total. Consequently, the risk to the patient would be greater than that for the Intramural Field Alternative. See Figure 11 for a comparison of University of Washington Medical Center transport times and transport times for landings at Children's and the Intramural Field.

The transport of the critically ill or injured patient from the University of Washington Medical Center rooftop, through the hospital to an ambulance and transport to the Children's Emergency Room entrance conflicts with the sponsor's objectives for minimizing the numbers of transfers and transport time.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Limited Landings - No Construction of the Proposed Action or Alternatives

The Limited Landings Alternative is characterized by no construction of a helistop at Children's or use of the Intramural Field or the University of Washington Medical Center's rooftop helistop (if its use were approved by the Seattle City Council; this option is not being considered by the University at this time). Critically ill and injured patients who otherwise would be transported to Children's by an Airlift Northwest helicopter would be off-loaded at Harborview or Boeing Field, transferred to a ground ambulance and driven to Children's. MAST helicopters would probably continue to land at the Intramural Field. There would, however, be continued limited landings in the driveway area outside the Children's Emergency Room entrance for the most critically ill or injured patients. Similar to the Proposed Action, this alternative would involve up to three flight segments (with an additional segment possible, if pickup of the medical transport team at the Intramural Field or Children's is necessary). In addition, landing at Boeing Field and ground transport to Children's could occur during inclement weather requiring pilots to fly under instrument flight rules.

Prior to the ambulance departing from either Harborview or Boeing Field, critically ill and injured patients would need to be disconnected from the systems in the helicopter, transferred to an ambulance, reconnected and, possibly, restabilized. This process is expected to take an average of six minutes (with a minimum of 4.5 minutes and a maximum of 13 minutes) for either Harborview or Boeing Field. This is the same amount of time as for transfers at the Intramural Field Helistop.

Ambulance travel time from Harborview Helistop to Children's averages 14 minutes (with a minimum of 10 minutes and a maximum of 30 minutes); from Boeing Field to Children's, 18 minutes (with a minimum time of 14 minutes and a maximum of 40 minutes) (Berschauer, 1987). Actual ambulance travel time is affected by traffic conditions and is likely to be lengthened or complicated during commute hours; during delays due to traffic backing up with Montlake Bridge openings; during events at the University, Seattle Center, or other locations in Seattle; or during construction that affects traffic on I-5, SR-520, Montlake Boulevard, or Sand Point Way N.E.

Thus, total minimum elapsed time for transit from landing at Harborview to a patient entering Children's Emergency Room entrance would be 15.5 minutes, would average 22 minutes and could take as long as 47 minutes.

From Boeing Field, the transfer would take a minimum of 19.5 minutes, would average 26 minutes and could take as long as 57 minutes. Additional time could be required if the patient is destabilizing or in an isolette. See Figure 11 for a comparison of patient transport times.

The helicopter's medical crew could judge whether patient and/or traffic conditions warranted landing the critically ill or injured patients in the driveway area outside the Children's Emergency Room entrance.

Dr. Neff, Children's Medical Director, has indicated that if Airlift were allowed to land only outside the Emergency Room, at Harborview and/or Boeing Field, then the majority of the patients would land outside the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's Emergency Room. The decision to land these patients outside the Children's Emergency Room would be based on the need to minimize the risk of destablization and adverse outcome. The remainder of the critical patients could be effectively transported by helicopter to Harborview and/or Boeing Field and then transported by ground ambulance to Children's.

In instances in which landings occur outside the Children's Emergency Room entrance, it would be necessary to secure the landing zone area. This would be accomplished by security and/or other personnel from Children's. The flight approach to this landing zone area would be similar to that for the proposed helistop.

The flight path in and out of the Intramural Field for MAST transports would be identical to that described under the Intramural Field Helistop Alternative. Muddy conditions or uneven terrain on the field also could expose the patient to risk of complication in the event that attendant(s) slip during transport and jostle connecting lines to the ALS systems (Kilian, 1987a; Childs, 1991a).

Because of the additional transport time and need for potentially destabilizing transfers, the Limited Landing Alternative does not meet the sponsor's objectives.

The Preferred Alternative - Landing the Most Critical Patients at Children's Helistop with Other Patients Landing at the Intramural Field

Children's asserts that the best alternative from a patient care perspective is that all patients transported to Children's by helicopter land at a paved, secured helistop outside the entrance to the Emergency Room (the Kitchen Garden site). Children's believes, however, that without inordinately sacrificing patient care, the majority of Children's-destined patients can land at the existing helistop at the Intramural Field and then be transported to the hospital by ambulance. Only the most critically ill or injured patients would have a medical need to land at the hospital.

These principles, along with the desire to minimize impacts on the community, are the premise of a new alternative (or Preferred Alternative) that is presented in this Final EIS. The Preferred Alternative combines some of the features of the alternatives that were examined in the Draft EIS and also includes mitigation measures that had not been incorporated previously.

The helistop at Children's would be a paved, fenced landing pad that would have the same features as those described under the Proposed Action. The only difference in the helistop would be that there would be fewer takeoffs and landings at the Children's campus.

Children's proposes in the new Preferred Alternative that only the most critically ill and injured patients land at a helistop that would be constructed at the Kitchen Garden site. These landings typically would involve patients who had destabilized in flight or patients whose outcomes would be adversely affected by a longer transport time. All non-emergent patients would land at the Intramural Field, if allowed, and be transported

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

to the hospital by ground ambulance. If the Intramural Field site were not authorized, the Harborview facility would be used. Similar to the Proposed Action, up to three flight segments would be involved (with an additional segment possible if pickup of the medical transport team at Children's or the Intramural Field is necessary). In addition, landing of the patient at Boeing Field and ground transport to Children's could occur during inclement weather requiring pilots to fly under instrument flight rules. Transport times would be identical to those described for the Proposed Action and Intramural Field alternative.

In 1990, there were an average of 4.3 airlift missions per month that landed at Children's; the remainder landed at the Intramural Field or at Harborview (Carona, 1991). Based on historical use data the average number of monthly Airlift missions that would land at the Kitchen Garden Helistop would be slightly greater in 1995 (Carona, 1991). In addition there would be occasional landings by MAST and Med-Flight. Under this alternative, the number of monthly transports landing at Children's is projected to be 3-5 in 1995 (Neff, 1989).

Dr. Neff has indicated that if Airlift were allowed to land only at the Kitchen Garden Helistop and at Harborview, then there would be a far greater number of patients that would land at the Kitchen Garden Helistop than would be the case if patients are transported to Children's and the Intramural Field. The decision to land these patients at the Kitchen Garden site would be based on the need to minimize the risk of destabilization and adverse outcome. The remainder of the critical patients could be effectively transported by helicopter to Harborview and then transported by ground ambulance to Children's.

The initial decision of whether to land at the Kitchen Garden site or Intramural Field site would be made by the referring physician and/or the attending medical team. If the patient's condition were to deteriorate during the flight to the Intramural Field, the medical team on board the helicopter could decide to land at the Kitchen Garden site during sudden life-threatening situations.

As in the case of the Proposed Action, in order to ascertain that the landings were appropriate (i.e., limited to life-threatening emergencies), Children's would participate in a Medical Review Committee that would examine the flights landing at Children's campus. The authority of the committee could be extended to the transports landing patients at the Intramural Field. It could recommend additional guidelines for deciding which patients should land at Children's. The Medical Review Committee is briefly discussed above and described in a memorandum contained in Appendix C to this Final EIS.

No Action - No Construction of the Proposed Action or Alternatives

Under a No Action Alternative, no helistop would be constructed at Children's campus and no possible improvements would be made to the University of Washington's Intramural Field site. Additionally, Children's-destined patients being transported by helicopter would not be permitted to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

land at the University of Washington Medical Center Helistop (this option is not being considered by the University at this time); or in the driveway area outside the Children's Emergency Room entrance.

Children's-destined patients flown by helicopter would land either at Boeing Field or Harborview and be transported by ambulance to Children's. As described in the Limited Landings Alternative, the total minimum elapsed time for transport from landing at Harborview or Boeing Field to entering Children's Emergency Room entrance would be 15.5 or 19.5 minutes, respectively, with additional time required if the patient requires stabilization or is in an isolette. Under most situations average transport time from Harborview is 22 minutes and could take as long as 47 minutes. From Boeing Field the average transport time is 26 minutes and could take as long as 57 minutes.

Because of the additional transport time and need for potentially destabilizing transfers, the No Action Alternative does not meet the proponent's objectives.

COMPARISON OF ENVIRONMENTAL IMPACTS OF ALTERNATIVES

Implementation of the Proposed Action or other alternatives would cause environmental impacts of varying degree. The important potential impact areas have been identified through the scoping process and are addressed in this document. These elements include noise and vibration, aircraft safety, and the potential for the project to establish a precedent that would result in the construction of helistops at other hospitals in Seattle (cumulative impact). These elements are examined in Chapter IV.

Implementation of the Proposed Action would involve the creation of noise and vibration to which area residents would be exposed. Noise impacts would not be as great for the Intramural Field Helistop Alternative as for the Proposed Action because residential areas are further from the proposed helistop location. Noise impacts on Montlake residents would be greater for helicopter transports under the University of Washington Medical Center Helistop Alternative. The Preferred Alternative and to a greater extent the Limited Landings Alternative involve some noise at Children's from landings and takeoffs, which could affect residents in the vicinity and also involve noise at off-campus landing locations. The No Action Alternative is characterized by noise at Harborview or Boeing Field. Any alternative except the Proposed Action could involve ambulance siren noise.

The risk of aircraft accident is statistically possible under any alternative, including No Action. The construction of a structurally sound, secured, lighted landing area increases the safety of takeoffs and landings but does not eliminate the risk. The potential for non-aircraft property damage or personal injury is probably the least under the secured Intramural Field Helistop Alternative.

Approval of the Proposed Action or alternatives is not expected to have an impact on the number of emergency helistops constructed in the region.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

BENEFITS AND DISADVANTAGES OF RESERVING IMPLEMENTATION OF THE PROPOSED ACTION FOR THE FUTURE

The City of Seattle may determine that it would be desirable to reserve implementation of the project - that is to delay development of the project - until any uncertainties are resolved. Typically, such a decision is predicated upon the completion of another action or activity. Other pending actions that influence the consideration of this proposal include the State Legislature's possible consideration of pending air ambulance use criteria, and the possibility that in the future a regional or statewide air ambulance plan will be integrated into (the appropriate) EMS plans.

The benefits of reserving implementation of the Proposed Action includes the near-term avoidance of environmental effects associated with project implementation: minimizing the number of helicopter flights landing at Children's and thereby reducing the exposure of area residents and students to noise and vibration, and reducing the risk of a helicopter accident occurring in the vicinity of the helistop. In the event that a regional or statewide EMS helicopter plan is prepared in the future, delay of the project could facilitate coordination with planned helistops (to the extent that specific helistop locations are identified in a regional or state plan).

DCLU also has indicated that a term permit would allow for monitoring of safety of aircraft operations and the monitoring of the use of the helistop to ensure that patient transport missions are appropriate.

Disadvantages of delaying project implementation include delay in some critically ill and injured patients receiving treatment offered only at Children's, which could cause unfavorable outcomes, including death, for some critically ill or injured patients, and the potential that an accident occurs because of a less-than-ideally safe (unsecured, unpaved, unlit) landing situation.

Chapter IV

Affected Environment, Impacts, and Mitigating Measures

IV. AFFECTED ENVIRONMENT, IMPACTS, AND MITIGATING MEASURES

This chapter presents analyses of environmental impacts that were deemed potentially significant through the scoping process. These elements are: emergency transport safety; noise and vibration; and cumulative impacts. For each of the first two elements, the Proposed Action is analyzed through a review of existing conditions, a description of probable impacts and impacts of the alternatives where such impacts differ substantially from those of the Proposed Action, and an identification of possible mitigating measures that are in addition to those measures incorporated as part of the Proposed Action or alternatives. A discussion of relationship to plans and policies and an assessment of cumulative impacts also are included in this chapter, as is a summary of impacts that cannot reasonably be mitigated.

EMERGENCY TRANSPORT SAFETY

Introduction

This section presents information on helicopter and ambulance safety. The helicopter safety characterization examines both general aviation (non-military) helicopter service for the years from 1976 to 1981, and Emergency Medical Service (EMS) related helicopter service from 1972 through 1989. Trends in helicopter safety also are explored qualitatively.

When the original research for the Draft EIS was conducted (early 1986), there was an emerging awareness of the magnitude of the safety problem that the EMS helicopter industry had been experiencing. It was widely recognized that 1985 had been a bad year in terms of the number of EMS helicopter accidents. The perception among the sources contacted for the Draft EIS was that, in general, the accident rate for 1985 was an aberration to an otherwise improving trend. Nonetheless, there was expressed concern that in the absence of strict safety guidelines, the rapid growth of the industry was causing the number of accidents to increase to unacceptable levels. Two trade organizations, NEMSPA and AAMS (see Chapter II), began to research the problem and establish guidelines to self-regulate the industry. As 1986 progressed and the number and rate of EMS helicopter accidents continued to increase, the media further publicized the problem.

The number and rate of accidents dropped during 1987 and 1988. 1988 also saw the completion of a National Transportation Safety Board (NTSB) analysis of safety in the commercial EMS helicopter industry. The accident rate for 1989 was comparable to the previous two years and not as great as the accident rate during the period from 1982-1986. The accident rate for 1990 dropped to zero, since no accidents occurred that year. This chapter of this Final EIS presents updated information on EMS helicopter safety.

Sources of Information

Primary sources for this study are reports by the National Transportation Safety Board, which is the federal agency with the responsibility of maintaining accident statistics on air and ground transportation; the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Aviation Safety Institute; NEMSPA; AAMS; articles in periodicals dealing with helicopter safety and helicopter ambulance safety; and Howard Collett, who is the editor and publisher of The Journal of Air Medical Transport (formerly Hospital Aviation) and Aeromed Week. In addition, personal interviews were conducted with recognized authorities in the field of hospital aviation safety, a rotorcraft safety specialist from the Federal Aviation Administration (FAA), and helicopter pilots from Airlift Northwest. Also, Aeromedical Safety, Inc., a business that specializes in the safety of helistops and EMS helicopter program operations, physically examined the landing locations, interviewed Airlift Northwest representatives and prepared a safety report.

The National Transportation Safety Board (NTSB) maintains comprehensive statistics on accidents involving U.S. General Aviation, and publishes them in the Annual Review of Aircraft Accident Data. NTSB statistics for general aviation for the years 1975-1986 are used in this review. Data from other sources for the years since 1983 also are presented.

The NTSB also has published a detailed safety study of commercial EMS Helicopter operations. This study (NTSB, 1988a) serves as the basis for much of the EMS statistics presented in this Final EIS. In developing their data base, the NTSB assembled statistics from their own accident investigation files, the FAA's Accident/Incident Data System, the Aviation Safety Institute, AAMS and NEMSPA, and The Journal of Air Medical Transport. Their data base was further refined by adding criteria to represent true "commercial EMS helicopter accidents" (NTSB, 1988a). These criteria included: the helicopter had to be dedicated primarily to the EMS mission, including on-board equipment to provide basic life support; the helicopter had trained medical personnel on-board; and the pilot was employed primarily to fly EMS missions (NTSB, 1988a).

For the purposes of this Final EIS, it is important to define the principal safety term used by the various information sources. The NTSB defines a helicopter "accident" as an event that causes:

1. Substantial structural damage to a helicopter not including engine failure or damage limited to an engine if only one engine fails or is damaged; bent farings or cowling; dented skin; small puncture holes in the skin or fabric; ground damage to rotor or propeller blades; and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wing tips; or

2. Serious injury (hospitalization for more than 48 hours); bone fractures of any kind (excluding fingers, toes, nose); severe hemorrhages; severe nerve, muscle, or tendon damage; injury to any internal organ; second or third degree burns; or any burns covering more than 5% of the body surface.

Helicopter "incidents" are considered to be those events that result in damage or injury but that do not meet the threshold for being classified an accident by the NTSB.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In the past, the Aviation Safety Institute (ASI) has maintained a data base of EMS helicopter accidents. However, recognizing that other organizations are maintaining accurate data, the ASI is not as systematic in their maintenance of the data base as they have been previously. The ASI's data base combines both accidents and incidents, as well as accidents that involve military aircraft and "good samaritans," which are those helicopters that do not normally fly on EMS missions but that were involved in an incident or accident while transporting a patient. The inclusion of incidents is consistent with the Institute's "belief that the helicopter community should be looking for the hazards that contribute to accidents. If the hazards are found and eliminated, accidents related to these hazards cannot occur" (Aviation Safety Institute, 1986).

Howard Collett, the editor and publisher of The Journal of Air Medical Transport and Aeromed Week, does not incorporate incidents in the data base maintained by his organization, which only considers accidents as defined by the NTSB. Accidents involving military helicopters also are not incorporated into Collett's accident frequency trend calculations, although Collett does maintain statistics on military helicopters in a separate data base. Collett also does not include "good samaritan" transports in his calculations.

Thus, each of the data bases available offers both benefits and disadvantages in application and all are used in this updated analysis of aircraft safety.

Helicopter Accident Frequency Trends

Between 1975 and 1986, the rate of helicopter accidents, as measured in number of accidents per 100,000 flight hours, decreased by more than 50%. As shown in Table 6, the number of accidents per year remained relatively stable from 1975-1983 and then decreased from 1984-1986. During that same period, the number of total flight hours increased considerably. Therefore, over the period from 1975 to 1986, the number of accidents per 100,000 flight hours decreased steadily from 27.31 to 11.16 between 1975 and 1981, increased considerably in 1982, and then decreased the following years to 11.31 in 1986.

A primary reason for this overall increase in helicopter safety has been the increased use of turbine-powered engines and the corresponding decreased use of less dependable piston engines (Collett, 1986; Benedict, 1986; and Hill, 1986). Of the roughly 170 helicopters in use in nationwide air ambulance services in 1985, only one was a piston-powered helicopter (Collett, 1986); therefore, statistics on turbine-powered helicopters generally are the most representative of EMS helicopters. Unless otherwise noted, all NTSB statistics cited in the remainder of this chapter refer to turbine-powered helicopters.

In a similar trend demonstrated in Table 7, turbine-powered helicopters have shown a decrease of approximately 39% in the number of accidents per 100,000 flight hours over the period from 1975-1986 with an 11-year average of 8.26 accidents per 100,000 flight hours. The annual number of accidents

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in turbine-powered helicopters doubled between 1975 and 1984, then decreased in the following two years. During that same 11-year period the average annual number of flight hours tripled. A comparison of Table 6 and Table 7 indicates that on the average turbine-powered helicopters were approximately twice as safe as all helicopters during the period from 1975 to 1986.

Table 6

ACCIDENT FREQUENCY FOR ALL HELICOPTERS
(1975-1986)

Year	Number of Accidents	Flight Time (in hours)	Accidents/ 100,000 hours
1975	266	947,000	27.31
1976	249	1,103,000	22.57

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Commercial EMS Helicopter Accident Frequency Trends

During the 1970s, many early EMS pilots were commercial pilots who branched out into EMS service. Many were "private rural pilots who wanted to relive the adrenalin rush of military helicopter service and expand the usage of their civilian aircraft businesses. Often their advertisements in the telephone Yellow Pages would list their aerial services as emergency medical, tourist, charter, cargo, and even crop dusting" (Reich and Kania, 1985). As the early industry organized (ASHBEAMS, which later became AAMS, formed in 1980) and established safety standards, the number of these part-time operators declined, with a resultant improvement in safety.

An article discussing the 1985 rash of accidents suggested that one reason for the accidents was the pilots' willingness to fly in adverse weather when other commercial helicopter pilots would not fly (Ver Berkmoes, 1986). As stated by Paul Procter, a business flying editor for Aviation Week and Space Technology, "Those guys absolutely hate the thought of losing a patient because they can't fly" (Ver Berkmoes, 1986).

EMS helicopters are frequently called in for particularly hazardous field pickups in locations that ground ambulances would have difficulty reaching. Even on relatively routine EMS flights, the pilots often land in unfamiliar surroundings in makeshift landing areas. Consequently, EMS helicopters may never reach the same safety levels associated with general aviation. It should be noted, however, that the added risk associated with these types of flights is generally limited to the field and not designated landing pads (see Accident Potential with Respect to Phase of Flight, below).

AAMS and the National Emergency Medical Services Pilots Association (NEMSPA) in 1986 developed standards on pilot training, staffing, and operations protocols. Their guidelines are summarized in Appendix B of this document. Based on the accident data, presented below, it appears that the guidelines may have contributed to improving the safety record of the industry.

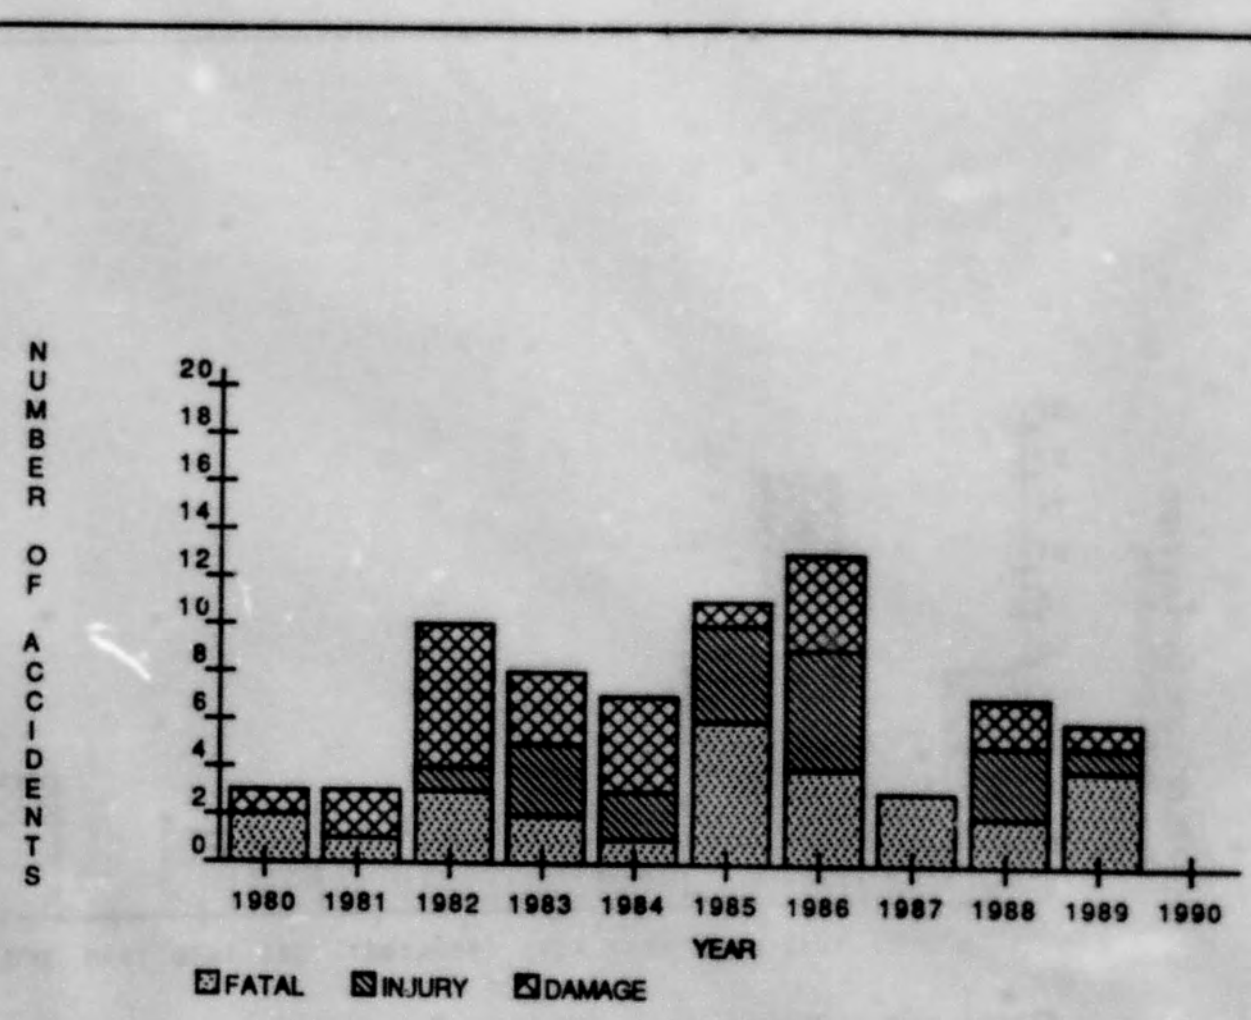
NTSB has compiled statistics for the period 1980-1986 regarding EMS helicopter flights. In addition, data on 1986-1989 have been gathered by Howard Collett. From 1980 through 1990, there have been a total of 71 accidents involving civilian EMS helicopter flights (NTSB, 1988a; Collett, 1991a). Figure 12 illustrates the distribution of these accidents by type - whether fatal, injury, or property damage only. Based on patient transport data, it is determined that from 1980 through 1990, EMS helicopter accidents have occurred at an approximate rate of 9.04 times per 100,000 patient transports. The accident rate by type of accident for the period from 1980 through 1990 is presented in Figure 13 (see Table 8). The data indicate that the EMS helicopter accident rates peaked in 1982 at a rate of 27.20 accidents per 100,000 patient transports. As shown in Table 8 and Figure 13, data for 1987-1990 indicate a marked improvement in the accident rate. The absence of accidents in 1990 has been attributed by Collett to a variety of reasons, such as increased emphasis on safety, particularly the use of safety committees to oversee safety, better equipment, more experienced personnel, improved training, less demand to fly under marginal conditions,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and an emphasis on accreditation (Lillie and Larsen, 1991). Figure 14 shows the overall distribution of fatal, injury and damage accidents for EMS helicopters between 1980 and 1990.

The EMS helicopter accidents for 1980-1986 can be analyzed in terms of the purpose of their missions. Both NTSB (1988a) and Collett (1988) have identified accidents by the purpose of the missions. The two data bases reflect different sets of accidents: all but five of Collett's 56 accidents are included in NTSB's set of 59 accidents. NTSB data indicate that approximately 78% of the EMS accidents between 1980 and 1986 were mission related (Collett's data indicate that 50% of the accidents were inter-facility transports and 27% were On-Scene Transports). Figure 15 illustrates the distribution of accidents by the purpose of the mission for 1980-1986. Thus, a 'corrected' accident potential figure would take into account the nature of the mission, so that the probability of an accident on an actual patient transport mission would be 78% of the probability for all EMS helicopters. Applying this factor to the accident potential presented on Table 8, results in a probability of 7.05 accidents for every 100,000 patient transport missions.

Table 8



ACCIDENT NUMBERS AND FREQUENCY FOR COMMERCIAL EMS HELICOPTERS
(1980-1990)

Year	Number of Accidents*	Number of Fatal Accidents*	Number of Patients Transported*	Accidents per 100,000 Patient Transports	Average Number of Patient Transports Between Accidents
1980	3	2	20,750	14.46	6,917
1981	3	1	28,071	10.69	9,357
1982	10	3	36,764	27.20	3,676
1983	8	2	45,233	17.69	5,654
1984	7	1	56,516	12.39	8,074
1985	11	6	71,831	15.31	6,530
1986	13	4	87,299	14.89	6,715
1987	3	3	97,900	3.06	32,633
1988	7	2	108,900	6.43	15,557

1990	0	0	118,860	0.00	118,860
Totals	71	28	785,324	9.04	11,061

Notes: *Data for 1980-1985 are from NTSB, 1988a; data for 1986-1990 are from Collett, 1991a. NTSB data for patients transported were reported as hours flown; however, it is estimated each transport takes approximately one hour to complete. Therefore, it is assumed number of hours flown is equivalent to number of patients transported.

Fatal Accidents Involving Helicopters

General Aviation. As illustrated in Table 9, total fatal accidents declined from 1.71 fatal accidents per 100,000 flight hours in 1975 to 0.63 per 100,000 flight hours in 1981, and then rose to 2.00 fatal accidents per 100,000 flight hours in 1986. The 169 fatal accidents identified in Table 9 account for a total of 339 fatalities during the nine-year period (NTSB, 1986; NTSB, 1988a). Of these, 37 were ground fatalities (persons not in the helicopter at the times of the accidents).

EMS. From 1980 through 1990, there were 28 fatal accidents involving commercial EMS helicopters (see Table 8). This has resulted in an accident rate of approximately 3.57 fatal accidents per 100,000 commercial patient transports (Collett 1991a). It should be noted that the NTSB has identifed 18 fatal accidents between 1978 and 1986 (NTSB, 1988a). Four of these fatal accidents have involved "major vendors" (defined as vendors serving three or more hospitals) (Collett, 1986). There has never been a ground fatality in an EMS helicopter accident (Collett, 1991a).

Accident Potential with Respect to Phase of Flight

General Aviation. The NTSB study identifies the location of helicopter accidents relative to the heliport or airport for 1981 only. These figures are available only for all helicopters (piston and turbine-powered). As shown in Table 10, more than half of the 257 accidents in 1981 (54%) occurred further than one mile from the airport or heliport. The second most frequent occurrence rate (22%) was at the airport. 2.3% of the accidents occurred on heliports. Four percent of all accidents occurred within one mile of the heliports or airport.

EMS. Of the 85 EMS helicopter accidents (including accidents on non-primary missions, i.e., flights whose purpose was refueling, maintenance, training, or public relations) that occurred through 1986, two are known to have occurred on the host hospital's landing area. (Both of these occurred when engines failed during takeoff from the landing area and takeoff had to be aborted.) There were no injuries or deaths on either occasion.

Reasons stated for accidents occurring at non-host hospital landing areas during takeoff and landing include the pilot's lack of familiarity with the landing area, poor visibility at field landing areas, panicky behavior of those on the ground attempting to guide the pilot, and the frequent need to land on marginally safe landing areas in the field. In familiar landing areas, pilots and support teams know the locations of wires

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and obstacles and are careful to avoid them. At an unfamiliar pickup point in the field, unknown wires present a more serious danger (Collett, 1986; Merrill, 1986; Poulton, 1986; Hill, 1986; Benedict, 1986).

The Aviation Safety Institute examined EMS helicopter accidents and incidents for the period from 1975-1986 and determined that the majority of the accidents occur as the aircraft is landing or taking off (Aviation Safety Institute, 1986). Figure 16 illustrates the accident frequency by phase of flight.

Causes of Accidents

General Aviation. The NTSB uses 14 different designations for types and causes of helicopter accidents, including "hard landing, collision with wires or poles, engine failure or malfunction," etc. (see Table 11). In 1981, the largest number of accidents (42%) was caused by engine failure or malfunction. Seventy-two percent of these accidents caused either minor or no injury. The other most frequent causes of accidents were "controlled" collisions with the ground and collisions with wires or poles (each causing 10.3% of all accidents). Both of these categories caused higher percentages of fatal and serious injury accidents. Nonetheless, even among turbine-powered craft, which have relatively dependable engines, engine failure or malfunction was the single leading cause of serious injury or fatal accidents. No data are available specifically on twin-engine helicopters.

SHAPIRO & ASSOCIATES

EMS. Following their initial examination of helicopter accidents in the EMS industry, the NTSB concluded that human error was involved in 68% of the accidents contained in its 1978-1986 data base of 5[illegible] accidents. As the accidents were studied further, the NTSB determined that there were certain other elements that were common to most of the accidents, including adverse weather, mechanical failure, and obstacle strikes; the remainder involved a variety of factors, with loss of control the most common.

According to the NTSB (see Table 12) 30% of the accidents were attributable to adverse weather including windshear, ice, snow, rain, fog or reduced visibility. Nearly two-thirds of the total number of accidents involving fatalities were attributable to adverse weather.

Mechanical failure was responsible for one-quarter of the 59 accidents, with the majority of the mechanical failures occurring in the engine systems. Obstacle strikes, which usually involved either the main rotor or the tail rotor coming into contact with trees, wires, buildings or other obstacles, usually occurred when the helicopter arrived at or departed from a landing area, and resulted in 21% of the accidents.

The miscellaneous category is comprised of a variety of factors that are not easily included in the other three categories. These accidents include fuel starvation, tail rotor damage by a foreign object, controls being jammed by loose equipment in the aircraft cabin, and losses of control for undetermined reasons.

Table 12

COMMERCIAL AIR AMBULANCE HELICOPTER ACCIDENTS BY CAUSE

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

According to information compiled by Collett for 1972-1990, the three major causes of EMS helicopter accidents prior to 1984 were weather, engine failure, and obstacle strikes, in that order (Collett, 1991b). In 1984, obstacle strikes replaced engine failure as the second major cause of accidents. Then in 1989, obstacle strikes became the leading cause of EMS helicopter accidents, followed by weather and engine failure (Collett, 1991b).

Time of Day (Light) and Weather Conditions

General Aviation. The NTSB annual report provides data on daylight and weather conditions for 1983 accidents, but does not provide that information specifically for turbine-powered helicopters. Therefore, the information in this section is based on all helicopters. The designations used by NTSB regarding weather conditions are limited to the "Visual Flight Rating" (VFR) and "Instrument Flight Rating" (IFR) designations common to aviation regulation. These designations refer primarily to visibility. According to Federal Aviation Regulation (FAR) Part 135, helicopters may be operated under VFR when visiblility is greater than one-half mile. Visibility of under one-half mile requires that helicopters be operated according to IFR. These categories, however, are not standardized and do not necessarily account for other factors, such as wind. For example, if ten different accidents occurred under VFR conditions, it is possible that the weather could have been different for each of the ten.

The statistics show that the majority (see Table 13) of helicopter accidents in 1983 occurred under VFR conditions. Although VFR conditions generally refer to better weather conditions than IFR conditions, this can be misleading. Most accidents occur under VFR conditions because far more pilots are qualified to fly under VFR conditions than those qualified for IFR flight (generally the more experienced pilots). One common situation is that a VFR-rated pilot takes a helicopter out when the weather is good and when it turns bad, the pilot is unprepared to deal with it. The majority of accidents (88%) occur in daylight.

Table 13

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

EMS. Aviation Safety Institute (ASI) data indicate that approximately half of all fatal EMS helicopter accidents and incidents in their data base occurred in daylight (see Figure 17). The ASI concluded (1986) that there was no difference between the number of accidents/incidents during daylight and darkness for cruising flight, yet there were twice as many occurring during takeoff and landing in daylight conditions versus darkness. Numbers of injuries and fatalities showed no significant differences for night or daytime events, respectively.

The ASI has assembled data on weather conditions that existed at the time of 40 of the 84 accidents and incidents that comprise their EMS data base. The ASI determined that "19 events took place in instrument meteorological conditions, eight in marginal visual meteorological conditions, and 13 in visual meteorological conditions" (Aviation Safety Institute, 1986).

Howard Collett's examination of aeromedical accidents indicates that, of the factors that can be measured in aeromedical helicopter accidents, "adverse weather appears to be the single largest common denominator in pilot error accidents" (Collett, 1986b). This is confirmed by NTSB's data and conclusions (see Table 12, above). According to Collett's analysis, adverse weather is a factor in the seriousness of the accidents, with weather being a factor in four times as many fatal accidents as non-fatal accidents. Collett determined that weather was a factor in two-thirds of the fatal accidents that occurred.

Accidents by Make and Model of Helicopter

There are no comprehensive summary statistics available from NTSB on the makes and models of helicopters involved in accidents. The Aviation Safety Institute's report on 84 aeromedical helicopter accidents and incidents occurring between 1975 and 1986 indicates that there are several helicopter makes that have been involved in a disproportionate number of events. Several of the aircraft makes that have been involved in disproportionate numbers of accidents have been replaced by more modern aircraft.

The Agusta 109 (the type of helicopter used by Airlift Northwest) has been involved in a total of three EMS-related accidents and four incidents. One accident occurred in Phoenix in 1983 and involved a blade slap against another helicopter while taxiing at an airport. The second accident occurred in New Orleans in 1984 and involved an Agusta striking a parked, night-camouflaged military helicopter, while performing a night landing at an airport. A third accident occurred in April 1986, when the main rotor of a taxiing aircraft struck a fence during the day (NTSB, 1988a). There were no fatalities or injuries associated with any of these accidents (NTSB, 1988a). One incident involved a near-miss of another aircraft. A second incident involved a driveshaft (bearing) failure and a third incident was a driveshaft shear during ground taxi operations (Ferreri, 1991). The fourth incident involved a tail rotor strike of a helistop perimeter fence (Childs, 1991a).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pilot Fatigue

In operating their aircraft, pilots are reacting to a combination of variables including the capabilities of the aircraft and its systems, weather, visibility, and geography. The pilot's ability to deal effectively with the aircraft is influenced by his/her training, experience with the aircraft, and state of alertness (Collett, 1986b). An additional factor is the inherent pressure in EMS service involving life-threatening emergencies. Pilot errors occur when a pilot reacts improperly to a given set of circumstances. Because pilot error is one of the leading factors involved in aeromedical accidents, the subject has received increasing attention from pilots and industry organizations, such as NEMSPA, and the NTSB. A key factor influencing the pilot's alertness is fatigue. Therefore, the work/rest schedule on which a pilot operates is critical to managing the pilot's performance (Collett, 1986c).

The NTSB determined that pilot fatigue was a factor in only one of the 59 accidents that the NTSB has investigated (NTSB, 1988a). However, the NTSB also concluded in their study that, ". . . commercial EMS helicopter pilots work in a high-stress environment with rotating shifts; this predisposes them to acute and chronic fatigue." (NTSB, 1988a).

As part of their recommendations, NEMSPA has issued guidelines that are specifically intended to allow the pilot an appropriate balance between work and rest (please refer to Appendix B).

Air Ambulance Competition

Competing aeromedical services has been identified as one of the factors that can adversely affect the safety of EMS programs (NTSB, 1988a). From 1982 to 1986, the number of competing services increased from 12% to 35%, with the increased competition resulting in greater utilization than would occur if there were a single program serving an area (Collett, 1986c).

At least two fatal accidents are attributed to programs accepting missions under marginal weather conditions after a competing program had declined the mission (Collett, 1986c).

Conclusions of the NTSB Study on Commercial EMS Helicopter Operations

Based on the results of their study of commercial EMS helicopter operations, the NTSB made a series of recommendations to the Federal Aviation Administrationincluding the following topic areas: pilot certification and training; Visual Flight Rules (VFR) Minimums; Instrument Flight Rules (IFR) Minimums; Alternate Airport Requirements; EMS pilot priority status for weather briefings; the safety of EMS helicopter interiors; crew clothing and equipment; conducting research to examine the effectiveness of existing regulations regarding flight time/duty time; and the training of medical personnel in aeromedical safety.

Recommendations to the Association of Air Medical Services (formerly ASHBEAMS) include the following: assisting programs in the development of safety committees; offering guidance on safety issues for EMS program

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

administrators; offering guidance on safety issues for training of medical personnel who fly on EMS missions; and encouraging members to provide protective clothing and equipment for aeromedical personnel.

Recommendations to the Helicopter Association International include the following: encourage members to develop VFR weather minimums for their local terrain and weather patterns; in conjunction with NEMSPA, encourage the development of safety committees; in conjunction with the FAA and the Association of Air Medical Services, develop training guidelines for medical personnel.

The final recommendation is for the National Aeronautics and Space Administration in cooperation with the FAA to develop and conduct a research program on pilot workload, shift lengths, and circadian rhythms to determine their effects on EMS helicopter pilot performance.

Military Helicopter Safety

The military reports accidents in a different manner than the FAA does; therefore, a comparison of military and civilian accident rates is difficult to conduct. The military divides accidents into two categories. Class A accidents are characterized by property damage of $500,000 or more, destruction of the aircraft, and/or injuries resulting in a fatality or permanent total disability. Class B accidents involve property damage of $100,000 to $499,999 and/or a permanent partial disability injury or the hospitalization of five or more people. Generally speaking, Class A military accidents are comparable to fatal aeromedical accidents because all aeromedical accidents involving permanent disability have, according to available information, also involved fatalities. The military also calculates accident rates in terms of flight hours, whereas the aeromedical industry makes its calculations in terms of patient transports. However, an informal survey among five of the nation's leading aeromedical services has revealed that patient transports average approximately one hour each in duration (Collett, 1987). Thus, despite certain shortcomings, a comparison of military and aeromedical accident rates is legitimate. Howard Collett compared accident rates between the military and the aeromedical industry. The results are as follows (Collett, 1987):

Type	Rate (Accidents/ 100,000 Flight Hours)
Fiscal Year 1986 USAF Class A	1.53
FY 1986 Army Class A	1.98
FY 1986 Navy Class A	3.39
FY 1986 Marine Class A	4.19
Overall Military Accident Rate	2.23

These statistics suggest that in 1986 the military experienced a lower fatality rate than did the aeromedical industry.

NOTICE: IF THE DOCUMEN. IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Affected Environment

The Seattle metropolitan area is served by two major airports (Sea-Tac International Airport and Boeing Field), and several smaller airports and airfields (including seaplane ports on Lake Union and Lake Washington, some of which are private docks along the lakefronts).

Sea-Tac and Boeing Field receive all of the jet traffic in the area; the nearest other jet ports are Paine Field in Everett and McChord Air Force Base, southeast of Tacoma. General aviation, fixed-wing traffic also is handled at Sea-Tac and Boeing, as well as at smaller airfields in the area. Several commercial helicopter organizations are headquartered at Boeing Field. In addition to the helicopters based at Boeing Field, the FAA has records for the following helistops and heliports in the City of Seattle:

Boeing Plant 2 Heliport
Park 90 (Airport Way)
201 Elliott Avenue
Lockheed Plant 2
KOMO TV (100 Fourth Avenue North)
Harborview Medical Center (325 Ninth Avenue)
Broadcast House Helistop (Third and Broad Streets)
Washington Building (Rainier Bank Tower)
Seattle First National Bank (1001 Fourth Avenue)
Seattle Private Number One (320 Aurora Avenue North)

Airlift Northwest, the organization that would be transporting nearly all patients to and from Children's, is headquartered at Harborview Medical Center. Its helicopters and medical transport teams are based at Harborview and Boeing Field.

As discussed in Chapter II, Airlift Northwest is a service to referring physicians who initiate the missions. Because the service is physician initiated, there is no competition for specific patient transports.

According to Robb Childs, Airlift Northwest's Associate Director, the aeromedical service has oriented its staff of administrators, pilots, mechanics, and medical personnel to the safety of its missions. The organization is committed to the safety of the crew, patients, public, and aircraft (Childs, 1989). To that end, Airlift Northwest endeavors to maintain the highest standards in its training of personnel, in its inspection and maintenance of equipment, and in aircraft operations (Childs, 1989).

Airlift Northwest has a safety committee, whose responsibility is to ensure that safe operations are integrated into the EMS program. At quarterly meetings, the safety committee discusses a variety of issues, such as dispatching procedures, EMS helicopter accidents that have occurred elsewhere in the U.S., mishaps, and any transports with unusual circumstances or outcomes (Childs, 1991a). Other operational procedures considered to be part of Airlift's safety procedures include:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

- Requiring vendors to operate according to AAMS weather minimums;
- Requiring Class I physicals for all Airlift Northwest pilots;
- Using aircraft (the Agusta 109) that can be operated by a single pilot under instrument conditions;
- Requiring pilots to be instrument-rated and instrument current; and
- Using a post accident/incident plan (PAIP) for non-reporting aircraft (Childs, 1991a).

As shown in Table 14, Airlift Northwest has more stringent standards for pilots than the FAA.

All Airlift Northwest pilots are instrument current as well as instrument-rated. Instrument currency means they are continually tested for their ability to fly with only an instrument orientation, and, therefore, are able to fly without the ground being visible. As identified in Appendix B, the Airlift Staffing Program of 12 hour days with five days on and five days off is not consistent with NEMSPA's guideline recommending no more than four daily shifts in a row. However, the staffing policy is consistent with the FAA requirements.

It is Airlift Northwest policy not to fly in winds in excess of 40 knots. Under marginal flying conditions, the company flies at the option of the pilot. Airlift does not pressure its crews to fly during marginal or unsafe weather conditions. The operations manual for Hospital Air Transport (HAT) provides that the pilot has the final authority to discontinue operations (Childs, 1989). In determining whether to fly or not, the pilot is required to use Airlift Northwest guidelines. The FAA standards call for the pilot not to operate under visual flight rules when the visibility is less than one-half mile; the Airlift Northwest guidelines are the same as AAMS minimums, which are as follows:

	Ceiling	Visibility
Day Local	500 ft	1 mile
Day Cross-Country	1,000 ft	1 mile
Night Local	800 ft	2 miles
Night Cross-Country	1,000 ft	3 miles

The weather minimum for Airlift Northwest differs from that in the Draft EIS, which stated a 500-foot ceiling or less than one mile visibility. The change reflects a revision to the HAT operations manual.

When Airlift Northwest flies under instrument flight rules, the helicopters land at Boeing Field, rather than at Children's, the Intramural Field or Harborview. During Airlift's five and one-half year history of flying helicopters, there have been several instances when the aircraft have faced adverse weather conditions and the pilots have elected to land at outlying locations. Gene Hill, a pilot with Airlift Northwest, noted that under bad weather conditions, such as the fog that enveloped Seattle in December 1985, the company does not fly at all. During that fog, Airlift Northwest refused to answer 20 calls over a two week period because the company did not believe it was safe to fly.

Table 14

FAA AND AIRLIFT NORTHWEST
COMMERCIAL HELICOPTER PILOT CERTIFICATION REQUIREMENTS

	FAA	ALN[illegible]
Pilot in Command Under Visual Flight Rules	Commercial pilot certificate. 500 hours of flight time as a pilot including at least 100 hours of cross-country flight time, of which at least 25 hours were at night. 50 hours of the above must be in rotary-wing aircraft, the rest may be in fixed-wing.	Commercial pilot certificate wi[illegible]ent rating Minimum of 3,000 hours of helicopter flight time as a 1000 turbine-engine Pilot in Command, (PIC), including at least 100 hours of night flying time, 25 flight hours in aircraft type and 5 hours of local area orientation in aircraft type.
Pilot in Command Under Instrument Flight Rules	Commercial pilot certificate with instrument rating. 1,200 hours of flight time as a pilot including at least 500 hours of cross-country flight time, 100 hours of night flying time and 75 hours of actual or simulated instrument time of which 50 hours were in actual flight. 50 hours of the above must be in rotary-wing aircraft, the rest may be in fixed wing.	Commercial pilot certificate with instrument rating. Minimum of 3,000 hours of helicopter flight time as a 1000 turbine-engine Pilot in Command, (PIC), including at least 100 hours of night flying time, 25 flight hours in aircraft type and 5 hours of local area orientation in aircraft type. 250 hours of actual or simulated instrument flight.

Source: Airlift Northwest, 1991.

There have been no accidents in the eight year history of Airlift Northwest. There has been one incident, however, which occurred July 24, 1989 (Childs, 1991a). The incident involved a tail rotor strike of the helistop perimeter fence at Harborview. No injuries occurred, but there was damage to the helicopter (Childs, 1991a). The FAA was notified and the pilot suspended for a period of time. From April 1985, when Airlift Northwest began operation of the Agusta 109 helicopter, through the end of 1990, there have been 6,107 transports.

Airlift Northwest has been landing Children's-destined patients at Harborview, the Intramural Field, Boeing Field, and at the existing landing location immediately outside the Children's Emergency Room entrance. Only the most critical patients were landed at Children's, with the majority of the patients being transported to Children's by ambulance after being landed at an alternate location.

As shown in Figure 18, the distribution of these landing locations has evolved since the inception of the Airlift Northwest helicopter service in 1985. Through 1986, the majority of the patients landed at either Children's or at Harborview. Since 1987 there has been increasing use of the Intramural Field as a landing location, with a corresponding decrease in the use of Harborview. The number of patients landed at Children's has remained fairly constant during this period, with monthly fluctuations in use.

The existing helicopter landing location outside the entrance to the Children's Emergency Room does not meet the FAA's guidelines for heliport design. The landing area does not conform to the FAA's minimum size recommendation. The landing surface does not meet soil stabilization or pavement design recommendations. Other potential problems include lack of identification, poor drainage, insufficient lighting of the boiler stacks and landing area, and a lack of fencing to restrict unauthorized entry to the area.

Currently, there is no mechanism for Airlift Northwest pilots to practice approaches, landings and takeoffs, and departures to and from the landing area outside the Emergency Room entrance. This results in new pilots and pilots who have not flown frequently to Children's being unaccustomed to the specific characteristics of flying in and out of this particular landing location. This situation may add to the potential risk of an accident on actual patient transport missions. Training flights currently consist of flying the flight paths; no take-off and landings are conducted. Training flights occur, on average, three times a year (Childs, 1991a).

All of the alternatives to constructing a helistop at Children's Kitchen Garden site involve transport of patients and attending medical crew to Children's by ambulance. According to the Washington Department of Transportation, during an approximately 9.5-year period ending in 1986, there were 46 ambulance accidents in the City of Seattle, resulting in 34 injuries and no fatalities (Toohey, 1986).

Distribution of Landing Locations for Children's Destined Patients Transported by Airlift Northwest (1985 - 1990)

Source: Childs, 1987-1991

Impacts

General Impacts - All Alternatives

In calculating the potential for accidents associated with air ambulance service to Children's, several assumptions must be made regarding the number of transport missions. Currently, there is an average of 17 Airlift Northwest helicopter patient transports per month. For the purpose of the Final EIS, the number of transports by Airlift Northwest is expected to remain constant at 15 to 20 patients per month through 1995. (See description of the derivation of the number of transports in the Description of the Proposed Action.)

In the Draft EIS, the assessment of accident potential was based on the amount of flight time for individual EMS air ambulance missions. Since the issuance of the Draft EIS, the industry has prepared analyses that are based on the numbers of patients transported and not on the number of hours flown. Use of the industry's data provides a more direct means for assessing the probability of an accident occurring.

Use of the industry's data, which relate accidents to the numbers of patients being transported, may overstate the potential for accident when the statistics are applied directly to the Proposed Action. As described above and illustrated in Figure 15, not all EMS helicopter flights have patient transport as their primary mission. Seventy-eight percent (78%) of the EMS helicopter accidents that the NTSB investigated were patient transport missions; the remainder of the missions were for refueling, training, missions classified by the NTSB as "public relations" and other purposes. Therefore, because the accident potential calculation is based on the number of patients being transported, a 'corrected' accident rate for transports of Children's-destined patients would delete the non-primary missions from the calculated rate. This would reduce the accident rate presented in Table 8 by 22%. As it may be desireable to provide new pilots with training flights into the helistop, a second "corrected" accident rate would reduce the accident rate presented in Table 8 by 20%.

Several different accident frequency figures are used to derive projections for different statistical accident frequencies for Children's air ambulance service (see Table 15). The results are presented as the statistical probability of an accident occurring during any portion of a mission involving the transport of a patient to Children's. The frequency of such accidents occurring on a Children's-destined mission would depend on the actual number of patients brought to Children's by helicopter. As a worst case scenario, the statistically probable number of years between accidents on Children's-destined missions is presented, assuming a forecast of 20 patient transport missions per month.

To summarize the results (see Table 15) a worst case scenario for any of the helistop alternatives was generated using the overall accident rate for EMS helicopters. Under this scenario, a patient transport mission involving a Children's-destined patient would have a statistical probability

Table 15

EXPECTED FREQUENCY OF ACCIDENTS
FOR AIRLIFT NORTHWEST HELICOPTER TRANSPORTS OF PATIENTS TO
CHILDREN'S HOSPITAL AND MEDICAL CENTER

		ASSUMPTIONS			
	Accidents/ 100,000 Flight Hours	Transport Missions/ Month	Minutes/ Transport Missions*****	Probability of Accident for a Single Transport*	Statistical Frequency of Accidents (Expected Number of Years Between Accidents)
1) U.S. General Aviation, Turbine-Powered Craft, 1975-1986	8.26	20	50	1 in 14,529	60.5
2) Fatal Flights U.S. General Aviation, Turbine-Powered Craft, 1975-1986	1.6	20	50	1 in 75,003	312.5
3) Commercial EMS Related Accidents, 1980-1990	**	20	N/A	1 in 11,062	46.1
4) Corrected Commercial EMS Accidents, 1980-1990	***	20	N/A	1 in 14,184	59.1
5) Commercial EMS Related Fatal Accidents, 1980-1990	****	20	N/A	1 in 28,011	116.7

1) See Table 7
2) See Table 9
3) See Table 8. Note that the risk is based on the rate of 9.04 accidents/100,000 patient transports.
4) This calculation of Commercial EMS Accident Probability is based on the assumption that the probability of accident in Table 8 is reduced by 22% to reflect a correction for the primary purpose of the patient transport mission; this results in a rate of 7.05 accidents/100,000 patient transports. The 22% reduction reflects the deletion of training, refueling, maintenance and public relations accidents from the overall accident potential statistic. See text.
5) See "Fatal Accidents Involving Helicopters" section. Assumes 3.57 accidents/100,000 patient transports.

* On Children's-Destined transport, anywhere in transport mission either picking up medical transport team (if necessary); departing with transport team; delivering patient to Children's; or departing for return to base or next mission.
** Note that the risk is based on the rate of 9.04 accidents/100,000 patient transports.
*** Note that the risk is based on the (corrected) rate of 7.05 accidents/100,000 patient transports.
**** Note that the risk is based on the rate of 3.57 fatal accidents/100,000 patient transports.
***** Note that average transport time for all Children's-destined patients transported by Airlift Northwest helicopter through July 1987 was 49.8 minutes; it is assumed for the purpose of this analysis that 100,000 flight hours is equivalent to 100,000 patient transports.

Source: Compiled by Shapiro and Associates, Inc., from data sources indicated above; see text and tables from body of report.

of an accident in one of every 14,184 transports. The accident could occur at any point on the three or four segments of each flight. If one assumes 20 transport missions per month, then the first accident would be statistically expected to occur every 59.1 years.

An assessment of the specific factors affecting the acceptability of the alternative helistop locations from a safety perspective focus on the design specifications of the helistop, the properties that would be placed at risk, and the availability of acceptable alternate landing locations to be used in the event of the need to execute an emergency landing of the helicopter.

For all alternatives, motorists could be distracted by helicopters operating in the vicinity of their vehicles. The potential for distraction would be the greatest during aircraft approaches and departures.

Children's Kitchen Garden Helistop Alternative

The Federal Aviation Administration has developed a design guide to help in the construction or improvement of heliports. For a private use heliport, such as Children's, the FAA criteria are guidelines rather than regulations. The design guidelines consider takeoff and landing area, touchdown pad and surrounding area, and obstructions within the aircraft approach area.

The proposed Kitchen Garden Helistop would be consistent with the FAA guidelines for heliport design for the design aircraft, Agusta 109, as well as the MBB 105. The proposed takeoff and landing area would meet the requirements for horizontal clearance, and additional clear area of approximately 12 feet (to the next obstruction, i.e., the security fence) would be included to achieve consistency with the overall clear area recommended by FAA for the design aircraft. The concrete pad exceeds the requirement for size and weight limitations. The proposed Kitchen Garden Helistop would not be consistent with the design guidelines for MAST aircraft.

The FAA does not specify a minimum distance that buildings may be located from the helipad. They do, however, specify "heliport approach surfaces" and "heliport transitional surfaces" within which no obstructions should be located. This "approach surface" specifies a rising slope of 8:1 extending in a horizontal distance to 4,000 feet from the landing area. The "transitional surface" specifies a rising slope of 2:1 to a distance of 250 feet on either side of the landing area. Obstructions are allowed within these surfaces only when an aeronautical study concludes that the obstruction would have no adverse effect upon aeronautical operations. Neither existing nor future hospital expansion would penetrate these surfaces. Several trees and light poles to the north and northeast of the helipad would penetrate these surfaces and, therefore, have been identified for removal with the development of a helistop at the Kitchen Garden site. The primary and secondary approach and departure routes would be unobstructed, provided that several trees and light poles are either removed or relocated as proposed under this alternative.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The heliport markings would be consistent with the FAA guidelines. Wind socks would be placed on the helistop as well as on the medical center rooftop. A glide slope indicator light would enable pilots of approaching helicopters to stay within designated final approach paths.

Regarding the proposed location of the Children's helistop, FAA Inspector Benedict believes that it is an extremely safe site (Benedict, 1986). He compared it to landing areas near the Seattle Center and downtown Seattle that are over busier streets and more congested conditions. He believes that the Children's site is far safer than such landing areas, which are already safe themselves.

A natural gas meter house is located approximately 38 feet northwest of the northern edge of the proposed pad at Children's helistop site. No other existing buildings are located within 100 feet. Communication with representatives of Washington Natural Gas discloses that the current protection of the meter with a fence and a concrete structure is considered reasonable and adequate to prevent a fire in the event of a helicopter accident (Jainga, 1985). In the event of a major accident that results in the breach of the gas supply line, the natural gas would flare until shut off at the main valve across from Children's on Sand Point Way N.E. Children's personnel have been trained and are supplied with the equipment necessary to shut off the main gas supply valve. This will allow any gas flare to be extinguished more quickly in an emergency situation.

Over time, the trees to the north of Penny Drive and northeast of the helistop could grow, intruding on the airspace for landing approaches from the secondary flight path.

Because the proposed flight path largely follows waterbodies and arterials (see Figures 7 and 8), the properties that primarily are at risk are those that adjoin or are close to the flight path. In the Children's approach and departure paths, the affected land uses are commercial and residential properties along Sand Point Way N.E. and, to a lesser extent, the residential properties along the secondary flight path that would be used infrequently. Other concerns in the area are the Laurelhurst Elementary School located three blocks to the east, Villa Academy located to the northeast, and Laurelon Terrace located adjacent to the western boundary of the Children's campus.

In the vicinity of Children's, there are a number of locations that potentially could be used for emergency landings. These emergency landing locations include: parking surfaces on and off campus, roadways, the University of Washington's East Campus athletic fields, and the Sand Point Naval Air Station.

Intramural Field Helistop Alternative

The Intramural Field Helistop would be consistent with the landing surface specifications recommended by the FAA. The approach and departure paths also would be free of obstructions per the guidelines. The FAA's Principal Aviation Safety Inspector has indicated that the Intramural Field site, similar to Children's, offers an extremely high level of safety (Benedict, 1987).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Airlift Northwest pilots have expressed some concern with respect to the large numbers of birds on the athletic fields at various times of the year (Davidson, 1987). This concern was one factor that influenced the realignment of the flight path that had been presented in the Draft EIS. The earlier path involved a route that would have taken aircraft closer to known roosting areas. The current flight path, as illustrated in Figure 9, reduces, but does not eliminate, the potential for a bird strike.

In addition, the proximity of a golf driving range, several light standards, and a baseball backstop pose minor obstructional problems. There is a lack of operational controls at the existing Intramural Field site.

The Intramural Field has a flight path into the general area that is comparable to that for the proposed helistop on the Children's campus. The approach and departure paths also follow waterbodies and arterials. The land uses along the approach and departure paths that are at risk are those commercial, residential, and institutional land uses that adjoin or are close to the flight paths illustrated in Figure 9. The approach and departure paths to the Intramural Field involve less overall overflight of residential areas than does the Children's campus helistop alternative. The area immediately surrounding this location involves less risk to property and persons than does the Kitchen Garden site.

The landing locations that could be used in the event of an aircraft emergency include the athletic fields in the University of Washington's East Campus area, the top of the Triangle Garage, and Husky Stadium field.

In addition to the risk associated with helicopter operations, there is the accident risk associated with the transport of the patient by ambulance for a distance of less than one mile.

University of Washington Medical Center Helistop Alternative

The University's rooftop helistop is able to accommodate helicopters that have a gross weight less than 6,000 pounds. Although some of the public may perceive the rooftop helistop to be less safe, Airlift's Lead Helicopter Pilot sees no operational problems with the site (Davidson, 1987). It is acknowledged, however, that the structure to the south of the rooftop landing area could constrain flight path options in the event of an aborted landing attempt. The FAA's Principal Aviation Safety Inspector has indicated that the University of Washington Medical Center Helistop site offers an extremely high level of safety (Benedict, 1987).

The approach paths into and departure paths from the University of Washington Medical Center Helistop are similar to those for the Intramural Field. The affected properties at risk also would be comparable. The landing locations that could be used in the event of an emergency are the same as those that could be used under the Intramural Field Alternative.

In addition to the risk associated with helicopter operations, there is the accident risk associated with the transport of the patient by ambulance for a distance of approximately two miles.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Harborview Medical Center

The Harborview Medical Center helistop is fenced and includes pad lighting. The landing area's approach and departure paths are located primarily over commercial and institutional land uses. There are several landing locations in the area that could be used in the event of an emergency, including a variety of parking surfaces within a one-mile area.

In addition to the risk associated with helicopter operations, there is the accident risk associated with the transport of the patient by ambulance.

Boeing Field

Because the helistop locations are not equipped for refueling or maintenance, the Airlift Northwest helicopters regularly fly into the Seattle Jet Center, which is located at Boeing Field. Although there is a greater amount of air traffic at Boeing Field than at the alternative sites, this remains the only location where the aircraft can perform an instrument-controlled landing.

In addition to the risk associated with helicopter operations, there is the accident risk associated with the transport of the patient by ambulance.

Mitigation Measures

Children's could move the natural gas meter house to an alternative location (estimated cost $35,000).

Children's should continue to monitor Airlift Northwest's safety program to ensure that staffing, training, maintenance, and operations are conducted so that the highest commitment is to safety.

Children's would inspect the helistop regularly to ensure that there are no unsafe conditions.

New Airlift Northwest pilots could be allowed to practice landings and takeoffs to the helistop. Existing pilots could be allowed to practice to maintain familiarity with the helistop.

One light pole, three trees north of the site, and three trees to the northeast of the site would be removed or relocated. The height of other campus trees to the northeast of the Kitchen Garden site on the north side of Penny Drive could be monitored to ensure that they do not grow into the airspace for final approach.

Signs should be posted along affected roadways warning motorists of helicopters operating in the vicinity.

Obstruction lights could be placed upon the boiler stacks on the north hospital building.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A mechanism could be established for the City to respond to non-emergency flight deviation complaints that compromise safety.

Any new development on the southside of the building should be reviewed by Airlift Northwest pilots for safety considerations.

The design of the helistop could be modified to bring the design closer to compliance with FAA guidelines for the MAST helicopter, the UH-1.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

NOISE AND VIBRATION

Introduction

This section discusses noise and vibration impacts of the proposed helistop. The section was prepared by Towne, Richards & Chaudiere, Inc.

The report Helipad Noise Evaluation Children's Orthopedic Hospital (Seton, Johnson & Odell [SJO], 1985), prepared as part of the environmental checklist for this proposal, is a partial basis for the noise and vibration analysis. Data from Federal Aviation Administration (FAA) documents, from Airlift Northwest, and from other sources also were used to evaluate and supplement the SJO analysis.

As discussed in the Executive Summary and the Descriptions of the Proposed Action and Alternatives earlier in this Final EIS, most transport missions for Children's-destined patients would involve three flight segments: departure from the helicopter base (Harborview or Boeing Field) to the location of the patient; transport of the patient to Children's Helistop; and return to the helicopter base for dispatch to the next mission. This description differs from that contained in the Draft EIS which indicated a total of four flight segments would be involved. Because it is now assumed that most transport teams would be based at Harborview or Boeing Field, it usually would not be necessary to pickup the medical crew at Children's or the Intramural Field and one flight segment would be eliminated. However, certain cases still could require pickup of a specialized medical crew at Children's or the Intramural Field prior to departure and flight to the location of the patient. Because a fourth flight segment could be necessary in some cases, the analysis in this section assumes a worst case scenario in which noise from two landings and two takeoffs would occur at the designated helistop for each patient transport mission.

Sound Level Descriptors and Criteria

Descriptors

Sound levels are measured in decibels, abbreviated dB. Environmental noise is measured as A-weighted sound level in decibels, often abbreviated dBA or dB(A) to denote the A-weighting. The A-weighting is a frequency-dependent level adjustment that is based on the sensitivity of human hearing at various sound frequencies and takes into account the human ear's lack of sensitivity to low frequencies. Table 16 shows A-weighted sound levels associated with various noise sources and conditions.

The dBA measurements scale is a logarithmic rather than a linear scale, and is, therefore, not directly proportional to the energy or loudness of the noise. The smallest noticeable increase in noise is usually considered to be about 3 dBA, which is a doubling of sound energy. A doubling of judged loudness occurs for each 10 dBA increase in level. For example, 80 dBA is judged to be twice as loud as 70 dBA and four times as loud as 60 dBA.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The increase in loudness of various sound level changes is judged as follows:

Sound level increase, dBA	Judged loudness increase
0 to 2	Barely perceptible
3 to 5	Noticeable
10	Doubling of loudness
20	Quadrupling of loudness

TABLE 16

SOUND LEVELS OF VARIOUS NOISE SOURCES AND CONDITIONS

Sound Level, dBA	Source or Condition
140	Hearing damage risk for short exposure
130	Threshold of pain
120	Race car at 50 feet
115	Occupational noise limit for 15 minutes/day exposure
110	Orchestra fortissimo; rock concert
100	Occupational noise limit for 2 hours/day exposure ambulance siren at 50 feet
95	Occupational noise limit for 4 hours/day exposure
*90	Occupational noise limit for 8 hours/day exposure
*85	Accelerating truck or bus at 50 feet; power lawn mower
*80	Average downtown traffic noise; ambulance siren at 500 feet
*75	Inside auto, accelerating
*70	Inside auto, steady speed
*65	Urban residential average noise; typical auto measured at residential setback
60	Normal conversation
55	Suburban residential average noise
50	General office
45	Residential indoor
40	Quiet indoor
20	Whisper
0	Threshold of excellent hearing

* Approximate sound levels of intermittent aircraft flyovers in Seattle area.

Source: Towne, Richards and Chaudiere, 1986.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

For evaluating the effect of noise on people, one must consider both the level, time of day, and duration of the noise. Noise descriptors that are based on the average sound energy have in the past ten years been found to be the best indicators of noise impact and community response, regardless of whether the noise is steady (such as a freeway) or fluctuating (such as local traffic and aircraft). Community noise, therefore, is often measured as an equivalent or average sound level, Leq, which is the level of a steady sound that contains the same acoustical energy as the fluctuating noise over a given time period.

Noise over 24 hours is measured as day-night average sound level, Ldn, which is the Leq over 24 hours with a 10 dBA penalty included when averaging the Leq for nighttime hours of 10:00 p.m. to 7:00 a.m., because of the greater noise sensitivity during nighttime. For locations exposed to intermittent aircraft noise, it is common for governmental agencies to use the yearly Ldn. The Ldn based on a particular day or condition can also be used to evaluate short-term impact. Ldn is the most widely accepted noise descriptor in the U.S. The descriptor is used by the U.S. Environmental Protection Agency (USEPA), the U.S. Department of Housing and Urban Development (USHUD), and the FAA to evaluate noise impact and land use compatibility. Ldn noise criteria are based on studies of activity interference (speech and sleep), annoyance, and community reaction.

The highest instantaneous sound level occurring during a given time period is called maximum sound level, Lmax. The Lmax descriptor can provide information about intermittent sound levels from particular noise sources, and the amount of noise fluctuation. Although Lmax is not commonly used by regulatory agencies to evaluate noise impact and land use compatibility, it can be used to estimate the probability of sleep interference from single noise events.

Individual aircraft events are also measured as sound exposure level, SEL, which is the level of a steady one-second sound that would contain the same amount of sound energy as the entire event. The SELs of individual aircraft events are used to compute the overall Leq and Ldn.

Although the A-weighted sound level and the Leq and Ldn noise descriptors are currently considered the best overall measures of noise, there are other factors that may affect sensitivity to noise. Impulse noise associated with helicopter blade slap tends to distinguish the helicopter noise from other noise sources. (This blade slap noise is primarily a characteristic of helicopters with two-bladed rotors). Research to determine whether an adjustment should be made to the sound level based on the impulsivity of the helicopter sound has led to conflicting results. The current position of the FAA and the International Civil Aviation Organization (ICAO) is that an impulsivity adjustment is unnecessary to properly certify aircraft and to adequately assess human response.

Criteria

There are no local, state or federal noise regulations specifically for helistops. The following is a discussion of existing noise standards and guidelines, and of noise effects.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Seattle Noise Ordinance. The Seattle Noise Ordinance (City of Seattle, 1977) exempts "sounds originating from aircraft in flight, and sounds which originate at airports and are directly related to flight operations." The ordinance also exempts "sounds created by emergency equipment and emergency work necessary in the interests of law enforcement or of the health, safety or welfare of the community." Exempt sound sources also cannot be considered a public nuisance noise or public disturbance noise. Based on these exemptions, noise from aeromedical helicopters and from ambulance sirens would not be considered subject to the Seattle Noise Ordinance.

United States Environmental Protection Agency (USEPA) Noise Guidelines. Day-night average sound levels, Ldn, affecting residential, hospital and educational activity can be evaluated using USEPA noise guidelines (USEPA Region 10, 1975). Significant impacts on these activities are considered to exist if exterior Ldn is 65 dBA or above. The guidelines consider overall noise increases due to a project of 0 to 5 dBA to cause slight impact, 5 to 10 dBA significant impact, and over 10 dBA very serious impact.

United States Housing and Urban Development (USHUD) Noise Standards. USHUD has established Ldn noise standards for USHUD-assisted projects and actions (USHUD, 1979). The USHUD standards are cited only as an additional reference, since this project is not USHUD-assisted. Ldn 65 dBA or less is "acceptable." Ldn exceeding 65 dBA but not exceeding 75 dBA is "normally unacceptable," and special approvals, environmental review and sound attenuation are required. Ldn exceeding 75 dBA is "unacceptable," and special approvals, environmental review and sound attenuation are required.

FAA Land Use Compatibility Criteria. The FAA (FAA, 1984) has developed land use compatibility criteria based on Ldn as shown in Table 17. The criteria basically consider residential or hospital land use to be not compatible where the yearly Ldn is 65 dBA or above, unless outdoor to indoor sound level reductions are 5, 10 or 15 dBA over standard construction sound level reductions of 20 dBA. All land uses are considered to be compatible where the yearly Ldn is below 65 dBA.

Sleep Interference. The probability of sleep disturbance from noise varies depending on the level and duration of the noise, stage of sleep, individual exposed, and adaptation. Intermittent indoor sound levels (up to a few minutes duration) above 70 dBA have a significant probability of causing sleep interference. Intermittent levels of 40 to 70 dBA are generally considered to have some potential for causing sleep interference. Continuous sound (for example, from air conditioners or fans) causes sleep interference above 35 to 45 dBA. Sleep interference can also occur at lower sound levels, although the probability of sleep disturbance diminishes significantly at the lower levels. Adaptation to a particular sound level or noise source is a factor in determining sleep interference. This factor generally cannot be simulated in laboratory studies. Age is also a factor, with the elderly and children in certain age groups being more susceptible to awakening. Intermittent indoor sound levels up to about 55 dBA are generally not considered to cause impact, based on collated data such as shown in Figure 19. More conservative data from studies conducted in schools and hospitals, as shown in Figure 20, indicate a sleep interference threshold of 40 dBA, with probabilities of awakening from maximum sound levels of 50 dBA as 10%, 60 dBA as 20%, and 70 dBA as 30%.

* The designations contained in this table do not constitute a Federal determination that any use of land covered by the program is acceptable or unacceptable under Federal, State, or local law. The responsibility for determining the acceptable and permissible land uses remains with the local authorities. FAA determinations under Part 150 are not intended to substitute federally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise compatible land uses.

KEY TO TABLE

SLUCM	Standard Land Use Coding Manual.
Y (Yes)	Land Use and related structures compatible without restrictions.
N (No)	Land Use and related structures are not compatible and should be prohibited.
NLR	Noise Level Reduction (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.
25, 30, or 35	Land used and related structures generally compatible; measures to achieve NLR or 25, 30, or 35 must be incorporated into design and construction of structure.

NOTES FOR TABLE

(1) Where the community determines that residential uses must be allowed, measures to achieve outdoor to indoor Noise Level Reduction (NLR) of at least 25 dB and 30 dB should be incorporated into building codes and be considered in individual approvals. Normal construction can be expected to provide a NLR of 20 dB, thus, the reduction requirements are often stated as 5, 10 or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year round. However, the use of NLR criteria will not eliminate outdoor noise problems.

(2) Measures to achieve NLR of 25 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(3) Measures to achieve NLR of 30 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(4) Measures to achieve NLR of 35 must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(5) Land use compatible provided special sound reinforcement systems are installed.

(6) Residential buildings require an NLR of 25.

(7) Residential buildings require an NLR of 30.

(8) Residential buildings not permitted.

Sleep Disturbance by Noise

N

SHAPIRO & ASSOCIATES

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Motor vehicle noise is the primary cause of sleep interference in residential areas. In typical residential areas, there is a relatively steady background sound level from distant traffic. Higher sound levels from local traffic events are superimposed on this background. Typical intermittent sound levels at the 30- to 50-foot setback of a residence would be similar to those that have been identified in national surveys (USDOT, 1978). At 31 miles per hour (50 kph) and 49 feet (15 m), the "national energy mean emission levels" of various vehicle categories are as follows:

Vehicle Category	Sound Level, dBA
Heavy truck	80
Medium truck	74
Automobile	62

Noise emissions from buses are similar to medium or heavy trucks. Noise emissions are several dBA higher when vehicles are accelerating. Typical maximum sound levels in residential areas are, therefore, between about 75 and 85 dBA due to occasional noisy vehicles. Where there is a significant amount of traffic, such as at residences adjoining Sand Point Way N.E., maximum levels between 80 and 90 dBA are common (Towne, Richards and Chaudiere, 1982).

Outside to inside sound level reductions are about 25 dBA in the Northwest when the windows are closed. Residential interior maximum sound levels due to occasional motor vehicles are typically 50 to 60 dBA, which can cause occasional sleep interference. With windows partly open, interior sound levels are typically 10 dBA higher, or about 60 to 70 dBA, and there is greater probability of sleep interference.

Ambulance sirens are another noise source that is occasionally present near Children's. The sirens produce between 90 and 106 dBA at 50 feet, depending on their power rating and orientation (Federal Signal Corp., 1986). The sirens, therefore, are capable of causing interior sound levels significantly above the sleep interference thresholds.

In evaluating the sleep interference potential of the Children's helistop, it is important to consider those noise sources that are already present, and whether there would be a significant increase in intermittent and average sound levels.

Health Effects of Noise. The only clearly established health hazard of noise is hearing loss. State and federal occupational noise exposure limits based on hearing loss are 90 dBA for eight hours exposure, or higher levels up to 115 dBA for shorter exposure periods.

Based on animal studies involving prolonged exposure to high sound levels, health effects other than hearing loss have been postulated. Between 1977 and 1980, several studies to identify possible adverse health effects on residents in high noise environments, such as neighborhoods adjoining Los Angeles International Airport, however, have been inconclusive. There is little conclusive scientific basis for claiming direct health impacts from aviation noise. However, anxiety, high blood pressure and stress reactions are a potential effect for some individuals exposed to noise.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Noise-Induced Structural Vibration. Detectable vibration of portions of building structures can occur if exterior sound pressure levels in the low frequencies below 100 Hz (100 cycles per second) are above 65 to 80 dB, as discussed in the SJO report. Short-duration sound pressure levels above approximately 120 dB are considered to cause annoying rattles and fright (U.S. Department of the Interior, 1980). Sound pressure levels from diesel truck drive-bys and general aviation aircraft flyovers are approximately in the 65 to 80 dB range, based on USEPA sound pressure level data (USEPA, 1971), but are well below 120 dB.

The vibration response of a particular structure depends on the construction type and the window size and type. Residence vibration studies have generally been based on structures in southern California and other parts of the southern United States. It is likely that residences in the Northwest, which typically provide about 5 to 7 dB more outside to inside sound level reduction than residences in Southern California (based on airport acoustic insulation studies), are also less susceptible to structural vibration.

Detectable buzzing or rattling of windows due to structural vibration can result in increased annoyance, but is not damaging to the structure unless the outside sound pressure levels are above approximately 134 dB (U.S. Department of the Interior, 1980). Studies of historic building structures near airports with high sound pressure levels from aircraft noise, including 104 dBA from the Concorde supersonic jet transport (Hershey, Kevala and Burns, 1975), have shown that exposure to normal weather (such as thunder or wind loads) produces a higher probability of breakage than vibration from the noisiest aircraft, the Concorde. The contribution of aircraft to structural damage was found to be insignificant. Since the helicopter sound levels received at residences near Children's would be significantly lower than those measured for the Concorde, there is not expected to be any likelihood of structural damage from the noise.

Residents in the area have reported in their comment letters on the Draft EIS that helicopter operations in the area have cause rattling and movement of dishes and other lightweight objects.

Helicopter Noise Sources

The Children's helistop would primarily be used by Airlift Northwest. Airlift Northwest uses the Agusta 109 Mark II helicopter, which is turbine-powered. The 109 represents near-current low-noise helicopter design. The helicopter has four blades per rotor instead of two, which results in less of the impulsive blade slap noise that is commonly associated with two-bladed helicopters. The Mark II has additional aerodynamic noise reduction features such as a cap on the rotor head, to reduce the air flow angle into the blades and thereby reduce blade noise, and a vortex generator to control blade slap noise. Sound level data for this helicopter were obtained from measurements made by SJO at Children's, from FAA test data, and from measurements made at Harborview Medical Center (King County, 1986).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The MAST helicopters are two-bladed, turbine-powered Bell UH-1Vs and have a more impulsive noise than the Agusta because of blade slap. A-weighted sound levels of the two helicopters are comparable, although because of the blade slap, the MAST is perceived as being noisier. Sound level data for the MAST helicopter were obtained from measurements at Harborview Medical Center.

The loading of the helicopters (gross vehicular weight) has a negligible effect on their noise emission, because power settings, flight paths and blade speed are negligibly affected or unaffected (Hill, 1986).

Affected Environment

Helicopter flight paths are described in detail in Chapter III of this Final EIS. The primary approach to Children's would follow the N.E. 45th Street/Sand Point Way N.E. corridor east of Union Bay Place N.E., enter the Children's campus north of the main entrance, turn south approximately over the parking garage, and land at the helistop. Departures would follow a similar flight path, but at higher altitude.

The existing noise-sensitive land uses are single-family and multi-family residences near the N.E. 45th Street/Sand Point Way N.E. corridor, including Laurelon Terrace Apartments and Laurelhurst West; and single-family residences east of Children's, primarily along 44th Avenue N.E. between N.E. 47th and N.E. 50th Streets. Laurelhurst School, located 1,000 feet east of the helistop site, is also noise-sensitive.

Existing sound levels were described in the SJO report for five locations that had been selected in coordination with the Seattle/King County Department of Public Health and the City of Seattle Department of Construction and Land Use. The measurement locations (see Figure 5, Campus Map) and existing day-night average sound levels, Ldn, were as follows:

	Location	Ldn, dBA
1.	4720-4724 44th Avenue N.E. (N.E. of Children's)	52
2.	4530 45th Avenue N.E. (East of Children's)	53
3.	Laurelhurst West (near Sand Point Way N.E.)	68
4.	Laurelon Terrace (set back from Sand Point Way N.E., West of proposed helistop)	55
5.	4757 - 41st Avenue N.E. (near Sand Point Way N.E., near main entrance to Children's)	63

Existing maximum sound levels were not measured in the SJO study, due to the relatively small number of sound level readings taken at each location. As discussed previously, however, typical maximum levels in residential areas are between about 75 and 85 dBA due to occasional noisy vehicles. Near Sand Point Way N.E., maximum levels between 80 and 90 dBA occur from motor vehicle traffic. Along ambulance routes, sirens produce maximum levels between 90 and 106 dBA at 50 feet (Federal Signal Corp, 1986).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A secondary flight path to Children's would be from the northeast over a single-family residential area. The Villa Academy is located several blocks east of the secondary flight path. This flight path would only have to be used during wind conditions that occur infrequently.

The primary helicopter approach and departure paths to the Intramural Field are from the east over water, from the southwest from the Montlake Cut, and from the north via I-5 and N.E. 45th Street. Noise-sensitive land uses include residences near the Montlake Cut.

The approaches to the proposed University of Washington Medical Center helistop are from the east and northeast, over the University of Washington sports facilities, from the south passing close to the Montlake area, and from the north via I-5, N.E. 45th Street and Montlake Boulevard N.E. The proposed helistop would be located across the Montlake Cut from a noise-sensitive residential area.

Impacts

Proposed Action - Children's Helistop

Noise impacts of the Children's helistop were described in the SJO report. The report assumed 20 patient transports or 40 "round-trip" flights per month, of which 29 would occur during daytime hours of 7:00 a.m. to 10:00 p.m., and 11 during nighttime hours of 10:00 p.m. to 7:00 a.m. Impacts could in fact be less than those described in the SJO report, because of fewer flights. For the noise analysis, it has been assumed that there would be two "round-trip" flights to Children's for each patient transport: the first to pick up the medical crew and the second to deliver the patient. This is a worst case scenario, because it is now assumed that, with the medical transport team based at Harborview or Boeing Field, three not four flight segments would be necessary for the majority of patient transports. Only in certain cases would a specialized medical crew be picked up at Children's or the Intramural Field. This worst case scenario would result in 80 over-flights per month. The assumed 20 patient transports/40 "round-trip" flights per month is, therefore, a "worst case" assumption.

The number of nighttime transports is expected to be less than the 28% assumed by SJO. Data for 103 transports that landed patients at the Children's campus indicate that approximately 18% of the transports occur during nighttime hours of 10:00 p.m. to 7:00 a.m. For the purpose of these environmental analyses, it is assumed that 25% of the transports would occur in nighttime hours.

The SJO report's comparison of monthly day-night average sound levels, Ldn, with and without the proposed helistop, based on noise tests of the Agusta helicopter at Children's, is shown in Table 18.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 18

EXISTING AND PREDICTED Ldn

	Monthly Ldn, dBA			
Location	Existing	Helicopter (20 patient transports; 40 round-trip flights)	Combined	Increase
1. 4720-4724 44th Ave. N.E.	52	55	57	+5
2. 4530 45th Ave. N.E.	53	48	54	+1
3. Laurelhurst West	68	50	68	0
4. Laurelon Terrace	55	56	59	+4
5. Across from main entrance	63	52	63	0

Source: Seton, Johnson & Odell, 1985.

The projected worst case noise increase of 5 dBA in Ldn is considered a slight impact according to USEPA noise guidelines (USEPA, 1975).

The highest maximum sound level of the helicopter was measured by SJO to be 84 dBA at the closest receptor location, 4720-4724 44th Avenue N.E. Interior sound levels would depend upon whether the windows are opened or closed. Typical interior maximum sound levels from helicopters were estimated to be about 55 dBA, assuming typical outdoor maximum levels of 80 dBA and an outdoor to indoor sound level reduction of 25 dBA with windows closed. This level was estimated to awaken 15% of a normal population sample. As indicated previously, intermittent levels up to about 55 dBA are generally not considered to cause impact. At the closest receptors, the maximum sound levels would be about 84 dBA exterior and 59 dBA interior with windows closed. This 59 dBA level would cause about a 20% probability of awakening, based on Figure 19. With windows partly open, interior maximum levels would be about 10 dBA higher, or up to 69 dBA, causing a 30% probability of awakening according to Figure 19. This probability of awakening is about 5-10% higher than for the estimated existing condition without helicopters, which is maximum levels of 60 to 65 dBA interior with windows partly open.

Based on discussions with Airlift Northwest concerning noise considerations, the primary flight path for Children's has been modified to allow a more gradual and direct turn into Children's than was used in the SJO noise tests, instead of the sharp turn that was previously made north of the intersection of Sand Point Way N.E. and N.E. 50th Street. The portion of the new flight path near the helistop would also be farther east of the Laurelon Terrace apartments, resulting in about 7-9 dBA lower maximum levels from helicopters than for the current flight path.

Maximum and day-night average sound levels were calculated for the new flight path using FAA noise test data for the Agusta 109 Mark II (FAA, 1985). The FAA data provides Lmax and SEL readings at the centerline and

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

several side distances for various approach, takeoff, level flyover and hover operations. In addition to an average monthly Ldn, a "worst one-day" Ldn was also calculated, assuming two daytime and two nighttime flights. Results of the calculations are shown in Table 19. The helicopter Ldns shown in Table 19 are considered to represent the "worst case" cumulative impact condition, as discussed previously.

The calculated monthly Ldn from helicopters are relatively close to those of SJO (see Table 18) at Locations 2, 4 and 5, but are lower at Locations 1 and 3, presumably because of differences in the flight path (affecting distance and exposure time) and possibly a difference in the helicopter altitude used to calculate levels at Location 3, Laurelhurst West. The helicopter Ldns shown in Table 19 are consistent with a current measured helicopter Ldn of 48 dBA 450 feet from the helistop at Harborview Medical Center (King County Department of Executive Administration, 1986).

The calculated highest Lmax of 84 dBA at the closest residences is identical to the level predicted by SJO.

The predicted sound levels are not expected to exceed the EPA's recommended significant impact criteria of a Ldn above 65 dBA or of an increase of more than 5 dBA in overall monthly and worst one-day noise. At all locations, the calculated monthly Ldn from helicopters would be less than the existing Ldn, resulting in a 3 dBA or less noise increase. There would, however, be increased sleep interference affecting Laurelon Terrace, residences west of the Children's main entrance that are not near Sand Point Way N.E., and the closest residences northeast of the proposed helistop site. At these locations, interior Lmax from helicopters are likely to be several dBA above the currently existing Lmax from motor vehicles (up to 59 dBA predicted versus 50 to 55 dBA estimated existing). Assuming about 25% of the flights occur at night, in 1995 there would be an average of approximately four to five nighttime patient transports per month.

Because the rise in noise would be gradual, startle effects associated with rapid noise increases from sources such as blasting or sonic booms would not occur. Nevertheless, it is acknowledged that there could be adverse responses to the noise, including stress.

There would be some noise impacts affecting Laurelhurst School. There would be approximately five minute-long noise impacts during approaches and landings and a similar duration of noise for takeoffs and departures. These events would result in exterior sound levels (FAA, 1985) of up to 72 dBA at the second story and 62 dBA at the first story and playgrounds, which are shielded by residential structures. The interior maximum sound levels would be about 47 dBA with windows closed and 57 dBA with windows open at the second story, and 37 dBA with windows closed and 47 dBA with windows open at the first story. These levels are approximately similar to sound levels currently caused by motor vehicle drivebys. The noise could disrupt classroom activity. The secondary approach/departure route would have a greater effect on the noise levels at the Laurelhurst School than would the primary flight path.

**The "existing worst one-day Ldn" is assumed to be the existing Ldn measured by SJO plus 3 dBA, since the existing Ldn varies from day to day depending on the traffic conditions and local activities.

Source: Towne, Richards and Chaudiere, Inc., 1986.

There would be sleep interference impacts several times per month affecting hospital patients whose rooms are exposed to helicopter noise. Maximum exterior sound levels at the portion of buildings closest to the helistop would be about 94 dBA. Interior maximum sound levels would be about 69 dBA with windows closed, which is considered to be the typical nighttime condition. These levels would cause about a 30% probability of awakening, based on Figure 19. Maximum sound levels, however, would be less than for the Limited Landings Alternative, since the helistop would be farther from the hospital building.

Low-frequency sound pressure levels from helicopters were estimated in the SJO report and found to be approximately similar to the levels at which perceptible structural vibrations are considered possible. The levels,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

however, are also similar to those that typically occur from diesel trucks and general aviation aircraft flyovers, as discussed previously. The estimated levels are significantly below levels that are considered to cause fright or structural damage.

The probability of structural vibration would be less than for the current flight path required by the Limited Landings Alternative.

Flights by the MAST helicopters would produce A-weighted sound levels almost identical to those of the Agusta, based on measurements at Harborview Medical Center (King County, 1986). The MAST helicopter noise would be more noticeable than that of the Agusta because of more blade slap, as discussed previously.

There are no known adverse health effects associated with the predicted helicopter sound levels for the neighborhood around Children's.

There would be temporary noise impacts from intermittent construction noise during the two-month construction period, primarily affecting hospital patients whose rooms face the construction site. The noise would occur from trucks delivering fill material, grading and compaction of the site, and construction of the concrete surface. These activities would be limited to daytime hours. The Seattle Noise Ordinance (City of Seattle, 1977) contains stringent limits on construction noise received in residential areas during nighttime hours of 10:00 p.m. to 7:00 a.m. on weekdays and 10:00 p.m. to 9:00 a.m. on weekends. The daytime construction noise is not expected to affect residential areas because of the distance to these areas.

The following is a summary of impacts. The summary is consistent with the findings of the SJO report:

- The helicopter noise would be infrequent and short-term in nature, and the increase in sound levels that would be received at residences would be moderate.

- Helicopter flights during sleeping periods could cause awakening probability of about 15-30% at the closest, line-of-sight residences and 30% at the closest hospital patient rooms.

- The impact of the helicopter noise exposures as measured by Ldn would increase by 3 to 5 dBA at residences closest to the helistop. Under EPA criteria, this is not considered a significant impact.

- Structural vibrations due to helicopter flights are not expected to be significant.

Intramural Field Helistop Alternative

Construction noise impacts could occur if the University of Washington made improvements to the existing helistop. When the primary approach and departure paths are used, the Intramural Field Alternative is not expected to result in significant noise impacts from helicopter operations, since it is an existing use and residential properties are a substantial distance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

from the helistop. There could, however, be impacts on student dormitory residents and possibly noise interference with class lectures on the few occasions when the secondary approach path over the University of Washington campus is used.

This alternative could result in ambulance sirens occasionally being used between the Intramural Field and Children's. The sirens are approximately as loud as the helicopters, producing about 90 to 106 dBA at 50 feet and 86 dBA at 500 feet. Residences along Sand Point Way N.E., including the Laurel Village University of Washington housing, Laurelhurst West, portions of Laurelon Terrace, and several other single- and multi-family residences, could experience higher maximum sound levels from ambulances than from the helicopters associated with the Proposed Action. The closest single-family residences to the east of Children's along 44th Avenue N.E., and patient rooms near the northern part of Children's, would experience lower maximum levels than under the Proposed Action, assuming that the ambulance sirens are not used within the hospital property.

University of Washington Medical Center Helistop Alternative

This alternative is not being considered by the University at this time. However, if the University of Washington Medical Center Alternative helistop were used, it would result in slight helicopter noise impacts affecting patients whose rooms were exposed to helicopter noise and residents south of the Montlake Cut. These impacts would be several dBA less than those described previously for residents closest to the Children's helistop, because of greater distance from the operating aircraft.

This alternative could also result in the occasional use of ambulance sirens during transport between the University of Washington Medical Center and Children's. As indicated above, the ambulance sirens could produce higher maximum sound levels at residences along Sand Point Way N.E. than would helicopters, but lower levels at single-family residences to the east of Children's and at the northern hospital rooms.

Limited Landings Alternative

Under the Limited Landings Alternative, helicopter flights to Children's are expected to continue as they currently do in response to the most critical emergencies, resulting in occasional noise impacts. Impacts from individual missions would be slightly greater than those events described for the Proposed Action, because the approach and departure paths and landing area would be somewhat closer to the hospital and patients' rooms. In 1995, nighttime missions would occur on the average of slightly less than one per month.

This alternative could also result in the occasional use of ambulance sirens during transport from Boeing Field or Harborview Medical Center.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Preferred Alternative

The Preferred Alternative involves the majority of the patients being transported to Harborview and/or the Intramural Field, with the most critical patients landed at the Children's campus. There would be construction noise that would be comparable to the construction noise impacts described under the Proposed Action. In addition, there could be construction noise associated with minor improvements that could occur at the University's existing helistop at the East Campus location.

Under this alternative, there would be no landings at Children's in order to pick up the medical crew. In 1995, there would be approximately four patients per month that would be landed at the Children's helistop. Impacts on monthly Ldn would be less than those identified in Table 18. The noise on a day with a single helicopter landing and departure event would be approximately the same as presented in Table 18. An estimated average of less than one landing per month could occur during the nighttime hours.

Under this alternative, the majority of the patients would land at either Harborview and/or at the Intramural Field. The noise impacts at the Intramural Field would be comparable, although less, than the impacts described under the Intramural Field Alternative, above. The noise impacts at Harborview would be comparable to what would be expected under the No Action Alternative, as described below.

No Action Alternative

Under the No Action Alternative, noise impacts associated with helicopter approaches and departures would be limited to the area around Harborview and Boeing Field. In addition, there could be occasional use of ambulance sirens during transport from Boeing Field or Harborview.

Mitigating Measures

The following are proposed mitigating measures that are incorporated into the Proposed Action:

- The helistop would be used primarily by a modern, multi-blade helicopter representing near-current low-noise technology.
- The proposed primary flight path would keep the helicopter at high altitude above Sand Point Way N.E.
- The helicopter would use a noise abatement approach and departure that reduces disturbances to residences.
- The Kitchen Garden Helistop location maximizes ground distances to residences, and is shielded on the south by the hospital structure.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The following additional mitigating measure is possible:

. The medical crew could be picked up at a location other than Children's, resulting in a 50% reduction in the number of flights to Children's. (This practice has been implemented by basing the helicopter and transport teams at Harborview and Boeing Field.) The monthly and worst-day Ldn from helicopters as shown in Table 18 would then be reduced by 3 dBA, resulting in slightly lower noise increases.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CUMULATIVE IMPACTS

The potential for Children's helistop approval establishing a precedent for the siting of helistops at other Seattle-area hospitals was determined to be an issue through the scoping process. The concern regarding the establishment of a precedent is important for two reasons. First, there is a concern that other medical institutions may seek permission to construct helistops on their respective campuses. This in turn could result in more dispersed EMS helicopter operations throughout the City, along with the environmental impacts associated with those operations. The second component of the precedent issue is the possibility that the construction of a helistop could be the first step in the establishment of a new air ambulance service that would compete with existing air ambulance services. As stated by the Puget Sound Health Systems Agency, ". . . individual institutions (could) establish helipads and eventually separate helicopter programs in an effort to meet particular patient care objectives which might be met satisfactorily under the current arrangement of emergency services" (Thompson, 1985).

While local and community hospitals in the region are capable of treating most life-threatening emergencies, some patients with particularly complex or severe presenting conditions will be referred to the more sophisticated level of services and capabilities offered only at certain tertiary care hospitals and medical centers.

In Seattle, many hospitals are involved in treating critically ill and injured patients who are facing life-threatening emergencies; however, only a few of these institutions are considered as tertiary care centers for these emergencies. In Seattle, these referral centers and their areas of particular medical expertise are:

Children's - Neonatal/Pediatric Medical and Surgical Emergencies
Harborview - Trauma, Burn Emergencies
Providence - Adult Cardiac Emergencies
University - Neonatal, Obstetrical, and Adult Medical (including Cardiac) Emergencies

Harborview and the University of Washington currently have approved helistops. Helicopters are landing at Children's and Harborview, with Children's having submitted an application for a helistop. No other Seattle hospitals are deemed likely candidates for helistops (Nicola, 1986).

Based on a survey of Seattle-area medical institutions, Ballard Community Hospital, St. Cabrini Hospital, Group Health Cooperative, Northgate General Hospital, Northwest Hospital, Pacific Medical Center, Providence Medical Center (a member of the Airlift Consortium that shares the Harborview Helistop), Swedish Hospital and Medical Center (an Associate Member of the Airlift Consortium), West Seattle Community Hospital, and Virginia Mason Medical Center (an Associate Member of the Airlift Consortium) do not currently plan a helistop. These medical institutions represent all the major hospitals in the City of Seattle.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In order for a Seattle area medical institution to receive a conditional use approval, it must demonstrate that the helicopter is needed to save lives. Although it is conceivable that the non-centrally located hospitals (Ballard, Northgate, West Seattle) could have occasion for patients to be transported from the hospital due to extraordinary circumstances (such as severe traffic congestion), it is unlikely that a dedicated helistop would be warranted.

Approval of the Proposed Action is not expected to have an impact upon the number of helistops nor the number of helicopter services. Rather, the creation of Airlift Northwest by a consortium of specialty, regional referral medical institutions was designed to avoid the proliferation of air ambulance services and to provide critically ill and injured patients with an appropriate level of medical service. It is unlikely that new air ambulance programs in the Seattle area would be able to compete successfully with Airlift Northwest, whose membership is comprised of the principal tertiary care institutions to which emergency patients requiring helicopter transport are being taken. Because the Airlift Northwest medical transport crews provide an extension of the medical capabilities of the consortium members, a new air ambulance program would have difficulty offering the same type of service provided by Airlift Northwest.

An additional factor is the cost of establishing an air ambulance service, including the cost of permit approvals, purchasing and/or leasing the equipment, maintaining the aircraft, and the cost of maintaining a staff of qualified pilots, mechanics, medical transport teams and program administrators.

In the event a helistop application for air medical use is made in the future, it would be subject to the land use criteria used by the City of Seattle for evaluation of applications for institutional helistops. Those criteria limit the use of helistops to those situations involving life-threatening emergencies and those with a demonstrated medical need. The proposed major institution policies contain similar language to the existing code.

The Washington State Medical Association's draft air ambulance protocols (appended to Dr. Nicola's updated report in Appendix A) have been prepared and submitted to the State Department of Social and Health Services (DSHS) for their consideration (see discussion in Chapter II). These guidelines can be used by agencies to determine whether particular medical institutions are appropriately involved in the treatment of the types of patients that are identified in the draft protocols as warranting air ambulance transport.

The City's land use review process, the Washington State Medical Association's guidelines for patient transport, which have been recommended to the DSHS, and the (probable) development of guidelines for integrating the helicopter service into the regional EMS system are expected to prevent the inappropriate development of helistops and helicopter services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Although the above considerations and regulations may effectively limit the proliferation of helistops, it is possible that medical institutions in the Seattle area would allow helicopters to land patients at their campuses. Specifically, Children's has interpreted the WAC 248-18-285 (see Chapter II) to mean that a hospital is obligated to accept patients that are brought to their doors and, therefore, cannot deny helicopters the permission to land patients. The City of Seattle does not agree with Children's interpretation of this section of the WAC. Other Seattle area hospitals may interpret the Washington Administrative Code in the same way as Children's and may not prohibit helicopters from landing patients. However, in order to construct a helistop, these other institutions would need to receive a Council Conditional Use Permit.

Mitigating Measures

As part of the Proposed Action and Preferred Alternative, a Medical Review Committee, which is described in Appendix C, has been proposed. The Committee's responsibilities would include the examination of Airlift Northwest transports that land at Children's to ensure that use of the helistop conforms to the medical needs criteria of the conditional use approval. Such a review could be expanded to all Airlift Northwest helicopter transports to Children's and to transports by other programs, such as Med-Flight or Mast.

Children's could work with Med-Flight and other air ambulance services to ensure that protocols, including dispatching procedures, communications, flight paths, and guidelines for selecting landing locations, are understood and adhered to.

Children's and Airlift Northwest have committed to cooperating in any future program to integrate air ambulance services into County, regional and State Emergency Medical Services plans.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

UNAVOIDABLE ADVERSE IMPACTS

This section identifies, for each of the alternatives, the unavoidable adverse impacts that cannot be mitigated.

The Proposed Action

Noise

There would be noise generated during the two-month long construction of the helistop at the Kitchen Garden site on the Children's campus.

Noise and vibration would be generated by the helicopter during an estimated 15-21 patient transports per month by 1995. Assuming that there are no reduced flights due to medical transport team pickup at an alternate location, it is estimated that in 1995 there would be approximately 30-42 monthly landings and takeoffs that would generate noise and vibration.

Noise and vibration levels would cause disturbance to conversation and other noise-sensitive activities.

With an estimated 25% of the patient transport missions occurring during the nighttime hours (10:00 p.m. to 7:00 a.m.), it is estimated that by 1995 approximately once a week there would be noise and vibration levels sufficient to cause sleep disturbance to 15-30% of the closest receptors.

Safety

There is a statistical risk that there would be one accident in every 14,184 patient transport missions. (Refer to Table 15.)

Of all alternatives, the Proposed Action presents the greatest risk to people and property along the flight path and in the area around Children's.

Cumulative Impact

It is possible that the University could receive City approval to use the existing helistop on the roof of the expansion wing of the University of Washington Medical Center; although use of the helistop is not being considered by the University at this time. This would result in three helistops in close proximity to one another.

Intramural Field Helistop Alternative

Noise

There would be noise generated during the two-month long construction period, if improvements were made to the existing helistop at the Intramural Field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Noise and vibration would be generated by the helicopter during an estimated 15-21 patient transports per month in 1995. Assuming that there are no reduced flights due to medical transport team pickup at an alternate location, it is estimated tha. in 1995 there would be approximatelv 30-42 monthly landings and takeoffs that would generate noise and vibration.

Noise and vibration levels at the Intramural Field location would cause less disturbance to conversation and other noise-sensitive activities than the Proposed Action. However, there may be noise interference with class lectures and impacts on dormitory residents.

Under this alternative sleep disturbance would be less than the Proposed Action because noise reduction would occur over the increased distance to sensitive receptors.

There could be ambulance siren noise over a portion of the distance from the Intramural Field to Children's.

Safety

There is a statistical risk that there would be one accident in every 14,184 patient transport missions. This statistical risk is identical to the Proposed Action.

Although the risk of an accident at Children's is eliminated, there is an increased risk associated with the area along the flight path to and from the helistop at the Intramural Field. The risk of a bird strike is increased, compared to the Proposed Action.

There is some risk associated with the ground transport of patients via ambulance from the Intramural Field to Children's.

Cumulative Impact

No unavoidable adverse impacts have been identified.

University of Washington Medical Center Helistop Alternative

It should be noted that this alternative is not being considered by the University at this time.

Noise

Noise and vibration would be generated by the helicopter during an estimated 15-21 patient transports per month in 1995 if the helistop was being used. Assuming that there are no reduced flights due to medical transport team pickup at an alternate location, it is estimated that in 1995 there would be approximately 30-42 monthly landings and takeoffs that would generate noise and vibration.

Noise and vibration levels would cause some disturbance to conversation and other noise-sensitive activities, but would be less than the Proposed Action.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Under this alternative sleep disturbance would be less than under the Proposed Action because noise reduction would occur over the increased distance to sensitive receptors.

There could be ambulance siren noise over a portion of the distance from the University of Washington Medical Center to Children's.

Safety

There is a statistical risk that there would be one accident in every 14,184 patient transport missions. This statistical risk is identical to the Proposed Action.

Although the risk of an accident at Children's is eliminated, there is an increased risk associated with the area along the flight path to and from the rooftop helistop at the University of Washington Medical Center.

There is some risk associated with the ground transport of patients via ambulance from the University of Washington Medical Center to Children's.

Cumulative Impact

This alternative would result in two helistops on the University of Washington campus being actively used.

Limited Landings Alternative

Noise

Noise and vibration would be generated by the helicopter delivery to the existing landing location outside the Children's Emergency Room entrance of a majority of the patients being transported by helicopter.

With an estimated 25% of the patient transport missions occurring during the nighttime hours (10:00 p.m. to 7:00 a.m.), it is estimated that by 1995 approximately less than once a month there would be noise and vibration levels sufficient to cause sleep disturbance to 15-30% of the receptors closest to Children's Kitchen Garden site. Noise and vibration levels would cause disturbance to conversation and other noise-sensitive activities in the area immediately surrounding Children's.

There would be additional noise generated in the vicinity of the helistop at Harborview or at the landing location at Boeing Field. This noise would be within regulated limits.

For patient transports landing at Harborview or Boeing Field, there could be ambulance siren noise over a portion of the distance from those landing locations to Children's.

Safety

There is a statistical risk that there would be one accident in every 14,184 patient transport missions. This statistical risk is identical to the Proposed Action.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There is a greater risk in landing and taking off from the existing location at Children's than there would be from a constructed helistop at the Kitchen Garden location.

Risk of an accident at Children's is reduced compared to the Proposed Action; however, the risk for the area along the flight paths to and from Harborview and Boeing Field is increased.

There is some risk associated with the ground transport of patients via ambulance from the Harborview or Boeing Field to Children's.

Cumulative Impact

It is possible that the University could use the existing helistop on the roof of the expansion wing of the University of Washington Medical Center, although this is not being considered by the University at this time.

The Preferred Alternative

Noise

There would be noise generated during the two-month long construction of the helistop at the Kitchen Garden site on the Children's campus.

Noise and vibration would be generated by the helicopter takeoff and landing at the Kitchen Garden site during the transport of an estimated 3-5 patients per month in 1995.

With an estimated 25% of the patient transport missions occurring during the nighttime hours (10:00 p.m. to 7:00 a.m.), it is estimated that by 1995 approximately once a month there would be noise and vibration levels sufficient to cause sleep disturbance to 15-30% of the closest receptors. Noise impacts of individual events would be less than the Limited Landings Alternative.

During the 3-5 landings per month in 1995, noise and vibration levels would cause disturbance to conversation and other noise-sensitive activities in the area immediately surrounding Children's.

There would be additional noise generated in the vicinity of the helistop at Harborview or at the helistop at the Intramural Field. This noise would be within regulated limits.

For patient transports landing at Harborview or the Intramural Field, there could be ambulance siren noise over a portion of the distance from those landing locations to Children's.

Safety

There is a statistical risk that there would be one accident in every 14,184 patient transport missions. This statistical risk is identical to the Proposed Action.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Risk of an accident at Children's is reduced compared to the Proposed Action; however, the risk for the area around Harborview and the Intramural Field is increased.

There is some risk associated with the ground transport of patients via ambulance from Harborview or the Intramural Field to Children's.

Cumulative Impact

It is possible that the University could use the existing helistop on the roof of the expansion wing of the University of Washington Medical Center; however, this is not being considered by the University at this time.

No Action Alternative

Noise

Noise and vibration would be generated by the helicopter during takeoffs and landings from Harborview or Boeing Field for an estimated 15-21 patient missions per month in 1995.

There could be ambulance siren noise over a portion of the distance from the landing locations to Children's.

Safety

There is a statistical risk that there would be one accident in every 14,184 patient transport missions. This statistical risk is identical to the Proposed Action.

Although the risk of an accident at Children's is eliminated, there is an increased risk associated with the area along the flight paths to and from the landing locations.

There is some risk associated with the ground transport of patients via ambulance from Harborview or Boeing Field to Children's.

Cumulative Impact

It is possible that the University could use the existing helistop on the roof of the expansion wing of the University of Washington Medical Center; however, use of the helistop is not being considered by the University at this time.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

RELATIONSHIP TO PLANS AND POLICIES

This section discusses both the original and revised Seattle's Major Institutions Policy Sets and Seattle's Residential Area Policies as they relate to the Proposed Action and the Intramural Field and Preferred Alternatives.

Original Major Institution Policies

As discussed in Chapter II of this Final EIS, the original major institutions policies were adopted on July 6, 1981 (Resolution 26579; SMC 23.16.010) and the Land Use Code on April 25, 1983 (Ordinance 111100 and 111101; SMC 23.48). The original major institutions framework policy (SMC 23.16.010) recognizes the "valuable and needed services, education, training and employment opportunities" provided by major institutions and states that "their reasonable growth in Seattle should be encouraged." However, the framework policy also acknowledges that when major institution activities and facilities are located in residential areas, they "can have negative impacts in terms of traffic generation, loss of housing and incompatible physical development." The purpose of the policy, therefore, "is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods adjacent to institutions."

According to the framework policy, "development of a major institution within its established boundaries shall be guided by the development standards of the assigned institutional classification(s) and shall not require a master planning process." However, the master plan process is required in certain situations, including when "development is to occur outside of established boundaries," and when "development is planned which, when taken into account with other recent development within the boundaries, creates a significant cumulative impact on the surrounding area."

Comment: The proposed Kitchen Garden Helistop is considered an accessory use to Children's, which is a permitted use, and is allowed as a conditional use subject to the Council Conditional Use Permit process. This EIS addresses noise and safety impacts on the surrounding area and also examines cumulative environmental effects as they relate to the proliferation of helistops at other hospitals in the City. The EIS also addresses other conditional use issues, including restricted use, sensitive siting, and alternative locations for the helistop. The proposed helistop would not result in loss of housing, nor be incompatible with existing physical development on Children's campus.

Under the Proposed Action, development would not occur outside the established major institution boundary of Children's.

Under both the Intramural Field and Preferred Alternatives, the existing helistop at the Intramural Field could be improved, with Children's destined-patients landing at the facility. Thus, the patients would land outside Children's major institution boundary. Off-campus noise impacts from the Proposed Action and the Intramural Field and Preferred Alternatives would be within regulatory guidelines. However, noise impacts on

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

residential areas would be greatest under the Proposed Action and least under the Intramural Field Alternative. There would be an increase in the risk of an aircraft accident in the surrounding area. The risk to residential areas would be greatest under the Proposed Action and least under the Intramural Field Alternative.

Ten implementation guidelines, including one specific to the University of Washington, identify major institutions and guide development within their boundaries. Implementation Guideline 1, Definition and Identification of Major Institutions, identifies Children's as a major institution. Four other implementation guidelines also apply to the proposal.

Implementation Guideline 3, Development Not Requiring a Master Plan, establishes institutional zoning within major institution boundaries and states: "the institution shall be allowed to expand or redevelop within its boundaries following the development standards of the assigned institutional classification(s), except that... development which creates negative impacts due to cumulative development shall require a master plan." The Guideline requires assignment of the institutional classification(s) be made "so as to mitigate the adverse impacts of institutional development on the surrounding community, while recognizing that by limiting the area of institutional expansion, more intensive growth within the institutional boundaries may be necessary."

Comment: The proposed helistop would not create negative impacts due to cumulative development and therefore a Master Plan would not be required. The approval of the Proposed Action would intensify use within Children's institutional boundary. The Intramural Field Alternative would intensify development on the University campus. The Preferred Alternative would intensify development on both the Children's and University campuses but to a degree less than that which would occur under either the Proposed Action or the Intramural Field Alternative.

Implementation Guideline 4, Institutional Classifications, establishes six institutional classifications in the Land Use Code and requires development standards within the classifications be developed with several policy objectives in mind including:

"f. Mitigate adverse impacts associated with the use of the proposed facility so that the location of parking and the routing of traffic do not create serious noise, safety problems or blighting influences on the surrounding area;...

i. Promote safety for those living, working and visiting the area."

Comment: The Proposed Action would not require parking nor create vehicular traffic. The Intramural Field Alternative would generate negligible vehicular traffic associated with the ground transport of patients to Children's. Vehicular traffic under the Preferred Alternative would be less than that associated with the Preferred Alternative.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Safety and noise are issues that are discussed in Chapter IV. Under the Proposed Action, noise and safety impacts would be greater than the impacts under the Preferred Alternative, which, in turn, would be greater than the Intramural Field Alternative.

Implementation Guideline 5, Development Requiring a Master Plan (Alternative B), repeats the recommendation in Implementation Guideline 3 that requires preparation of a master plan when "development is planned which, when taken into account with other recent development within the boundaries, creates a significant cumulative impact on the surrounding area." Master plans are required if development is planned outside of the established boundary.

Comment: As stated under Implementation Guideline 3, above, the Proposed Action would not create negative impacts due to cumulative development nor would development occur outside the established institutional boundary and, therefore, a Master Plan would not be required. Under the Preferred and Intramural Field Alternatives, development would occur outside (but within one mile of) the major institution boundary and a Master Plan would be required.

Implementation Guideline 7 Decentralization, encourages "decentralization of major institutions..., where appropriate." In particular, it requires "alternative locations for uses which may not be necessary on the main campus, such as laundry facilities and computer services,... be considered."

Comment: Alternative landing locations for Children's destined patients have been analyzed in this EIS. These locations include the University of Washington Medical Center Rooftop, the University of Washington Intramural Field, Harborview and Boeing Field. In addition, two alternatives, the Limited Landings and Preferred Alternatives, consider landing only the most critically ill and injured patients at Children's while landing the remainder at an alternative location. The medical necessity of locating the proposed helistop at the Kitchen Garden site also is evaluated, as part of the Council Conditional Use Permit process, described earlier in this EIS.

According to Dr. Nicola, "4 or 5 of the [15-20 patients being transported to Children's each month] may have a medical need for helicopter transport to the doors of the hospital" (see Appendix A). Thus, according to Dr. Nicola not all patient transports must land at the Children's campus. Under the Proposed Action all patients being transported by helicopter would land at the hospital, with not all of the landings at Children's being necessary from a medical need perspective. Under the Intramural Field Alternative, all Children's-destined patients would land off-campus, which may be inappropriate to their medical treatment requirements. The Preferred Alternative would have the most critical patients land at Children's, with the remainder being transported to the Intramural Field, where landings would not inordinately sacrifice patient care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Under the Major Institutions Land Use Code adopted in 1983 (SMC 23.48), Children's is designated a major institution (23.48.002). Within major institutions, helistops are allowed as a Council conditional use, if the Council finds that (SMC 23.48.005):

"a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property;
c. Use of the helistop will be restricted to occurrences involving life threatening emergencies."

Comment: This EIS is designed to fulfill the SEPA requirements of the Conditional Use Permit. With respect to findings of medical need necessary to secure a Conditional Use Permit, DCLU requested that Dr. Nicola, the former Director of the Seattle-King County Department of Public Health, assist DCLU in the medical need determination. The other conditional use issues, including restricted use, sensitive siting and alternative locations also are addressed in this EIS.

Further, this section of the Land Use Code states: "The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas."

Comment: As discussed under Implementation Guideline 7, above, alternative locations for the proposed helistop are identified and evaluated in this EIS.

Revised Major Institution Policies

As new development occurred and master plans were prepared under the original major institutions policies (1981) and Land Use Code (1983), concerns with the implementation of the policies and code were raised by the major institutions and citizen groups in neighboring areas. In response to these concerns, the major institutions policies were revised via Resolution 28081, adopted March 26, 1990, as amended by Resolution 28191, adopted June 25, 1990. Application for construction of the Children's Kitchen Garden Helistop was filed with the Department of Construction and Land Use and the Draft EIS on the Children's helistop proposal was issued prior to adoption of the revised major institutions policies. Therefore, the proposal is vested under the original policies and Land Use Code and the revised policies do not apply. However, for the purposes of full disclosure, revisions to the major institutions policies are discussed in this section.

The Major Institutions Land Use Code and list of major institutions (SMC 23.48) is repealed under Policy 6, Transition Provisions, of the revised major institutions policies. This policy establishes a major institution overlay district for each institution that meets the definition of a major institution as established in Policy 1, Definition. However, the policy states: "Major institution master plans and other major institution development agreements adopted prior to these policies shall remain in effect under the conditions of adoption or until such time as they are amended or superseded under the provisions of these policies."

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Comment: Because the application for construction of the Children's helistop was filed with the Department of Construction and Land Use and the Draft EIS on the Children's helistop proposal was issued prior to adoption of the revised major institutions policies, the proposal is vested under the original policies and Land Use Code and the revised policies do not apply.

The intent of the major institution overlay district, as established in Policy 2, Overlay District, is "to permit appropriate institutional development within boundaries while minimizing the adverse impacts associated with development and geographic expansion" and "to balance the public benefits of growth and change for major institutions with the need to maintain livability and vitality of adjacent neighborhoods." Within the overlay district, "all functionally integrated major institution uses shall be allowed, provided the development standards of the underlying zone are met." Through a master plan process, "development standards specifically tailored for the major institution and its surrounding area may be permitted within the overlay district." "Functionally integrated major institution uses" are further defined in Implementation Guideline 2, Overlay Provisions, of this policy as "all uses that are functionally integrated with the central mission of the major institution or that primarily and directly serve the users of the institution." Characteristics to be used to determine whether or not a use is functionally integrated with the central mission of the institution include:

"a. Functional contractual association
b. Programmatic integration
c. Direct physical circulation/access connections
d. Shared facilities or staff
e. Degree of interdependence."

Comment: The proposed Kitchen Garden Helistop is an appropriate use as it contributes to Children's ability to provide appropriate care for its critically ill and injured patients whose medical conditions warrant immediate transport to the hospital. However, environmental impacts are greater relative to the Intramural Field and Preferred Alternatives. The Intramural Field Alternative minimizes environmental impacts on neighborhoods adjacent to Children's Hospital, however, it does not provide for institutional development that would support the care of the most critically ill and injured patients whose medical conditions would warrant transport directly to the Children's campus. The Preferred Alternative strives to balance institutional development needs with the need to maintain the livability of the neighborhood adjacent to Children's.

The helistop is considered a functionally integrated major institution use as it serves users of the institution who require immediate transport to the hospital. The Kitchen Garden Helistop provides for direct patient access. Under the Intramural Field Alternative direct access is limited compared to the Proposed Action, while under the Preferred Alternative direct access is provided to those patients for whom minimal transport time may be crucial. Under tne Proposed Action and Intramural Field and Preferred Alternatives the patient transport service is integrated with other hospital-based patient care capabilities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The institution's underlying zone is a single-family zone. Please refer to the discussion below regarding the relationship of the project to single-family policies.

The revision to the major institution policies defines more specifically when a master plan is required. Policy 4, Master Plan, states: "A master plan shall be required for each major institution proposing development which could affect the livability of adjacent neighborhoods or has the potential for significant adverse impacts on the surrounding areas." The policy goes on to specify the threshold requirement for master plan preparation, and the required components and contents of the master plan.

Comment: The effect of the Proposed Action and Alternatives on the adjacent neighborhood and potential for significant adverse impacts are addressed in this EIS. The Proposed Action and Intramural Field and Preferred Alternatives do not fall within threshold requirements, which include: development which exceeds development standards of the underlying zone; an increase in the major institution overlay (MIO) district height limit; a boundary expansion; cumulative development exceeding 40,000 square feet within 2,500 feet outside the MIO boundaries; or demolition or change of use of a residential structure.

The Seattle Municipal Code (SMC) provides certain amplification of policy intent.

SMC 23.69.002 - Purpose and Intent. The purpose of this chapter is to implement the Major Institution Policies, Resolution 28081, by regulating Seattle's major educational and medical institutions in order to:

A. Permit appropriate institutional growth within boundaries while minimizing the adverse impacts associated with development and geographic expansion;

B. Balance a major institution's ability to change and the public benefit derived from change with the need to protect the livability and vitality of adjacent neighborhoods; and

C. Encourage the concentration of major institution development on existing campuses, or alternatively, the decentralization of such uses to locations more than two thousand five hundred feet (2,500') from campus boundaries.

The first two elements are addressed in the comments on policies, above. The third element provides for dualistic objectives: encouraging institutional concentration while at the same time providing for decentralization. The established intent provides a basis for concentrating on the campus those uses that are in need of proximity to other campus uses, while simultaneously enabling uses that are not functionally related to central institutional uses to be developed more than 2,500 feet from the campus.

Comment: The Proposed Action would centralize development and use of the Kitchen Garden Helistop. The Intramural Field Alternative decentralizes the institutional development to a location greater than 2,500 feet from the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

campus. The Preferred Alternative provides for both centralization and decentralization of air medical transport services. Those uses that are most appropriate for campus location (the most critical patients being landed at the Kitchen Garden Helistop) are centralized, while other uses not dependent on a Children's campus location (all other patients being transported by helicopter), are decentralized and concentrated with existing facilities at the University of Washington.

Residential Area Policies

Children's is a major institution located in a single-family residential area. It, therefore, is subject to Seattle's Residential Area Policies contained in Chapter 23.16 of the Seattle Municipal Code. Specifically, the proposal is subject to Single-Family Residential Use, and Institutions and Facilities in Single-Family Residential Areas policies and implementation guidelines.

The purpose of the Single-Family Residential Use Policy is "to preserve the character of Single-Family Residential Areas, and discourage the demolition of single-family residences and displacement of residents." The policy states that "in order to protect single-family residential areas from the negative impacts of incompatible uses, the city shall limit the number and types of nonresidential uses permitted in these areas." Two implementation guidelines provide the basis for weighing the preservation and protection of single-family residential areas against the desirability of other uses.

> Implementation Guideline 1 - Residential use by one household (see Definitions) is affirmed and encouraged as the principal use in Single-Family Residential Areas, and is the primary use permitted outright. Many of the principal uses which were permitted under previous zoning provisions are no longer allowed, or shall be allowed only under the conditions stated in these land use policies.

Comment: As a Major Institution located in a residential area, Children's is a permitted use. The helistop is an accessory use to this principal use and is allowed as a conditional use subject to the Council Conditional Use Permit process. This EIS is designed to fulfill the SEPA requirements of the Council Conditional Use Permit. By addressing impacts and alternative helistop locations, the EIS provides background on the Council Conditional Use issues.

> Implementation Guideline 2 - In order to allow residents of Single-Family Residential Areas maximum flexibility in the use and enjoyment of their homes, the types of use and activities associated with single household residential living shall be regulated primarily by performance standards and City ordinances protecting privacy, health, safety and rights of neighbors.

Comment: The proposed use is associated with a Major Institution, not with "single household residential living." The helistop would be regulated, however, by Seattle's Major Institutions Policy and the Council Conditional Use Permit process. This EIS addresses health, safety and rights of neigh-

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

bors through discussion of specific findings of medical need for the helistop, and other conditional use issues, including restricted use, sensitive siting, and alternative locations for the helistop.

With respect to institutions and facilities in single-family residential areas, the policy intent states the following:

> "The City recognizes the positive contributions many institutions have made to the neighborhood in which they are located, respecting community needs and providing appropriate services. However, location, scale, access and development standards of institutions and activities shall be controlled in order to reduce negative impacts such as noise, traffic and parking problems, and to protect Seattle's single-family housing stock."

Two implementation guidelines and standards related to concentration of institutions or facilities, traffic and parking, demolition of residential structures, and bulk and siting provide the basis for implementing this policy. Applicable guidelines and standards include:

> Implementation Guideline 1 - Institutions and facilities may be established or expanded within Single-Family Residential Areas through a Hearing Examiner (see Definitions) conditional use authorization process. Siting of major public facilities (see Definitions) shall be appealable to the City Council (Council Conditional Use). Petitions for new facilities or significant expansions shall be accompanied by a transportation plan. The following standards and requirements shall be met in order to grant a conditional use authorization for establishment or expansion of an institution or facility within a Single-Family Residential Area.

Comment: The proposed helistop is permitted as a conditional use associated with Children's, a Major Institution. This EIS is designed to fulfill the SEPA requirements of the Council Conditional Use Permit. No transportation plan is included in the EIS, because the Proposed Action (the Kitchen Garden Helistop) would not create vehicular traffic. The Intramural Field and, to a lesser extent, the Preferred Alternatives would generate negligible traffic associated with the general transport of patients. Transportation concerns are addressed, however, from the perspective of air medical transport safety.

> Concentration of Institutions or Facilities - The establishment or expansion of an institution or facility shall not result in a concentration of institutions or facilities which would create or appreciably aggravate parking shortage, traffic congestion and noise, or physical scale and bulk incompatible with single-family residences.

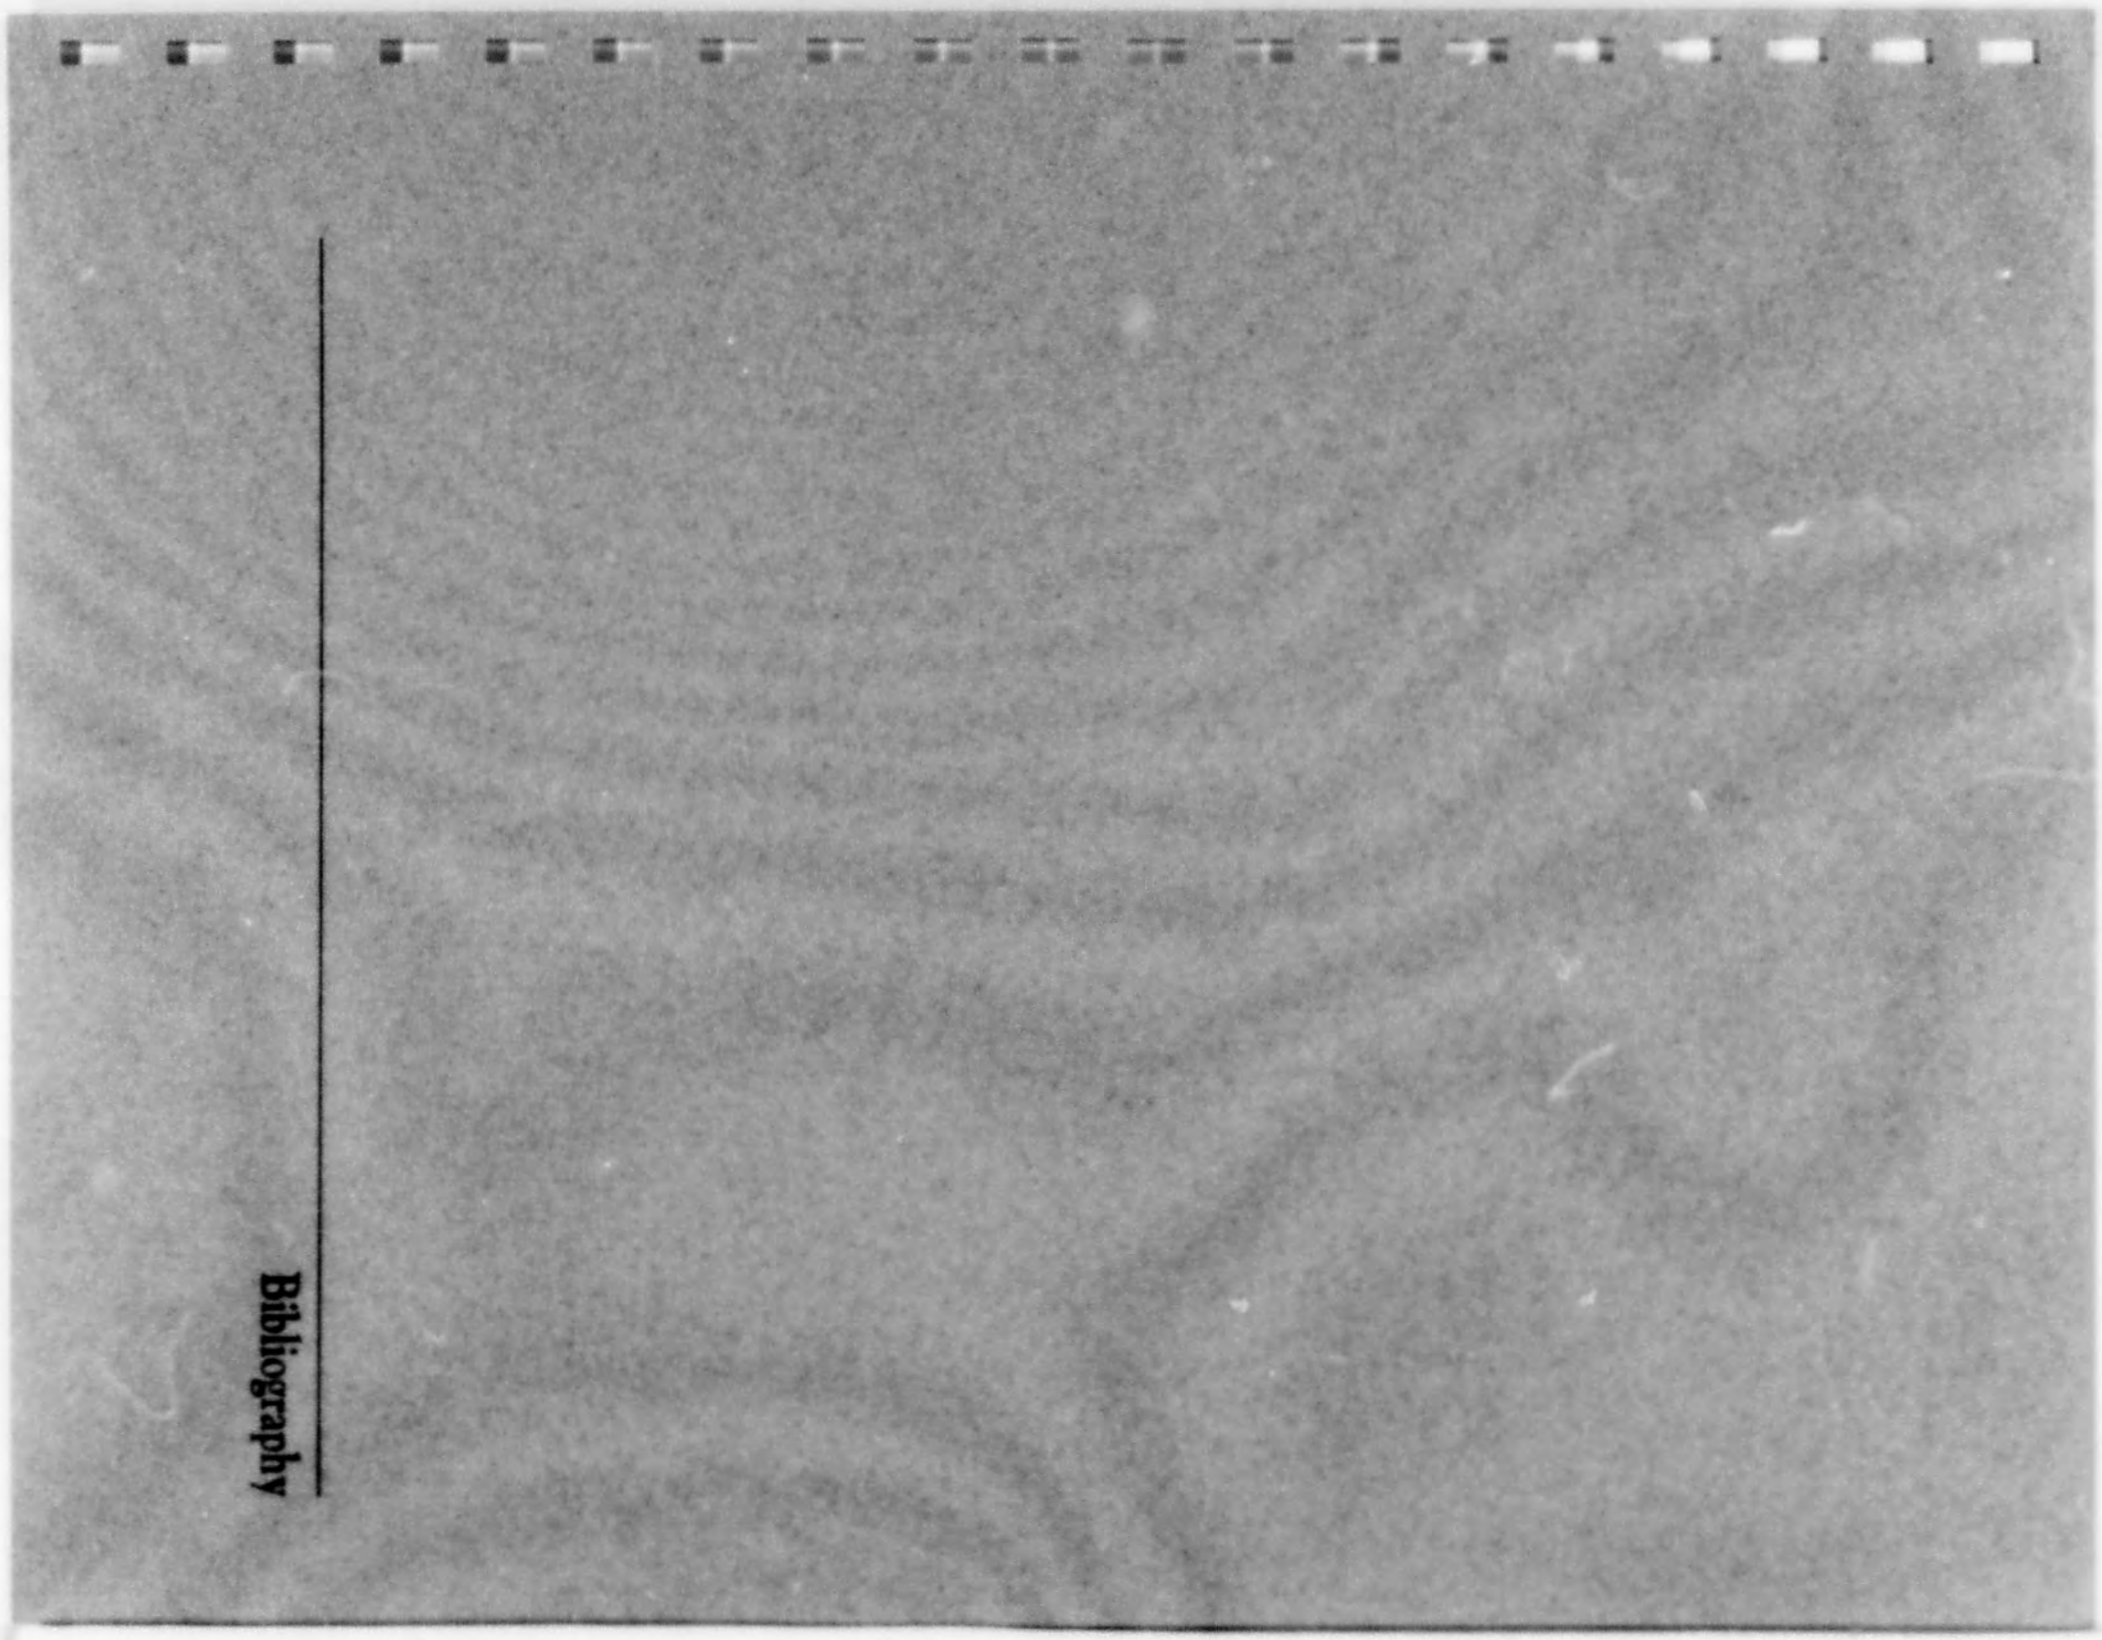
Comment: The Proposed Action and alternatives would not create or aggravate parking shortage, traffic congestion, or result in physical scale and bulk incompatible with single-family residences. Operation of the helistop under the Proposed Action and alternatives would create noise, however, which is addressed in this EIS. Under the Intramural Field and, to a lesser extent,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Preferred Alternatives there would be a consolidation of facilities (University and Children's) that would reduce the number of residential properties exposed to noise and safety risks, compared to the Proposed Action.

Demolition of Residential Structures - Residential structures, including those modified for non-residential use, shall not be demolished for facility or institution establishment, expansion or parking unless a need has been demonstrated for the services of the institution or facility in the surrounding community and no other practical alternative site is available. It is the intent through this standard to preserve housing in single-family residential areas and permit conversion or demolition of housing only as a last resort when the public benefits clearly outweigh the loss of housing.

Comment: No residential structures would be demolished to construct the proposed helistop under the Proposed Action or Intramural Field or Preferred Alternatives.



Bulk and Siting - The bulk of institutions and facilities shall be compatible with the surrounding community. Specific bulk and siting requirements are to be included in the Zoning Code and shall be at least as restrictive as those applied to single-family residences. Screening and landscaping shall be required.

Comment: The proposed helistop would be located at the Kitchen Garden site on Children's campus. The helistop design, however, includes screening and landscaping to reduce its visibility, while satisfying applicable guidelines for helistop construction and operation. It is unknown whether any future improvements to the existing helistop at the Intramural Field would incorporate landscaping or screening.

Implementation Guideline 2 - Public facilities that do not meet the standards and requirements in Implementation Guideline 1 may be located in single-family residential areas if there is a public necessity for their location there. If a City facility and site has been approved by ordinance through a public process, then a conditional use authorization is not required in order to locate the City facility on the site.

Comment: The proposed helistop would meet the standards and requirements of Implementation Guideline 1. The issue of necessity also is addressed in EIS.

April 1991

The intent and purpose of this final environmental impact statement is to satisfy the procedural requirements of the State Environmental Policy Act (RCW 43.21c) and City Ordinance 114057 as amended. This document is not an authorization for an action, nor does it constitute a decision or a recommendation for an action: in its final form it will accompany recommended actions and will be considered in making the final decision on the proposal.

Dear Ms. Gibb:

Thank you for the opportunity to comment on the draft environmental impact statement (EIS) for the Children's Hospital and Medical Center Helistop. From the information supplied in the draft EIS, it appears that no permits/approvals are required from the Department of Ecology for this proposal and, therefore, we have no jurisdiction. 1

If you have any questions, please call me at (206) 459-6025.

Subject: Comments on the Draft Environmental Impact Statement
for Children's Hospital and Medical Center Helistop

Thank you for the opportunity to comment on the Draft EIS for the Children's Hospital and Medical Center helistop. The department has the following comments.

Certificate of Need Process

The EIS states that a proliferation of helistop requests will not occur due to the rigidity of the Certificate of Need process from which the Children's Hospital helistop has been exempted. The Final EIS should state why this helistop is exempt from that process and why other hospital facilities would not have many of the same reasons for a helistop as Children's Hospital and Medical Center. 1

Flight Path

The Draft EIS uses the flight path for the helistop as a mitigating measure for the on-site location. That flight path is subject to FAA approval. What assurances does Children's Hospital have that the flight paths used within the SEPA process will be approved, as stated, by the FAA. 2

Cumulative Projects

It is the department's understanding that University Hospital is also in the process of studying the potential of a helistop. Due to the close proximity of these institutions, it would make sense to look at a common site for both. The University Hospital site may not be the most desirable site due to potential traffic impacts; therefore, the Graves field site may be the best for both. Perhaps this decision should be combined with the University's need in order to reduce the possible duplication of a helistop. 3

DM:cdm

An equal employment opportunity - affirmative action employer

Municipal Bldg., 4th Floor, 600 4th Ave., Seattle, Washington 98104-1876, 206 625-4537

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. The Certificate of Need Program is a process for reviewing certain specified health care services or facilities. Air ambulance programs established by hospitals were subject to review on new tertiary health care services under a regulation issued by the Department of Health that was repealed in 1986. This description of the Certificate of Need Program differs from that described in the Draft EIS. Helistops no longer are subject to Certificate of Need review.

2. The FAA has not made a final determination regarding the proposed flight paths for the Proposed Action or alternatives; however, Frank Benedict, the Principal Aviation Safety Inspector of the Seattle District Office of the FAA, was consulted during the development of the flight paths. Children's will request that Airlift Northwest pilots and other air ambulance pilots use the path that is approved by the FAA. If the FAA recommends flight paths that are substantially different than those in the EIS, further SEPA review may be required.

3. The Draft EIS examined the environmental impacts of sharing the use of the rooftop helistop on the University of Washington Medical Center's East Wing, use of this helistop is not under consideration by the University at this time. The Final EIS considers that alternative, as well as the Intramural Field Alternative and the Preferred Alternative, which also involve the shared use of a helistop on the University of Washington campus.

Attention: Julia Gibb

Dear Ms. Miller:

Reference: Draft EIS for Children's Hospital and Medical Center Helistop dated September 1986; our EI 86-306

The Seattle Police Department has reviewed the Draft Environmental Impact Statement for the Children's Hospital and Medical Center Helistop.

We support the location proposed for the following reasons:

1. Transporting critical patients from either of the alternate locations could delay the arrival of the patient due to traffic congestion. If either alternate location is used during football games, the route may, in fact, be impossible. |1

2. The University Hospital is isolated from Children's Hospital during football and basketball games. |2

3. A severe impact on travel time must be considered during rush hours. |3

4. The athletic field complex is situated just south of businesses and a well-traveled road. We would expect an impact on the Seattle Police Department if this location is selected because of on-lookers, sightseers, and people slowing or stopping their vehicles to see what is happening. |4

For the reasons stated above, the Seattle Police Department favors location of the Helistop at Children's Hospital. |5

Very truly yours,

PATRICK S. FITZSIMONS
Chief of Police

SEATTLE POLICE DEPARTMENT

1. Use of the Harborview Hospital helistop, University of Washington Medical Center rooftop helistop or Intramural Field helistop would increase the amount of time before the patient could be treated at Children's Hospital. (Please review description of transfers in Chapter II, and Figure 11 in Chapter III of the Final EIS, which compares transfer times). Ground transport time could be greater than usual during University of Washington athletic events, Montlake Bridge openings, or heavy commute times. For those transports that could be adversely affected by ground delays, landing directly at the Children's campus could be warranted for patients who otherwise would have been flown to an alternate (non-campus) location. For patients not requiring a landing at the Children's campus, landing at the Intramural Field would involve less potential for delay than landing at Harborview or the University rooftop helistop.

2. See response to Comment #1, above.

3. See response to Comment #1, above.

4. Distraction of motorists could occur at any of the identified locations for a helistop.

5. Comment acknowledged. Thank you for your comments.

Re: Draft Environmental Impact Statement
for Children's Hospital Helistop

Dear Ms. Miller:

The Noise Section of the Draft Environmental Impact Statement (DEIS) is adequate and well done, however, I do have concerns about the adequacy of the DEIS in other areas that may relate to noise concerns. Specifically, one of the alternative Helistop locations is the proposed University of Washington Helistop noted on page 39 where it indicates that there is an already-constructed Helistop on the roof of an expansion wing. I visited the University of Washington and examined the so-called Helistop there. This area would be, for several reasons, very inappropriate to be used as a Helistop. First, the Helistop would cause an extremely disruptive noise impact for the patients at the University Hospital. Secondly, the safety of the proposed Helistop is in question. This is mainly because of the additional structure to the south of the proposed Helistop which would prevent any aborted landing attempts and also, if the winds were coming out of the south, cause downdrafts which would make it very difficult to land the aircraft at the proposed Helistop. This and other safety considerations have been discussed with helicopter pilots and they concur that the area would not be an ideal Helistop. When inspecting this site I also noted that there is a very substantial steel rail around the area which could pose another very significant safety problem for approaching and departing aircraft. 1 2

One of the few logical Helistop areas near the University Hospital would be the roof of an existing garage just north of the proposed University Helistop. Using the roof of this garage which has been stressed to handle the weight of the newer, heavier helicopters, one could take patients from the arriving helicopter, transport them either to the University through the existing system of elevators and tunnels or transport them to Children's Hospital via ground transport. I will have a complete analysis of the proposed University Helistop at a later date, however, several things such as the strength of the existing roof and its capability of holding the newer, heavier aircraft, is in question at this time, and I feel that using it as an alternative would be unwise. 3

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

There are other anomalies in this DEIS, one of which is Table 5. It indicates that there were no rotary-winged aircraft transports to Children's Hospital between the years of 1981 through 1984. It was my understanding that Graves Field had been used prior to 1984 for transporting patients to Children's Hospital, and if this is not the case it should be made more clear than Table 5 indicates. Other areas of concern include the reference to the Washington Administrative Code 248-18-285, indicating that a helicopter cannot be prohibited from landing without violating that code. The applicable federal law should also be referenced. In addition, approach and departure routes other than those indicated should be noted since, during certain weather conditions, the indicated approach and departure routes may not be the safest. Different approach and departure routes would also bear on the noise impact suffered by the community. 4 5 6

In conclusion, I feel that the DEIS as it now stands should have a supplement that would be more detailed to satisfy the various noise concerns that would be caused by other procedures such as landing at the University of Washington, landing at Graves Field, and alternate approach and departure routes. 7

Sincerely,

Curt Horner

Curt Horner, Coordinator
Noise Program

CH:mw

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. It should be noted that use of the rooftop helistop at the University Medical Center is not under consideration by the University at this time. It is acknowledged that the helistop location on the rooftop of the University Medical Center would result in noise that could be disruptive to Medical Center patients. The noise section in the Final EIS has incorporated this comment.

2. It is acknowledged that the structure to the south could constrain flight path options in the event of an aborted landing attempt. The structure also could create downdrafts. The magnitude of the downdrafts would be dependent upon specific meteorological conditions. Airlift pilots have stated that the weather conditions that would create significant downdrafts would correspond to periods when they would likely not be flying. Although the University of Washington Medical Center helistop is not ideal, it is judged by the Airlift Northwest pilots to be safe. Frank Benedict, the FAA Principal Aviation Safety Inspector, has inspected the University of Washington Medical Center Helistop; he expressed no concerns regarding the helistop or flight paths to or from the helistop (Benedict, 1987). A copy of Mr. Benedict's letter is on file at the Department of Construction and Land Use.

3. Comment acknowledged. The Triangle Garage option has been examined as a potential site for helicopter landings; however, the location was judged to be less suitable than other alternatives. For University of Washington Medical Center-destined patients, the principal factor affecting the suitability is the awkward and time-consuming transport route via elevator and underground tunnel to the University of Washington Medical Center emergency room. In addition, it is not possible to use the existing elevator system to accommodate hospital gurneys. Transport of patients to Children's could be affected by traffic conditions. See response to Comment #1 of the Seattle Police Department, above.

4. The transports listed in Table 5 of the Draft EIS were Airlift Northwest transports that involved the landing of the patient at Children's campus. The table does not include Airlift Northwest transports that landed elsewhere nor does it include transports by MAST or transports by other vendors that occurred prior to 1984. MAST has used the Intramural Field to land critical patients since the 1970s. Table 5 of the Draft EIS has been updated and included as Table 3 in the Final EIS.

5. Section 135.19 of the Federal Aviation Administration Regulations relating to Air Taxi Operators and Commercial Operators states the following:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(a) In an emergency involving the safety of persons or property, the certificate holder may deviate from the rules of this Part relating to aircraft and equipment and weather minimums to the extent required to meet that emergency.

6. For each action alternative, there would be a primary and secondary flight path; the primary to be used under most weather conditions, the secondary to be used during specific wind-related weather conditions. These flight paths are discussed in Chapter III of the Final EIS. At the pilot's discretion, there could be deviations from the primary or secondary flight paths due to weather. If weather conditions warranted a deviation from the designated flight path(s), then the pilots would strive to seek the safest path in terms of aircraft operations. It is Children's and Airlift Northwest's intention to use the designated and FAA-approved flight paths. The noise section in the Final EIS addresses noise impacts of alternate flight paths.

7. It is the position of the Department of Construction and Land Use that a Supplemental EIS is not necessary.

Thank you for your comments.

City of Seattle Hearing Examiner
c/o Children's Orthopedic Hospital
P.O. Box C-5371
Seattle, WA 98105

Dear Sir:

On behalf of the children and parents of our City and Fire District, we would like to express our utmost support of the proposed conditional use of Children's Orthopedic Hospital and Medical Center as a heliport site for emergency transport of the critically injured or ill children and infants.

Often it is easy to focus our views and needs on a more local latitude and somehow forget the vast, rural areas with their infants and children--which do desperately need the critical care provided by such facilities at COHMC. More often than not, our children have greater potential for, or illness, requiring the type of treatment available only by COHMC where time is <u>THE MOST CRITICAL FACTOR.</u> With the availability of air ambulance service to our area, we can actually bring specialists to the scene and turn around and transport them back to their facility in less than 40 minutes. This is truly a matter of life or death in some situations. Therefore, we are asking that you rule favorably to allow this use of COHMC facilities.

For many, many parent's sake in Western Washington, this is a cry for the children...

Sincerely,

Robert Merritt

October 15, 1986

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

OCT 17 1986

Dear Ms. Miller:

RE: Helipad Proposal for Children's Hospital of Seattle

The Federation members ask that the following topics be covered in the Final Environmental Impact Statement prepared by Children's Hospital.

-The cumulative impact of the University Hospital proposed helipad and the Children's Hospital helipad should be examined jointly and simultaneously. Combined, they will have a greater impact on the adjacent communities than either helipad does alone. They are only one mile from each other. Logic dictates that they should be examined together. The combined impact of their proposed actions will strongly influence actions by other hospitals in the city and region and will largely determine the type and amount of hospital helicopter service Seattle ends up with. 1 2

-A regional plan for integrating helicopter and other emergency medial services must be in place before any permits are granted. Once major actors in any plan have their service, it will be impossible to establish a coordinated and effective regional emergency medical services system. 3

-No permits of any kind should be granted until and unless demonstrably enforceable rules are in place for restricting flights to life-threatening emergencies, as called for in the city code. The history of Children's Hospital does not provide any reason for optimism that they will meet permit conditions. The great difficulty and 4-years of time spent by DCD to obtain compliance by Children's Hospital on the conditions attached to their 1981 permit to build a large parking garage, and the repeated helicopter landings on their campus without a permit are two recent examples which give us reason to be very concerned about compliance and enforcement issues. 4

Please keep us informed as to your schedule and actions on this matter.

Sincerely,

Beth Means

Beth Means
President

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. It is DCLU's position that the Intramural Field landing area is an established existing use for helicopters transporting patients to the University Medical Center. The Department of Construction and Land Use (DCLU) recognizes the relationship between the impacts that would result from the construction of and operations at the proposed Children's Hospital and Medical Center helistop and the continued use of the University of Washington helistop at the Intramural Field. The cumulative impacts of both projects have been examined in the EIS and will be considered in rendering a decision on the proposal.

2. Based on the survey of Seattle hospitals that was conducted for consideration of cumulative impacts in the Draft EIS on the Children's Helistop, it does not appear that other Seattle medical institutions are planning to seek permission to construct a helistop. Any medical institution that wishes to develop a new helistop would need to secure Seattle Council Conditional Use Permit approval. See also the response to Seattle Department of Community Development's Comment #1, above.

3. Dr. Nicola has recommended that "the emergency transport of patients by helicopter be a planned part of a complete EMS (emergency medical services) transportation system, with guidelines for use, rather than a hospital-by-hospital provided service. The proposed WAC guidelines for air ambulance use appear to support this approach. A consortium of hospitals providing helicopter services, such as the one in Airlift Northwest, is certainly a most sensible approach and will make it easier to establish a systematic approach to the provision of these services. [King County is] just beginning to integrate helicopter transport into [its] EMS system. The proposed WAC guidelines are a first step in this direction. They condition licensure of air ambulance services on meeting standards for equipment, personnel, community need, and use, and place air ambulance services under the medical control of local medical program directors" (Nicola, March 25, 1987).

   Both Children's and Airlift Northwest have indicated their willingness to participate in a future regional EMS Plan. Such a regional plan would help ensure that only appropriate medical facilities have helistops, that services are not unnecessarily duplicative, that competition is prevented, and that medical costs are managed. The City has the authority to condition the project so that it would comply with the applicable provisions of a future regional EMS plan.

4. The sponsor's revised description of the Proposed Action in Chapter III of this document, as well as Appendix C, indicates that all transports landing at the permitted helistop outside the entrance to the Children's Emergency Room could be the subject of a medical review committee. The purpose of the committee would be to review compliance

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

of the helistop use with the Council Conditional Use Permit criterion that states that the use of the helistop will be restricted to occurences involving life-threatening emergencies. Additional review criteria could be added by the City as conditions for approval to any permit issued for the helistop.

Thank you for your comments.

Re: Comments on Draft Environmental Impact Statement
for Childrens Hospital Helistop

Dear Director Miller:

This letter is submitted on behalf of the Laurelhurst Community Club, a Washington non-profit corporation whose membership is comprised of Laurelhurst community residents, to comment upon the Draft Environmental Impact Statement (DEIS) in the above matter. These comments should be considered as supplemental to comments submitted by other members of the Community Club.

In general, the DEIS presents only a superficial view of the issues raised by the proposal. Specific inadequacies are noted below:

Land Use, Page 28: The DEIS assumes that consistency of the proposal with specific land use criteria is not a topic appropriate for discussion in the DEIS, at least to the extent of reviewing the criterion of medical need. This is incorrect. Such a criterion is part of the City's Land Use Code. The DEIS should consider consistency with the Land Use Code, including this criterion as part of the EIS process. 1

Further, the DEIS discussion of land use impact is wholly insufficient in its focus solely upon the policies applicable to the major institution zone. The City's conditional use criteria require review of impacts upon surrounding residential property. In reviewing such impacts, the DEIS should also examine policies applicable to the surrounding residential zones to determine whether the proposed use is consistent with those policies in its impacts, which clearly spill over beyond the campus where the helistop will be located. 2

Alternatives, Page 49: The discussion of alternatives appears to accept the judgment that the proponent's objectives are synonomous with "the purpose of the Helistop" as that term is used in Seattle Municipal Code, Section 23.48.05. Thus, the discussion of alternatives does not analyze their consistency with the conditional 3

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

use criteria, but merely dismisses them as inconsistent with "the proponent's objectives." While it may be relevant to discuss whether or not the alternatives fit into the proponent's tailor-made objectives, the DEIS should also discuss whether or not the alternatives are consistent with the standard established by the City for the conditional use permit. 3

Weather, p. 67: Although weather is considered in the context of safety, the DEIS does not contain a similarly detailed discussion of weather as a factor in preventing airlift operations in the context of the proposal and its alternatives. Clearly, weather conditions may affect the viability of the proposal and its various alternatives and the extent to which they accomplish their announced purposes. 4

Noise Impacts, Page 80: The suggestion that "there is little valid scientific basis for claiming direct health impacts from aviation noise " is unsupported in the DEIS and is suspect. While it may be true that noise cannot be correlated with direct impacts (e.g. tumors), there is a substantial body of evidence that noise may be associated with, for example, pyschological and physiological changes relating to health. This should be addressed in the DEIS. 5

Page 90, Cumulative Impacts: The discussion of cumulative impacts is singularly one-sided and perfunctory. It ignores the very justifications used by the proponent for its application, dismissing the possibility that other institutions will use the same justifications, regardless of whether they are currently considered tertiary care referral centers. Further, although the possibility of further helistops is discounted in the discussion of cumulative impact, based on the alleged restraints by various governmental reviews necessary for their establishment, no mitigating measures are explored which would turn this speculative restraint into a reality or which would affect the COH permit in any substantial way (e.g. through automatic revocation) if other helistop approvals by other institutions were sougnt. 6 7

Because of the deficiencies in the EIS, a new DEIS should be prepared and recirculated for comment prior to issuance of a Final Environmental Impact Statement to ensure that the public has an opportunity to comment on missing information and analysis which must be included if the EIS is ultimately to be found adequate. 8

Thank you for this opportunity to comment on the DEIS.

Sincerely,

Peter J. Eglick

LAURELHURST COMMUNITY CLUB (PETER EGLICK)

1. A determination of the medical need of the proposed project warranted an independent analysis by Dr. Nicola, the former Director of the Seattle-King County Department of Public Health. By virtue of Dr. Nicola's report having been appended to the Draft EIS, commented upon, and revised in response to those comments, it is a criterion that has been examined through the EIS process.

   The restriction of the use of the helistop is addressed through the definition of the Proposed Action and alternatives, and also is examined in Dr. Nicola's report. The topic of the proposal's compatability with affected land uses is examined through the environmental analysis of noise, air transport safety and cumulative impacts. The Final EIS also includes comments on the relationship of the Proposed Action to Single Family and Major Institution policies.

2. The scoping process determined that the elements of Noise, Aircraft Safety and Cumulative Impacts would possibly generate significant impact. Therefore, only those elements were examined in the Draft EIS. Because the Council Conditional Use Permit allows helistops within institutional boundaries, subject to specific criteria including the requirement that "the helistop is [to be] located so as to minimize impacts upon surrounding residential property," the EIS has addressed the issue of noise and safety impact upon residential areas. In addition, a discussion of Seattle's Major Institutions Policies and Residential Area Policies, specifically those policies dealing with Single-Family Residential Use, and Institutions and Facilities in Single-Family Residential Areas, has been added to the Final EIS. This section includes comments on the relationship of the Proposed Action, as well as the Intramural Field and Preferred Alternative with policies and implementation guidelines. (See Chapter IV of the Final EIS.)

3. The issue of whether alternatives meet the proponent's objectives is crucial to their reasonableness. Children's has indicated that they will not develop an alternative that compromises its objective with respect to appropriate patient care. As part of their findings and recommendation report DCLU will identify their conclusions with respect to each of the EIS project alternatives and their consistency with the Council Conditional Use Permit criteria.

4. A discussion of how weather conditions affect flights is included in the Draft EIS on pages 66-68 and in Chapter IV of the Final EIS. The meteorological conditions at the alternative sites are not sufficiently different to significantly alter helicopter operations at the sites. At any given time, however, the weather conditions at a particular site may influence operations.

5. It is acknowledged that noise from the helicopter can have an effect on residents, workers, and others in the affected area. Effects could include physical reactions, such as stress. Chapter IV of the Final EIS has been revised accordingly.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

6. Other institutions will be bound by the Conditional Use Permit regulations and other applicable regulations. It is acknowledged that other institutions may believe that they are required by Section 248-18-285 of the Washington Administrative Code to permit helicopters to land at their hospita . The cumulative impact section has been revised accordingly. It should be noted that Children's offers certain specialists, equipment and capabilities that are not currently available at other Seattle-area hospitals; therefore, it would be unlikely that Airlift Northwest would transport pediatric patients to other non-consortium hospitals in the Seattle area.

7. Any new medical institution helistop applications received by the City of Seattle must be reviewed individually. The Cumulative Impacts section of the EIS has been revised.

8. It is the position of the Department of Construction and Land Use that a new Draft EIS is not necessary based on the provisions of Section 25.05.405 of the Seattle Municipal Code.

Thank you for your comments.

Re: Children's Orthopedic Hospital and Medical Center
Helistop/Draft Environmental Impact Statement
File No. 8405870

Dear Ms. Miller:

We represent the Laurelhurst Condominium Association. That association is composed of the owners of 55 condominiums located at 4545 Sand Point Way N.E., approximately 1/4 mile from Children's Orthopedic Hospital. Substantively, the Association opposes absolutely the construction of the helistop. However, we realize that your department seeks input on the adequacy of the Statement. Gauging from the level of public interest shown at the recent hearing at the Laurelhurst Elementary School last month, your department will have received a great many comments. We wish to add, briefly, our input.

We direct your attention to page 92 of the draft Environmental Impact Statement. The section is entitled, "Significant Impacts that Cannot be Mitigated." The risk of helicopter accidents is stated to be "a potentially significant impact that cannot be entirely mitigated." A helicopter flying in and out of the hospital will be traveling a corridor up Sandpoint Way and 45th N.E. (This is the primary approach, p. 45 of the draft Environmental Impact Statement). We are less sanguine about that conclusion than the proponents of the statement. This area is densely occupied and heavily traveled during certain hours of the day. The draft Environmental Impact Statement contains little information regarding EMS helicopter flights. Certainly, the NTSB does not compile such statistics (p. 61, draft Environmental Impact Statement). The comparisons with St. Anthony's Hospital in Denver is demonstrateably unsound. ("... actual figures on

the total number of six ambulance flight hours have not been kept.") Also, is "accident" defined by the Denver study (p. 61, draft Environmental Impact Statement), in the same fashion as the National Transportation Safety Board? (p. 65, draft Environmental Impact Statement). Are the physical conditions of arrival and departure comparable between the two hospitals? Under what conditions did the accident occur? What was the distance of the accident from the hospital? At p. 64, the draft Environmental Impact Statement recites 57 EMS helicopter accidents occurring in 1985. The hearsay statements of Nina Merrill of ASHBEAMS and Tim Einhorn of NEMPSA should be supported by a writing from those parties regarding the distance of those accident occurrences from the hospital. The observations in the helicopter safety section at p. 60 of the draft Environmental Impact Statement is replete with hearsay quotations from Gene Hill, Frank Benedict and Thomas Poulton. What questions were put to these individuals? Are the responses complete and in context? There would be a total of sixty to eighty overflights per month. These overflights will pass directly over our client's eight story condominium at a height of 1,000 feet. Our client is not satisfied that complete and accurate information is set forth in the draft Environmental Impact Statement. Frankly, the risk of accident does not appear to be "a potentially significant impact," but rather, a significant impact that cannot be mitigated." (p. 92, draft Environmental Impact Statement).

In the next paragraph, at p. 92, the proponent states that noise and vibration is not a significant impact based on regulatory criteria; however, it is recognized that helicopter noise could and probably would be disruptive of some adjacent residents' lives. SMC 23.48.05(A)(1)(b) sets forth the following criterion that "the helistop is located as to minimize impacts upon surrounding residential property." Helicopter noise is an "impact" that a number of the residents of the Laurelhurst Condominium have brought to our attention. The residents have not previously been concerned about noise from helicopter landings at the Graves Field. However, the Condominium Association informs us that a serious noise problem exists when helicopters fly to Children's. We note that the proponents of the draft Environmental Impact Statement are willing to quote conclusory hearsay statements from "experts" on helicopter safety. While there is a significant effort devoted to the noise issues, no resident of the area has had a chance to give his or her impressions on the subject of noise. "Regulatory criteria" aside. There is a dearth of evidence regarding the nature of the disruption of the adjacent residents' lives. As stated at page 28 of

the draft Environmental Impact Statement, the purpose of Seattle's Major Institutions Policy, SMC 23.16.10, "is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods adjacent to institutions." It does not appear that the proponent of the draft Environmental Impact Statement put all that much thought into the statement set forth st page 92 of that document. We suggest that additional information be obtained and included in this final chapter and that an additional effort me made to verify the reliability of the comparison with St. Anthony's Hospital in Denver and the self-serving quotations which are sprinkled through the draft Environmental Impact Statement. 11

29

Very truly yours,

Ron McPhee

LAURELHURST CONDOMINIUM ASSOCIATION (JOEL WATKINS)

1. The risk of a helicopter accident cannot be fully eliminated. Additional recent information on EMS air ambulance safety has been incorporated into Chapter IV of the Final EIS.

2. Comment acknowledged. The NTSB does not compile flight hour statistics for EMS helicopters. See response to your Comment #3, below.

3. There is no comparison with St. Anthony's Hospital in Denver in the Draft EIS. The Denver program is referred to as the first hospital-based helicopter ambulance service in the U.S. The accidents that had occurred since that time ocurred at various locations nationwide, not in connection with the Denver program.

   Total number of EMS helicopter flight hours may or may not have been kept by the individual EMS vendors; however, there is no reliable compilation of data on flight hours. There is, however, a record of helicopter accidents and numbers of transported patients. The numbers used for flight times in the Draft EIS are approximations based on available data on the total number of EMS helicopter flights and average flight times. These estimates were provided by the National EMS Pilots Association (NEMSPA) and Howard Collett, publisher of Hospital Aviation magazine (now called the Journal of Air Medical Transport). These were the only identified sources that had current published data on EMS flight safety.

   Chapter IV of the Final EIS contains updated information on EMS air ambulance safety, including information obtained from a study conducted by the National Transportation Safety Board (NTSB).

4. All "accidents" discussed in the Draft EIS were so designated by NTSB investigators. Since that time, the NTSB has redesignated some accidents. See Chapter IV of the Final EIS for a discussion of the differences between helicopter "accidents" and "incidents" as well as updated information on accidents.

5. The proposed Children's Hospital helistop is not compared to St. Anthony's Hospital in Denver. See response to Comment #3 above.

6. Comment acknowledged. These statements have been deleted from the Final EIS.

7. Due to the relative paucity of available data on EMS helicopter safety, the statistical analysis in the Draft EIS was supplemented with a qualitative discussion of safety trends in the helicopter field. The responses are all used in context. Gene Hill and the other Airlift Northwest staff received advance copies of relevant Draft EIS sections to comment on the accuracy of data presented in the document. Frank

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Benedict of the Federal Aviation Administration was sent a copy of the issued Draft EIS. No comments were received from Mr. Benedict. Thomas Poulton was sent a copy of the section of the Draft EIS that included his observations. His letter of reply, which is on file with DCLU, agreed with the findings that were presented in the Draft EIS.

Since the time of the issuance of the Draft EIS, a substantial amount of data have been developed that provides a better understanding of accident potential. These data have been incorporated into the Final EIS. The observations have been deleted from the text.

8. Comment acknowledged. The information presented in the EIS is factual. The risk of accident is significant. The impact on property or public safety from an accident may or may not be significant. The sentence has been revised accordingly.

9. Helicopters landing outside the Children's Emergency Room entrance previously followed a flight path that brought the aircraft closer to the Laurelhurst Condominiums than the current flight path does, since a more direct flight path to the Emergency Room entrance is made possible through the removal of some obstructive trees. Noise impacts on condominium residents may be less than before (and certainly would be for Laurelon Terrace residents). Noise impacts associated with use of the Kitchen Garden Helistop would continue to be greater than would occur if all the aircraft were to land at the Intramural Field site.

10. The Noise section of the Final EIS includes statements regarding the potentially disruptive impact of helicopter noise on the lives of area residents.

11. Children's Hospital is not compared to St. Anthony s Hospital in Denver. See response to Comment #3, above. See Chapters II, III and IV of this Final EIS for updates and revisions to the Draft EIS.

Thank you for your comments.

Suzanne McQuary

To: City of Seattle, Department of Construction and Land Use

From: Laurelhurst School P.T.A. Board

Re: Hearing on Draft Environmental Impact Statement of Children's Hospital and Medical Center Helistop

Date: September 23, 1986

We, the Laurelhurst School P.T.A. Board, come before you this evening primarily in the interest of the children who attend this public school. Our interest does extend beyond the school as well. We represent the board only, not the whole Laurelhurst School Parent-Teacher Association. At this time, we are merely familiar with the major arguments for and against the proposed helistop. We wish to express in brief our concerns, and we wish to ask some questions for which we could not find answers in the Draft E. I. S.

While the school is normally occupied between 9:00 A.M. and 3:00 P.M. five days a week, children and staff arrive on foot, by car and by bus as early as 7:30 A.M. (some for day care). Children leave at 3:00 P.M. to walk or ride home, but some stay as late as 6:00 P.M. (until picked up by parents). Staff leave at differing times in the afternoon. Outdoor playtimes include A.M. and P.M. recesses, post-lunch recesses and some physical education classes. Many children play and participate in activities at the adjacent Laurelhurst Park. On several occasions there are evening events sponsored by the P.T.A. which draw students, their families and staff. In addition, some Laurelhurst Park Department classes are taught in the school. It is safe to say that the school is unoccupied between 10:00 P.M. and 7:00 A.M.

We are concerned, therefore, about the impact of noise and vibration on Laurelhurst School. It is noted in the Draft E. I. S. that "helicopter noise could and probably would be disruptive of some adjacent residents' lives." (pg. 92) Would the impact be greater for the secondary approach-departure path, which covers the area over Laurelhurst School? What would the impact of noise and vibration mean to daily instruction in the classroom, study in the library, instrumental music lessons in the auditorium, individualized teaching on the second floor or programs in the gymnasium? We are concerned about the frequency of flights, given that every instance requires two approaches and departures each. 1 2 3

In regard to the flight path, the Draft E. I. S. says, "a secondary approach-departure path would be used during northwesterly winds that are in excess of approximately 17 knots. Based on surface wind data for Sand Point this latter situation is expected approximately 0.2% of the time, and would be most likely to occur during the winter months (U.S. National Climatic Center, 1982)." (pg. 45) We are concerned about these statistics, since the school and hospital are sited in a more hilly location than Sand Point, 17 knots indicates a moderate breeze and 0.2% of the time may only amount to once a year. 4

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It would seem that there would be a frequent use of the secondary approach-departure path. Who determines the weather conditions and their suitability to flight paths? Who is responsible for these decisions? Who can elect to make flight path deviations? Who takes responsibility for them? 5

In consideration of the possibility of helicopter accidents, we notefrom the Draft E. I. S. that "a worst case scenario was generated using the overall accident rate for E.M.S. helicopters. Under this scenario, a flight involving a Children's-destined patient would have a statistical probability of an accident one in 5,459 transports. The accident could occur at any point on the four segments of each flight." (pg. 72) While this is a favorable statistic for the projections of flight frequency given, any accident is of concern to us. Who is responsible in the event of an accident? What if an accident occurred on or near the school grounds, during recess when many children are playing out of doors or after school hours when children are walking home? If the City of Seattle issues a use permit, will the city provide all of the necessary services in the event of bodily harm and/or property damage? 6 7 8

Laurelhurst School has been considered for closure by the Seattle School Board on more than one occasion. Parents from the surrounding neighborhood as well as those from many other Seattle neighborhoods whose children attend this school consider it imperative that this school stay open. We are concerned that the installation of the proposed helistop, whose siting raises serious questions, could jeopardize the future of Laurelhurst School. The alternative possibility of a helistop at the Intramural Field bordering N. E. 45th Street is not ruled out as a satisfactory site in the Draft E. I. S. Will the final E. I. S. contain an evaluation of the impacts regarding the public school which is only two blocks away? We hope it does. 9

Thank you.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

LAURELHURST SCHOOL PTA BOARD

1. Noise impacts from the secondary approach probably would be greater on the Laurelhurst School under the secondary approach-departure flight path, compared with the primary flight path.

2. Impacts on daily instruction, library study, music lessons, individualized teaching on the second floor or athletic programs would be dependent on the alternative and its flight paths, on flight timing, on classroom orientation relative to the flight path and on whether windows are open in the classroom. Actual noise duration would be relatively brief (approximately five minutes for an approach and landing; and five minutes for a takeoff and departure). However, the activity may excite some students for a period longer than the actual duration of the noise impact.

3. The basing of the medical transport team at Harborview or Boeing Field reduces the number of flights by one-half. Only on rare occasions when the appropriate medical flight team is at Children's would it be necessary to fly to pick up the team at the hospital (or at the Intramural Field). It also should be noted that a new alternative presented in the Final EIS, the Preferred Alternative, would further reduce the number of patient transports that would land at the hospital. These two factors reduce the number of flights into the Children's helistop.

4. The source of wind data in the Draft EIS is in error. The source is the U.S. Air Force Air Weather Service, 1970 and the data were for Seattle-Tacoma International Airport. In addition, since the Draft EIS was published, surface wind data for Naval Air Station Sandpoint has been obtained. Based on these data, winds in excess of 17 knots from the northwest quadrant are expected about 0.6% of the time (Fulton, 1990). The ground layer is a source of friction that slows winds, creates turbulence, and interferes with wind direction and speed. Any differences between winds at Sand Point and winds at Children's and the Intramural Field are not expected to be significantly great.

5. The pilot monitors weather conditions both from broadcast weather reports and from personal observations while in flight. Based on this available weather information, the pilot determines the safest flight path. The pilot is responsible for in-flight decisions on flight paths, including decisions to deviate from designated flight paths. Please refer to the response to the Seattle-King County Department of Public Health Comment #6.

6. See Chapter IV of the Final EIS for a revised analysis of accident risk.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7. In the event of an accident, the party causing the accident would be responsible.

8. When called upon, the City of Seattle would provide the necessary services for emergencies (such as police and fire) within its jurisdictional boundaries. Please refer to the response to Liz Anderson Comment #17, below.

9. The continuing viability of Laurelhurst School is an issue decided by the Seattle School Board based on neighborhood population projections, the physical conditions of school facilities, and other factors. Whether the risk associated with helicopter operations will be considered in any closure decision is not known. Chapter IV of the Final EIS has incorporated additional statements on noise and aircraft safety with respect to the neighboring schools.

Thank you for your comments.

Comments on the Childre..'s Hospital and Medical Center Heliatop
Draft Environmental Impact Statement

36

Dear Ms Miller,

Our preliminary comments were made at the Public Hearing on September 23, 1986 and concerned the failure to involve any of the community groups which will be impacted by the numerous helicopter flights and the failure to consider the cumulative impact of such flights to/from both Children's and University Hospitals. A copy of the testimony is appended for your convenience.

Environmental Impacts
Why is no attempt made to assess noise and vibration impacts along the entire flight path? Montlake residents are well aware of helicopters over our community. We hear them overhead when we are inside well-built homes and feel the vibration they cause. This is hardly the reaction to a truck going by. You predict 15-20 flights a month which must be doubled due to the medical team pick-up. This means an additional 360 to 480 flights per year to Children's which has only 17% of the flights. How many helicopter flights will have as their destination University Hospital? How will the constant barrage of helicopter noise affect the emotional well-being of Montlake residents and the livibility of our community? 1 2 3

Role of Helicopters
Table 2 lists 21 patients who were transported by helicopter with a mortality rate of 48% and brain damage in other cases. What is the mortality rate for all patients transported by helicopter since May, 1985? Charges have been made that helicopter transport is more traumatic and can cause cerebral hemorrhage in neonatals. Could damage to the patient be caused by helicopter flight? 4 5

Table 3 is a purely hypothetical case. Use a real case and take into consideration the time involved when the community doctor calls the medical director for advice, the medical director calls Boeing Field, the helicopter pilot takes off and lands at Children's, the medical team is loaded and the helicopter departs and lands at the community hospital. This time interval was completely absent from Table 3. 6

Is the increase in use of medical helicopters forcing community-based physicians to send patients who cannot be helped to tertiary care facilities because of the fear of malpractice charges? 7

Why has Children's Hospital failed to file an updated form 7480 with the FAA? 8

Is it more than a little premature to plan a relatively massive assault on densely populated areas with medical emergency helicopters before the proposed guidelines and standards are formulated by Puget Sound Health Systems Agency, the Subcommittee on Air Ambulance Medical Standards of the Washington State Medical Association and American Society of Hospital Based Emergency Air Medical Services and National Emergency Medical Services Pilots Association? It appears that a Supplemental Draft Environmental Impact Statement should be completed and offered for additional comments by the public after the reports by the associations are finished and a part of the document. 9

Will the expanded service of Airlift Northwest and other helicopter services force the curtailment of MAST operations in western Washington? MAST is not allowed to compete with private enterprise. 10

Helicopter Safety
According to aeromedical experts, hospital-based helicopters crash far more frequently than other helicopters or civil fixed wing aircraft. Therefore it is necessary to examine closely the predicted increase in emergency flights by helicopters which have such abysmal accident records. How many helicopter pilots does Airlift Northwest employ? How many helicopter pilots are on duty at one time? How many hours per day is each helicopter pilot on duty? How many days per week does each helicopter pilot work? Is a helicopter pilot ever required to work extra hours per day, per week, per month? 11

Part of the arguement for building a secured, lighted pad is the safety factor. Is there any concern for safety when the helicopter lands at a community hospital with no landing pad or at an accident scene on a freeway or in a field? 12

What kind of insurance does Airlift Northwest carry in case the helicopter crashes in a densely populated area? 13

Is enough information available to make a convincing case for allowing 80-90 emergency helicopter flights per month in Seattle? In the American Medical News of September 5, 1986, preliminary evidence suggests that helicopter transport may be detrimental to patients' outcomes. 14

Sincerely,

Doris Baxter Burns

Doris Baxter Burns
President

MONTLAKE COMMUNITY CLUB

1. It is acknowledged that noise levels along the entire flight path would increase. Some properties along the flight path would be more affected than others; however, the noise levels at the ground would be within regulatory thresholds, based on calculated impacts at the Children's property line where the off-site noise levels would be greatest. Consequently, it was determined that it would not be necessary to examine noise along the entire flight path.

2. The Proposed Action projects an average of 15-21 patient transports by helicopter to Children's each month in 1995. As described in Chapter III of this Final EIS, these numbers reflect an increase from the number of transports projected in the Draft EIS. An average of approximately six patients would be transported by helicopter to University of Washington Medical Center each month. See revised description of alternatives in Chapter III of this Final EIS.

3. Some residents of the community may be affected by impacts from helicopter operations. Other residents may not be affected by the operations. Please refer to the response to Laurelhurst Community Club's (Peter Eglick) Comment #5.

4. An analysis of the mortality rate of all patient transports is outside the scope of this document. Please refer to Appendix D, which identifies patient outcomes for all Children's-destined helicopter transports through March 26, 1989.

5. There has been some concern regarding the potential for helicopter transports to cause physical damage to patients (e.g. Mattox, 1986), according to Karen Kilian, Assistant Chief Flight Nurse with Airlift Northwest, the severity of patient conditions require immediate transport and the transport of neonatals is no more traumatic than ground transfers. The transport teams are experienced in and equipped to deal with the patient needs as dictated by altitude physiology.

6. Table 3 has been revised and is included as Table 2 in the Final EIS. The time involved when the community doctor calls the medical director for advice would occur in either a ground or air transport. The Airlift helicopters are stationed at Boeing Field and Harborview; only the Boeing Field-based helicopter crew is called (by Airlift Northwest) to initiate a transport.

   Under the new Preferred Alternative, the medical team would be stationed with the aircraft at the base (either Boeing Field or Harborview), as is currently the case. If a specialized transport team located at Children's is necessary, they would be picked up at Children's or the Intramural Field.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7. Community-based physicians refer patients to tertiary care centers so that their patients can receive the appropriate treatment from medical specialists who have at their disposal equipment that may not necessarily be available at community hospitals. It is not known whether fear of malpractice is a factor in any referrals that involve helicopter transports.

8. Children's submitted a Form 7480 to the FAA on February 14, 1985 with a revised submission on August 9, 1989. The request was approved with an expiration date of December 31, 1990. A request for extension was submitted November 12, 1990 and an extension to December 31, 1991 was approved November 19, 1990. An updated FAA Form 7480 will be submitted at the conclusion of the Council Conditional Use Permit process. The FAA, a reviewer of the Draft EIS, has not indicated that a revised Form 7480 should be submitted any earlier.

9. Refer to Central Seattle Community Council Comment #3.

   The Puget Sound Health Systems Agency (PSHSA) is no longer an active entity. Consequently, it would not be appropriate to delay consideration of this proposal until such time as the PSHSA study is completed.

   Preliminary guidelines from the Subcommittee on Air Ambulance Medical Standards of the State Medical Association, NEMSPA and AAMS are presented in the revised Chapter II and Appendix B of the Final EIS. It does not appear as though there are any significant differences between existing Airlift Northwest organization or operation/medical practices and the preliminary materials. DCLU has determined that a Supplemental Draft EIS is not warranted.

10. The availability of Airlift Northwest helicopters could replace MAST for some patient transport missions. At the discretion of the Army, MAST would continue rescue missions and the transport of military personnel and their dependents. Some military neonatal and pediatric patients may be transported by Airlift because of the available equipment, attending medical personnel, and reduced vibration on Airlift Northwest's Agusta helicopter compared with the MAST aircraft.

11. Airlift Northwest currently employs 6 full-time and 1 part-time pilots. Additional pilots will be employed before the second Agusta helicopter goes full-time. At any one time, one pilot per aircraft is on duty. Each pilot is on duty 12 hours per day for five days, then has five days off. It is possible that a pilot could be required to work extra hours to cover a shift that is empty due to vacation or sick leave, as long as the extra hours do not violate FAA regulations.

12. Community hospitals receive instructions on preparing landing areas for helicopters and may have their own approved helistop facilities or designated landing zones. Accident scenes are inherently less safe

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

unless proper ground preparations are made to effectively designate and secure the landing area. If in the pilot's judgment a landing area is not safe, then alternate landing plans must be made.

13. Hospital AirTransport, which contracts with the Airlift Northwest consortium via Seattle Jet Center to provide the helicopter aircraft, pilots and mechanics, is required by its contract with Airlift Northwest to carry a $20 million liability insurance policy.

14. Please review response to Comment #5, above. Also, please review Dr. Nicola's updated report (Appendix A), which indicates that the air ambulance transports to Children's appear warranted based on the Washington State Medical Association's Draft Guidelines.

Thank you for your comments.

Subject: Helipad at Children's Orthopedic Hospital

At the October meeting of the Ravenna Bryant Community Association (10/7/86) concern was expressed for the proposed helicopter landing site at Children's Orthopedic Hospital. Our board has examined the current status of the proposals placed before your agency and we hope to see the strictest review of the proposal by all concerned city, state or federal agencies before approval is considered for the proposal. 1

A motion was placed before the board and was adopted unanimously. Please enter the motion in your file of testimony and hearings. 2

RBCA Motion A/10-7-86/Unanimous

Moved: That RBCA support the position of the Laurelhurst Community Club concerning the helicopter landing site proposal of Children's Orthopedic Hospital, in that the Laurelhurst Community Club poll of local residents demonstrates near unanimous concern for the proposed site, in that it is the conviction of RBCA that a statement of need and demonstration of need for air transportation must be provided and approved before our community association would consider approval of the site proposal, and in that RBCA sees the need for a statement of justification and demonstration of why the existing joint use of the University of Washington landing site (shared by the UW and COH for emergency cases) is not a superior and safer alternative for a site location for helicopters.

Please place our association on your mailing list for subsequent matters concerning the COH proposal.

Sincerely yours,

David W. Rigby
President

Dear Katy,

I have received your letter of October 10 regarding Children's Hospital Helistop Draft Environmental Impact statement. The Hospital Council, as a matter of policy, does not get involved in individual institution's Certificate of Need applications or zoning applications with the City of Seattle. The current competitive environment in which hospitals operate, prohibits such involvement by the Hospital Council. The Council is involved in emergency medical services matters, particularly in terms of involvement with the King County Emergency Medical Services Division, but we would only review general matters of policy and procedure, not specific matters related to only one institution. We appreciate your invitation to submit comment, and hopefully this letter will clarify our position. Should you have any questions, please let me know. 1

Sincerely,

James L. Nell
President

Re: COH Helicopter Landings

Dear Ms. Miller:

I wish to be on record as opposing the COH application to have helicopter landings at the hospital rather than at the soccer field or the intramural field at U.W. 1

I am unconvinced of the medical necessity of such a program and fear that it is predominantly a marketing ploy for COH that would put the transported patient, and the surrounding community at an unacceptably high risk for accident. 2

I urge denial of permits for the on site helicopter pad as unnecessary and dangerous. 3

Sincerely,

Lawrence R Donohue

SEATTLE WOMEN'S CLINIC

1. Comment acknowledged. Under the new alternative presented in the Final EIS (referred to as the Preferred Alternative) only helicopters with the most critically ill and injured patients would land at the Kitchen Garden Helistop on the Children's campus. All other patients being transported by helicopter to Children's would land at either the University of Washington Intramural Field, if allowed, or at Harborview. Patients then would be transferred to Children's by ground ambulance.

2. As determined by Dr. Nicola, the ability to land patients at the Children's campus may be a life-saving benefit to some patients.

3. Comment acknowledged.

Thank you for your comments.

1. Air quality and odor - were not revieved because proposal would not have significant effect. Each time there has been a landing I have been aware of a terrible odor associated with the emissions of the helicopter. This will most likely effect those residents closest to the proposed site. Please include a discussion of what is causing the odor, how toxic this emission; is, what, if any, will be the long term and cumulative effect on adjacent residents, with particular attention to pregnent women. |1

iii. Climate - should have been included and not determined non-significant. While the construction of the helipad does not effect the climate, the climate will effect the operation of a helicopter service in this area. There is not an adequate discussion of weather in this document. Please include a specific discussion of what conditions allow Airlift Northwest to fly or not fly, how frequently (in days, not percentages) will there be winds from specific direction (i.e., out of northwest quadrant requiring the use of secondary flight path.) |2

1. How often can predict rain, fog, sun |3
2. How often is visibility less than 500 ft. |4
3. What will visibility have to be in order to fly? |5
4. How will pilot be appraised of area condition at COH? |6
5. How does climate at COH differ from Boeing field? |7

C. Water iv. page xi. No discussion is included. Thes people living adjacent to Laurelon Terrace are very aware of the underground springs that run through the hillside that includes COH Campus. With each phase of building on the campus cases disruption to the springs and consequent flooding in the Laurelon Terrace condominiums. Please address this issue in the next document by answering these questions:

1. What is the potential for flooding in Laurelon Terrace as a direct result of the disruption and paving over of the hillside? |8

2. Who will be responsible and liable party in the event of flooding or continued flooding and inevitable damage? |9

3. What conditions might DCLU impose on permit to build helistop that may mitigate this potential impact on nearby residences? |10

2. Built Environment pg. xii.
iii Release of toxic or hazardous materials. This is not revieved and is deemed non-significant. There is a liquid oxygen tank (5000 gal. drum) located on COH campus. Please discuss the potential effects on residents in the event of a helicopter crash that ignites this highly combustible material. |11

b. Land and Shoreline Use.
iv. Aesthetics -- not revieved, non-significant. This proposal will greatly change the aesthetics of the surrounding neighborhood. What is a quiet residential neighborhood is transformed to a "war zone" each time one of those helicopters land. Many people who have witnessed landings by Airlift Northwest and MAST (Military Assistance to Safety and Traffic) have remarked that they felt as if they were in the middle of Viet Nam. The sound of the incoming helicopter frequently "blankets" the entire neighborhood from some distance away as it is approaching the hospital. Please discuss the potential psychological effects on neighboring residents who must experience the anxiety and fear each time a landing occurs, and the anxiety of "anticipation" that is associated with this proposal. Please include in your discussion the potential effects on the patient population at COH--with specific attention; to the fact that this population is obviously physically debilitated to start with. |12 |13

pg. iii. Light and Glare--not revieved, not significant. How will the lighting on the helipad effect the nearby residences? Will there be lights only when the hospital is notified of incoming flights or will there be lights on 24 hours a day? How will light projected from the helipad effect the sleep patterns of neighboring residents? |14

pg. xii. ii. Vehicular Traffic. Not revieved--not significant. Will an ambulance have to meet each patient transported directly to the ER door of COH as is done at Harborview currently? If not, please discuss why not. On Page 2, para. 1, DEIS it is stated that "upon arriving at the helistop, the engine would be shut down, a ground crew would assist the on-board medical team for transporting the patient to the emergency room." Please define what is meant by a "ground crew". |15 |16

pg. xiii. d. Public Services --Fire. Please include in the next document, a detailed discussion of what would be done in |17

the event of a crash and/or fire on or near the Campus of COH. What unit would respond to the site? What special training if any would be required of the personnel involved? How much time would it take to respond to the COH Campus? What emergency procedures would be followed in the event of a crash on the elementary school playground or the nearby park? What special program if any could the fire dept. conduct at the schools (Villa Academy as well as Laurelhurst Elementary School) so as to educate the population on how to respond in the event of an emergency landing or a crash. 17

Please include in this discussion the identification of any special fire fighting equipment that will be stored at the helipad and how CO personnel will be trained to respond.

iii. Schools - because there was no increase in population, a discussion of the impacts on the two elementary schools in the Laurelhurst neighborhood was deemed non-significant. I find this hard to believe in light of the fact that one of the major safety points that has been repeatedly raised as a result of this proposal was the close proximity of the proposed helipad to the school and the fear of a crash there. Include in the next document a complete discussion of the potential impacts on both elementary schools. Key points addressed should be: 18

1. Noise impact on classroom instruction
   A. How often will classes be disrupted?
   B. What will be the noise level experienced by the school?
   C. How can impacts be mitigated?

2. How often can the school expect direct overflights?

pg. xiii. Parks and Recreation
1. Please discuss how often the Laurelhurst Park will be overflown. 19

2. Who will respond in the event of a crash? 20

3. What will noise impact be on people using the park? How will that effect the use of the park? 21

pg. xv. Distribution List

Why were the community clubs surrounding COH not sent a DEIS? Not even the Laurelhurst Community Club was sent one. Please see to it that the next document is sent to the following community organizations: 22

Laurelhurst C.C. Bob Klug Pres.
View Ridge C.C. Bob Di Julio
Hawthorne Hills C.C. May Kemp

Belvedere Terrace C.C.
Windermere C.C. Becky Weed
Montlake C.C. Doris Burns
City-University Citizens Advisory Committee (CUCAC)
University District C.C. Linda Doupe
Ravenna Bryant C.C. David Rigby
Central Seattle Community Council Federation Beth Means 22

Page 1, para 2. There is an inadequate discussion of what the objective of the COH proposal are. Please include a discussion of what role "marketing" plays in this proposal, as it is well documented that marketing plays as much of a role in the instigation of these services throughout the nation as does the delivery of medical care. It is not sufficient to say that the COH insignia is knot painted on the side of the aircraft. What steps has COH taken or anticipates taking to market such a service? Brochures? Physician contact? Advertising in newspapers, magazines, T.V.? And in what states will they advertise? 23

Page 1, para 4. It is stated that 3 trees will be removed from the site. On FAA form 7480-1, COH submits that one 50 ft. cypress is an obstruction to the flight path. Please rectify this descrepancy. Please submit as part of the final document, a copy of the current FAA Form 7480-1 that COH has submitted. 24 25

Please explain why the original prediction of 3-4 landings per month has now jumped to 10 per month. What is the basis from which either of these predictions are made? Airlift Northwest is described as "a Seattle vendor based at Boeing Field." Yet, on the aircraft operated by Airlift Northwest is clearly stated "operated by Hospital Air Transport, Inc.." Who is Hospital Air Transport, Inc.? What role do they play in this proposal? Do they have guidelines or standards to which pilots must adhere? Do they carry liability insurance? If so, how much? How has the liability insurance figure in the Airlift Northwest contract been determined and who is the provider/vendor? Who is their contract with Seattle Jet or the four hospitals involved in the proposal? 26 27 28 29 30

Dr. Nicola's report predicts that over time COH could expect 15-20 flights per mention. (Mentioned on Page 1, DEIS.) Yet, Airlift Northwest records will show that for the month of August, 1986, COH recieved 17 patients via Airlift Northwest. Three or four came directly to the door of the E.R. at COH and the remainder were delivered to Harborview, transferred to an ambulance and then transported to COH by ground ambulance. Why were these patients delivered to Harborview at all? Was the helicopter ride necessary? Where did the patients come from? Whaty was their presenting condition? If this helipad is permitted will these patients who are obviously stabilized come directly to COH via Airlift Northwest in the future? If 15-20 flights per month was Dr. 31 32 33 34

Nicola's predicted use for future then those figures need to be reassessed. If COH had 17 ANW transports in Aug '86 then 15-20 per month is a future prediction that is grossly underestimated. Please address this in FEIS. 34

Pg.1.DEIS. "The majority of these flights would be performed by Airlift Northwest (ALNW), a Seattle vendor based at Boeing Field; although flights could occur by other ambulance services, U.S. Army MAST helicopters, or private helicopters." It is not sufficient to merely predict that landings will occur other than ALNW. The impacts on the neighborhood of these potential landings must be weighed just as those of ALNW. What other ambulance services in the area exist that might use this helipad? What types of aircraft do they fly? Will the helipad physically be capable of servicing these aircraft? What types of liability insurance do they carry? What will be the predicted frequency of MAST landings at COH as well as others providing this service? 35 36

Page 2 - sixth paragraph. "Impacts on patient outcome are expected to be more favorable under the proposed action....." This is an entirely subjective statement by the proponent. There is no scientific basis for this claim. All evidence to date supports the fact that in the eleven years of landings at the soccer field there were never any problems with patient transfer other than one occasion on which the ambulance became stuck in the mud. This is a problem which is easily remedied by improving the landing site or building the proper facilities at some point on the east campus of UW. The proponents further claim that anything "other than the proposed action would result in suffering, the need for prolonged treatment, or even death." Again there is no scientific basis for this claim, please remove from DEIS. Any of these could result from the patient manipulation that will be involved in landing on COH campus and pushing the patient 120 ft. on a gurney to the ER. There will be less patient manipulation involved and less exposure to the elements if the current landing situation (Graves field) remains status quo. 37 38

Page 3. 2nd para. It is stated that 3/4 of patient transports are expected to occur during daytime hourvs. How was this prediction determined? This entire paragraph should be omitted from DEIS as it is based on an inadequate noise study. See remarks from noise consultant. 39

Page 3 (2nd para cont.)The concluding remarks of paragraph two are ridiculous. The ambulances that approach COH turn off their sirens and lights as traffic permits, but once they turn onto the COH Campus the sirens are always turned off (Shephard Ambulance, Oct.,1986) It is not sufficient to say that sirens are approximately as loud as a helicopter. Please provide specific comparisons. 40

Page 3. The expected statistical frequency of a helicopter accident one in every 5,459 flights or 1 every 23 years is an estimate that is based on inappropriate figures. To determine the accident probability; the proponent should have used worst case scenario which Dr. Nicola predicts to be 40 cases per month. The accuracy of this prediction is supported by the fact that COH had seventeen patients transported by ANW Aug. '86. Further the average length of flight of 48 minutes which is used in this calculation is not representative of what is reported in the ALNW actual flight logs, according to the logs. 41 42

Page 4. 1st para. If the grassy area outside of ER door does pose public risks because the site is not secured etc. why is COH currently landing there? Since the City has not ordered them to cease and desist landing will the city of Seattle share in the liability in the event of an accident? Please discuss in final EIS what current landing proceedure on campus is--what are problems associated with this proceedure. Why this proceedure will not be adequate in future as well. 43 44 45

Page 4 paragraph 2.
In the event of a crash and fire on COH campus in vicinity of natural gas meter, could there be an explosion? I find it hard to believe that the natural gas would simply flare until shut off. Please have remarks verified by local gas authority as well as fire department. 46

Page 4 para.2 --
It is mentioned that there is possibility of traffic accidents associated with ground ambulance. There is also the potential for traffic accidents caused by the helicopter flying overhead along Sand Point Way. Further, when people get in their cars and drive there is an associated risk that drivers accept. I t is entirely different though to sit in your own home and have the risk of a helicopter crashing on your roof because the helipad is located too close to residences. O ne situation involves a voluntary participation in action that could result in an accident and the other situation involves a risk that is totally involuntary! These kinds ofi remarks should be eliminated from this draft, because argus ents such as these can be presented to the point of absurdity. 47

Page 4 Paragraph 2
I object to the three point rationale used in maintaining that there will be no proliferation of helicopter services in Seattle. 48

1. The point is made that the land-use criteria used by DCLU to evaluate helistop applications limit the use of helistops to those facilities that can demonstrate that it is needed to save lives. The argument is that COH is a tertiary care facility offering specialized services to the region, and thus demonstrates the need and offers unique medical 49

capabilities that no other hospital offers in; this region. There are two problems with this logic. First the land use criteria states only that the hospital must need a helipad in order to save lives. Every hospital in the state of Washington faces life threatening emergencies probably every day. COH is not unique from that standpoint. There is no mention in the land use criteria about those hospitals having to be tertiary care facilities or having to offer unique medical services. They must only show that the helipad is needed to save lives. Secondly, Mary Bridge Hospital in Tacoma offers the same medical services that COH does with the exception of cardiac surgery. Yet in many instances already ALNW has flown right over the roof of Mary Bridge in order to supposedly save someone's life at COH. If those people involved in transporting these patients feel that the pt. can afford the time involved to be selective about what hospital they are sent to then why is landing site at Graves Field or the East Campus not an adequate site for a helipad? Further, COH has no permit and no pad and is landing anyway, directly violating the land use code, why wouldn't other hospitals do the same? 49 50 51

The 2nd argument is that the PSHSA has written two proposals to develop guidelines for the siting of helistops and policies having to do with the integration of such services with the statewide EMS system. The claim is made in the DEIS that these guidelines along with those being written by the Wa. State Medical Association will deter proliferation & the improper use of such services. 52

The problem with this argument is again twofold: 1. Currently, there is nothing be done to promote the development of regional plan. So far many people have given lip service to the idea but there has been no financial backing of such a proposal. Accordin gto my conversations with Dr. Lothar Pinkers, there is not even consensus on what criteria should be evaluated in a regional plan. The last information that I received on this issue was that the "meat" of the plan had sbeen gutted and as it stood now the plan called only for an inventory statewide to be taken of such services. By DCLU's own admission (a conversation with Katy Chaney) a regional plan would take years to develop.

According to a recent conversation with Dr. Lothar Pinkers the guidelines being developed will be thought of as "suggested buidelines." The Wa. State Medical Association does not have the authority to force compliance with such guidelines, and by COH's own admission in this document, they will also view these recommendations as suggestions, not standards with which to comply.

Why would these guidelines carry any more weight with any other hospital than COH?

Finally, COH cites the CON as being another protection against proliferation. One only has to review the history of events resulting in COH's exemption from this process to realize how ridiculous this statement is. DSHS asked COH 3 53

different times to go through this process and their responses included filing a lawsuit against the State. Currently, the UW is in the process of preparing a DEIS on a similar proposal and they have not obtained a Certificate of Need either. St. Luke's Hospital in Bellingham recently (this spring) went through the C.O.N. process. The CON committee voted unanimously to deny the application but the ultimate action taken by DSHS was quite contrary. They recommended that St. Luke's make a few changes in their proposal and the Certificate would be granted. What kind of protection does a process like this offer the public? DCLU has only to contact legislator Ken Jacobsen or1 any other for that matter to verify that there is a big push; by lobbyists in Olympia to get rid of the C.O.N. process altogether. Which leaves absolutely no protection for the public from the proliferation of helipads and helicopter services. 53

Please eliminate these arguments from the final EIS and state that there is no effective way to guard against proliferation and improper use of such services, and that DCLU will,1 be forced to deal with these permits on an application by application basis, which does not allow for the development of a regional plan for such services that is so desperately needed. 54

Please include in final document a detailed description of what the actual problem is that generated this proposal for a helipad at COH Campus. Please document all statements regarding problems that have been experienced under the past landing situation (MAST, Graves Field.) 55

Page 7 para 3 --Please include in next document--a discussion of*who* has classified COH as a tertiary care facility? Was this through a self designation process? 56
They may be the largest pediatric facility; in the area but they are not the only pediatric facility. Because Blue Cross designated 64% of a summary of cases '84-85 as unique cases, does not mean that COH was the only hospital that could administer this care. Please include a detailed very specific discussion in next document of COH's particular medical capabilities that no other hospital has. Please include a comparison of the capabilities and services available at COH and Mary Bridge Hospital in Tacoma. What other children's facilities or pediatric services are available in Idaho, Alaska, & Montana? 57 58 59

On page 8 para 4. Statement is made that "Childrens is not a trauma center, as it does not meet all criteria necessary to be so designated." Yet all supportive data in Dr. Nicola's report examines the transport of trauma victims. If there is no data avilable that suggests that neonates or other nontrauma patients benefit from helicopter transport this document should state that clearly. Please include in next publication. I request that the medical need matter be remanded to Dr. Nicola for further scrutiny. Dr. Nicola's 60 61

next report should focus solely on the type of patients that COH transports. 61

Please discuss whether COH has plans to upgrade their capabilities so as to self designate themselves a regional pediatric trauma facility? Does COH plan to administer care in the future to pediatric trauma or burn victim? Does COH have a written or verbal agreement with Harborview as to who receives this type of patient now or who will in the future? Please include in next document. What sort of agreement has been signed between the involved hospitals (UW, COH, Harborview and Providence) as to the division of patients transported by ALNW? 62

What would COH have to do to become classified (self or otherwise) a trauma center? 63

Is there any provision in ALNW proceedure for their medical team to stabilize patient at community hospital and then transport patient by ground? If so, how do they handle billing? Will patients always be transported to another hospital? And always by ALNW? Is there any provision for team to administer care at community or outlying hospital resulting in stabilization of patient and the option of leaving patient at referring hospital? Please discuss in next document. If answers are "no" please include explanation. Please refer to Dr. Nicola's report (Pg. 3) "Once stable, a baby can be transported much more safely; some pediatricians prefer ground transport to helicopter because it is possible to stop an ambulance by the side of the road and listen to baby's heart and lungs and check the stability of its condition." 64 65

Page 10--5th para.
There is a minimal description of the training required by paramedics. Please include in next document a complete discussion of training required for paramedics--This is pertinent to this proposal and important to include because it will be the paramedics that will be calling for ALNW in many instances. What training do they have that will enable them to decide when to call ANW? How will they be able to distinguish what patients can be transported by ground and which require air transport? How is dispatch handled--how is site determined for ALNW to land--at what risk to surrounding community? 66 67

Please expand this discussion to include the background, training and experience of flight physicians associated with ALNW. Some speciiics to address: 68
1. Are they residents?
2. Are they intensivists?
3. Are they board certified?
4. What has been their experience in pediatric medicine?
5. Are they neonatologists?

Dr. Nicola's report suggests (Pg. 3) that "One of the most important aspects in the case of the critically ill neonate is the transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse to the community hospitals to stabilize a deteriorating baby." 69

Page 10. para 3. There is a reference to the guidelines being proposed by the Wa. State Medical Association. The proponent suggests that "It is the opinion of the Seattle King County Dept. of Public Health that any recommendations be used as guidelines and not standards." This is quite contrary to what is mentioned in Dr. Nicola's report; "I would also recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with specific criteria for use."(Pg. 4) 70

Please resolve this discrepancy, and include a discussion of how any guidelines proposed will be implemented by this program (ALNW). Who will monitor adherence to these guidelines? Please include in next document a copy of the Patient Distribution Guide (pg.11--2nd para) that is used by hospital medical staff in determining appropriate medical center for treating patients. When was the last time this was updated? 71

It is mentioned that COH & UW only offer neonatal services (pg. 11. para 6) and that critically ill or injured pts. are generally referred to COH but HARBORVIEW is the only hospital with an operating room staffed twenty four hours a day. How long does it take for COH to become "operating room ready"? How is the ER staffed at COH? How is the ICU or NICU staffed at COH? 72

Page 12--1st para -- According to DEIS in 1985 there were 2 helicopter transports to COH out of 141 patients that were served by the County's EMS systems. How does this figure compare with the number of total transports thus far in 1986? How do you account for the difference? 73

Page 12 --2nd para. Discussion of guidelines that paramedics use for determining mode of transport. Under item #1. examples are listed of presenting medical problems that would MOST likely require helicopter transport. What specific areas of South King County would transport these patients by helicopter rather than ground? 74

Page 12--last para. "Under no circumstances shoul d there be a delay at the scene waiting for a ride from the helicopter." Please examine flight record of near drowning patient transported from Auburn. Did the paramedics in fact wait for ALNW to arrive at a Park and Ride lot that they had transported the patient to in order to be picked up? What was the reason for this action. What was the delay in time? What effect did this have on patient's condition? 75

Page 13 --item #4 "Permission to use any helicopter by a paramedic must be obtained from the medic unit's base hospital physician." Please include a discussion which details the dispatch system of ALNW. What has been used to date, and what might be contracted in the future. Please verify that the paramedic must call into the unit's base hospital physician, who then must in turn call the dispatch person for ALNW who must in turn contact dispatch doctor on call, who must then return call to unit's base hospital physician, who must then return call to paramedic unit giving o.k. How much time on the average does this dispatch system require? 76 77 76 77

Page 13 --item #6--Please explain the rationale used in determining that paramedics should not call to get estimated arrival times for MAST and ALNW. 78

Page 13 - last para. COH describes "critically ill or injured patients as those patients who might die or become seriously damaged unless appropriate treatment is received immediately."(Neff,1986). Please explain in next document why some patients have been flown over the roofs of h ospitals that could have provided the same treatment sooner that COH administered. 79

Page 14, 15 & 16. Please explain how these patients were selected for this list. Does this list represent all patients transported to COH for this time frame or have these patients been selected over others to be represented in this document. If so how have these patients been selected? Are these consecutive cases that were transported to COH? What is the relationship between this list and Attachment "A"? 80

Page 13 last para. Dr. Neff suggests that critically ill patients who have been brought to COH include (1) near drowning --shouldn't these go to nearest hospital?
(2)premature children --may go to UW as well
(3)severe injuries --is categorized as trauma and would go to Harborview
(4)overwhelming infection--COH or closest hospital?
(5)ingestion of toxic substance--Shouldn't this go to nearest hospital? 81
Please include more specific discussion of what type of patient will be transported to COH and provide explanation of how and why decision would be made? The explanation that is provided in this paragraph does not make sense. If patients (trauma) are transported to Harborview then that is where the surgery would be done.

Page 17 para 5. Dr. Neff suggests that if the patient is jostled in transfer there is a risk that a child will become hypothermic due to the opening of the isolette. Is it not true that the isolette would not be opened until it was placed in the ambulance?--which would consequently have little effect on the patient? 82

Page 18 --Table 3.
This table should be eliminated from the draft. No one is suggesting that critical patients be transported by ambulance from Enumclaw -- only that the helicopter transporting them land at the soccer field, in which case the difference in travel time would be ten minutes or less. In addition, almost all patients from Enumclaw could be served at Mary Bridge Hospital Tacoma which is a lot closer to Enumclaw than COH/Seattle. 83

Please include a table that shows the difference in transport time when comparing the transport of a patient from Enumclaw to Mary Bridge and Enumclaw to COH! 84

Page 19 para 2 -- Please include a list of physicians that Dr. Nicola spoke with both in and out of the region in gathering information for his recommendation. 85

Page 19. Dr. Nicola's analysis and report are seriously flawed and should b.e re-examined. The data he uses to support his findings have to do with studies dealing with trauma patients. COH does not receive trauma patients. There is current data that has been released that relates to helicopter transports that should be included in an analysis, as some are now saying it may be detrimental to certain patient populations. From what bases does Dr. Nicola determine that COH may require three patient transports per month? 86 87 88

Pg. 20 para 2
Dr. Nicola suggests that some patients may be adversely affected by 3-5 min. delay in receiving treatment. Please have Dr. Nicola address in next medical need analysis, the issue of whether or not some of these patients are being adversely affected by the delay in treatment which is a direct result of patients not being sent to the nearest medical facility that can provide the appropriate care. 89

Page 20 para 5-- PL ease clarify and expand the statement about the phase-in of Blackhawks by MAST being altered. The reference is listed as Greenavalt, 1986. Please include in next document a detailed description which includes the physical characteristics of the Blackhawks (i.e. weight, dimensions, etc.) This is important information and pertinent to this proposal as these helicopters will land at COH once the helipad is built according to Nancy Greenavalt. 90 91

Page 21 para 4 --Proponents mention that from 1983 to date MAST transported 29 patients to COH. 92
--Please compare the use of MAST for transporting patients with the current use of ALNW (May '85 --present). Please explain why there has been dramatic change in number of transports.
--Please have MAST document whether or not there were ever any problems with transfer at soccer field. 93

--Please explain in next document how MAST will continue to operate in region with ALNW when they are restricted from competing with private transport services. 94

--Please include a copy of any agreement which exists between MAST and ALNW for the division and transport of patients. 95

Page 22 para 2 --Please include in next document a copy of current contract or proposed contract under which ALNW is or will operate in future. This information is critical in terms of analyzing this proposal as it (contract) "characterizes the airlift program and organizational structure, the roles of support, distrribution of revenues, indemnification, record-keeping, services extended to non-participating hospitals, and provisions for amendment and termination of contract." It is well documented that in many locations across the nation, the improper use and abuse of such helicopter services have been the direct result of the contract signed for such services. 96

Further, since this consortium was formed in 1984, there have been at l east two different contracts, possibly three. I have been given conflicting information about who it is that contracts with Seattle Jet, what function or role Hospital Air T ransport, Inc. serves and who carries liability insurance related to a helicopter accident. The contract which defines this structure should be made public information. 97 98

PLage 22 --There is no mention of what type of helicopter is used for back-up in ALNW service. There are times when Agusta will be serviced or inspected by FAA which will preclude the aircraft from being used for transport. What type of aircraft will be flown in this situation? What are specific features of this aircrait (i.e., dimensions, weight, engines, fuel, range, speed, seating)? How is it maintained? How does it compare to Agusta in terms of noise gnerated and what is the standard medical equipment on board? Is this aircraft capable of carrying a 160 lb. isolette unit with ventilator? 99

What is 147 gallons equivalent to in terms of measured weight? This is important information to include in next document as the helicopter that was used in noise test did not carry an isolette (weighing 160 lbs.) nor did it carry a full crew (only a flight nurse and pilot). It is my understanding that the heavier the aircrait the more noise it generates. At the time of the test the pilot told me that the full tank of fuel made up for the weight that would be added with the isolette and full crew. Please verify in next document. If this is not accurate information then noise studies are not valid. 100

Page 24 para 4 --Table two describes ALNW helicopter transports through mid June 1986, yet ALNW began services in May '85--Please include total number of transports to COH May, June and July '85. If there were none during this time please specify. Does Table 2 represent consecutive transports 101

to COH--were these all the transports to COH via ALNW during the time. What other patients did COH receive via other helicopter services during this time and what were the specifics of each case as listed in Table 2. If this is not a complete list of consecutive flights how were these selected? 101

Page 25--Table 5
Item #4 --What is basis for forecasted figures in Table 5? Please include in next document method used for these projections. The prediction is that COH's transports will grow steadily over ten year period but as a per cent of the total ALNW roter transports, there is a steady decline. Please explain basis for this prediction in next document. 102

It should be noted that this table also does not reflect any "return flights" as represented in Attachment "A." 103

Please include in next document a table that does include numbers that are reflective of all flight segments involved in the transport of patients as proposed by COH in this DEIS. This would include the pickup of medical team at COH, the pickup and delivery of patient, and the return of the helicopter to the base. Please include predictions that allow for "return flights" as well since this is also being done and involves 2 flight segments over the community. 104

Accurate numbers and method for projecting these figures are critical to any analysis of this proposal, as the risk to the community must be properly assessed and weighed in relation to the benefit that patients might receive from this transport and the location of the landing site. A final EIS lacking this information would be inadequate. 105

Page 26 para 1. Please include an explanation in next document of why dimensions of helipad are less than what is suggested by HEMSPA. And please describe how dimensions of COH's proposed pad compares with those suggested in FAA guidelines for construction of helipad. 106 107

Page 26 para 2.
What is meant by "generally helicopters are given more latitude in their operations than fixed wing?" Please explain. 108

Page 26 para 3 --Please include in next document a copy of current FAA Form 7480-1 filed with FA in regard to COH's proposal for helipad. 109

Please note that because there is little or no monitoring of this type of flight activity once approved by FAA --the burden of dealing with pilot negligence and deviation from approved flight path rests with the citizen as FAA states quite clearly that unless complaintant can prove negligence or operation of aircrait in unsafe manner, the FAA will generally not take any action on complaints. Is the City ready to share in the responsibility of monitoring these 110

flight paths? What role might the City play in enforcing adherence to these flight paths? What authority will City have over aeromedical pilots if this permit is granted? 110

Regulations: 111

While the Wa. State Medical Association is developing "user guidelines" that may be applicable to these services as proposed in the DEIS, the proponent makes it quite clear that these will be viewed as guidelines, not standards. If there are no specific criteria to which the operators of such services must adjere, only guidelines, from what basis will a peer review committee operate? The use of guidelines rather than standards diminishes the possibility of any group or agency having any authority over such services. WHat would characterize inappropriate use of such services if there are no standards with which to comply, and what legal support would exist for the revocation of a permit in the event of inappropriate usage? Who will assess the appropriateness of patient transfers, how often and who will empower this committee? How would this committee be selected? How can the community be assured that such a group would report inappropriate usage? How would this committee deal with the patient's right to privacy and how would committee view transports that were inappropriate but initiated by patient request? Dr. Copass has stated clearly that he is in the business of providing a service and will not deny this service to anyone. Will ALNW be held accountable for such flights if this permit is granted and conditioned with peer review? Who will be accountable COH, ALNW, Seattle Jet, Hospital Air T ransport, Harborview, the referring physician? WHat will be the consequences of violations of the permits issued? 112 113

Will there be any formal or informal public review of the guidelines proposed by Wa. St. Med. Assoc. subcommittee before they are adopted? What can the City do to insure some citizen input to the process? 114

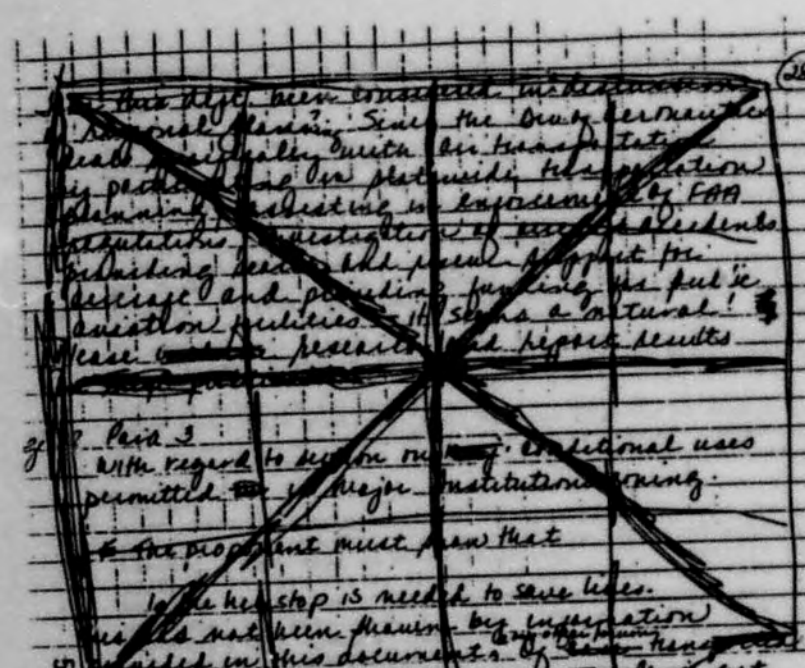
Please disclose in next document whether ALNW, Sea. Jet or Hospital Air Transport, Inc. are members of ASHBEAMS. If not, please explain why. If they have enrolled please include in final EIS the criteria to which they have agreed to comply. Does the City have the authority to enforce compliance with such guidelines? 115 116

Are ALNW pilots members of the NEMSPA? 117

Please include in next publication of this document an interpretation of WAC 248.18.285 as proposed by the City Of Seattle legal department. Please state whether or not the City is in agreement with proponent's interpretation of ordinance. If the City is not in agreement with proponent in this regard how might the use of this helipad be regulated by COH and how would City persuade COH to do so. What consequences would COH face if they did not comply? 118

If DCLU issued permit to COH for construction of helipad on their campus, what possible conditions could be placed on the permit? How would these conditions be enforced and such service monitored over time? Who would be responsible for determining such conditions? Please provide a detailed discussion of possible conditions and potential for enforcement. Please suggest who would be charged with responsibility of reporting violations other than the appropriateness of transport (i.e., noncompliance with noise abatement proceedures?) A complete discussion of this topic must be included so as to determine whether or not the adverse impacts of such a proposal on surrounding neighborhoods might be mitigated in the event of a permit being issued. 119

The conclusion that should be drawn and stated in next publication with regard to regulation of such services is that this proposed service as well as any other of like nature are and will be totally unregulated once flight paths are approved by FAA and that no agency, whether federal, state, or city has the authority to modify, revoke, or even condition such services. Please state so. 120
It would be irrational, irresponsible, and certainly worthy of challenge in a court of law for the city to grant a permit for this proposal cognizant of these facts.



Pg. 29 para. 5
Please include in next document a discussion of the role the Wa. State Dept. of Transportation might be encouraged to play in this issue. In other states (i.e., Louisiana) it was this department that orchestrated and carried out formal studies of aeromedical helicopters for such transport within their states and produced an overall plan. Does this Dept. have the capability of conducting such a statewide study and plan in this state? 121

Has this (Dept. of Transportation) been considered in a discussion of regional planning? Since the Div. of Aeronautics "deals specifically with air transportation by participating in statewide transportation planning, assisting in enforcement of FAA regulations, investigation of aircraft accidents, providing search and rescue support for aircraft, and providing funding for public aviation facilities--it seems a natural! Please research and report results in next publication. 122

Page 28 para 3
With regard to section on conditional uses permitted in Major Institutions zoning.

The proponent must show that 123

is. The helistop is needed to save lives. This has not been shown by information provided in this document or any other forum. OF transported patients 50% died anyway. It is 124

Para 3
With regard to [illegible] additional uses permitted [illegible] major institutional zoning.
The proponent must show that
a. the helistop is needed to save lives.
[illegible] not been shown by information provided in this documents. [illegible] does not clear & even addressed whether the other remaining patients lives must saved do the helistop being located at CotH. — Please discuss how CotH plans to document that they are in compliance with this first criteria. Does the city believe that CotH has provided adequate information from which they will be able to determine whether or not this proposal meets this criteria? Please discuss how city views report issued by Dr. Nicola as well.

b. the helistop is located so as to minimize impacts upon surrounding residential property
— Have city personnel who will be responsible for making this decision visited the CotH campus and witnessed a helicopter landing? Without doing so I don't believe that they can adequately assess whether proposed site mitigates the impact upon surrounding

residences. The city should conduct an independent survey of residences within a 3 block radius of heliport helipad to determine what their experiences have been to date with the helicopter landings. With particular attention to how it has changed their lives (i.e. some residents feel they must sell property and move, some have experienced personal damage due to vibration, some have experienced physical changes, & psychological changes (ie elevated blood pressure, sleeplessness, anxiety, fear, stress).

What type of homeowners insurance will be required of residents closest to heliport and how will premiums be effected?

A study by EIS seeking this information which is available due to the fact that CotH has been leading only just from proposed site since May '85 — would not provide sufficient information from which to be determined whether or not there is a conditional use — Helistops had been met. Please conduct survey and include results in final EIS.

c. Use of the helistop will be restricted to occurrences involving life threatening emergencies.
— Since this service has been operating illegally at proposed site since May '85 it seems appropriate to review all flight records to determine whether or not CotH has been using helistop for only life threatening emergencies. Please form a "citizens" Review panel that includes objective people, lay people as well as physicians to determine whether flights to date have been justified. Please include

(12)

Criteria for evaluation and results in final EIS. Please see Attachment "A" as this reflects that use of helistop is not being used for life threatening cases, i.e., return flights etc. | 130

2. "The directors report shall examine alternative locations for the helistop, including sites outside the institutions boundaries which would accomplish the purpose of the helistop with a lesser impact upon residential areas."

The purpose of the helistop according to COH is two fold; critical time saved and decrease in patient manipulation. Locating the helipad at an alternate site located on the UW east campus saves the same amount of time in transport, less a few minutes. These few minutes that might elapse because of an additional transfer can be made up on some other leg of the transfer with minimal modifications. I'm sure ALNW can do something which would allow them to take off sooner. The COH pediatric team might respond quicker for pick up - a possible change in the flight path might make arrival at the destination sooner. Better preparations at referring hospitals may expedite the transfer. Improvement in the overall dispatching systems which Robb Child, administrator of ALNW describes as "archaic" could easily make up for the minutes lost doing a field transfer. Most peole involved in search and rescue and emergency transport will agree that it is a very small percentage of cases in which minutes are critical anyway (Dr. Nicola). In most cases transport of patients take hours (flight time, stabilization time, transfer time) In view of this, an alternate site at the UW campus would meet COH's first objective. | 131

The second objective is to decrease patient manipulation. In talking to people involved in doing emergency transport, I have discovered that some people think one is really splitting hairs" in discussing whether or not there is more patient manipulation due to an additional transfer at the east campus. The reasoning is that if a site is permitted at the COH campus in the Kitchen Grade area the helicopter will land, unload a patient on to a gurney (same procedure as field) or stretcher and they will be pushed, 120 ft. (all the while exposed to the elements) into the Emergency room at COH. All the while exposed to the risk of tubes and I.V. becoming tangled, jostled, disconnected. At the field, the ambulance pulls up to the aircraft the patient is moved into the ambulance (is not exposed to elements anywhere near as long as in case of proposed action) and then is transported to emergency room directly and unloaded. He is not subjected to the jostling associated with a 120 ft ride on a gurney. The point is that neither procedure is perfect, they both have their disadvenleges and one is not inherently better than the other. | 132

The alternate site offers better safeguards against hypothermia than the proposed COH site. When one weighs these facts with the ever present risks to community associated with landing at COH, the prudent site selection is an alternative at UW east campus, and this alternative meets COH's criteria for decrease in patient manipulation. (Windchill factor from blades ? and 120 ft trip) | 133

Please keep in mind that the purpose of the Major Institution Policy is to balance the need for institutional growth and change with the need to protect the livability of neighborhoods. | 134

Locating the helipad at the UW east campus area is not an idyllic situation. At best it is a compromise that the Laurelhurst and Montlake Communities are willing to live with. Much of our Communities will still suffer adverse impacts from the use of this alternative site. The noise will still be of concern although to a lesser degree. The flight paths may be modified but I doubt seriously altered and the number of flights COH receives via ALNW may even escalate as a result of the use of the east campus area. The burden of reporting violations will still be on the surrounding communities. What sort of compormise has COH offered to live with? They have dismissed the possibility of an alternate site saying that it does not meet their objectives. Please include in final EIS a serious consideration of alternate sites which included a realistic assessment of the proposed transfer at COH landing site.

(Please refer to testimony of Dr. Jerry Schneider from public hearing held September 23, with regard to Draft EIS) | 135

Page 33, para 2

1. The sponsors objectives are suspect due to the fact that ALNW is not attempting to deliver medical expertise available to critically ill patients in the least amount of time. | 136

A. Please explain why many transported cases have flown over hospitals that could have administered medical treatment more quickly than COH? | 137

B. What steps might be initiated by proponent and ALNW to insure that doesn't happen in future? How might geographic area be divided so as to delineate what patients are taken to what hospital? | 138

2. They are not minimizing transport time from the place of patient pickup to ER at COH. Please describe in detail the system which dispatches ALNW. What are existing problems with ths system? How might it be changed in future to expedite transfers? How does total dispatch time compare to the time involved in transfer at soccer field? | 139

The proposal may not minimize or reduce additional transfer. 140
Please define what is meant by "ground crew" that will assist in transfer of patient to ER at COH site. Will an ambulance be used to transfer patient from COH helipad to ER door, as is the case of Harborview. If not, please explain why. The proponent has not discussed what potential problems exist for the patient landed at COH and then transfered 120 ft to the ER. Please include in final EIS. Consider in discussion jostling and movement of patient, exposure to elements (i.e., rain, cold temperature, snow, hail, wind) consider also the wind chill factor produced by aircraft, the risk involved in disconnection of life support lines etc, the potential problems associated with moving patient on gurney over slick surfece. Please examine what potential effects these problems may have on patient stabilization as these must be weighed against the potential problems of a transfer at the soccer field. 141

The 4th objective,- to construct a helistop that minimizes potential environmental impacts in a manner that would not sacrifice proper patient medical treatment. The alternative locations in this section have not been adequately reviewed and discussed in order to determine that the proposed action is the action that most effectively meets this objective. Please include in next document a comprehensive discussion of alternative sites both on and off the campus of COH. Merely stating that an alternative has been judged unacceptable is not a sufficient discussion of alternatives. Who has determined that these sites are unacceptable? If discussion does not include how transfer of patient would be made and all the other information that is provided for in the proposed action section (i.e., flight path, transfer time, transfer methods, associated transfer problems), how might the reader of this document determine whether or not an alternative is even remotely feasible? One cannot, one has to rely solely on the biased opinion of the proponent in this situation. Please redo this entire section giving it as much consideration in your document as is done for the proposed action and is required by SEPA. 142 143 144

56

In addition, please address specifically

1. Why would a route through the medical center be less desirable? The patient would not be exposed to the elements which results in proposed action. 145

2. Changing floors is mentioned as being a disadvantage. Does the UW share this opinion? Their rooftop location will require a descent by elevator 5 floors to the emergency door. Please address. 146

3. Surrounding tall trees are not seen as a disadvantage in proposed action. They have been earmarked for removal. Would this not likewise be a solution to this problem with alternative location of pad? 147

4. Please explain why flight path would change in administrative wing and surface parking lot alternative. How could landing site be any closer to residences than what it is for Laurelon Terrace? Please compare distance and report 148

5. Pg 39 para 2- "The significance of the safety distinctions are believed by the pilots to be negligible". The pilots referred to are ALNW pilots whose livelihood depends on the continuation of this service. Please provide an unbiased safety report that relates to the proposed action as well as the alternatives on and off campus. 149

Pg 39. Had all concerned parties been involved in the scoping process, there would have been an opportunity to discuss as an alternate site the possibility of sharing a helipad on the NOAA or Navy property (Sand Pt Way) 150

This site is already paved, lite secured and marked with a big red H. It has adjacent parking as well. It is easily accessed from the lake without having to fly over the homes of surrounding residents. There is a paved road that leads from the site out onto Sand Point Way (short distance) and the distance to COH is minimal. (3 minutes by car). Please explore this situation as a possible alternative to a site at COH and discuss in final EIS. Since the pad is already built and would eliminate a major expense, and have minimal adverse impact on surronding neighborhoods, it should be considered. 151

Pg 40- Please address why the proposed helipad specifications are less than those proposed by NEMSPA for medium size helicopters. How do these dimensions compare with those suggested by the FAA? 152

Who would be responsible for turning on lights at helipad in event of emergency? Isn't this an additional risk to safety of community. Failure to turn on lights may result in a catastrophic accident. Please state that an added advantage to an off site pad is the option of leaving lights on 24 hours a day, and not being subject to human error. 153

Pg 40- Please state in next document that "future" in relation to this proposal equates to ten years, lest someone underestimate potential for growth of this proposed service. Please provide estimates for twenty year growth so that the cummulative impact over time might be properly assessed and weighed now when decision is being made. 154

Pg 40- Why haven't signs been posted warning people of current helicopter activity on campus as a safety precaution? 155

Pg 41- The projection for expected flights in year 1990 is not any where near accurate. COH received in Aug '86, 17 flights via ALNW alone. 3 or 4 came to emergency room, the remainder were transferred at Harborview to ground ambulance and transported. The future (10 year) projection is representative of the number of flights COH is currently receiving. Please adjust figures and present more realistic predictions for future growth. Dr. Nicole estimates that the average number of flights that COH will receive once helped is located on campus is 30-40. Since the proponents refer to Dr Nicola's report for support of their proposal many places throughout the draft, why are his figures ignored? Please provide realistic figures in terms of anticipated utilization, both current and projected. If COH does not agree with Dr. Nicola's figures then state so and provide argument for this position. | 156

Pg 41 3rd para- How has proponent arrived at conclusion that COH shares 17% of ALNW total flights? Please include calculation in next document. In order to determine whether or not one can realistically predict that COH's transports will remain constant, one must have some conception of what changes in capabilities might occur. While I recognize that it is difficult to determine what physicians may leave COH in future, certainly COH has an institutional plan for growth which would reveal what additional services would be made available at COH in near future that would affect the total number of transports expected. What programs and /or specialists does COH plan to add to present staff that may affect this proposal. | 157 | 158

It is stated that ALNW has capability of performing 80-90 flights per month. How does ALNW plan to meet demand for additional flights if requested? Would there be additional helicopters leased that might land at COH? How might an expansion of ALNW effect COH in terms of present flight #'s and expected flights? #'s What happens to flight #'s if a hospital drops out of consortium? | 159 | 160

Page 42 para 1- Please include in next document any agreement reached with MAST in terms of landing and communication. If agreement has not been reached, please include a discussion of what is being considered by involved parties. What efforts will COH make to meet with other aeromedical transport companies in the region that may have reason to transport to COH? | 161 | 162

Please define and describe a pre-arranged transport by ALNW. | 163

How much time elapses on the average from the time the first call comes in to dispatch system until the time the helicopter lifts off? | 164

Pg 43 In reviewing history of ALNW helicopter service to date, in how many instances has the helicopter landed in front of ER door of referring hospital? In how many instances has there been an ambulance ride involved in the transfer at referral hospital? | 165

How long must helicpter run after landing at COH before engine may be shut down? How long must engine run before actual lift off? | 166

How does the number of flights transported by fixed wing to Boeing field that are met by ALNW compare with those initiated by a referring physician requiring pick up of medical team at COH? Please provide figures that are representative of service since acquisition of helicopter by ALNW. (Please review statement on pg. 43 in which proponent maintains that there would usually not be a need for pick up of medical crew at COH.) | 167 | 168

Page 45 What patient condition might require deviation from flight path? | 169

Please define "adverse" weather conditions during which ALNW would not fly. | 170

Please provide comparison of FAA standards, NEMSPA and ALNW policies and/or standards for weather corditon. | 171

How does the noise generated by the ALNW helicopter relate to the turn South over the parking garage in attempting to land at COH? What are specific dangers associated with this restricted turn. | 172 | 173

Pg 45 para 4 - Please discuss the proximity of the helicopter to residences in relationship to the unusal winds which require deviation from normal flight path. | 174

Please state clearly in final EIS that when winds are out of northwest quadrant and 17 knots or better, the secondary flight path will be used which puts the helicopter over the Ville Academy School, Laurelhurst Elementary, St. Bridget's Church. Many people do not look at maps and this information needs to be clear for those assessing this proposal. | 175

Please check estimates for length of time elapsed from moment of touchdown until patient enters the emergency room. There will have to be time allowed to push patient on gurney 120 ft to the emergency room doors. This movement alone may require more than three minutes. Please adjust figures for final document to reflect this leg of the transfer. | 176

how long can one expect it to take for the pilot to retrieve the isolette and take off. For people trying to sleep at night in neighboring residences and for patients being cared for at COH this time is critical as it is disruptive to normal sleep patterns. Please include in final document. | 177

Conclusions drawn on page 46 (last two paragraphs) need to be supported by providing comparative figures for transporting patients by ALNW and Medic One or other responding gound transport systems. Please review all patients that have been transported via ALNW since May'85 and determine transport time for each and provide estimate for similar transport by ground. Please include origination of patient and specific time initial call came into ALNW. Also include how many actual transfers each patient experience before final delivery into ER at COH. | 178 | 179

How might the risk of the patient destabilizing been decreased by transporting the patient to the nearest qualified hospital to administer the appropriate level of care, rather than flying to COH? Please review patient transports May '85 to present and provide this information in final EIS. Please provide data to support claim that "time savings can reduce suffering, decrease hospital stay time and in the most severe cases, can mean the difference between life and death". If no data is available that pertains to specific nature of patients transported to COH (not trauma or burn data) please remove this statement from document. Unsubstentiated claims of this nature are inappropriate in this document. | 180 | 181

What role will medical malpractice play in the decision to transfer patient via ALNW and/or the decision of where to land? Please include discussion relating to this topic in final EIS. Please use unbiased sources (those having no affiliations with proposed service (ALNW) or any affiliation with participating hospitals.) | 182

Figure 7
What safety risks are associated with the noise abatement approach in figure 7. | 183

Page 49- Please discuss "fire prevention system" that helistop will incorporate. Where has the oxygen tank been moved to? Please describe location in terms of distance from the proposed heliped site. | 184 | 185

Please explain comment. "Childrens and Airlift have actively participated in the development of communications guidelines to ensure communication from air-to-ground is facilitated." | 186

Please include ALNW specific guidelines on acceptable weather conditions in next document as mentioned on pg. 49- paragraph 4. In addition provide ALNW pilot qualifications. Please document that ALNW requirements exceed those guidelines developed by NEMSPA and ASHBEAMS. | 187

What provision might ALNW make for pilots to report safety concerns without fear of losing employment? | 188 How are pilots checked out before lifting off? | 189 What sort of aircraft maintenance program does ALNW employ? | 190 What safety checks are made on craft before lift-off? | 191 Where are windshield wipers for ALNW aircraft? | 192 How often does FAA inspect aircraft- what does inspection consist of? | Please provide in next document the safety record for the Aguste A109 Mark II.

What is minimum distance allowed by FAA between helicopter landing site and surrounding buildings? How close to a building does the FAA allow a helicopter to land? | 195

Is there a weather advisor that will be stationed at COH to report to ALNW? and incoming flights- please discuss. | 196

How does COH see a review panel functioning? Please discuss possible participants, frequency of review, violation and enforcement, credibility. | 197

Please include in next document copies of correspondence between Tullman Trask and Trueman Katz as mentioned on page 50 in the DEIS. Also include letter to Bob Klug, Laurelhurst Community Club President with regard to same topic (Trueman Katz was sent a copy.) As your comments on pg 49 and 50 are misleading and need to be clarified. | 198

Page 52- The 15 minute transfer may not be accurate as described. I have been told that in most cases the ambulance pulls up very close to the helicopter. Consequently the eight to nine minute estimate of moving patient from chopper to ambulance is an exaggeration. Please verify that in most instances the patient is not moved across the field to the waiting ambulance. Also please clarify for readers that proposed heliped alternative area would be paved and have adjacent parking lot and allow for ambulance to back up to aircraft. | 199 | 200 | 201

Please provide data to support Dr. Neff's statement (1986) on pgs 52 and 53. If no data is available please remove from this document. | 202

Page 53- Please explain what specific liability reasons would preclude COH from using proposed UW rooftop heliped. Please include any documentation of this communication in final EIS (Goertzen, 1986; Showcroft, 1986) | 203

Argument about traffic delaying the transfer of patient from UW to COH is ridiculous. There is a back road from stadium through east campus area that would eliminate any problems caused by congested traffic (See Public Hearing transcript, Dr. Jerry Schneider testimony) Please address this point in final EIS. 204

Page 56- In the limited landings section. Please address in the final EIS that the possibility does exist for COH to remove tall trees so as to avoid deviation from proposed flight path in final approach to COH. 205

Page 57- In final EIS please clarify that potential mud problem may be eliminated by considering a landing site already paved as mentioned in Dr. Jerry Schneider's testimony, public hearing DEIS Sept 23, 1986. 206

Page 57 Para 5 - Please include in final EIS a copy of section 7.70.040 of the Revised Code of Washington and a discussion which reveals whether the city is in agreement with the interpretation made by the Hospital. 207

65

Pg 58 Please include in final EIS a report from Medic One which clearly reveals their policies on running their sirens. Also include a discussion of agreement COH has made with Laurelhurst Community and City of Seattle with regard to ambulance sirens approaching their hospital -- Please review past permits issued COH by City of Seattle. 208 209

Pg 58 Please remove statement about approval of proposed Action or Alternative not having an impact on the number of Emergency helistops constructed in this region. This is an opinion expressed by the proponent that is quite contrary to the trend across the United States that has been well-documented. 210

Pg 58 An added benefit as a result of reserving implementation of the proposed action for the future is that the area school populations (which have been sadly overlooked in this DEIS) will not be subjected to noise and vibration and resulting disruptions to classroom activity. In addition they will not be subjected to overflights in bad weather and possibility of crash on school play ground that most likely would involved death and destruction. Please address in final EIS. 211

Helicopter Safety

Pg 59 Please identify recognized authorities mentioned pg. 59 paragraph 3. For final EIS please use unbiased sources rather than opinions of ALNW pilots. Please recognize that they may be experiencing a conflict of interest 212

This discussion of "trends" in helicopter safety is not germaine to the issue. How many EMS programs were even in operation during the time frame 1975- 1981? How has that figure changed during the years '80-'85. Please focus on safety as it relates to the EMS helicopter industry from 1980 - '85. And include conclusion-recognized by authorities- that it has the worst aviation record in history (Einhorn, AMA News, Sept 5, 1986). Please secure NTSB statistics for general aviation for the years 1982-85 and provide that information for final EIS. 213 214 215

On pg 60 the proponent maintains that the increase in helicopter safety is due to the increased use of turbine powered engines. But on pg. 65 Table II shows that in 1981 the single leading cause of accidents among turbine powered helicopters was engine failure or malfunction. 216

On pg. 65 proponent makes the argument that pilots are crashing due to striking wires or obstacles (single greatest cause of EMS accidents 1977-1985) is because the pilots are unfamiliar with the landing area. I would like to submit that this has more to do with the inability to see wires and obstacles as a result of flying in restricted areas and flying at night. (See 67, 1st para). The second greatest cause of EMS accidents is power loss or mechanical failure (25%)- Thirty six percent of these accidents resulted in injury or death. 217 218

Helicopter Safety

Pg 67 It is stated that in December of 1985 ALNW refused to answer twenty calls over a two week period due to bad weather. Please investigate what happened to these patients and report findings in final EIS. Please indicate condition of patient at time of call to ALNW- subsequent treatment administered-- what hospital were patients transfered to-- geographic origin of call -- mode of transfer- time of transfer and patient outcome. 219

FAA standards for flying are written for and applicable to all aircraft. There is a big difference between what conditons are acceptable for commercial jets to fly in and what would be acceptable for helicopters-- Please include this in final EIS. Please specify what FAA standards are as well as ALNW. Who establishes the ALNW criteria for flying and how do they compare with the NEMSPA. Please include NEMSPA standards in final Document so that there is a means of comparison for the reader. 220

Pg 68 para 1- What is good visibility? Why doesn't ALNW fly with two pilots? (instead of 1) 221 222

para 2- How many Aguste 109's are in operation around the country. How many are involved in EMS programs? |223

pg 68- Gene Hill's comments on the reliability of turbine powered aircraft is not supported by information provided in Table 11-- 42.3 % of all helicopter accidents (turbine powered) were due to engine failure or malfunction. Please ask G. Hill comment on this and provide for final document. Engine malfunction is not the only factor that contributes to helicopter safety. Please have Gene Hill or preferably an unbiased pilot comment on potential outcome in the event of transmission failure or rotor problems. |224

Frank Benedict is not viewed as a reliable source in the discussion of EMS helicopter safety. In a conversation with Mr. Benedict on Sept 23, 1986, he told me that he was completely unaware of the current safety record held by the EMS helicopter industry. Please include in final EIS comments on the fact that in 1985, one out of 10 aeromedical helicopters suffered a reportable accident (Aviation Week and Space Tech., March 24, 1986). Please include this article as part of final EIS. |225 |226

Pg. 68 +69- The comments made by Dr. Thomas Poulton in regard to improved EMS flight safety are not substantiated by the data represented in this document. What is meant by "early operators"? How does Dr. Poulton feel about accident rate of EMS helicopters in 1985? |227 |228

If restrictive budgets play a role in EMS helicopter safety, please define. What is a restrictive budget? How does this compare with that of the ALNW budget. Please provide this budget information in final EIS. Please include all cost related information to the operation of ALNW (i.e., salaries of personnel, expenses, equipment etc.) Please explain how participating hospitals share in expenses, both fixed and variable. Please provide information on cost to patient of such services. Billing procedures, history of date of recovery of these charges. What has been experience (since inception of service) with regard to third party payors? |229 |230

How does the budget of ALNW affect the judgements made in regard to which flights to take and which not? |231

Pg 69 para 2- Please provide specific information and data on safety record of "major vendors". It is not sufficient to say that it is someone's opinion that they have a better record. Please provide the data to support this point. |232

Pg 69 para 3- What are "insurance companies' standards"? How do they compare with FAA regulations? It is not sufficient to say they are more stringent. Please provide information. Please provide ALNW standards for pilots so that reader may make comparison. Please provide individual pilot accident record to date for pilots flying for ALNW in final document. Please specify definition of "small airport". |233 |234 |235 |236

Pg 70 para 2- Dr. Nicole suggests COH will have 30-40 flights per month not 15-20. This document is supposed to represent worst case scenario. COH had 17 transports Aug '85-- your figures are not realistic. Please adjust for final E.I.S. |237

Pg 70, para 3- According to our review of flight logs, the average flight was not 48 minutes but 77. Please address in final EIS. |238

Please provide accident probabilities based on worst case (40 flights per month). Please project this probability over twenty year period allowing for growth of service. Include in final EIS. |239

Pg 72, para 5- Please include in final EIS Mr. Benedict's comments on which landing site would offer least safety risks to community in comparing proposed action with alternative sites reviewed in EIS and include Navy Site, Sand Point. In my conversation with Mr. Benedict (Sept 23, 1986), he was unaware that MAST had previously landed at UW soccer field and that this alternative was being considered in proposal. Has Mr. Benedict physically visited the COH campus and viewed proposed site or alternatives reviewed in this document? Please include in EIS. Comment in EIS suggest that Mr. Benedict compared the COH site only to landing areas in downtown Seattle. |240

Pg 72- There is no discussion of proposed medical office Bldg and its effect on landings at COH. Please include discussion in final EIS, include unbiased credible sources when determing effect. Please also include what other bldgs COH has planned to erect on its property (not just vicinity of proposed site). This development and proposed development should be considered in siting a helipad on campus. |241 |242

Pg 72- Please address in final EIS- possibility of natural gas meter leaking undetected as a result of accident on site and possibility of subsequent explosion. Who is responsible for shut off of main valve across SandPoint |243

Pg 73- Please refer to Table 12 - Helicopter Accidents by Cause 1972-1985. 31.5% struck wires and obstacles. 22.2% flew into the ground. 16.7% loss of control. The flight path to landing site at COH includes more wires and obstacles, trees, light standards, buildings etc., than open area of alternative sites. The flight path is over homes and schools, the landing site is 240 feet from multi family housing. The landing site is located in a very restricted area -- loss of control could have devastating results. How can you possible conclude that the alternative sites would not be more safe from a helicopter accident frequency ? Please consider varying wind currents, the influence that buildings have on wind, etc. 244

The fact that you cannot produce any statistics on ambulance accidents involving a transfer of patient such as would be required in alternative action suggests that if a risk exists it must be very minimal-- please compare this risk to that which is experienced by locating helipad at COH. 245

Please have pilots comment on whether open, paved lite secured area of alternative (build helipad on East Campus) is preferred to restricted site at COH. Please have ALNW pilots comment as well as unbiased authority. 246

Pg 76- Please explain why exempt sound sources can not be considered a public nuisance, and what authority puts forth this information. 247

Pg 80- The discussion on health effects of Noise is inadequate. Please attempt to give serious consideration to this issue. As one source of infomation please refer to EPA pamphlet entitled "Noise: A Health Problem"(Enclosed). Please refer to letter sent to Hermie Ipp, DCLU, by Liz Anderson in reference to noise tests conducted at COH. Date: See pic Attn. 248

There is no discussion of impacts of Helicopter noise on elementary schools located in vicinity of landing site. Secondary approach departure path is over both elementaries. Please give serious consideration to this issue and present in FEIS. It is not sufficient to say that they are noise-sensitive. 249

Please verify that noise measurements were actually taken at only one spot designated to be measured. Other information was extrapolated from these findings. 250

Pg 81 There is not an adequate discussion of impacts of two bladed helicopters that will land at COH-- please address. 251

Pg 81 para 6 Please verify that gross vehicular weight has negligible effect on helicopter noise. Gene Hill is not a noise expert. Provide comments by credible authority in final EIS. 253

Specific noise measurements should be taken at both elementary schools doing separate tests for primary and secondary flight paths. Include results in FEIS. 254

Pg 83- Noise information conclusions are invalid as presented in this document as the report assumed twenty patients transport or 40 round trip flights. Impacts of 40 transports per month or 160 round trip flights should be used as is supported by findings of Dr. Nicola, 1986. Please use accurate worst case predicions in FEIS. 255

Pg. 84 para 2 - The flight path that incorporates a sharp turn south over parking garage is still being used. Consequently there would not be a lowering of 7-9 dBA. Delete from test for FEIS. 256

There have been no measurements taken for backup aircraft used by ALNW which has landed several times at COH already. Please provide noise information for this aircraft in FEIS-- Please provide noise information on BlackHawk helicopter, as military plans to replace the Huey. Provide for final EIS. 257

Please provide information on how hospital rooms at COH were determined noise-sensitive. If noise studies were done accurately, it would be shown that more than 30% of hospital would be awakened. Please discuss effects on patients when windows are open during summer, fall, spring of year. 258

How did proponent determine there were no known health effects associated with the predicted helicopter sound levels for the neighborhood surrouding COH? Please discuss FEIS. 259

The current helicopter noise awakens more than 15-20% of closest residents. Please poll the closest line of sight residences to determine. 260

Please address the potential impacts on residences of consecutive night flights that prevent residents from sleeping at all. This has already been experienced at least once since landings have been taking place at COH. 261

Why is it that in addressing noise impacts of intramural field helicopter the

but does not even acknowledge this same impact with regard to the elementary schools located in vicinity of COH. This disruption occurs even when the school is not overflown. 262

Pg 89- The proposed flight path does not keep helicopters at "high" altitude over Sand Point Way. What does proponent consider high altitude? 263

The disturbance to residences as experienced in noise abatement approach is not minimal. 264

Residents to the south of hospital experience disruption to lives as a result of helicopter landing at COH. Many have complained about sleep interference. 265

Pg 90- When did the UW receive CON approval for their helistop? Helen Shewcroft (UW) was unaware that the institution had gone through process. See testimony Joanne Brekke hearing, September, 1985. 266

29

What do long range plans of Seattle area project in terms of helicopter service acquisition? 267

Please note: Six months prior to COH announcing its plans to acquire helicopter service and building pad, hospital representatives maintained in a public community meeting that they in fact had no plans to acquire such services nor did they intend to build a helistop on their campus-- so much for your survey of Seattle area hospitals. Why would these hospitals divulge their plans to COH anyway? COH certainly does not share its institutional plans with other hospitals. Please delete your survey of hospitals, it has no validity with regards to the precedent setting nature of the issuing of this permit. 268

Ludwell Lake, EMS helicopter program consultant, has remarked in the St. Luke CON hearing (helicopter proposal Spring '86) that a consortium is the worst way to set up an EMS helicopter program. Please address in final EIS and research his "Public Utility model". 269

How can ALMW do an adequate job of providing appropriate medical services to public if it is not integrated to total EMS system and part of regional plan? 270

See references to CON process and helicopter service acquisition by hospitals.

Your conclusions on pg. 91 are contrary to realistic results expected and experienced to date, of CON, PSHSA study, Washington State Medical Association guidelines, the city's land use process -- see earlier discussion. 271

Pg 91- What Dr. Nicola suggested as referenced in para 6 is illegal. 272

Pg 92- Please refer to comments on 1st para in public hearing speech, Liz Andreson 9/23/86. Please reconsider concluding paragraph on noise and vibration when accurate noise study is complete. 273

Submitted DCLU 10/17/86

LIZ ANDERSON

1. During the scoping process, the issues of Air Quality and Odors were deemed not to be significantly affected by the Proposed Action or alternatives. It is DCLU's position that the emissions from the helicopter do not warrant analysis.

2. During the scoping process, the issue of climate was deemed not to be significantly affected by the Proposed Action. The discussion of weather conditions and how they may affect Airlift Northwest's determination to fly or not to fly is presented on page 67 of the Draft EIS and in Chapter IV of the Final EIS. The frequency of use of the secondary flight path to Children's is presented in terms of the frequency (based on the average number of hours in a year) that winds in excess of 17 knots originate from the northwest quadrant.

3. See response to Comment #2, above.

4. See response to Comment #2, above.

5. Visibility conditions in which Airlift pilots fly or do not fly are presented on page 67 of the Draft EIS and in Chapter IV of the Final EIS.

6. Airlift pilots receive general weather information from Boeing Field. The distinction between weather at Boeing Field, Harborview, and the Children's campus are not significant. The pilot, upon approach to the landing area, is able to observe the weather conditions and to take the necessary steps to ensure that weather conditions permit a safe landing. Trained weather observers are used for instrument approaches, which cannot occur at Children's. Weather conditions at Children's can be ascertained by the pilot through radio contact with personnel at Children's, and through pilot observations. Following helistop approval, if received, one or more wind socks would be placed on campus.

7. A detailed analysis of climatological differences is beyond the scope of this EIS; however, the most prominent distinctions likely would be created by the topography and, to a lesser extent, the buildings and vegetation that exist at the two sites.

   Boeing Field is situated in the floor of a valley system. Valley systems of this size are typified by mild valley winds, which generally are more pronounced during summer months, and the potential for windless periods when inversions are likely to occur. Fog in the Puget Sound area occurs most frequently during the autumn and early winter months.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's is situated on a hillside where winds would tend to disperse fog that would be more likely to form at lower elevations. Depending upon specific wind conditions, the area's topography could serve to either redirect and intensify winds or to disperse winds. The structures probably would influence ground layer winds at the location of the Kitchen Garden helistop site or outside the Children's Emergency Room. Winds at the Intramural Field site are less influenced by topography, structures and vegetation than any other site. Airlift Northwest pilots have indicated that the overall weather conditions are not markedly different among the helistop locations.

8. The area that would be paved for the helipad and walkway would be approximately 2,070 square feet. Surrounding the paved landing area would be grass that would minimize the amount of rainfall that would run off the helistop. Consequently, water was determined through the scoping process to be an element that would have no significant impact.

9. See response to Comment #8, above. The party responsible for any flooding would be liable.

10. DCLU would require that the applicant comply with City regulations regarding stormwater runoff controls. No other mitigation is necessary. See response to Comment #8, above.

11. In April 1986 in order to minimize the possibility of an accident rupturing the oxygen tank, it was moved from its former potentially vulnerable position to a more protected, enclosed area inside the hospital building, approximately 180 feet from the proposed helistop. An intense flame would result from a fire fueled by oxygen.

12. The issue of noise is discussed in the Noise section of the EIS. DCLU has determined that a separate section on Aesthetics is not warranted. People experiencing approaching helicopters may be reminded of wartime helicopter operations. This could have an effect on some veterans or other individuals. The helicopter operations could create anxiety or disturb sleep for some individuals. Please refer to the response to Laurelhurst Community Club's Comment #5.

13. On page 86 of the Draft EIS and in the Noise section of the Final EIS, there is a discussion of the potential impact of noise on the patient population. Please refer to the response to your Comment #258, below.

14. As described on page 49 of the Draft EIS and in Chapter III of the Final EIS, the helistop's landing lights would be "glow" lamps rather than direct beam lamps. These landing lights would be turned on only for landings. In addition, obstruction lights would mark the southern corners of the parking garage and the Medical Pavilion and main building penthouses, and a strobe helipad location beacon would be placed on the top of the main medical building. The strobe light would

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

emit 30 watt-seconds of light per flash (which is 2.5 times as bright as a typical anti-collision light) and would flash 20 times per minute. The strobe would be visible to pilots within 5-10 miles of the helistop (depending on weather conditions) and would be turned on by the ground crew when a helicopter was approaching. Lighting would not project directly to the adjacent neighborhood and, therefore, the lighting would not affect sleep patterns. In addition there would be a glide slope indicator light that would project different colored light to the north as a means for indicating appropriate altitude during field approach. Consequently, there would be no significant impact.

15. The Kitchen Garden helistop site is sufficiently close to the entrance of the Children's Emergency Room that the patient can be easily and quickly wheeled by gurney directly into the hospital. See also response to your Comment #38, below.

16. A ground crew is composed of both security and medical personnel. The security staff have the responsibility of restricting individuals from entering the landing area and would consist of the regular on-staff security personnel. The ground crew medical staff, usually comprised of 24-hour Emergency Room or ICU staff, assists the on-board medical team in unloading the patient from the aircraft, placing the patient on the gurney and wheeling the gurney into the hospital.

17. The helistop would be equipped with fire suppression equipment. Children's staff will be trained in the proper use of the necessary fire suppression equipment for the possible types of accidents and the appropriate means for notifying the Fire Department.

    Children's staff have been trained to immediately notify the fire department in the event of a fire. Staff also are trained in the use of fire extinguishers. If the helistop is constructed with a foam fire suppression system, staff would be trained in its use.

    The Seattle Fire Department, Police Department and Medic Units would respond to any accident that were to occur. A fire alarm at Children's would be answered by Engines #38 (5503 33rd Avenue N.E.), #17 (1020 N.E. 50th Street), #40 (9401 35th Avenue N.E.), and #10 (13th and Pine); and Battalion Chiefs #6 (1020 N.E. 50th Street) and #1 (810 South Dearborn Street). If a fire at the hospital were confirmed, an expanded response company--either Engine #9 or #6--would also respond. Initial response time would be less than five minutes.

    Normal training of Seattle Fire Department personnel would be sufficient to adequately respond to a fire from a helicopter accident. The Fire Department and Medic Units would respond promptly to an accident that occurs at the school or any other location.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Seattle Fire Department may be able to instruct neighborhood residents and school personnel in any special procedures needed to respond to an aircraft-related emergency or accident.

Representatives of Airlift Northwest, if an Airlift Northwest helicopter is involved, and the FAA also would respond to investigate the cause of any accident.

18. Both noise and safety impacts on schools are addressed in the EIS. The principal means for reducing the risk of accident and noise impacts is to reduce the number of flight operations in the vicinity of the schools. This has been done through the revision of the alternatives to create a new Preferred Alternative that would not involve the pickup of the medical transport team at Children's and would land the majority of Children's-destined patients at either Harborview or the Intramural Field helistops. Direct overflights of the Laurelhurst Elementary School or Villa Academy would not occur with use of the primary or secondary flight paths into or out of the Kitchen Garden helistop, and would occur only if Airlift Northwest pilots needed to deviate from the designated flight paths. See page 86 of the Draft EIS and Chapter IV of the Final EIS for a discussion of noise impacts at the Laurelhurst Elementary School. See also responses to Laurelhurst School PTA Board Comments #1 and 2.

19. Direct overflights of Laurelhurst Park would be rare, and would occur only if helicopter pilots needed to deviate from the designated flight paths.

20. See response to Comment #17, above.

21. See response to Comment #18, above. Helicopter operations could be heard at the park. Helicopter noise would be less than that experienced at the five receptor locations as described in the Noise section of the Draft EIS and Final EIS. It is expected that these operations would have negligible, if any, effects on its use.

22. The Distribution List for the Children's Hospital and Medical Center Draft EIS inadvertently omitted the area community councils. After this was brought to the City's attention at the hearing on the Draft EIS, copies of the document were provided to community councils and the 30-day comment period was extended by 15 days.

23. The purpose of the EIS is not to evaluate the objectives of the Proposed Action but rather the environmental impacts of the Proposed Action and its alternatives. Children's does not currently advertise, nor does it plan to use Airlift Northwest or helicopter transport capabilities, in a marketing role. Airlift Northwest does meet with representatives of community hospitals, fire districts, and medic units in the region to explain the services and capabilities Airlift offers,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

and to explain operations procedures. This function allows Airlift Northwest to explain when helicopter use is appropriate and how best to prepare for Airlift Northwest helicopter operations, once requested. See also the response to Laurelhurst Community Club Comment #3.

24. Airlift Northwest pilots identified three trees that affected the safety of landing and departing from the existing landing area ouside the entrance to the Children's Emergency Room. These three trees, the cypress near the foot of the driveway and two Norway spruce west of the cypress, have been removed. The removal was performed in order to increase the safety of landing outside the Children's Emergency Room entrance. The Final EIS indicates other trees warrant removal if the Kitchen Garden Helistop is constructed and used.

25. A copy of the current FAA Form 7480 is on file at DCLU.

26. The projected number of flights presented in the Draft EIS was determined by the medical and administrative staff of Children's Hospital and Medical Center, and of Airlift Northwest. The numbers are based on assumptions that relate to historic Airlift operations, population projections and professional judgement. Dr. Nicola has indicated that, "It is difficult to derive reliable projections of total numbers of patients who would be transported by helicopter to Children's. Given that a medical breakthrough, catastrophe, addition of competing helicopter service, increasing specialization, or some other situation might change their projection, Children's estimates that by 1990 the number of children transported by helicopter for admission to Children's in any given month may be 15 to 20"(sic) (Nicola, 1987). This projection is consistent with the average number of transports that were actually flown (see the Final EIS).

    Figure 3 in the Final EIS illustrates the monthly number of Children's-destined patients transported by Airlift Northwest from May 1985 through December 1990. This figure illustrates that there is considerable variation in month-to-month transports; however, the average number of transports has been relatively stable at between 15 and 18 per month since October 1987.

    In 1988 and 1991, Children's commissioned a projection of patient transports. By considering (affected) County population cohorts, referral patterns, and Airlift Northwest utilization data by County, it was determined that by 1990 approximately 15 patients per month would be transported by helicopter. The projection for 1990 was comparable to the actual number of transports in calendar year 1990, which was 193 (see Table 3 in Volume I). Thus, it would appear that Dr. Nicola's estimate of 15-20 Children's-destined helicopter transports per month is a reasonable projection.

    Projections through 1995 also were made with an average of approximately 18 Airlift Northwest transports in 1995. When MAST and MedFlight transports are included, it is estimated that there would be

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

an average of 15-21 transports per month in 1995. It was assumed that changes in projections could occur if situations, such as those identified by Dr. Nicola, were to materialize.

27. Airlift Northwest is a cooperative venture among Children's Hospital and Medical Center, Harborview Medical Center, Providence Medical Center and University of Washington Medical Center to provide fixed-wing and rotary-wing air ambulance services to the Pacific Northwest. St. Joseph's Hospital of Tacoma and Virginia Mason and Swedish Hospital of Seattle became Associate Members of Airlift in late 1987, early 1990, and early 1991, respectively.

    This cooperative venture, which is formalized through the Inter-Hospital Agreement, establishes Harborview Medical Center as the lead administrative agency for the four founding hospitals. Harborview, in turn, has contracted with Seattle Jet Center to provide fixed-wing aircraft, pilots, mechanics and fuel for Airlift Northwest, and with Hospital AirTransport to provide the rotary-wing aircraft, pilots and mechanics portion of the Airlift Northwest contract.

    Airlift Northwest is based at Harborview Medical Center and Boeing Field.

28. Hospital AirTransport requires its pilots to meet strict standards before they are hired and to continue to meet strict standards throughout their employment with Hospital AirTransport. Please refer to Appendix B, which identifies the consistency of Airlift Northwest with AAMS and NEMSPA guidelines regarding pilot standards.

29. Hospital AirTransport is required by its contract with Airlift Northwest to carry a $20 million liability insurance policy. The provider of this insurance coverage is not germane to the consideration of the environmental effects of the Proposed Action or alternatives.

    The amount of liability coverage was determined through consultation with the University of Washington Risk Management Department.

30. See response to Comment #27, above.

31. During the month of August 1986, five patients were transported by helicopter directly to the Children's Hospital campus. These five patients were determined by the attending medical personnel to be in a critical, life-threatening condition that warranted their direct transport to the advance care available at Children's. Eleven patients were transported by helicopter to Harborview and then ground transported to Children's, and one other patient landed at the Intramural Field and then was transported by ambulance to Children's. The twelve patients that did not land at the Children's campus were in a life-threatening condition; however, the attending medical transport

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

team determined that their outcome would not be dependent on their being transported directly to Children's. Yet, for these remaining patients, the referring medical personnel determined that the patients well-being would be better served by being transported to Harborview via helicopter then on to Children's, rather than by an alternate means of transportation. For a description of origin of transported patients (in 1988), please refer to Appendix D.

32. Airlift Northwest medical transport teams apply their professional judgement to determine whether patients should be transported directly to Children's. Dr. Nicola reviewed transports directly to Children's as well as 30 randomly selected cases flown by helicopter to Harborview for ground transport to Children's and determined "that all cases met the State's proposed criteria for use of air transport but were less severe than those flown directly to the hospital. Referring physicians and Children's appear to be sorting patients appropriately" (Nicola, 1987). In light of this determination, descriptions of the presenting conditions of the August 1986 Children's-destined transports have not been provided.

33. Under the Proposed Action that is presented in the Draft and Final EIS, all Children's-destined patients being transported by helicopter would land at the Kitchen Garden helistop.

    Under the new alternative (the Preferred Alternative), only those patients that are in the most critical, life-threatening condition would land at the Kitchen Garden helistop. All other patients would land at either the University of Washington Intramural Field, if allowed, or at Harborview. The patient then would be transported to Children's via ground ambulance.

34. Fifteen to 20 patient transports per month is an average figure. Dr. Nicola reviewed the 17 Airlift Northwest transports of August 1986, when preparing his updated report (Appendix A). See response to Comment #26, above.

35. It is not possible to predict what other vendors would use the helistop and at what frequency in the future. Other ambulance services that operate in the area include Med-Flight out of St. Joseph's Hospital in Bellingham, which flies an MBB-105; MAST, which flies a Huey UH-1; the Coast Guard, which used the HH-52A (civilian equivalent is the F-62) until May 1988, and is currently using the HH-65A (civilian equivalent is the Aerospeatiale Dauphin); and the Navy, which uses the SH-3D. If historic use is an accurate indicator (there are only two records of helicopters other than Airlift Northwest's Agusta or MAST's UH-1 landing at Children's), then one could say that the transports by other vendors to Children's would be rare.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The helipad would be painted with the number "12", which indicates a weight limit of 12,000 pounds. This would be able to support the weight of the MAST UH-1, Coast Guard HH-52A and HH-65A, Airlift Northwest Agusta 109, and Med-Flight MBB 105, but not the Navy SH-3D (see Table 4 in the Final EIS for the specifications of the helicopters).

The Kitchen Garden Helistop, as proposed, provides clearance of 96.4 feet, which provides for a main rotor diameter of 36.1 feet according to the FAA Design Criteria, which recommends a takeoff and landing area at least twice the rotor diameter, plus an additional one-third rotor diameter of clearance on each side to any obstruction that could be struck by the tail rotor. This main rotor diameter allowance is less than that of the MAST, Coast Guard and Navy helicopters identified that could use the helistop; however, it would accommodate the Agusta 109 Mark II and the Med-Flight MBB 105.

The design helicopter, Agusta 109 Mark II requires clearance of two times its rotor diameter of 36.1 feet (or 72.2 feet) plus 12 feet around the perimeter, which corresponds to a diameter of 96.2 feet. The MBB 105 (used by Med-Flight) requires clearance of 64.6 feet (two times its rotor diameter of 32.3 feet) plus 10.8 feet, which corresponds to a diameter of 86.2 feet.

Children's would inform these other vendors of the protocols (flight paths, sorting of patients, communication guidelines, etc.) for landing at Children's and/or for landing Children's-destined patients at Harborview and the Intramural Field, if permitted. See response to Comment #36.

Based on the available data as presented in the Final EIS, the overall statistical risk of accident would not be different for other commercial vendors; although military air ambulances do have less statistical risk of accident compared to commercial EMS vendors. The pilots of other air ambulance services could be less familiar and experienced with landing at the Children's helistop, the Harborview helistop, the Intramural Field helistop, or the University Medical Center rooftop helistop, if permitted. Such a lack of experience in landing at these helistops could be either a liability (less familiarity) or a benefit (more caution). The military aircraft do not have liability insurance. Med-Flight would not divulge any details regarding their helicopter liability insurance.

36. MAST, Med-Flight, Coast Guard, and Navy aircraft would be requested to continue to land at the Intramural Field or at Harborview. Therefore, their use of the Children's Helistop would be infrequent and limited to the most critical life threatening situations.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

37. For the majority of patients flown to Children's, the time differential between landing at the University of Washington Intramural Field and landing at the Children's Emergency Room would not be critical. In cases of the most critical and/or rapidly destabilizing patients, however, it is the professional opinion of Dr. Neff, Medical Director of Children's Hospital and Medical Center, that the delay resulting from landing at the Intramural Field and transporting the patient from there to Children's via ambulance could result in suffering, the need for prolonged treatment, or even death. Dr. Nicola has concurred that "there are hospital transfers to Children's where ten minutes are critical to a severely ill infant or youngster; but the actual number of such cases are small" (Nicola, 1987).

The proponents have created a new alternative (the Preferred Alternative) that would land only the most critical patients at Children's, with the majority of patients landing at the Intramural Field, if allowed, or at Harborview.

38. Under the original Proposed Action, there is the least need for patient manipulation and the associated potential risk of patient destabilization. There is less manipulation of the patient if the patient does not have to be loaded into and out of the ambulance.

In landing at the Kitchen Garden site the patient would be exposed during transfer out of the aircraft and onto the gurney, and while in (the revised 142 foot) transit to the Emergency Room. In landing at the Intramural Field site the patient would be exposed during transfer out of the aircraft and onto the gurney, while in transit to the ground ambulance, while loading, and then while unloading at the Emergency Room entrance. It is important to note, however, that the patient typically is wrapped in a plastic blanket and fabric blanket that protects him/her from the elements.

In the event of patient destabilization, stabilization is more easily accomplished in the hospital (Children's) than in the ambulance at the Intramural Field.

39. As discussed on page 83 of the Draft EIS and in Chapter IV of the Final EIS, Airlift flight logs for a period of several months indicated that between 19% and 25% of flights occur during the hours of 10:00 p.m. to 7:00 a.m. It was, therefore assumed for the purpose of the noise analysis that such a distribution of flights would continue to occur.

Table 2 in the Draft EIS indicates that five of 21 (24%) of the patients transported directly to the Children's campus had a takeoff and/or a landing that occurred between the hours of 10:00 p.m. and 7:00 a.m.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table 2 of the Draft EIS has been updated and included in the Final EIS as Appendix D. That appendix indicates that 26 of the 141 (18.4%) patients transported directly by Airlift Northwest helicopter to Children's between August 1, 1985 and March 26, 1989 had a takeoff and/or landing during the nighttime hours.

40. Sound levels of ambulance sirens are discussed on page 80 of the Draft EIS and in Chapter IV of the Final EIS. The sirens produce sound levels between 90 and 105 dBA at 50 feet. Maximum helicopter sound levels that occur at the nearest residential receptor locations (Laurelon Terrace and 4720-24 44th N.E.) are calculated to be 84 dBA. Although the sirens may not be used depending upon traffic conditions and are turned off once the ambulance enters the Children's campus, the sirens, if used, could be audible in other neighborhoods adjacent to the ambulance's travel route.

41. Dr. Nicola's worst-case estimate of 20 transports in 1990 is characterized by one flight to pickup the medical transport team at Children's and one flight to deliver the patient for each of the 20 patient transports. Since the 48-minute per transport estimate that Airlift Northwest developed incorporated this return flight, the 15-20 patient transports per month calculation is an appropriate estimate, given the assumed frequency of accidents. An updated accident frequency analysis that is not flight-duration based has been incorporated into Chapter IV of the Final EIS.

42. The figure of 48 minutes used in the Draft EIS represented an average air time for all segments of the transport: from the time the helicopter leaves Boeing Field, through picking up the medical team, then picking up the patient and delivering the patient to the hospital, to returning to base. Airlift flight logs for all patients transported by helicopter to Children's through June 1987 indicates an actual average of 49.8 minutes. (Note that Airlift bares the medical transport teams with the aircraft.) An updated accident frequency analysis that is not flight-duration based has been incorporated into Chapter IV of the Final EIS.

43. The site is not secured by fencing; however, security personnel do restrict access into the area during helicopter operations. Please refer to response to Comment #45, below.

44. The City of Seattle does not assume any liability in the event of an accident at Children's. Please refer to the response to Laurelhurst School PTA Board Comment #7.

45. The current landing procedure is initiated by Airlift notifying the Children's communications center, which alerts the appropriate medical staff (by phone) and security personnel (by page/phone). In order to restrict unauthorized personnel from the landing area for the approximately three-minute period before a landing and until the aircraft rotor stops (typically 2.5 - 3 minutes after a landing),

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

hospital personnel lock the Emergency Room door and the side door near the Emergency Room and are stationed at the Emergency Room driveway intersection with Penny Drive, and at the Emergency Room entrance. (During night landings, there is one security person on duty. Rather than stationing this person at the intersection with Penny Drive, a hospital van is used to block access into the emergency room drive.) These personnel are instructed not to allow non-necessary individuals into the vicinity of the landing area. Similarly, during takeoffs, the area is restricted from the time the pilot prepares for takeoff until the helicopter is clear. This procedure has proven to be sufficient to protect the public and Hospital employees. The construction of the helistop with a low chain link security fence, as proposed, would enchance security. The Facilities Director has the overall responsibility for security during landings and takeoffs.

46. The determination that, in the event of an accident that severs the natural gas line on the Children's campus, the gas would flare until shut off (rather than cause an explosion) was made originally by Joe Jainga, a supervisor with the Washington Natural Gas Company. Mr. Jainga's letter is on file at DCLU. It should be noted that Children's staff have received training and equipment for shutting off gas service.

    Doug Damm of Washington Natural Gas' Safety Division stated that a helicopter accident involving the meter house most likely would cause a gas leak that would in turn ignite and result in a flare. If the leak occurred beyond the pressure regulator where the pressure is one pound/square inch, there would be a small fire ball and a flare limited to the immediate vicinity. If the gas line were broken before the pressure regulator where the pressure is 60 pounds/square inch, a flare 40 to 60 feet high could be ignited.

    Captain W.J. Donohoe of the Seattle Fire Marshall's Office was reluctant to speculate as to whether a helicopter accident involving the natural gas meter house would result in a flare or an explosion. He said there were too many variables to predict the likely result of such an accident.

47. Comment acknowledged. There are elements of risk associated with helicopter operations, including motorist distraction and the possibility of a helicopter accident resulting in a vehicular accident. There is an element of risk associated with an overflight of populated areas by any type of aircraft.

48. Comment acknowledged.

49. Comment acknowledged. As noted by Dr. Nicola (see Appendix A), the use of the helistop could save the lives of some of the patients being transported by helicopter to Children's. Most, if not all, hospitals in the State of Washington do face life-threatening emergencies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It is possible that the City Council could allow helistops only at those Seattle medical institutions that offer life-saving specialty care that is not available at other local hospitals.

50. The patients transported by Airlift Northwest are being taken to the receiving hospital that has been designated by the referring physician. It is acknowledged that some of the patients being transported to Children's could have been transported to another hospital that also would have been capable of providing appropriate care to the patients. At the request of referring physicians, Airlift Northwest has transported patients to Mary Bridge Hospital.

    Mary Bridge Hospital in Tacoma offers similar primary care facilities as Children's; in selected services, Mary Bridge offers equivalent secondary and tertiary care capabilities; however, Mary Bridge does not offer the full range of secondary and tertiary services available at Children's. These specialities include cardiac surgery, hemodialysis, treatment of congenital defects and neonatal surgery. See response to Comment #58, below. Mary Bridge PICU with six beds is frequently filled so that potential patients cannot be served.

    Also, see response to Comment #56, below.

51. The City has extended the compliance date of the issued notice of violation for landing helicopters at the campus until resolution of the Council Conditional Use Permit process.

    Other hospitals could be subject to the enforcement provisions of the Land Use Code if they are found to be in violation.

52. Comment acknowledged. The PSHSA is no longer an active entity and it does not appear as though the PSHSA proposal(s) will be funded. Please refer to the response to the Montlake Community Club Comment #9.

    The Washington State Medical Association guidelines are designed, in part, to assist referring medical personnel in the determination of when helicopter transport would be appropriate. Although these guidelines would assist in reducing inappropriate use of helicopters, they may not have an effect on the proliferation of helistops. The effect of the guidelines on existing helistops and medical facilities has not been established. The text of the EIS has been revised accordingly. Please refer to Central Seattle Community Council Federation Comment #3.

53. Please refer to the discussion of the Certificate of Need Program in the response to Seattle Department of Community Development Comment #1.

54. As discussed in the response to Comment #52, above, the Washington Medical Association guidelines may reduce the potential for the improper use of helicopter transport services.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Conditional Use Permit process does guard against proliferation of helistops in Seattle. The Department of Construction and Land Use and City Council will review Conditional Use Permit applications for helistops from medical institutions, which would need to demonstrate compliance with the criterion that the helistop is needed to save lives. An application-by-application review of medical institution helistops does not preclude the development of a regional plan.

55. The sponsor states that the helistop was proposed in order to make the helicopter transport of critically ill and injured Children's-destined patients as effective as possible. The patient requiring helicopter transport is already in jeopardy; increasing delays in treatment or subjecting the patient to a more difficult transport may aggravate the patient's medical condition. A secured, lit, and solid landing surface close to the location of advanced treatment increases the safety of the transport and reduces the time required to initiate hospital-based care.

    Part of the problems with helicopter landings at the Intramural Field have included there being no attending ambulance when a MAST flight approached; the security gate at the Intramural Field being locked; and an ambulance getting stuck in the mud; and members of the transport team slipping in the mud during the patient transfer. Although notification and confirmation procedures have reduced the potential for the first two situations recurring, the absence of a secured, solid landing surface and solid walkway from the landing area does remain a potential problem.

56. Dr. Nicola states that, "Although there is no formal classification system, by industry standards Children's is a tertiary care center. Based on a self-assessment questionnaire prepared by nearly all Washington hospitals, the State of Washington's Profile of Critical Care Facilities (Second Edition, January 1980) lists Children's as a Level III facility for all services profiled (trauma, burns, cardiac, respiratory, neonatal, and head and spinal). Under the State's classification scheme, Level III generally indicates in-house, 24-hour availability of specialists, specialized facilities, capability to perform specialized surgery and special therapies, and availability of special transport teams. The State's Level III corresponds with the generally accepted definition of tertiary care" (Nicola, 1987). Self-designated Level III services offered by hospitals in King, Snohomish, Pierce, Pacific, Lewis, Gray's Harbor, Kitsap, Jefferson, Clallam, Skagit, Island and Whatcom Counties include the following:

    Neonatal: Children's, University Medical Center, Madigan Army Medical Center, Tacoma General Hospital
    General Trauma: Children's, Harborview Medical Center, Virginia Mason, St. Joseph Hospital and Health Care Center, Tacoma General Hospital

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Head and Spinal: Children's, General Hospital of Everett, Harborview Medical Center, Northwest Hospital, Overlake Memorial, Providence Medical Center, Providence (Everett), University, Valley General (Renton), Virginia Mason, St. Joseph Hospital and Health Care Center, Tacoma General Hospital

Burns: Children's, Harborview Medical Center, St. Joseph Hospital and Health Care Center, St. Peter Hospital

Cardiac: Children's, Providence Medical Center, Swedish, University, Virginia Mason, St. Joseph Hospital and Health Care Center, Tacoma General Hospital

Respiratory: Children's, Burien Medical, Evergreen General, General Hospital of Everett, Group Health Eastside, Harborview Medical Center, Highline Community, Northgate General, Northwest, Overlake, Providence Medical Center, Providence (Everett), Riverton General, Stevens Memorial, Swedish, U.S. Public Health, University, Virginia Mason, St. Joseph's Hospital (Bellingham), Good Samaritan, Puget Sound General Hospital, St. Joseph Hospital and Health Care Center, Tacoma General Hospital, Mary Bridge

Dr. Nicola indicates that pediatric and/or neonatal intensive care unit beds are located at Children's as well as University of Washington Medical Center, Tacoma General Hospital, Madigan Army Medical Center and Swedish Hospital.

57. It is acknowledged that some of the cases designated unique by Blue Cross could have been treated by other medical institutions. Some cases requiring specialty treatment could be served by other centers that administer care to children. Please refer to the response to your Comment #58.

58. The following statement by Dr. Neff, Children's Medical Director, describes distinctions between Mary Bridge and Children's Hospital.

> "There are many similarities between Mary Bridge and Children's Hospital. Both are specialty pediatric centers and both have excellent staff. Children's Hospital and Medical Center in Seattle, however, is a larger and more comprehensive facility. There are more full-time children's specialists at CHMC than at Mary Bridge. There also are some groups of critical surgical illnesses that are treated at Children's but not at Mary Bridge because Children's has teams of pediatric surgical specialists, anesthesiologists, intensivists and other pediatric specialists who cover the services 24 hours per day. These illnesses include most complicated congenital heart disease and children born with complicated newborn surgical problems. These include omphalocele and gastroschisis (children born with intestines extruding from the abdominal cavity), diaphragmatic hernia (children born with intestines in the chest) and tracheo-esophageal fistula (children

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

born with a hole between esophagus and trachea and obstruction of esophagus). These are unusual situations that require specialty care of physicians who have treated enough of these problems to maintain their skills. Although infrequent, these children come from hospitals all over the state. These illnesses are emergency, life-threatening conditions. Children's Hospital is the only hospital in the Puget Sound area that provides surgery for these conditions on a regular basis." (Neff, 1988)

59. A complete inventory of neonatal and pediatric services available at hospitals in Idaho, Alaska and Montana is beyond the scope of this EIS.

60. Both the December 1985 and March 1987 reports by Dr. Nicola to the Department of Construction and Land Use cite studies that examined pediatric air transport. Dr. Nicola also examined cases of neonates and adolescents transported to Children's. These included non-trauma conditions (see Appendix A). Refer to responses to your Comments #62 and 63, below.

61. In March 1987 Dr. Nicola did update his report, which, in part, included a retrospective review of appropriateness of patients being transported by Airlift Northwest helicopter to the hospital. The updated report is attached as Appendix A to this Final EIS.

62. Children's does treat some patients who are referred to by physicians as "trauma" patients. Although Children's met the definition of being capable of providing trauma treatment, as contained in the Critical Care Hospital Facilities questionnaire (see response to your Comment #56, above), Children's has no current plans to develop a regional pediatric trauma or burn facility that would compete with Harborview. See response to your Comment #63, below.

    Trauma and burn patients who have received treatment at the designated trauma and burn center, Harborview Medical Center, may be transferred to Children's for recovery. There is no agreement between Harborview Medical Center and Children's regarding which hospital receives burn and trauma patients. These patients typically are treated at Harborview because of their specialized staff and facilities. Those trauma or burn patients whose medical conditions are serious enough to warrant helicopter transport for advance care would be transported to Harborview.

    The consortium has no agreements regarding the division of patients.

63. As discussed in the response to Comment #56, above, care facilities self-designate their capability classification, based on criteria provided by the State.

    Children's, Harborview and Virginia Mason are three Seattle-based medical institutions that, based on the criteria, in 1980 designated themselves as capable of treating general trauma patients. Children's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

operating rooms are ready immediately or within 30-45 minutes depending upon the time of day or night (see response to Comment #72) while Harborview is 24-hour operating room ready. Harborview also maintains a neurosurgeon on-campus all the time and, therefore, is always capable of treating patients requiring emergency surgical intervention. In order to become a recognized trauma center, Children's would need to acquire these capabilities.

64. The decision to transport a patient via helicopter is made by the referring physician and is based on that physician's judgment regarding the gravity of the patient's condition. Airlift Northwest is requested to transport the patient to a tertiary care facility for treatment that is not available at the referring hospital. Once activated, Airlift Northwest assumes medical responsibility for stabilizing and transporting the patient.

65. This sentence was deleted from Dr. Nicola's updated report.

    It is acknowledged that if time is not a factor or if more advanced level of care is not a factor, then most physicians prefer to transport their patients via ground rather than helicopter. The transport of patients by helicopter is performed for that (very small) population of patients whose treatment at a tertiary care center must commence earlier than otherwise would occur if the patient were transported by ground.

    The medical transport team uses a doppler to monitor the heart and (potentially) the patient's lungs. Just as in ambulance transports, the helicopter medical team watches the patient's breathing.

66. Paramedics certified to practice in King and surrounding counties have graduated from year-long training programs that are characterized by the acquisition of clinical information and supervised practice on critically ill patients. Paramedics deal almost entirely with life-threatening medical emergencies. The care delivered in those life-threatening medical emergencies is under medical control provided by physicians at base hospitals in radio contact with the paramedics. Afterwards the emergency supervising physicians review the entire medical response.

    The appropriate disposition of a patient to a prepared medical facility is an important aspect of the practice of field emergency medicine. This disposition is reached concurrently by the paramedic and his/her supervising physician. Once a decision to transport by helicopter is reached with medical control, the paramedics contact their dispatch center to request activation of the helicopter via Airlift Northwest dispatch (see response to Comment #76, below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The King County EMS Division has established guidelines for assisting paramedics in the South King County area to decide whether to transport by ground or by helicopter. These guidelines are cited on page 12 of the Draft EIS and in Chapter II of the Final EIS. The Washington State Medical Association's EMS Standards Committee also has developed guidelines to assist field medical personnel in determining the appropriate mode of transport (see Dr. Nicola's revised report in Appendix A of this Final EIS).

67. Local fire departments and paramedic units throughout the Puget Sound area have received instructions on the selection of appropriate landing zones. In addition, pre-designated landing zones have been established in many areas of King and surrounding counties. Should a landing zone not be satisfactory, the Airlift Northwest pilot has the authority to alter the landing site.

68. There are approximately 40 physicians and flight nurses who conduct transport missions for Airlift Northwest. The physicians include a number of specialists in areas such as pediatrics, pediatrics/infectious diseases, hematology burn treatment and neonatology. These lead physicians have completed medical school training and are in at least the third year of their residency program. (Medical doctors have a three-year residency; surgical doctors are required to complete five or more years of residency.) Some of the lead physicians are up to the eighth year of their residency. Other physicians are fellows who are in training beyond their residency, or are attending physicians. Another lead physician is an intensivist, and others are in training to be intensivists. Some of the lead physicians are Board-certified.

69. Comment acknowledged. It should be noted that Dr. Nicola's next sentence is that "Once stable, a patient can be transported much more safely" (Nicola, 1987).

70. Although Dr. Nicola's December 4, 1985, report did call for "specific criteria for use," a subsequent conversation among Dr. Nicola, Steve Call (the Director of the King County EMS Division) and the EIS author on May 13, 1986, revealed that Dr. Nicola believed that the concept of applying criteria would potentially dilute the authority of the attending medical team and that, furthermore, the combination of presenting conditions could be so complex as not to be able to be fully and appropriately covered by the criteria.

    Dr. Nicola's updated (March 25, 1987) report to DCLU states "I recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with guidelines for use rather than a hospital-by-hospital provided service." (Emphasis added.) Because no guidelines for use have been implemented, no mechanism for monitoring adherence to them has been developed. As part of the new alternative (Preferred Alternative) presented in the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Final EIS, a Medical Review Committee has been proposed. Such a committee could examine the relationship of the transported patients to the guidelines that have been generated by the Washington State Medical Association.

71. The Patient Distribution Guide was last updated in 1978. Copies of this guide are available from the King County Emergency Medical Services Division.

72. Children's operating rooms can be made available immediately during the hours of 6:30 a.m. to 7:00 p.m. From 7:00 p.m. to 11:00 p.m., an operating room generally can be made available within minutes. After 11:00 p.m. it takes approximately 45 minutes to ready an operating room.

The Emergency Room at Children's is a Level III facility; Harborview is the only other Level III facility in Seattle (see definition of Level III facility in response to Comment #56, above). The Children's Emergency Room is staffed by an attending physician 24 hours a day. From 8:00 a.m. to 5:00 p.m., the attending physician is joined by a senior resident. During the remainder of the day, family practice, emergency medical, pediatric and other specialty residents are in the Emergency Room. Specialists from all disciplines are on-call 24 hours a day. The Children's Emergency Room staff also includes two registered nurses (RNs) from 7:30 a.m. to 11:00 a.m.; three RNs from 11:00 a.m. to 3:00 p.m.; four RNs from 3:00 p.m. to 11:30 p.m.; two RNs from 11:30 p.m. to 3:00 a.m.; and one RN from 3:00 a.m. until 7:30 a.m. In addition, there are interns and medical trainees at varying periods throughout the day and night.

Children's has two Intensive Care Units (ICUs): an infant (IICU) unit that handles newborns and infants up to the age of six months, and a pediatric (PICU) unit. Both are facilities with a house staff of doctors, nurses, and respiratory therapists. The IICU house staff always has one attending, legally responsible physician and from two to four senior level residents in pediatrics or physicians in training to be pediatricians. There is always a 1:2 ratio of nurses to patients, except in the case of air medical patients, for whom at least a 1:1 ratio and sometimes even a 2:1 ratio during the most critical early hours is maintained. At least one respiratory therapist is in or near the IICU unit at all times.

The PICU facility is staffed in an identical fashion to IICU in terms of nurses and respiratory therapists. However, the PICU house staff has two attending physicians at all times, each of whom is doubly or triply trained in pediatrics, critical care medicine, and/or pediatric anesthesiology.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

73. In 1986 a total of 183 patients were transported to Children's through referral by King County Medic Units (South King County, Bellevue FD, Shoreline FD, and Evergreen). Thirteen of these transports were by helicopter (Call, 1987). The increase is attributable to the Airlift Northwest helicopter service beginning operations in April 1985.

74. The geographic area affected by these distribution guidelines is primarily the southeastern portion of the County where ground ambulance transports can take 40 to 45 minutes. Steve Call, Manager of the King County EMS Division, has indicated that the County deliberately did not establish geographic boundaries, as distance is only one variable that may affect the appropriateness of a decision to transport by helicopter. Other non-medical variables include time-of-day, traffic and weather.

75. According to Steve Call, "The statement that "under no circumstances should there be a delay at the scene waiting for a ride from the helicopter" is intended to reinforce the general policy that there should be no unnecessary delays in transporting patients to the appropriate medical facility. Since air transport is in most circumstances used to move patients to tertiary care facilities in Seattle, paramedic personnel are expected to exercise judgment regarding total transport time to such a facility. As a result, waiting for air transport may be appropriate in some instances if total transport time is still less than ground transport to the same facility" (Call, 1987).

76. The base hospital physician approves/disapproves the paramedic's recommendation to go either to the base hospital or to another hospital, and also approves the mode of transport. (See also response to Comment #66, above.)

77. Requests for Airlift Northwest are routed through its dispatch center. Once the request is made, the following steps are undertaken for inter-hospital transports:

    1. On-call Airlift Northwest Administrator is paged to determine the team configuration for the flight.
    2. Pilots and medical team are paged. The medical team is provided with patient information.
    3. Pilot notifies dispatch center of the approximate flight transit time at time of lift-off.
    4. Dispatch center calls referring facility with estimated time of arrival.
    5. Dispatch center arranges ground transportation at referral end, if necessary.
    6. Dispatch center calls receiving facility with estimated time of patient arrival and arranges ground transportation at receiving end, if necessary.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The response time to complete the above steps is approximately two to three minutes. Dispatching and aircraft preparation averages 5-10 minutes, but can be as long as 27 minutes if an isolette or specialized transport team is required. For pre-hospital transports steps 1 and 2 are different: the medical transport team is fixed and the Airlift Administrator on-call is advised of the mission.

78. According to Steve Call "The rationale for directing paramedics not to ask for comparative estimated time of arrival (ETA) for MAST and Airlift Northwest is clear when this protocol is considered in the context of the EMS policy memorandum dated February 12, 1986. As stated in the second paragraph, "The underlying principle that should be considered when ordering air transportation is not so much that the patient gets to a hospital fast, but that it is a rapid method of getting medical help to the patient. Therefore, the primary concern for EMS is to focus on patient care and utilizing the type of service and transport that is most appropriate for the patient." In other words, the quickest air transport service (shortest ETA) is not always the most appropriate. Airlift Northwest offers a higher level of care with their medical transport teams than does MAST. However, if the first service of choice is not available, then the second helicopter service can be requested" (Call, 1987).

79. Please see the response to Comment #50, above.

80. The list of patients in Table 2 of the Draft EIS (updated and included as Appendix D of the Final EIS) is a list of all patients who were transported directly to Children's by Airlift Northwest helicopter between August 1, 1985, and June 10, 1986. Patients who landed at the University Intramural Field or Harborview and were subsequently transported to Children's by ground ambulance were not included in this table. The City of Seattle has determined that an "expanded Table 2," which would include information on all patients transported by helicopter to Children's, is not warranted.

"Attachment A" refers to Dr. Nicola's original report, which examined Airlift Northwest's fixed-wing and rotary wing transports to Children's during the period from July 1, 1984 to June 30, 1985. None of the patients identified in Table 2 of the Draft EIS would be expected to be incorporated into the data cited in Dr. Nicola's original report.

81. The decision regarding to which hospital a patient is transported is made by the referring physician. The objective of the transport is to take the patient to the hospital that offers the most appropriate care as determined by the referring physician. Variables that affect that decision include the type and severity of the illness/injury, the distances to various hospitals from the patient's location, weather, and the types of care available at the various hospitals. It is conceivable that the patients mentioned in the referenced paragraph could go to Children's or to other hospitals in the area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If a trauma patient is transported first to Harborview, it cannot be assumed that Harborview is where the surgery would be performed.

82. The isolette may or may not be opened in the ambulance depending upon the specific weather conditions. Neonates are extremely vulnerable to temperature extremes and dramatic changes in temperature. Any ambient temperature--whether in the ambulance or outside--that is markedly below the isolette temperature of approximately 91 degrees, has the potential of causing hypothermia.

83. This table, which has been revised in the Final EIS, is included to illustrate to the reader the amount of time that can be saved when transporting a patient via helicopter rather than by ground ambulance. As background information, it is designed to provide the reader with an understanding of the issue of reduced patient transport time, which is one of the objectives of the Proposed Action.

It should be noted that average transport time from the helicopter landing at the Intramural Field to the Emergency Room entrance is ten minutes, with a minimum of seven minutes and a maximum of 20 minutes. Actual time could be less or more than that (see Figure 11 in Chapter III of the Final EIS).

Not all patients could be served at Mary Bridge. See response to your Comment #58, above.

84. Flight time from Enumclaw to Mary Bridge is approximately ten minutes; to Seattle it is approximately 15 minutes. See response to Comment #83, above.

85. The following physicians provided Dr. Nicola with factual information about their facilities:

Robert Scherz, M.D., President, Medical Affairs, Mary Bridge Children's Health Center;
John Coombs, M.D., Vice President, Medical Affairs, Tacoma General Hospital;
John Mulligan, M.D., NICU, Mary Bridge Children's Health Center;
John Neff, M.D., Medical Director, Children's Hospital and Medical Center.

In his letter of October 24, 1985, Dr. Lothar Pinkers provided information about a number of helistop-related issues to Dr. Nicola. Dr. Nicola also spoke with a number of other physicians about the medical need for a helistop at Children's; these physicians requested anonymity (Call, 1987).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

86. Please refer to response to Comments #60 and #61, above.

87. Please refer to the response to Montlake Community Club Comment #14. As part of the literature search that was conducted for Dr. Nicola's updated report, no journal articles or other source material were identified that definitively concluded that helicopter transports may be harmful to certain patient populations. Some of the risks that have been identified include exposure to high concentrations of carbon monoxide (Poultan, 1987), and concerns experienced regarding the helicopter transport of high risk infants and neonates (Mattox, 1986).

88. Dr. Nicola's findings are based, in part, on a review of medical records of actual transports. Please refer to Dr. Nicola's updated report, which has been appended to this document (Appendix A). Also please refer to projections prepared for Children's, as presented in Appendix E.

89. An analysis of the impacts of patients being transported to other facilities that may or may not offer appropriate services for treating the types and magnitudes of the illnesses and injuries of the patients being transported by Airlift Northwest is outside the scope of Dr. Nicola's report.

90. It is not possible to predict future plans for either the MAST program or other vendors that might occasionally use the helistop. The dimensions, weight and specifications of the Blackhawk helicopter are provided in Table 4 in Chapter II of the Final EIS.

91. MAST helicopters would continued to be encouraged to land at the Intramural Field or Harborview helistops.

92. MAST operates its program under the provisions of Title 10 U.S.C., 2635, (Section 814, Public Law 93-115), which stipulates, in part, that MAST will not unreasonably compete with private air ambulance services. A Letter of Agreement between Civilian MAST and Airlift Northwest formalizes this understanding.

Between May 1985, and December 31, 1990, there were a total of 77 MAST transports of Children's-destined patients. This figure compares to 912 Airlift Northwest Children's-destined helicopter transports during the same period.

The sponsor contends that Airlift Northwest offers superior in-flight medical care (compare for example, superior flight physician training as cited in response to Comment #68 v. description of MAST personnel medical capabilities in Chapter II of Final EIS), faster transports (the Agusta can cruise at 180 m.p.h. v. MAST's UH-1 cruising speed of 52 m.p.h.), greater availability (because MAST gives precedence to

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

military transfers over civilian transfers) and less vibration. Consequently, Airlift Northwest's service provides a preferred mode of transport for certain critical helicopter transports.

93. According to the late Dr. Jay Kranz, former chairman of the MAST Coordinating Committee, there have never been any "bad outcomes" from landing patients at the Intramural Field site. On one occasion, in the winter of 1986, the MAST pilot found it necessary to land at the Children's campus.

94. At the direction of the Army, MAST will continue to perform civilian search and rescue missions and to transport military personnel and their dependents. As is the case currently, it may be expected that if MAST receives a call to which no private vendor is able to answer, MAST will respond. See also response to Montlake Community Club Comment #10.

95. A Letter of Agreement between Civilian MAST and Airlift Northwest is on file at DCLU.

96. A copy of the contract is on file at DCLU.

97. Please see response to Comments #27 and 29, above.

98. Please see response to Comment #96, above.

99. Hospital AirTransport has agreed to supply Airlift Northwest with an Agusta 109 identical to the two aircraft (one full-time and one part-time, which will be available full-time in May 1990) for use as a back-up rotary wing aircraft. This backup helicopter is available when one of the dedicated rotary wing aircraft is unavailable during long periods of maintenance. The medical equipment, including the isolettes, is standard and interchangeable among the aircraft.

100. One hundred forty-seven gallons of fuel weigh approximately 984 pounds. Airlift pilots typically fly with fuel tanks that are half full, and will fill up for longer missions. The aircraft used for noise tests had approximately 900 pounds of fuel on board when the noise test was conducted. As shown in the comparison below, the typical Airlift Northwest helicopter transporting a patient and landing at Children's would be lighter than the aircraft used in the noise test.

Test Helicopter Base weight (includes pilot)	4,600 lbs.
Fuel	900 lbs.
Flight Nurse	130 lbs.
TOTAL WEIGHT	5,630 lbs.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Airlift Northwest Helicopter Base weight (includes pilot)	4,600 lbs.
Fuel	500 lbs.
Flight Physician and Nurse	300 lbs.
Isolette	160 lbs.
TOTAL WEIGHT	5,560 lbs.

101. Airlift Northwest made no helicopter transports directly to Children's during May, June, and July 1985. The list of patients shown in Table 2 of the Draft EIS represents all Airlift Northwest transports directly to the Children's Emergency Room entrance through June 10, 1986. The remainder of the patients being transported by Airlift Northwest helicopter landed either at Harborview or the Intramural Field and were transferred into an ambulance and then driven to the hospital.

    Other helicopter transports directly to Children's during that time include two transports by MAST (December 1985) and one transport via the KIRO news helicopter. Please refer to response to Comment #80, as well as the updated information on patient transports by all vendors contained in the Final EIS.

102. See response to Comment #26, above.

103. Table 5 in the Draft EIS (Table 3 in the Final EIS) notes that the number of transports reflects the total number of patient transports and does not reflect all flight segments, which would include "return flights," pickup of the transport team (if necessary), and pickup and delivery of the patient.

104. Each of the alternatives in both the Draft and Final EIS describes the origins and destinations of the flight segments. Under the Preferred Alternative, presented in the Final EIS, there would be no pickup of medical transport crews at Children's--the crew would be picked up at either Harborview Medical Center (the aircraft's operations base) or the Intramural Field, if allowed. "Return flights" have been included in the environmental analysis in both the Draft and Final EIS.

105. Comment acknowledged. Please refer to Comments #26 and #104, above.

106. NEMSPA has prepared guidelines for dimensions of landing zones but not helistops; AAMS and the FAA have prepared guidelines for helipads. The pamphlet LZ, which is circulated by NEMSPA, is designed to assist field personnel in establishing landing zones for helicopters. Landing zones do not have the same amenities (surfaced, lit, fenced) as helistops, consequently their area requirements are greater. Airlift Northwest disseminates LZ information to fire departments, hospitals and medic units to assist them in preparing safe landing zones for Airlift helicopters. A review of AAMS Interim Safety Guidelines indicates that the proposed helistop is consistent with the stated interpretation of the standard that "the helipad must be designed and located so as to facilitate the safe and effective transfer of patients."

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The proposed landing pad at Children's was designed in cooperation with Airlift Northwest personnel familiar with the Agusta 109. The landing pad is large enough to accommodate the Agusta's requirements for maneuvering during landings and departures.

107. FAA Advisory Circular #150/5390-2, Heliport Design, provides general guidelines for helipad design, including dimensions. On page 11 of this circular, the dimensions for private use heliports are recommended as:

> TAKEOFF AND LANDING AREA. A private use heliport should have an unobstructed area available for the takeoff and landing of helicopters.
>
> a. Location. The takeoff and landing area may be located on the ground, on a water surface, a roof of a building, or an elevated platform. The location should provide at least 1/3 rotor diameter, but not less than ten feet (3 m), horizontal clearance between the takeoff and landing area and buildings, fences, parapets, curbs, and objects which could be struck by main or tail rotors.
>
> b. Size. The takeoff and landing area length and width, or diameter, should be at least twice the rotor diameter of the design helicopter.
>
> HELIPADS AND HELIDECKS.
>
> a. Size. The minimum length and width, or diameter, of a helipad or helideck should be at least 1.5 times the design helicopter's undercarriage length or width, whichever is greater.

The Agusta 109 has the overall length, from rotor tip to tail, of approximately 43 feet, and its rotor diameter is 36 feet (Table 4). The unobstructed area of the proposed Children's helistop would be 96.4 feet in diameter. The Agusta 109 would require a takeoff and landing area diameter of 72.2 feet, which is smaller than the unobstructed area that would be provided. The additional one-third rotor diameter horizontal clearance (12 feet) also would be provided on both sides of the takeoff and landing area, for a total of 96.4 feet. The concrete helipad of 40 feet square would be more than 1.5 times the undercarriage length.

The designers of the pad believed that to make the landing area any larger could serve to encourage MAST and other helicopters to land at Children's, rather than at the Intramural Field site. Although based on the FAA criteria (see Table D-1), all of the aircraft except the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Agusta 109 Mark II (flown by Airlift Northwest) and MBB 105 (flown by Med-Flight) would have rotor diameters that would exceed the obstacle-free area guidelines contained in the FAA circular. Also, see response to Comment #35, above.

108. FAA regulations of helicopters are less restrictive than those of fixed-wing aircraft. For example, certain fixed-wing aircraft have specific flight paths that must be followed in every phase of flight. Helicopters, because of their ability to hover, change direction quickly and change altitude with minimal lateral movement, are far more maneuverable. Moreover, helicopters require a relatively small clear area to land and are able to perform autorotation landings in the event of engine failure.

109. Please see response to Comment #25, above.

110. The flight paths approved by the FAA are established as guidelines for helicopter pilots to follow. The FAA would be responsible for enforcing their use. The Airlift Northwest pilots would adhere to the established paths, but in certain conditions (e.g. extreme medical emergency, unusual weather conditions, conflicting air traffic) could deviate from the flight path. A mechanism could be established to respond to citizens' complaints or flight path deviations.

111. It is not unusual for guidelines rather than criteria to be applied in the medical community. Criteria, by their very nature, are restrictive. The purpose of guidelines is to ensure that the authority of the medical personnel attending to a patient is not restricted. In most cases, when a medical professional is considering the transport of a patient by helicopter the patient is extremely ill or injured. The medical symptoms may be straightforward or the condition may be complex. It would be impossible to develop criteria that would accommodate every situation.

112. Inappropriate use could be defined as the frequent landing of patients that were not facing life-threatening medical emergencies. The proposed Medical Review Committee could formulate criteria for purposes of their review, and recommend corrective action, if during review of transport it appears medically unnecessary landings are occurring. Additional review criteria could be added by the City as conditions for approval to any permit issued for the helistop.

113. Dr. Nicola determined that, "Referring physicians and Children's appear to be sorting patients (among these landing locations) appropriately" (Nicola, 1987). A Medical Review Committee, which is described in Chapter III and Appendix C of the Final EIS, would provide a review of the medical necessity of patient transports by helicopter directly to Children's. See also response to Comments #110, 111, and 112, above.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

114. There have been both formal and informal review of the guidelines. The City of Seattle cannot require a private association to involve the public in its activities. The Department of Social and Health Services (DSHS), however, is considering protocols (see the draft guidelines appended to Dr. Nicola's updated report in Appendix A), which will involve a formal public hearing process after an internal review of the proposed guidelines has been completed. According to Howard Farley of the DSHS, the public hearing on the guidelines has not been scheduled and will not occur until after the proposed guidelines have been circulated at a legislative level.

115. Airlift Northwest is a provider member of the Association of Air Medical Services (AAMS), and Seattle Jet Center and Hospital Air Transport are associate members of AAMS (formerly known as ASHBEAMS).

116. Under the Council Conditional Use Permit process, the City has the ability to impose conditions that it deems necessary and appropriate. Such conditions could include requiring compliance with AAMS guidelines, or allowing only AAMS member transport to Children's. See also response to Comment #119, below.

117. Some of the Airlift Northwest pilots are members of the NEMSPA.

118. The City does not concur with Children's interpretation of WAC 248.18.285 Children's would communicate with other area aeromedical vendors to discuss landing protocols, particularly as they relate to patient condition and the suitability of the Kitchen Garden, Intramural Field, and Harborview helistops. See also response to Comment #112, above.

    The City has authority to issue or deny a Council Conditional Use Permit for the facility. Should the City deny the facility, continued landings at the site would be in violation of the Land Use Code and subject to enforcement action.

119. As noted in the response to Comment #116 above, under the Council Conditional Use Permit process, the City has the ability to impose whatever conditions it deems necessary and appropriate for a project. The EIS identifies mitigating measures that could reduce adverse impacts (see Chapter IV of the Final EIS). Other conditions may be recommended by DCLU or the Hearing Examiner and/or imposed by the City Council.

    The purpose of this EIS document is to provide full disclosure of the expected impacts that the Proposed Action and alternatives would cause, and to identify possible mitigation. Additional conditions that may be placed on any permit issued are not known at this time. The enforcement of the conditions would be in accord with the enforcement provisions of the Land Use Code and with any possible new enforcement and monitoring methods that might result from permit conditions.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

120. Such a conclusion would not be accurate. The FAA has the authority to regulate the flight paths. The City of Seattle also may condition the project, including provisions for regulatory enforcement, which may include revocation of the permit.

121. It is acknowledged that the Washington State Department of Transportation (WSDOT) could conduct studies on aeromedical helicopters and could prepare an "overall plan."

122. Bill Hamilton, WSDOT Aviation Division Assistant Secretary, was contacted during the preparation of the Draft EIS. A determination of whether WSDOT was considered by the Puget Sound Health Systems Agency during development of their proposal on state and regional EMS helicopter transport is outside the scope of this EIS. WSDOT could be involved in the development and/or review of such a plan.

123. The Council Conditional Use permit approval process allows helistops in major institutions zones, provided that the City Council finds that the helistop is needed to save lives and meets the other two criteria.

124. Dr. Nicola concluded in his initial report that "there will be a small number of cases at (both University Medical Center and Children's) where the ability to land at the hospital may be life-saving" (Nicola, 1985). This finding was confirmed in his updated report: "Based on my review of Children's case files, I conclude that the Children's helistop meets the City's land use permit requirement that it save lives" (Nicola, 1987).

    It is not possible to determine which of the remaining patients' lives actually were saved by being transported by helicopter directly to the hospital.

125. In directing the preparation of the Draft EIS, the City's Department of Construction and Land Use (DCLU) determined that an informed and objective medical specialist should assist DCLU in addressing the issue of whether the helistop is needed to save lives. DCLU requested that Dr. Nicola, who, at the time, was the Director of the Seattle-King County Department of Public Health, provide the opinion regarding this first criterion of the Council Conditional Use Permit. Children's provided Dr. Nicola with all medical information that he requested in preparing his initial and updated reports to the Director of DCLU.

126. Representatives of the City of Seattle have visited the Children's campus. Hermia Ip, a DCLU land use specialist, observed the helicopter landing at Children's that was staged for Dr. Nicola. City representatives also have observed helicopter operations at other facilities. Observing a helicopter landing may be an option for the Hearing Examiner and/or City Council prior to making a decision.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

127. An independent survey of residences of the surrounding area is not necessary for DCLU to make a recommendation. The numerous comments received by DCLU have presented many of the experiences and viewpoints of the neighbors.

128. Allen Morrow, Supervisor of the Rate Review Division of the Washington Insurance Commission, has stated that he is unaware of a homeowner's insurance rate or underwriting potential being affected by proximity to airports, airfields, heliports or helipads.

129. Comment acknowledged. Please refer to response to Comment #127, above, and Laurelhurst Community Club Comment #5.

130. Dr. Nicola in his updated report stated that a "review of the case files of the children flown directly to Children's indicates that, with one possible exception, all presented life-threatening conditions that warranted transport right to the doors of the hospital. Review of 30 additional randomly selected cases flown by helicopter to Harborview for ground transport to Children's shows that all cases met the State's proposed criteria for use of air tranport but were less severe than those flown directly to the hospital" (Nicola, 1987).

A Medical Review Committee that would retroactively review the medical appropriateness of patient transports with the helicopter landing at Children's has been proposed by the Sponsor. The Medical Review Committee is described in Chapter III and Appendix C of the Final EIS.

The "Return Flights" cited in "Attachment A" (Attachment 1 in Dr. Nicola's original report) include transports of patients by fixed-wing aircraft as well as rotary wing aircraft.

131. One of the objectives of the helistop is to minimize patient transport time. Any means by which transport time can be reduced deserves consideration. Airlift Northwest has taken steps to shave minutes from its overall transport time, including improving the previously "archaic" dispatch procedures, and basing the medical transport team at both Harborview and Boeing Field.

Regardless of whether there are other ways that Airlift Northwest and/or Children's could safely reduce the overall time of patient transport, there would still be a time savings (of 3 - 16 minutes) associated with landing the patient at Children's as opposed to landing at the Intramural Field. Please refer to Figure II in the Final EIS for a comparison of ground transport times from alternate landing locations to the Emergency Room entrance. As the comment acknowledges, there would still be extremely critical situations in which the judgment of the medical team aboard the helicopter would dictate the necessity for a direct landing at Children's, rather than at the Intramural Field or Harborview.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

132. It is acknowledged that neither landing at Children's campus nor at the Intramural Field is perfect; however, the landing at the Children's campus is better from the perspective of reduced patient manipulation.

A patient being flown to Harborview or the Intramural Field would have to be unloaded onto a gurney, pushed 30 feet or more on the gurney to the ambulance, transported via ambulance to the Emergency Room door, and unloaded again (patients flown directly to Children's would be unloaded once and transferred via gurney 142 feet to the Emergency Room door). In the event that tubes or intravenous lines are disconnected during the transfer from helicopter to ambulance, the tubes must be reconnected to the patient and the patient restabilized before the transport can be completed. This procedure can add to the overall transport time. With landings at the Kitchen Garden site or outside the Emergency Room entrance, any dislodged tubes can be reconnected in the hospital where advanced care can be administered earlier.

It should be noted that regardless of the alternative, the patient is protected from the elements during the transfer process(es) (see response to Comments #15, above and #133, below.

133. The patient would not be exposed to the elements while being wheeled from the Kitchen Garden site to the Emergency Room entrance at Children's. As necessary, the patient is protected by a plastic cocoon, hat and blanket(s) during transfers.

During extreme weather conditions, the risk of hypothermia for neonates being transported via isolette would not be as great under the campus alternatives; in the event that tubes became dislodged during transfer out of the helicopter the isolette would not have to be opened until inside the hospital.

Under most transports, the rotor comes to a complete stop before the patient is unloaded. Thus, there is no wind chill from the rotors.

134. Comment acknowledged.

135. In recognition of these concerns, Children's has proposed an alternative that reduces the number of transports to Children's without sacrificing patient care. Refer to the description of the new alternative (the Preferred Alternative), in Chapter III of this Final EIS.

136. The applicant is Children's Hospital and Medical Center, not Airlift Northwest. Please refer to the response to your Comment #68.

137. Please refer to the response to Comment #50, above.

138. The most appropriate hospital is not always the closest hospital. Please refer to the response to Comment #50 in this letter.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

139. The dispatch system procedures are described in the response to Comment #77, above. Airlift Northwest considers the problems with the existing dispatch system to be relatively minor; there are no plans to change the concept of the current system, although Airlift Northwest will continue to seek improvements. Airlift Northwest has calculated that dispatching takes two to three minutes. Between December 1, 1986, and April 30, 1987, average mobilization time from receipt of call to helicopter take-off (this includes the two to three minutes of dispatch time) ranged between 6.05 and 8.34 minutes (see response to Comment #164, below).

The transfer of a patient at the Intramural Field adds 3-16 minutes to a patient transport, compared with landings directly at the Children's campus.

140. Please refer to responses to Comments #16, 132 and 133, regarding patient transfers.

141. Unlike Harborview, where the distance from the helistop to the Emergency Room entrance is several hundred feet, Children's would not require a ground ambulance to transport the patient the 142 feet from the Kitchen Garden site to the Emergency Room. Please refer to responses to Comments #132 and 133, above.

142. The City has deleted the sponsor's fourth objective. The Council Conditional Use Permit requires that, "The Director's report shall examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas." The purpose of a helistop is to provide a safe location for the landings of a helicopter. This differs from the sponsor's objectives for the helistop, which are stated on page 33 of the Draft EIS, and in Chapter III of the Final EIS.

Alternative sites for the helistop, both on-campus and off-campus, that were considered are identified on pages 38 and 39 of the Draft EIS and in Chapter III of the Final EIS. Those pages also contain brief statements as to their acceptability as defined by the sponsor's original four objectives. These judgments are those of Children's professional medical staff. The sponsor contends that only a helistop located at the Kitchen Garden site or immediately outside the entrance to the Emergency Room entirely meets its objectives. The new alternative (or Preferred Alternative) proposes a balance between the objectives of Children's and the reduction of impacts on surrounding residential areas. The discussion of these alternatives has been expanded in the Final EIS.

143. The Lead Agency is responsible for the determination of acceptable alternatives. Please refer to the response to Comment #142, above.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

144. It is not necessary for the EIS to provide detailed analysis for alternatives that were considered but not advanced. Additional data on the alternative sites are provided in the Final EIS.

145. A route through the medical center from other entrances requires the negotiation of doorways, corridors and, for some alternatives, changes in floors. The proposed Kichen Garden site is 142 feet away from the entrance to the Emergency Room and adjacent to the operating room and Intensive Care Units. No other hospital entrances are as close to these key units. The Children's medical staff has determined that the effects of the 142-foot outdoor journey on the patient, if any, are less severe than the possible time lost in transporting the patient from an alternative landing site on the campus and wheeling the patient to and through the hospital. In any case, no matter what helistop location is used, a patient would be protected to reduce "exposure" to the elements (refer to the response to Comments #132 and #133, above).

146. The rooftop helistop site at the University Medical Center requires a transfer by elevator that is not optimal.

147. Although removal of trees could make alternative helistop locations to the east or south of the hospital building more feasible with respect to landing the helicopter, there would still be a need to transport the patient through hospital corridors, doorways, and/or elevators. These alternative helistop locations also would bring aircraft operations closer to residential areas and the Laurelhurst Elementary School. Refer to response to Comment #145, above.

148. The removal of the three trees enables the final approach to the temporary landing location outside the Children's Emergency Room to be more direct from the north, somewhat further away from Laurelon Terrace than occurred previously.

The administrative entrance to the hospital is closer to Laurelon Terrace than either the Kitchen Garden site or the temporary landing location that is outside Children's Emergency Room entrance. Residences along 44th Avenue N.E. are closer to the surface parking lot than are the Kitchen Garden site or the temporary landing location.

149. Frank Benedict, the FAA Principal Aviation Safety Inspector, was asked to provide his professional opinion of the alternative sites evaluated in the EIS. Mr. Benedict inspected the sites and determined that, "Given the hypothetical of a helicopter approaching over an open area and landing in a soccer field versus an approach and landing over a congested area, one would have to surmise there is no risk to persons or property on the surface regarding the first instance. This is by virtue of the fact it is a complete open area.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The site of the U of W proposed helistop (orginally this was the rooftop helistop location) was evaluated and inspected by me. In my view it is slightly different in that much of the ingress and egress can be accomplished over a more open area....

"The acceptable level of safety is extremely high at the Children's facility, U.W. facility and the soccer field" (Benedict, 1987).

A copy of Mr. Benedict's letter is on file at DCLU.

150. Comment acknowledged.

151. The location of a landing site at the Sand Point Naval Station, as is proposed in the comment, was considered. The Sand Point helistop is farther from Children's than the Intramural Field helistop site and, therefore, was determined to be less suitable in achieving the proponent's objective of minimizing transport time. Because of the distance of Sand Point from the University of Washington Medical Center, it is less attractive as an alternative that would enable shared use.

152. See responses to Comments #106 and #107, above.

153. There are several options for controlling of the proposed helistop lighting. The helistop lights could be left on 24 hours a day, as suggested in the comment. Children's and Airlift Northwest are currently examining the possibility of installing lights that could be turned on and off by the pilot, much like an automatic garage door opener. Should this option not prove to be feasible, turning on the lights would be an item on the ground crew's procedural checklist.

In the event that the lights were not turned on or otherwise inoperable, most helicopters (including Airlift Northwest's Agusta), are equipped with searchlights, which would be able to supplement the lighting already provided by outdoor lights. This capability reduces the risk associated with an unlighted landing area.

154. Estimates provided by Children's and Airlift Northwest regarding projected numbers of flights for 10 years into the future are speculative. An attempt at a 20-year estimate would be less reliable than the ten-year estimates used in the Draft EIS. The Final EIS presents demographic/use based projections to 1995.

155. Children's currently uses security staff to secure the landing area prior to the arrival of an incoming helicopter. Additional warning and safety precautions are believed to be unnecessary at this time, however, the hospital has been considering mitigation measures (including the placement of warning signs) that could be implemented.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

156. There is a difference between the number of patients transported and the number of flights. As described in the Draft EIS, there would be two flights (one takeoff and landing per flight) for each patient transport. In actuality, with the medical transport crew based with the helicopter at Harborview and Boeing Field, there has been one flight per patient transport (exclusive of the flight to the patient's point of pick-up).

Dr. Nicola offered inaccurate monthly patient transport figures in his first report. Please refer to response to Comment #26, above.

157. The figure was provided by Airlift Northwest, which in a letter dated July 10, 1986, stated, "Children's Hospital's rotary-wing volume has been running consistently around 17% of the total rotary-wing flight volume. We anticipate that that percentage will remain fairly constant through (1995/1996 fiscal year)." This letter from Airlift Northwest is on file at DCLU. Data indicate that between 1988 and 1990 Children's percentage of total Airlift Northwest rotary-wing transports has averaged 14.1%.

158. Children's does not have an institutional plan for growth or program for offering additional services that has been incorporated into the projections of the number of aeromedical transports.

159. If the demand for Airlift Northwest's services exceeded its existing capabilities, the organization would add equipment and personnel as needed. Airlift Northwest has contracted for a second, medically-equipped Agusta that currently is available "half-time" and is based with its transport teams at Boeing Field. This aircraft will be available full-time (24-hours per day) in May 1991. This has increased Airlift Northwest's transport capability.

160. The effect on Children's of an Airlift Northwest expansion (assumed to mean the addition of new members to the consortium) would depend on the capabilities and location of the new member. It is not known how, if at all, the number and destination of transports would change if an existing member hospital left the consortium or if a new member were added.

The effect on Children's of the second full-time Airlift Northwest helicopter is enhanced ability by Airlift Northwest to accommodate those requests for transports that were previously not accepted when the single helicopter was not available because of its use on another transport.

The availability of a second Airlift Northwest helicopter was assumed by Carona in her projections of future use (see Table 3 in the Final EIS).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

161. Children's has requested that MAST land at the Intramural Field. Most of the MAST helicopters have been equipped with telecommunications equipment that enable the aircraft to communicate with non-military ground personnel and other aircraft. No other specific agreements regarding landings and communications have been reached.

162. Children's has met with Med-Flight, the Bellingham vendor, and will meet with other area air medical transport services (including the Navy, Coast Guard, and MAST) after the City Council considers the Conditional Use Permit application for the helistop. The purpose of the meetings will be to agree to protocols for use and communications.

163. A pre-arranged transport is the transport of a critically ill or injured patient that has been arranged in advance by the receiving hospital and the referring physician.

164. Based on Airlift Northwest flight statistics from July 1 to December 31, 1990, the average mobilization time was 6.05 minutes for Pre-Hospital Transports and 8.34 minutes for Inter-Hospital Transports. In both cases, the flight nurses were based with the aircraft at either Harborview or Boeing Field.

Airlift Northwest estimates overall average mobilization time is 5-10 minutes.

165. Through March 1987, there were a total of 866 inter-hospital transports via Airlift Northwest helicopter. Of those, 545 transports (63%) landed at designated landing zones at referring facilities and required no ground transport. The remainder of the transports landed at designated landing zones removed from the referring facilities' campus that required ground transports of the patients to the helicopter.

166. According to Gene Hill of Hospital AirTransport, the manufacturer of the Agusta's engines recommends two minutes of cool down time prior to shut down. For some particularly critical patients, the transfer process will commence before the motor stops. Normally, the motor will come to a complete stop before the patient is unloaded from the helicopter. It takes approximately two minutes of run-up prior to lift-off.

167. As of May 20, 1987 Airlift Northwest had used the helicopter four times to transport a critically ill or injured child to Children's campus after a fixed-wing aircraft had transported the patient to Boeing Field.

168. Airlift Northwest has yet to pick up a medical crew at the Children's campus. Under the Proposed Action, it was indicated that a specialized medical crew could be picked up at Children's or the Intramural Field,

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

while under the Preferred Alternative the specialized medical crew would board at Harborview, or would be picked up at the Intramural Field, if permitted.

169. Any decision to deviate from the established and approved flight paths would be at the discretion of the pilot but would still have to be consistent with applicable FAA guidelines. A pilot could deviate from the flight path in the case of a destabilizing patient in extremely critical condition.

170. Please refer to your Comment #2, above.

171. Comparisons of Airlift Northwest policies with AAMS, NEMSPA and FAA guidelines are presented in Appendix B of the Final EIS.

172. Some blade slap may occur during the helicopter's turn to the south; however, blade slap in an Agusta 109 at that point in the approach is minimal.

173. There are no extraordinary dangers associated with the turn.

174. When winds necessitate the pilots using the secondary approach (approaching from the northeast), the helicopter would directly overfly an area of single-family residences, whereas the primary approach would proceed along the Sand Point Way N.E. corridor. While the primary approach would not directly overfly any residences, the 100-yard band on either side of the flight path contains several multifamily residential buildings. The 100-yard band on either side of the secondary approach contains a number of single-family residences.

175. When winds are out of the northwest quadrant at 17 knots or more, the secondary approach would be used (see page 47 of Draft EIS and Chapter III of the Final EIS). This approach is from the northeast, but would not directly overfly the Villa Acadamy School, Laurelhurst Elementary School, or St. Bridget's Church. This approach would overfly approximately one block north of both the Villa Academy School and Laurelhurst Elementary School, and approximately two blocks north of St. Bridget's Church.

176. Comment acknowledged. The total elapsed time from helicopter touchdown to the patient being wheeled via gurney (142 feet) into the hospital building is estimated to average about four minutes, including three minutes for patient landing and preparation and one minute for transfer to the ER.

177. Current policy and procedures call for the pilot to wait no longer than 30 minutes for the retrieval of the isolette and/or conveyance of patient medical information from the transport team to the hospital staff. It is acknowledged that for some nighttime flights, there could be added or repeated sleep disruption for some residents.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

178. A detailed comparison of transport times for patients being brought to Children's via helicopter versus what it would have taken to send a medical transport team to the patient and transport the patient via ground ambulance is outside the scope of this document. Table 3 in the Draft EIS (Table 2 in the Final EIS) was provided to illustrate a hypothetical example.

179. A comparison of numbers of transfers associated with different scenarios is as follows:

Patient pickup at referring hospital, landing at Children's	2 transfers
Patient pickup removed from referring hospital (necessitating ground transport at referring hospital), landing at Children's	3 transfers
Patient pickup at referring hospital, landing at Harborview or Intramural Field with ground transport to Children's	4 transfers
Patient pickup removed from referring hospital, (necessitating ground transport at referring hospital) landing at Harborview or Intramural Field with ground transport to Children's	5 transfers

180. In nearly all cases, the transport of the patient is to the most appropriate care facility as determined by the referring physician. If the patient is being transported a greater distance to Children's when another hospital would have been able to administer comparable care, then the patient would be exposed to an unnecessary risk of destabilizing during the added transport time. It should be noted that in some cases it may be that the referring physician, at time of referral, determined that the most appropriate care was available at Children's, even though in retrospect it may have been that appropriate care would have been available at a closer medical institution. Refer to the response to your Comment #89, above.

181. In response to this comment Dr. Neff replied, "...that re (probably) is no such controlled data. One, instead, has to use medical sense and clinical experience (to support the statement). There is no question that a small child whose blood pressure is dropping, who has a fulminant infection or obstruction in the respiratory tract, should be given every chance at optimal survival as soon as possible, and should be in an appropriate intensive care unit as quickly as possible. We can relate the cases that have landed at Children's Hospital from August 3, 1985 to December 31, 1986, [when] there were 57 transports directly to Children's Hospital and Medical Center. These all were admitted directly to the Intensive Care Units. These children were so critically ill that 22 of them died as part of their presenting condition, and 35 survived... All of these children were critically ill and required immediate transport to an intensive care unit...and had life-threatening conditions that required their immediate landing at

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's Hospital...in each situation it was the physicians' feelings that the child should be in the intensive care unit quickly. Any landing other than at Children's only would have had the potential to worsen the outcome and increase cost, and could not have possibly helped the child" (Neff, 1987).

182. With respect to the question of medical malpractice concerns affecting patient transport requests, please refer to the response to Montlake Community Club #7.

    The decision to land at the Kitchen Garden site versus Harborview or the Intramural Field may not be as susceptible to influence by medical malpractice concerns, due to the experience the medical transport crew has in assessing the transport needs of patients and choosing the appropriate landing location. Nevertheless, the medical transport team is aware of its liability for the patients under its care.

183. The noise abatement approach requires higher rates of descent at lower power settings. Below 300 feet above the ground, the pilot of a twin-engine helicopter is committed to a landing should there be an engine failure.

184. See response to Comment #17, above.

185. See response to Comment #11, above.

186. The communication practices between Airlift and Children's are designed to ensure that the hospital is alerted to both patient medical requirements as well as aircraft operations.

    Operational communications include the dispatching notification procedures, as described in the response to Comment #76 above, and the aircraft-to-hospital communications (direct communications with the Emergency Room) that inform the ground team of the estimated time of arrival (ETA) in order to ensure that security and medical preparations are properly timed.

    Medical communications are designed to inform ground medical staff of patient status and identified changing patient needs, if any.

187. An examination of the consistency of Airlift Northwest's weather standards and pilot qualifications requirements with those of NEMSPA and AAMS is provided in Appendix B of this Final EIS. See also response to your Comment #234, below.

188. Recognizing the importance of safety, Airlift Northwest encourages the pilots to identify safety concerns so that steps may be taken to enhance safety. Airlift indicates that no pilot would be discharged because of reporting safety concerns to Airlift Northwest management.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

189. Pilots are not checked out prior to liftoff.

190. Hospital AirTransport employs two full-time mechanics whose responsibility is to maintain the Airlift Northwest helicopters. The aircraft are inspected by one of Airlift Northwest's mechanics every day. The mechanics each have more than five years of helicopter maintenance experience. One is factory-trained and the other will be factory-trained by fall 1991.

191. Pilots conduct a pre-flight inspection of the aircraft before each shift according to the manufacturer's checklist, including an exterior inspection of the aircraft, testing of critical equipment, etc.

192. The windshield wipers are installed on the Airlift Northwest aircraft.

193. According to Earl Van Eaton of the FAA's Flight Standards Division, air worthiness inspectors assess and certify Airlift Northwest aircraft once a year. Maintenance procedures are inspected, log books and records are verified, and aircraft are physically examined before an Air Worthiness Certification is issued.

194. As of March 6, 1991, the Agusta had been involved in three aeromedical accidents (Phoenix, 1983; New Orleans, 1984; 1986) and four incidents as described in Chapter IV of the Final EIS.

195. The FAA does not specify a minimum distance that buildings may be located from a helipad. They do, however, specify "heliport approach surfaces" and "heliport transitional surfaces" within which no obstructions should be located. This "approach surface" specifies a rising slope of 8:1 extending in a horizontal distance to 4,000 feet from the landing area. The "transitional surface" specifies a rising slope of 2:1 to a distance of 250 feet on either side of the landing area. For heliports obstructions are allowed within these surfaces only when an aeronautical study concludes that the obstruction would have no adverse effect upon aeronautical operations. Neither existing nor future hospital expansion would penetrate these surfaces. Several trees and light poles to the north and northeast of the helipad would penetrate these surfaces and therefore have been identified for removal with the development of a helistop at the Kitchen Garden site.

196. Please refer to the response to Comment #6, above.

197. The Medical Review Committee, as proposed by Children's, is described in general in Chapter III and in detail in Appendix C of the Final EIS.

198. Copies of the cited correspondence are available for review at DCLU.

199. A more detailed examination of transfer times is contained in Chapter III of the Final EIS. The helicopter lands approximately 30 or more feet south of the paved parking area on the south side of Clark Road.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

It is not the distance between the helicopter and ground ambulance that most affects the average three minutes of transfer time, but rather the time taken to unload the patient from the aircraft, the time to move the gurney across the field surface, the time taken to load the gurneyed patient into the waiting ambulance, and then to secure the patient in the vehicle. The same average transfer time occurrs at Harborview and Boeing Field (see Figure 11 in Final EIS).

200. In most cases, the patient is moved 30 or more feet across the field to the waiting ambulance.

201. Future improvements at the University of Washington's existing helistop at the Intramural Field site may include paving and fencing. The ambulance would be able to pull up to a gate in the fence but would not be able to back-up directly to the aircraft.

202. See response to Comment #181, above.

203. According to Helen Shawcroft, the University Medical Center's Planning Director, the principal liability concerns that have been identified are the medical liability associated with a destabilizing patient who would need to be treated at the University Medical Center, and any situation during the rooftop-to-ground ambulance transfer that would adversely affect the patient's condition.

204. The back road that could be taken from the University of Washington Stadium area through the east campus area is not considered to be an improvement over Pacific Avenue and Sand Point Way for emergency vehicle use. This back road is unpaved in portions, and is obstructed by several closed (and, in some cases, locked) gates. An arrangement could be made with the University of Washington to provide ambulances with keys to the existing gates. In addition, portions of this road are used by University-oriented traffic, which can be especially heavy during athletic events at either the University Stadium or Hec Edmundson Pavilion.

205. The three tall trees have been removed. The Final EIS has been revised accordingly.

206. Comment acknowledged. A paved facility is a characteristic of the Intramural Field Helistop Alternative (if future improvements including paving are made by the University) and the new alternative (Preferred Alternative), as presented in the Final EIS.

207. A portion of Title 7 RCW 7.70.040 is in the Final EIS. The City of Seattle does not agree with Children's interpretation of this portion of the RCW.

208. The standard procedure for dispatch aid cars and medic units responding to an emergency involves the use of lights and sirens. However, according to Chief Harris of the Seattle Fire Department, patient

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

transports from a helistop site to Children's Hospital rarely involve the use of lights and sirens. Medic units typically stabilize the patient at the helistop site and then perform the transport without the use of lights or sirens. Only when a patient's condition is deteriorating are lights and sirens used.

209. Children's, the City of Seattle, and Shepard Ambulance have no record of an agreement between Children's and the City.

210. Because of the cost of designing, permitting and constructing helistops, it is expected that only those medical institutions that have a need for helistops will pursue their construction. The Cumulative Impacts section of the EIS has an expanded and updated discussion of the proliferation of helistops.

211. The potential disruption of classroom activities has been described in Volume 1 of the Final EIS.

212. Recognized authorities mentioned on page 59 of the Draft EIS include some of the leading authorities on hospital air transportation in the nation. The opinions of Airlift Northwest pilots were included as well, due to their familiarity with the proposed landing sites, the Agusta 109 aircraft, and general flying conditions in the region. Their opinions are essential to understanding how the alternative helistop locations would operate. Please refer to the response to Laurelhurst Condominium Association Comment #7, above.

213. As shown in the following table, as of 1986, there were a total of 138 hospital-based EMS helicopter services started (two of which failed) since the first program began in 1972.

Year	Number of Programs Begun
1972	1
1973	0
1974	0
1975	1
1976	1
1977	1
1978	7
1979	14
1980	5
1981	12
1982	13
1983	14
1984	21
1985	25
1986	23
Subtotal	138
Programs Failed	2
TOTAL	136

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

A total of 42 of these programs were started before 1982, with the remaining 96 programs having initiated operations between 1982 and 1986. According to Howard Collett of Air Medical Transport magazine, in 1986, there were approximately 30 other programs in the country that are not operated by hospitals. These include various publicly-run programs, such as those administered by police departments and regional EMS agencies.

214. Statistics on the EMS helicopter industry for the period from 1980-1986 indicate an accident rate that is much worse than helicopter aviation as a whole. Updated information on EMS helicopter safety, which reveals that the safety of the EMS industry has improved since 1986, has been incorporated into the Final EIS.

215. The NTSB data for 1982 and 1983, as well as NTSB data on the EMS helicopter industry, have been incorporated into the Final EIS.

216. It is acknowledged that the leading documented cause of accidents among turbine-powered aircraft in 1981 was engine failure or malfunction, which accounted for more than 42% of accidents. Nonetheless, the accident rate for turbine-powered aircraft is less than half that for all helicopters. Every authority contacted during the preparation of the Draft EIS cited the reliability of turbine-powered engines as the primary reason for the improvement in overall accident rates.

217. According to NEMSPA data, of 79 EMS-related helicopter accidents that occurred between 1972 and 1986, 13 (16%) are known to have involved a wire strike. Of these 13 accidents, seven occurred at night. Of these seven, three occurred in the vicinity of the host landing area. One of these three was due to a loss of power. The reasons for the other two wire strikes were unknown; however, it is known that one occurred during takeoff and the other occurred during the climb after takeoff.

218. Comment acknowledged.

219. The analysis requested is outside the scope of the EIS.

220. A comparison of FAA, NEMSPA and Airlift Northwest standards has been incorporated into Chapter IV and Appendix B of the Final EIS. Airlift Northwest's weather criteria are determined by applying the more stringent of AAMS' or Hospital Air Transport's (HAT's) guidelines. In all cases, ALNW's weather minimums are equal to or greater than the AAMS minimums.

221. Good visibility allows the pilot to maintain visual reference to the ground at his/her flight altitude.

222. In an EMS configuration, the Agusta 109 does not allow for two pilot operation.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

223. As of 1988, there were approximately 300 Agusta 109 Mark II helicopters in operation worldwide, 76 of which were in the United States. Of those in the U.S., nine were used in Emergency Medical Service.

224. See response to Comment #216, above. According to recent NTSB data, 15 of 59 EMS helicopter accidents were caused by mechanical failure.

225. Frank Benedict is the Principal Aviation Safety Inspector for the FAA's Seattle office, where he has been assigned for the past 11 years. He is considered a reliable source on aircraft safety, including helicopters, the safety of helicopter landing areas, and the acceptability of flight paths.

226. The cited article was reviewed in the preparation of the Draft EIS. The article is on file at DCLU. A profile of aircraft safety, including data more recent than that cited in the referenced article, is presented in Chapter IV of the Final EIS.

227. Early operators are defined as the first non-military EMS pilots.

228. Contact with Dr. Poulton following the issuance of the Draft EIS indicated that the document accurately reflected his opinions. A copy of Dr. Poulton's letter is on file with DCLU.

229. A restrictive budget is one that constrains the amount of funds allocated to various budget items. A budget that restricts funds for adequate helicopter personnel (e.g., training, staffing) and/or operations (e.g., maintenance) could affect the safety of the program.

230. The Airlift Northwest budget has not been filed with DCLU; however, the Airlift Northwest consortium contract that, in part, allocates the distribution of costs and revenues is on file with the agency. The cost of helicopter transports and flights is outside the scope of this analysis.

231. Airlift Northwest indicates the budget does not affect judgments regarding which transports will be accepted.

232. Data on major vendors have not been aggregated by any of the sources. Howard Collett, publisher of The Journal of Air Medical Transport magazine, is recognized as a credible source.

233. FAA Regulation 135.243 requires the following experience for commercial pilots who transport people and/or cargo:

Pilot in command under Visual Flight Rules:

Commercial pilot certificate. 500 hours of flight time as a pilot, including at least 100 hours of cross-country flight time, of which at least 25 hours were at night. 50 hours of the above must be in rotary-wing aircraft; the rest may be in fixed-wing.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pilot in command under Instrument Flight Rules:

Commercial pilot certificate with instrument rating. 1,200 hours of flight time as a pilot including at least 500 hours of cross-country flight time, 100 hours of night flying time and 75 hours of actual or simulated instrument time of which 50 hours were in actual flight. 50 hours of the above must be in rotary-wing aircraft, the rest may be in fixed-wing.

Insurance companies' requirements are variable. In some cases, they will accept the carriers' requirements for pilot flight minimums and adjust their premiums accordingly. In other cases, they will stipulate the minimum amount of flight time necessary before accepting a carrier. The Final EIS has been revised to reflect the distinction.

234. Airlift Northwest pilot standards exceed those of the FAA and are presented in Table 14 of Volume 1 of the Final EIS.

235. One pilot has been involved in a helicopter accident. There were no injuries and only damage to the aircraft.

236. The term "major airports," which refers to Sea-Tac and Boeing Field, was used in the Draft EIS; "small airport" was not. "Smaller airports and airfields" was used. The smaller airports and airfields cannot accommodate the larger commercial aircraft or jet craft that use major airports.

237. Please refer to response to Comment #34, above.

238. Please refer to response to Comment #42, above.

239. Chapter IV of the Final EIS contains an updated assessment of the risk of accident, that is based on the projected number of patient transports. See also response to Comment #154, above.

240. Please refer to response to Comment #149, above. Sand Point is not an alternative that has been advanced in the EIS. Mr. Benedict has not been asked to assess its safety as part of this EIS. MAST has been landing patients at the Intramural Field since the 1970s.

241. As illustrated in Figure 5, the Medical Pavilion is south and east of the Kitchen Garden site. The approach and departure path is from the north. Therefore, the Medical Pavilion would not be an obstruction along the designated flight path. The FAA Advisory Circular guidelines are discussed in Comment #195, above. The Medical Pavilion has been added to the discussion in the Final EIS.

Indirect effects (i.e., the building's influence on micro wind patterns) are not expected to result in a significant impact on aircraft approaches and departures.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

242. No major development is planned or proposed by Children's that would affect helistop's compliance with FAA Design Guidelines.

243. When distributed, natural gas is amended with a substance that provides it with a tell-tale odor that would be detectable if there were any leaks. In the event of an accident that involved the natural gas meter house, the meter and all pipes would be examined to ensure their integrity.

According to Doug Damm of Washington Natural Gas and Safety Division, the gas line at Children's would be shut off within 30 minutes after the gas company was notified. Alternatively, the natural gas purveyor has provided Children's with a "key" that enables the hospital personnel to shut off the main valve.

Refer to response to your Comment #46, above.

244. The Draft EIS states that "because the area immediately surrounding the Intramural Field and the primary and secondary approach/departure paths are located in an undeveloped area, potential physical damage from a helicopter accident would be relatively less for that alternative." On first appearance, the Intramural Field would appear to be a more obstacle-free area to land and, thus, a safer one. It should be noted, however, that the proximity of the driving range screen, several light standards, and a baseball backstop in the area appear as likely to precipitate an accident as the obstructions near the Children's site. To date there have been no helicopter accidents or incidents at the Intramural Field. The obstructions at the Children's site possibly would be more easily visible to an approaching pilot than those at the Intramural Field site. Thus, while it is noted that an accident occurring near the Children's site could have more serious consequences than a similar accident at the Intramural Field site, the likelihood of such an accident occurring is not significantly different between the two sites.

245. The Washington State Department of Transportation (WSDOT) has record of 46 accidents involving ambulances in the Seattle area in the approximately 9.5-year period between January 1, 1977, and May 31, 1986. In those 46 accidents, there were 34 injuries and no fatalities. WSDOT's transmittal letter regarding these data and attachments are on file with DCLU.

The lack of useful data associated with the frequency of ground ambulance accidents is due to difficulty in assembling available data into a format that can be accurately compared with helicopter accident statistics.

Several sources, including Tom Schibe of the U.S. Department of Transportation's EMS Division, Rick Minerd of the Journal of Emergency Medical Services, Robert Elling of the New York EMS Division, Howard

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Handler of the American Insurance Agency (a primary insurer of ground ambulances), Dr. John Stafford of the Arizona EMS Division, and Grace Hazzard of the National Highway Safety Administration, indicated that there is a large amount of data available on numbers of ambulance accidents in various states, but that there is no means by which to determine a rate of occurrence. Thus, it is impossible to meaningfully compare data or reach any conclusions about the data.

Handler, who many of the other sources acknowledged as perhaps the leading authority in the country, stated "The incidence and frequency of accidents involving land ambulances as opposed to air ambulances is very high, both in straight volume (which is expected due to the vast number of land ambulances in operation) and proportionately."

Ken Ruef, the former General Manager of Shepard Ambulances in Seattle, expressed concern about the use of any comparison of air and ground ambulance accident frequency. He noted that comparing ground and air ambulances is like comparing "apples and oranges," due to the relative lack of traffic and obstructions that helicopters have to deal with.

246. According to the Airlift Northwest pilots, if medical cost (the additional cost of an ambulance transfer) and medical concerns are not considered, a lit, fenced and paved helistop at the Intramural Field would be preferred over a lit, fenced and paved helistop at Children's campus.

247. The exemption is set forth in Section 25.08.510 of the Seattle Municipal Code.

248. The EPA pamphlet "Noise: A Health Problem" contains no quantitative information. Nevertheless, the cited material does indicate that noise can cause reactions including anxiety, stress, elevated blood pressure and other physical reactions. However, the EPA criteria used in the Draft EIS for evaluating impacts were developed with the objective of protecting public health and welfare. The letter referred to was considered in preparing the Draft EIS noise analysis.

249. The noise impacts on classroom activities is discussed in the Draft and Final EIS. Neither the primary nor secondary flight paths pass over either Laurelhurst Elementary School or Villa Academy. See response to Laurelhurst School PTA Board Comments #1 and 2.

250. The SJO measurement of helicopter noise at Children's was made at Location 1 (as shown on Figure 3 of the Draft EIS) and extrapolated to other locations based on the distance to the flight path. Towne, Richards and Chaudiere's noise predictions in the Draft EIS were based on multiple measurements by FAA made at various distances along several axes relative to flight paths, and verified by additional measurements at Harborview Medical Center.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

251. Please refer to response to Jerry Schneider Comment #23, below.

252. The measurements at Harborview Medical Center were made at locations with a direct line of sight to the helicopter flight path and, therefore, are considered applicable to those locations near Children's that also would have a direct line of sight to the flight path.

253. The noise measurements at Harborview Medical Center did not indicate that loaded medical emergency helicopters produce more noise than the levels given in FAA test data and used to prepare the Draft EIS noise predictions. Also, please note response to your Comment #100, above.

254. Because of the moderate sound levels predicted and infrequency of helicopter events over the schools, additional helicopter noise tests at the two schools are not warranted.

255. The operations used in the Draft EIS Noise section are considered to be worst case. See response to Comment #34, above, concerning the number of transports and the number of flights.

256. With the removal of hazard trees, the flight path incorporating a sharp turn is no longer used to land outside the Emergency Room entrance and would not be the flight path for the proposed Kitchen Garden helistop.

257. The backup helicopter used by Airlift Northwest is an identical Agusta 109 Mark II. The second helicopter also is an identical Agusta. The Sikorsky UH-60 Blackhawk helicopter has a four-bladed rotor instead of the noisier two-bladed rotor of the current MAST helicopter and based on FAA data is expected to be slightly quieter than the Agusta.

258. According to the Children's engineering office, the entire hospital building is air-conditioned, and windows are kept closed. The greatest probability of awakening is for rooms on the side of the hospital closest to the proposed helistop.

259. The determination concerning health effects was based on findings of published studies of health effects from noise, and on criteria that have been developed based on such studies. See also response to Comment #248, above.

260. The predictions of sleep interference are based on the sleep interference curves shown on page 79 of the Draft EIS and in Chapter IV of the Final EIS. These curves are fairly representative of average findings from sleep interference studies, although findings tend to vary from one sleep interference study to the next. Actual sleep disturbance may differ from these figures because of such factors as type of home construction, age, and characteristics of individuals. Please refer to the response to Comment #177, above.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

261. In the event that there are consecutive night transports, sleep interference impacts could be greater than those discussed in the Draft EIS. Based on the expected frequency of transports, relatively moderate sound levels and the fact that a large portion of residences in Seattle regularly experience similar or higher sound levels many times during nighttime hours, it is not expected that consecutive night transports would prevent residents from sleeping at all.

262. Helicopter noise received at Laurelhurst School, the school nearest the helistop, was evaluated on page 86 of the Draft EIS. See also response to Comment #254, above.

263. The approach flight path is 1,000 feet above Sand Point Way N.E. The departure flight path climbs to 2,000 feet.

264. The noise abatement path is designed to reduce noise impacts on surrounding residences. It is acknowledged that the disturbance is not perceived by some residents to be minimal.

265. Comment acknowledged.

266. The University of Washington has not received a Certificate of Need. The statement on page 90 of the Draft EIS was in error and has been corrected in the Final EIS.

267. There are several applications for constructing private use helistops that have been submitted to DCLU. See Chapter IV of the Final EIS for an identification of existing helistops and pending applications for helistops.

268. The survey may or may not be an accurate reflection of long-term hospital plans. The survey appears to be accurate with respect to the hospitals' intentions over the more than four years since the hospitals were contacted.

269. The appropriateness of organizational models for EMS helicopter services is not the focus of the EIS. Please refer to response to Kate Hemer Comment #3, below.

    It should be noted, however, that the member institutions of this consortium offer tertiary care services that are the general types of services that are needed to care properly for very sick or severely injured patients. It is unlikely that another service could cost-effectively compete with Airlift Northwest.

270. Airlift Northwest provides a key medical service to the region. It has been integrated into King County's EMS system and with local Fire Departments and Medic Units. Airlift Northwest will continue to support the physicians in community hospitals and will cooperate in the integration of its service into regional EMS plans, including an air transport plan.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

271. Please refer to responses to Community Council Federation Comments and your Comments #52, 53 and 54, above.

272. In his updated report (see Appendix A of the Final EIS), Dr. Nicola deleted the recommendation to review the Council Conditional Use Permit after six months.

273. According to a comment letter received from the Seattle-King County Department of Public Health (see letter in earlier section), the noise analysis is credible and adequate. Although additional information on noise and vibration has been incorporated into the Final EIS, a new analysis is not warranted and has not been conducted.

Thank you for your comments.

Seattle WA 98112

27 September 1986

Ms. Holly Miller, Director
City of Seattle, Department of Construction and Land Use
Room 400 Municipal Building
Seattle WA 98104

Dear Ms. Miller:

This letter is a response to the Draft Environmental Impact Statement for the Children's Hospital and Medical Center Helistop (September 1986). My direct interest in the outcome of the licensing of the helistop is that I live along the Montlake Cut which lies along one of the major proposed helicopter approach and takeoff paths. More generally I am very concerned about the high levels of noise throughout the city which may yet force us to move from Seattle into the suburbs. I have only a few brief points and a suggestion or two to make.

I strongly support the concept of rapid access to hospitals for patients who require it. My goal here is to assure reasonable access consistent with the health of city residents. A reasonable heliport site and approach path will be proposed that will permit CDH (and University Hospital) patients to have necessary timely medical care without placing an unfair burden on permanent residents along the helicopter flight paths. First I wish to draw your attention to serious deficiencies in the draft EIS regarding the impact of helicopter traffic on neighborhoods in the vicinity of CDH, including mine.

I refer primarily here to the chapter entitled "Noise and Vibration" in the EIS. Here are the data upon which the EIS draws its conclusions regarding helicopter noise in the neighborhood:

- Monthly number of takeoffs and landings: 80 (p.83)
- Typical maximum outdoor sound levels: 75-85 dBA (p.85)
  (75 dBA is comparable to siren at 500 feet - 1 block;
  85 dBA is comparable to accelerating truck, lawn mower, p. 75)
- Outdoor-to-indoor noise reduction level: -25 dBA

Based on these data and adopting standards of noise impact from of undiscussed acceptance, the EIS manages to conclude:

- Increases in neighborhood noise levels will be 0 to 3 dBA monthly (p.85)
- The impact of such noise increases ranges from "Barely Perceptible" to "Noticeable" at worst (p.74)
- The very worst case is an increased noise level of 5 dBA (p.83) which is considered "noticeable".
- In the worst case 40% of neighbors will be awakened if their windows are open and 20% if their windows are shut.

1 Anyone over the age of 3 years living anywhere in the University District or Montlake knows that the noise generated by a helicopter on approach to CDH is very loud. "Barely perceptible" is not a description of helicopter noise that any sane person would ever dream of using. "Noticeable" seems much too modest. The conclusions regarding noise impact fly right in the face of experience. How can the experts be wrong?

2 This is easy to understand if the data are converted into measures that most of us understand, and if the procedure for processing the data are made clear. The second question first. Believe it or not, the EIS allows itself to convert the noise made by helicopters from a "peak" value -- the value heard by people nearby when the helicopter passes overhead -- to a monthly average value! (See bottom of p.74 and top of p. 76.) Since helicopters are overhead no more than 10 minutes per day, and since there are 43,200 minutes per month, the monthly average noise made by a helicopter trip is about 18 percent of its peak value. In other words the writers of the EIS divide the noise of a helicopter by a factor of approx. 100 before they assess their noise impact! How's that for taking the benefit of the doubt! I am dazzled. If this is standard "industry" practice then Lord help us.

3 My second point regards the assumtion that going indoors is a perfectly good way to escape from helicopter noise since noise levels inside a house are 25 dBA (about six times) less inside than outside. The 25 DBA result is based on high frequency noise (such as sirens), and it assumes that the windows are closed. The assumption seems very reasonable for sirens during the half of the year that windows are shut. I submit that these standards are completely irrelevant for low frequency noise all year long.

4 Consider expensive loudspeaker cabinets. The best ones are invariably the largest. Why? Because even the best loudspeakers have difficulty producing low frequencies (helicopters are great at it, however). The loudspeaker

cabinet resonates and helps to strengthen the lower frequencies. The larger the cabinet the more effectively it boosts lower and lower frequencies. 4

A very expensive loudspeaker cabinet is your house. It resonates very effectively at the very low frequencies -- the sounds that helicopters produce abundantly. These frequencies are so low that the ear does not hear them. Instead the house (and all of the people inside of it) vibrate. As noted in the EIS (p.81) "short-term sound pressure of these [helicopter-generated] levels can cause rattling and movement of dishes and other lightweight objects". How would you like to live in a house whose dishes vibrate eighty times per month, or almost one-thousand times per year?

I have described the worst case, according to the EIS. Maybe, but I doubt it. My house is more than a mile from the landing site. I have never counted the occurrence of dish-rattling helicopter overpasses, but I assure you that they are not just occasional. I can also assure you that the writers of the EIS don't live near me, or that they have decided to take more doubtful benefits! Finally it is well known that low frequency noise is far more objectionable than high frequency noise to humans. I cannot supply a reference for this conclusion, but it is cited frequently in FAA documents on the subject of jet noise. 5 6

In other words, I urge you to not let yourself get lost in the overabundant words and jargon in the EIS chapter on noise impact. The data, or the interpretation of the data, or both, completely conflict with reality. Challenge their conclusions, especially the rationale for interpreting the data in the way that they have. 7

In spite of my cynicism regarding the noise impact of helicopters, I believe that it should be possible to land helicopters near CDH with only minor noise impact, and that the people at CDH and their consultants have not tried very hard to find a prudent procedure for accomplishing this. 8

My proposed landing procedure is based on the first alternative listed in the EIS; namely, the U.W. playfield site. I accept the conclusions that landings at this site will not be highly objectionable. My concern is with the proposed flight paths to this site which were recommended by the helicopter pilots. Since helicopter pilots are inside the helicopter and cannot escape its vibration and noise, the pilots cannot be expected to be very concerned with the noise impacts of helicopters along the approach paths. Rather, they want to fly the most direct routes and over low-lying parts of the city. I can't blame them 9

But that doesn't mean that they are right. Consider first the "generalized flight paths", or general approach routings, shown on p. 44. All approaches over the city follow either the I-5 or Fremont-Montlake canals. These are already among the noisiest parts of the city. Perhaps the helicopter pilots feel that these routes are safe (I wouldn't know) or that since these routes are already noisy, a little more noise won't hurt. I consider these routes to be highly inconsiderate of noise impacts for the many residents of these areas. 10

I urge you to require that large-scale approaches be overwater wherever possible. Flights from the west should come over Elliot Bay, along the Mercer Street corridor, over Lake Union across U.W. (see Figure "A" below), to the playfield. The approach from the east shown on p.44 is fine. Flights from the north and south should be required to fly over Lake Washington to a point a mile south of Webster Point and then approach the playfield as shown on p.51. None of these approaches will add more than 30 seconds to flights headed for CDH. 11

Generalized Flight Paths

Figure "A"

Approach Paths to Playfield Helistop

Figure "B"

Now examine the figure on p.51 which shows the proposed final approach paths to the playfield landing site. The approach from the southeast is fine as 12

shown. That from the southwest is abominable. The Montlake Cut region is already jammed with small planes and news helicopters, especially in the summer months. Emergency helicopters will create a safety hazard in this zone, and will add appreciably to the noise in the residential area to the south where I live. In addition, the route passes over University Hospital which it will vibrate. The University Hospital hopes to add a helipad on their roof, and the conflict of airspace will become even more hazardous if their rooftop landing site is approved. 12 13 14

In the interest of health and safety I urge you to require an approach path from the southwest as follows: cross the I-5 overpass over the canal and University Bridge. From there follow a line to the intersection of NE Boat Street and Brooklyn NE, and along the Burke-Gilman Trail to the I.M. Buildings immediately north of the Hec Ed Pavilion, and then directly to the landing site. (See figure "B" above). This flight path is far from residences and avoids classroom buildings on campus. The noise will impact transients (motorists) rather than residents. Conflict with low flying planes and helicopters is avoided. It is also faster than the routes shown on p.51. 15

Sincerely yours,

Bruce Balick

BRUCE BALICK

1. It is acknowledged that a single helicopter flight approaching Children's is audible. The "barely perceptible" increase is based on EPA regulatory criteria for average daily or monthly sound levels, which includes the cumulative effect of all noise during that period. Also, please refer to response to your Comment #2, below.

2. Maximum sound levels (Lmax), as well as Ldn levels, are described in Table 18 of the Draft EIS and Table 19 of the Final EIS. Criteria based on the Leq and Ldn descriptors are commonly accepted by acoustics professionals and regulatory agencies. These descriptors incorporate individual noise events as part of an average. Please refer to the definition of Lmax in the Final EIS. Also, please refer to the response to Jerry Schneider Comment #18.

   It should be noted that Leq and Ldn are not arithmetic averages of the sound levels, if influenced by the lower and higher sound levels, but are instead more heavily influenced by the higher noise events. It also should be noted that criteria using Leq and Ldn (see Chapter IV for a definition of these terms) were developed initially using aircraft noise, and therefore more intermittent higher sound levels, rather than the more constant surface traffic noise. The use of Leq and Ldn descriptors, and the concept that noise impacts (whether steady or fluctuating) are best gauged by the average or cumulative sound energy, are today generally accepted throughout the world.

3. Outside to inside sound reductions of 25 dBA are based on both high frequency noise and low frequency noise. Sound reductions would be less if windows are open. Also, please refer to the response to Jerry Schneider Comment #20.

   Comment acknowledged.

5. The noise consultants have worked with DCLU and the Seattle-King County Department of Public Health to discuss methodologies, assumptions and means for presenting findings.

6. Comment acknowledged.

7. Comment acknowledged. Please refer to the response to your Comment #5, above.

8. Children's, its consultants, and the City have worked to determine appropriate alternative locations for helistops, recognizing the importance of balancing patient medical needs with environmental effects on the surrounding community. Airlift Northwest has established a flight path designed, in part, to reduce noise impacts.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

9. Airlift Northwest's helicopter pilots' first commitment is to the safety of their passengers and those on the ground. Airlift also states that they are concerned about reducing noise impacts on the community. The pilots were the primary developers of the proposed flight paths to and from the sites, including the noise abatement approach and departure paths that are designed to reduce noise levels experienced by the community.

10. These generalized flight paths have been selected for safety as well as to reduce noise. Airlift Northwest pilots have indicated that, in using these flight paths, there have been fewer noise complaints than when they deviate from these paths. The most significant noise impacts are expected to occur to those residents immediately surrounding the landing and takeoff areas.

11. Flight paths over water are used whenever possible.

12. A description of aircraft use of the referenced area has been incorporated into Chapter IV of the Final EIS. It is acknowledged that emergency helicopter flights along the designated flight path would be audible along the Montlake Cut, and that there could be increased use of the airspace in this area.

13. Children's-destined helicopters that fly over the area of the University Medical Center would do so at an altitude of at least 1,000 feet, which would not cause significant vibration to the hospital.

14. If the University Medical Center receives permission to land helicopters at its constructed rooftop helistop, it would be served by Airlift Northwest, as would Children's. (Note that the University is not pursuing approval of the rooftop helistop at this time.) There could be a conflict of hospital-related air traffic in the area on occasions when helicopters are approaching the hospital(s) at approximately the same time. Airlift Northwest has developed communication and flight protocols to ensure that their aircraft operations are safe.

15. Request acknowledged. This flight path appears to take the helicopter over the University Medical Center complex and also closer to University campus classrooms.

Thank you for your comments.

Seattle, WA 98105
September 23, 1986

Julia Gibb
City of Seattle Department
of Construction and Land Use
Room 408
Municipal Building
Seattle, Wa

Dear Ms. Gibb:

For six years I was a Search and Rescue pilot for the U. S. Coast Guard. I also served for three more years as the Senior Controller in the Coast Guard's Rescue Coordination Center located atop the Federal Office Building downtown. I was responsible for information processing, planning, and launching helicopters from Astoria, North Bend, and Port Angeles, and fixed-wing aircraft from Sacramento and Kodiak. I have worked extensively with MAST, the National Guard, Navy helicopters from Whidbey Island, and the Air Force in conjunction with the National SAR Plan. I am a graduate of the National Search and Rescue School in New York. I have personally been involved in hundreds of search and rescue operations and medical evacuations on both coasts, the Caribbean, Mexico, Alaska, and the South Pacific. I am currently a Captain for Alaska Airlines. I am the 737 Safety Representative for the Airline Pilots Association, and recently completed the Association's Accident Investigation School in San Diego, California.

118

It is my professional opinion that the Children's Hospital and Medical Center Helistop Proposal is neither necessary nersafe. 1

It takes 2½ minutes, in rush hour traffic, to drive from the University of Washington Intramural Field to the door of the Emergency Room at Children's Orthopedic Hospital. On Table 2 (p. 14) of the DEIS, from August, 1985 thru June, 1986 the average one-way flight time (from pick-up of the patient to arrival at COH) was one hour and four minutes (1:04). If two of the longer flights are excluded, the average flight time is 46 minutes. The total mission time, including flight time from Boeing Field to COH to pick up the Medical Team, flight time to arrive at the accident scene or the referring hospital, and return to COH, is at least twice the amount of time reported in the DEIS. This does not take into account the initial medical evaluation time, the decision making process, notification, flight planning, and the preflight checks of the aircraft. The time frame we are discussing is obviously not minutes and seconds. In nine years of hands-on operations, I never, ever saw the outcome of a single mission determined by 2½ minutes. 2 3 4 5

The DEIS would have you believe that the jostling sustained in the transfer from helicopter to ambulance might be dangerous to a critically ill child. Turbulance is primarily caused by low level winds. Even light winds, when associated with buildings, hills, or trees can cause moderate to severe turbulence from the surface up to 2000 or 3000 feet in altitude. This, exactly, is exactly the operating regime of most helicopters. 6 7

I can personally guarantee that the smoothest part of a child's ride will be when it is carefully lifted by the paramedics from the helicopter and placed in the ambulance. To assert that a professional medical team will jostle a small child more than a 46 minute helicopter ride is nonsense. 7

While the necessity of the proposal seems contrived at best, the safety issues are very real.

The current helicopter landing sight at the University of Washington Intramural Field allows a wide-open, normal, controlled approach profile from all quadrants with no obstructions. The proposed helicopter landing sight at COH is surrounded by hills, tall trees, power lines, tall buildings, an elementary school and a densely populated residential area. 8

The approach profile proposed by Airlift Northwest calls for a 1500 ft/min rate of descent. A normal approach by a commercial jet aircraft is based on a 500-700 ft/min rate of descent. Remember how that feels on your ears and sinuses and thentry to appreciate the damage possible to a small child with a descent rate three times as great. 9

The proposed flight path also calls for excessive maneuvering in downwind landing situations. This is always a critical maneuver, but is made more so by the lack of escape routes from the proposed landing sight. A helicopter simply does not enter or sustain hover as well downwind, and a downwind departure with full fuel tanks, medical personnel, and at maximum gross weight, could be particularly demanding. 10

Emergency Medical Operations are conducted under the rules of Part 135 of the Federal Aviation Regulations. When operating under the Visual Flight Rules of this Part, helicopters must maintain 300 ft altitude over congested areas except in the landing environment. They must not operate under Visual Flight Rules when the in-flight visibility, as observed by the pilot, is less that one-half mile. Contrary to the testimony of the Airlift Northwest pilot in the DEIS, there is no FAA minimum ceiling specified for helicopters. 11

There are no FAA weather minimums, other than visibility and icing that are restrictions on Part 135 helicopter operations and inflight visibility is determined by the pilot and if the pilot, based on his observation of the weather, believes there might not be icing conditions, regardless of forecasts, then this restriction does not apply. 12

FAR Part 135.213(a) states that for operation under VFR, the pilot in command may, if a National Weather Service weather report is not available, "use weather information based on the pilots own observations...." 12

Under Part 135, and EMS pilot is limited to eight hours flight time in a twenty-four hour period, except in the event of bad weather when there is no restriction.

It is reasonable to assume that a helicopter pilot will do everything in his power to transport a critically ill child, even into a marginal landing environment. 13

Given a single piloted aircraft, such as the Agusta, in marginal weather conditions, the pilot must not only maintain aircraft speed, altitude, and attitude, monitor critical engine operating parameters, and maintain navigational guidance by reference to his instruments, but he must also maintain visual reference with the surface, all the while talking on the radios and maneuvering his aircraft to avoid obstacles such as hills, trees, power lines, tall buildings, and elementary schools. 14

There is no question that helicopters play a vital role in the transport of critically ill patients. 15

I would only ask that you consider the following. First, the need for a helicopter landing site 2½ minutes closer to Children's Orthopedic Hospital is negligible. 16

Second, the shift from a wide open, inherently safe landing site, to a congested, difficult, and demanding landing site invites incident ranging from the merely injurious, to the catastrophic. 17

If for some profit motive or marketing consideration this proposal is considered favorably and is brought to fruition, and if one small child dies or is seriously injured as a result of this senseless plan, this community and the city of Seattle should be morally outraged. 18

Sincerely,

Bart E. Baxter

BART BAXTER

1. The opinion is acknowledged.

2. It is acknowledged that the travel time from the Intramural Field to the entrance to Children's Emergency Room is brief. The 2.5 minutes is an understatement of added total travel time as it does not include the time that it takes to transfer the patient in and out of the ambulance.

3. Please refer to the response to Liz Anderson Comment #42.

4. Comment acknowledged. Please refer to the response to Liz Anderson Comment #164, regarding mobilization time. Please see Table 2 in the Final EIS. This table defines patient transport time by task for a hypothetical helicopter transport, and is compared with a hypothetical transport by ground ambulance.

5. Comment acknowledged. Please refer to response to Liz Anderson Comment #131.

6. Please refer to response to Liz Anderson Comment #132.

7. It is acknowledged that turbulence can affect the flight of a helicopter, although the Airlift Northwest helicopters generally cruise at altitudes greater than 2,000 feet, which is higher than the ground layer in which turbulence is likely to occur. One transport objective is to minimize the amount of transfers that would subject the patient to potential destabilization. The Draft EIS does not assert that a helicopter flight will jostle a patient less than an ambulance. It should be noted that the vibration on the helicopters typically flown by MAST, the Coast Guard and Navy is greater than that experienced on an Agusta.

8. Please refer to Liz Anderson Comment #244.

9. While commercial jet aircraft typically descend from an altitude of 30,000 feet, Airlift Northwest helicopters will be descending from a typical altitude of 2,000 feet. According to Airlift Northwest medical staff, the rate of descent used by Airlift Northwest helicopters will not cause any damage to a person's aural canal.

10. It is acknowledged that a downwind landing is the most demanding of landings. Airlift Northwest helicopters normally do not fly with full fuel tanks (please refer to the response to Liz Anderson Comment #100).

11. The correction has been incorporated into the Final EIS.

12. Comments acknowledged. Please refer to the response to Liz Anderson Comment #220.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

13. It is not reasonable to assume that a helicopter pilot will do everything in his/her power to transport a critically ill or injured child if the safety of the mission is questionable. Airlift Northwest provides its pilots with the discretion to fly or not to fly when the weather conditions are unsafe or marginal, or to land or not to land in an unsafe or marginal landing zone.

14. Airlift Northwest pilots are required to have in excess of 3,000 hours in flying helicopters. This Airlift Northwest requirement exceeds FAA minimums. Please refer to Table 14 in the Final FIS, which compares FAA and Airlift Northwest pilot requirements. See responses to Liz Anderson Comments #233 and #234.

    As noted on pages 67-68 of the Draft EIS and Chapter IV of the Final EIS, the Airlift Nortwest pilots would not land at Children's when operating under Instrument Flight Rules. Rather, the pilots would land at Boeing Field where an instrument-controlled landing could be performed.

15. Comment acknowledged.

16. See response to Comments #2 and 5, above. It should be noted that the time difference in landing at the Intramural Field and at Children's campus is at least three minutes, as much as 16 minutes, and typically would be closer to six minutes.

17. See response to Comment #8, above. The helistop at Children's is consistent with the FAA guidelines for helistop design (see Appendix B). Frank Benedict, the FAA Principal Aviation Safety Inspector, has stated that "The acceptable level of safety is extremely high at the (Children's) facility, U.W. facility and the soccer field."

18. The applicant presents the Proposed Action and alternatives in order to extend the tertiary care services available at Children's to all community hospitals in the region. With respect to marketing, please refer to the response to Liz Anderson Comment #23.

    Thank you for your comments.

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Holly Miller
Director, Dept. of Construction and Land Use
Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

I am writing about the proposed helipad at Children's Hospital. I am a pediatrician and on the staff of Children's Hospital, so I am not unsympathetic to the need for efficient and effective transportation of sick children. However, I believe that the current plan proposed by the hospital is insufficient and does not contain adequate safeguards for either the patients or the community. 1

Regarding the patients, while it may seem intuitively obvious that faster transport will enhance survival, this is not necessarily the case and should be documented with good scientific studies. Judging by Dr. Nicola's recent excellent review of the literature on this issue, there are none. A possibly analagous example of the misuse of technology is the situation with monitoring of near-term fetuses, where the use of electronic monitors increases the rate of Cesarean sections but does not necessarily enhance rates of survival of infants. Ground transportation has advantages over air transportation. The only way to resolve situations in which such uncertainty exists is to perform proper comparisons of the available methods on appropriate subjects. Until such a study is performed, one might be able to draw some tenuous conclusions from a review of data from transports performed during last year's snow. During that time, what was the survival rate of patients in comparison to similar patients transported during better weather? I think that Children's Hospital should be required to provide such data to justify the use of an expensive technology, for which the neighbors, the patients, and society at large must pay. It should be analyzed by a third party. 2

Regarding the community, are they being protected from the strictly entrepreneurial interests of Airlift Northwest and Children's Hospital? What mechanism is there to prevent the abusive use of helicopter transport for all sorts of medically unnecessary purposes? I have heard stories of Airlift Northwest transporting corpses of children. Why should the community suffer this? Will the city allow the proverbial fox to guard the henhouse? What disinterested party is going to monitor the use of a heliport once it is constructed? Who has verified the hospital's data on noise and other environmental concerns? Rather than belabor the issue with a long litany of possible abuses of the community by entrepreneurs, I will simply urge that this issue be considered in light of the recent history of Children's Hospitals relations with its neighbors. 3 4 5

Sincerely,

Thomas A. Bell, M.D., M.P.H.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. Your comment and belief are acknowledged.

2. It is Dr. Nicola's opinion that a helistop at Children's campus could be essential to saving the lives of the most critically ill or injured children being transported to the hospital by helicopter (see Appendix A).

   An examination of the patient outcomes from periods during which weather conditions prohibited Airlift Northwest operations is outside the scope of this document. Please refer to the response to Liz Anderson Comment #219.

3. A Medical Review Committee that examines the cases of patients being transported by helicopter to Children's would enable an examination of protocols and transport decisions. A description of the sponsor-proposed Medical Review Committee is presented in Chapter III and Appendix C of this Final EIS.

4. The City of Seattle, by releasing this EIS, has verified that it is satisfied with the data and the analysis presented in the document. The data and analysis are sufficient to disclose the magnitude of possible significant environmental impacts and provide sufficient information on which to base a decision.

5. Comment acknowledged.

   Thank you for your comments.

Subject: COH Helipad "Deis"

So much has been said against the COH helipad, I would be repeating what has been said. The exception would be the "DEIS" COH has released. It is nicely prepared with words of motherhood, but loaded with misleading statements and facts. These range from misapplying safety statistics to expanding the time line difference to transport from the playfield aread to COH vs direct flight. An Ambulance should not take any longer time than required to walk the distance. Please count this statement as strongly in opposition to the COH proposal. 1 2 3

Dear Ms Miller:

Just a note in opposition to the proposed helistop at Children's Hospital and Medical Center. As a physician I feel this helistop is not needed. It will not handle the larger helicopters most likely needed in real emergencies. The transfer time from the already used site at Graves Field is minimal and little more than at Harborview. 1 2 3

The proposed helistop offers more danger to the surrounding community, than it does advantages for improved emergency care. The enthusiasm of the arguments proposed by Children's exceeds the real medical needs by far. 4

The helistop offers little if any advantage in critical care over the current program and real disadvantages and danger to the community. Sincerely yours

R O Bullard M.D.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

R. O. BIRCHFIELD, M.D.

1. Your opposition to the helistop is acknowledged.

2. The proposed helistop's size has been designed purposely to discourage larger helicopters from landing. The Agusta 109, which would be the primary aircraft to use the helistop, is of sufficient size to transport a single patient and adequate for most types of medical emergencies. See response to Liz Anderson Comment #35.

3. Comment acknowledged. As described in the Final EIS, the average length of time (from touchdown to entering Children's Emergency Room entrance) for the transport of patients is 4 minutes for the Kitchen Garden site, 10 minutes for the Intramural Field site and 22 minutes for the Harborview site.

4. According to Dr. Nicola, the helistop could offer a significant medical advantage for some critically ill or injured patients. Dr. Nicola's findings are appended to this document (see Appendix A).

Thank you for your comments.

Dear Ms Miller,

I am writing concerning the helipad issue in regards to Children's medical Center (C.O.N.) located in Laurelhurst community. I am a great supporter of the hospital and all it seeks to achieve however, I do have some concerns regarding the necessity of a helipad at the hospital. Will there be a weather observer at the hospital to keep pilots informed of prevailing weather conditions? The flight patterns shown in the EIS show a secondary approach which when used in bad weather conditions appears much more dangerous to the pilot and his/her passengers. The existing field at the University of Washington which is used for hospital landings seems a more logical and safer place for all concerned. There are telephone poles, electrical wires

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

homes, schools and many occupants - in these dwellings that the pilot must be aware of. In an emergency (ie. unforseen weather problems, engine problems ...) the obstacles one must deal with & potential disasters are fewer if the soccer field approach and landing were to remain as is. In my dealings with the hospital, (I currently give tours for the hospital + was president of a guild which supports uncompensated care at the Children's Medical Center. I fail to see the critical need for a helipad sight located so far from the entrance to ER as opposed to a safer landing site and short driving distance to the door of Children's Do not trauma victims go generally to Harborview for emergency treatment? In conclusion - I must add the statistics printed in the American Medical News journal dated 9-5-86 alarms - and frightens me and my neighbors. 21 crashes this past year of medical helicopters is astounding. The boundary flight approach as proposed by the hospital puts the lives of my 4 children and 13 nieces + nephews along with their friends in school at Villa Academy in potential jeopardy. I urge you to consider the existing landing field at U.W. as a safer and better for all concerned place to land Airlift N.W..

Sincerely
Maureen Brotherton

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

MAUREEN BROTHERTON

1. Please refer to response to Liz Anderson's Comment #6, above.

2. The secondary approach path to the Children's site is the safest flight path for the weather in which it would be used. It would present no increased danger to the pilot or passengers. The secondary approach is located over a more populated area, however. In the event that an accident did occur, there could be a greater risk to persons and property.

3. Please see response to Liz Anderson Comment #244.

4. It is acknowledged that there would be fewer people at risk and less risk to property associated with landings at the Intramural Field.

5. According to Dr. Nicola, the helistop at Children's could offer a significant medical advantage for some critically ill or injured patients being transported to the hospital by helicopter. Dr. Nicola's findings are appended to this document (see Appendix A).

6. Please refer to the response to Liz Anderson Comment #62.

7. Comment acknowledged. The data on helicopter safety have been updated and expanded (see Chapter IV in the Final EIS). These data indicate that the safety of EMS helicopters has improved since 1986.

8. The secondary flight path proposed for the Children's site would fly closer to the Villa Academy than the primary flight path would; however, the helicopter would not directly overfly the Academy.

9. Comment acknowledged.

Thank you for your comments.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

TESTIMONY:
MARY CRISMAN
(Presented Sept 23, 1985)
Public HEARING DEIS/
COH HELIPAD

131

In reviewing the section in the DEIS concerning federal, state, local, and private agencies with jurisdiction over helipad construction and air ambulance servies, it has become clear that the hospital's statement that " there is no single agency with jurisdiction" is painfully true. While a number of agencies advise and give suggestions concerning helipad proposals, there is no agency that is responsible for enforcement, regulation and supervision of air ambulance services. To illustrate, the FAA, which many assume police and assure the safety of the skies, offers only guidelines, not specifications for helistop construction. Further, as quoted from the Draft, the FAA will investigate complaints but will "generally not take action" on them (p.26). At the state level, the CON office with the DSHS has been empowered to review helistop construction, but was unable to enforce this regulation on COH. Another state agency, the Emergency Medical Services, has no authority for COH's helistop, nor does the Washington State Department of Transportation. In short, this striking lack of jurisdiction was outlined in the Draft; it was not identifed as a problem area nor one requiring resolution. We in the community, however, feel that enforcement and regulatory provisions should be a necessary part of this draft and therefore ask that these concerns of regulation, enforcement and jursidiction be addressed in the next DEIS.

1

OCT 17 1986

Some of the enforcement questions which should be answered are:

1. Who ensures that pilots abide by FAA standards? |2

2. Who will monitor flight paths, for compliance with noise abatement procedures as outlined in the DEIS? |3

3. Who will ensure that ALNW functions to benefit the region, not just its sponsoring hospitals? |4

4. How will the appropriateness of patient transfers be assessed, with a consideration of retrospective review? |5

5.How will the military and civilian services be coordinated? |6

6. What will be the consequences of violations of the permits issued? |7

7. Who will monitor the safety of the flights? |8

While these are only a few of the questions which have occurred to us, they show our concerns with enforcement, regulation, and jurisdiction which need to be addressed in the DEIS.

We would also like to note that our concerns over regulation are neither idle nor naive; rather, they reflect a number of unfortunate experiences with COH which have impressed upon us the need to guarantee that safeguards are in place before the cat is out of the bag, the toothpaste is out of the tube. To illustrate, in 1979 and 1980, COH began a policy of charging for parking in their parking lots. This policy violated the City's Land Use Code but COH did not comply with the code until they received a number of citations(October, 1979; March, 1980). Further, the City's Land Use Code requires a permit for a helicopter to land; as far as we know, the Hospital still does not have a permit but continues to land anyway. Lastly, enforcement at the state level has been equally difficult. The State CON office did ask, on three separate occasions, that COH submit a CON application. COH refused and the State did not enforce their regulations. The failure of COH to complete a CON is of particular importance, as this regulation is one that is cited in the Draft as a |9 |10

safeguard against helicopter proliferation and resulting escalating health care costs. If COH can avoid doing a CON, there is little hope that other hospitals will not do the same and the promise of a source of regulation is further undermined. (It should also be noted that there is currently a concerted lobbying effort designed to abolish CON requirements totally.) 10

In sum, we would like to see our concerns about regulation, enforcement, and jurisdiction addressed in the EIS. The "who, what, and how" of enforcement should be an integral part of this proposal, not only so that COH can be encouraged to fulfill its obligations and agreements, but also so that the EMS system in this region can continue to be viable and affective. It is not enough to say the an agency does not exist that can oversee this proposal. What is needed is a plan for an agency, a proposal for regulation and supervision, which will ensure proper and fair compliance with provisions and standards. 11

132

Signed,
Mara Chrisman
(EA)

MARV CHRISMAN

1. Comments acknowledged. With respect to the comment regarding the FAA's investigation of complaints, the full sentence as presented in the Draft EIS should be considered: "It is important to note that the FAA does give pilots discretion in deviating from the flight path; they will investigate complaints but would generally not take action on a complaint unless the pilot was operating in an inherently unsafe manner (Benedict, 1986)." The issues of compliance with conditional use permit criteria is important. The City of Seattle has the authority to impose conditions through the Council Conditional Use Permit.

2. The FAA is responsible for enforcing its standards.

3. Please refer to the response to Liz Anderson Comment #110.

4. Currently, there is no mechanism available to ensure that Airlift Northwest functions to benefit the region. To the extent that the consortium hospitals provide a service to referring physicians in community hospitals, the service provides a benefit to the region.

   Please refer to the response to Kate Hemer Comment #3, below.

5. In order to monitor the helistop's consistency with the City's requirement that the use of the helistop is restricted to life-threatening emergencies, Children's has proposed a medical review committee, which is described in Chapter III and Appendix C of this Final EIS.

6. See responses to Liz Anderson Comments #94, 161, and 162.

7. Please refer to the responses to Liz Anderson Comments #119 and 120.

8. The safety of the flight is the responsibility of the pilot. Please refer to the responses to your Comment #2 and to Liz Anderson Comment #119.

9. Your concerns are acknowledged. Please refer to the response to Liz Anderson Comment #51.

10. Children's has not submitted a Certificate of Need application because the State determined that one was not required. Subsequently, the State determined that helistops will not be subject to Certificate of Need regulations. Please refer to the response to Seattle Department of Community Development Comment #1.

11. Comment acknowledged. The development of a plan for a regulatory agency that would oversee the construction and operation of the helistop is outside the scope of this project review. Please refer to the response to Liz Anderson Comment #119.

Holly Miller, Director
Dept. of Construction and Land Use
408 Municipal Building
Seattle WA 98104

Dear Holly Miller,

As you will note by my address below, I live across the street on the south edge of Children's Hospital. I am very much in favor of a helipad at the hospital to help children suffering traumatic health problems. The following are a few of my thoughts: 1

- Helicopter path and safety are controlable human factors. If the path is up 45th street at a reasonably high level and a quick decent to the pad, the noise is very briefly heard and safety to residences could not be a concern. 2
- Helicopter noise from those landing in the past has been no louder at my location than many of the street vehicles that go up and down 45th street. 3
- Helicopters are fun to watch even though it would only be a brief time at my location. And it is inspiring to know they are helping children. 4
- Please consider the south side of Children's Hospital for the helipad — in the area of the current play yard for children. 5

I am sorry to be so late with my comments and I was unable to attend the September 23rd hearing. When is the next hearing scheduled? I would like to support the helipad development.

Sincerely,

Rick Dam

RUTH DAM

1. Your support of the helistop is acknowledged.

2. Comment acknowledged. Noise and risk impacts have been reduced from the original project through the introduction of a Preferred Alternative that reduces the number of flights that would land at Children's, thus reducing the number of flights that would follow N.E. 45th Street and Sand Point Way N.E.

3. Comment acknowledged.

4. Comment acknowledged.

5. Please refer to the responses to Liz Anderson Comments #145 and 147.

Thank you for your comments.

RECEIVED
OCT 6 - 1986
DEPT. OF CONSTR. & LAND USE

Dear Ms. Miller:

I would like to submit some comments and criticisms on the Draft EIS, submitted for a proposed helistop, by Children's Hospital and Medical Center. Most of my criticisms and suggestions center on the issue of safety; I have also touched upon the issues of alternative sites. Lastly, I comment on the presence of bias in this document. Because of the number of problems in all these areas, I would like to see the next follow-up document be a second, rather than final, draft. In this way, comments could again be taken from the community with the hopes that a better, more credible and complete EIS would be produced. 1

Thank you for your time and consideration of this matter.

Sincerely,
Ruth Engelberg

137

1. A set of standards has been proposed for the EMS industry. These standards should be responded to in the DEIS (Bill Roy, AirNet, May, 1986).A stated, they represent" MINIMUM objective factors which should be present for safe EMS operations: 2

1. Four pilots serving 12 hour duty periods-- with a mandatory ratio of one day off duty for every half-day worked.
2. Night weather minima outside of metropolitan areas of 1000 ft ceiling and 3 miles visibility. 3
3. A system of stability augmentation for all night flights that is certified for single-pilot IFR. 4
4. Lacking stability augmentation, night flights must be flown by two pilots. 5
5. Four thousand hours total helicopter flying time. More than aircraft handling proficiency is demanded in EMS flying; a well-developed judgement in operational decision-making, based upon long and varied experience, is necessary as well. 6
6. The EMS pilot must be licensed and recurrently trained in instrument flight proceudres." (Air Net, Hospital Aviation, May, 1986) 7

It should be noted that these guidelines were to be formally reviewed and released to the industry this past week. While we presently do not have a copy of the regulations passed by NEMPSA, they should be secured and responded to in the EIS. 8

2. A pumphlet LZ put out by NEMPSA has been described by Helicopter News (12:11), p.85, 1986, as" making a major contribution to safety in EMS missions". Yet, CCH's proposal for a helistop is 40x 40 sided; LZ recommends 60x60 sided, with 100x100 sided for night. The Draft should discuss the implications of their reduced size of pad and why they did not feel they needed to comply with LZ standards.There are so few authorities in this field, as noted in DEIS-- shouldn't they have complied with one which has surfaced? 9

3. Another concern with standards- Gene Hill, an ALNW pilot, states that their (ALNW) standards are stringent (p.69), yet these standards are not included, except for flying conditions (p.45). . In the EIS, therefore, the pilot standards (staffing, training, required hours flying) should be included. 10

Hill also states that "pilot discretion" is used in marginal weather (p.67). How will pilot decisions in marginal weather be made and assessed? This is particularly important, as a major source of accidents has been found to be pilot error in marginal weather (p.66). Further, NEMPSA contends that EMS safety would be improved if pilot discretion and vulnerability to flying pressures were reduced. This policy does not seem to help the pilot with reducing vulnerability. Could the EIS respond to these concerns? Further, COH itself points out, with references, that "the rash of accidents suggests that one reason for the accidents is the pilots' willingness to fly in adverse weather when other commercial helicopter pilots would not fly." As stated by Paul Procter, a business flying editor for Aviation Week and Space Technology, "Those guys absolutely hate the thought of losing a patient because they can't fly"(p.62). 11 12

Other pressures noted by NEMPSA- institutional pressures, nursing pressures, financial pressures. The EIS should discuss the chain of command and the safeguards which will ensure that safety is a first, not last, consideration. On p.42, the referral chain is indicated. Nowhere in the outline of steps is the pilot's decision concerning whether it is safe or unsafe to fly-- he is told to fly after all medical decisions are made. The next Draft needs to specify when, how, and who makes the safety decisions. In addition, when do these safety decisions come into play in the referral chain? 13

4. Alternative considerations- this section is very inadequate, particularly regarding the safety advantages of alternate sites. COH needs to answer these concerns.

For example, Bill Roy (AirNet, May 1986) states:"It is commonplace among our pilots that the situation they fear most to be placed in is that of powerless flight at altitudes over a severely restricted landing or takeoff area". Yet the ALNW pilots (and this is the only source) state that there is no advantage to an improved East Campus site(p.73). Are there other sources (objective) who would agree with this appraisal of the equivalent safety characteristics of the COH site vs. East Campus site? With the professional building to the East, the Hospital to the South and West, and residential homes to the North-- this site presents a restricted area. Further, a quote from Benedict in which he says the hospital site is as safe as the downtown sites does not qualify as an assessment of safety for the alternative East Campus site(p.72). Lastly, there are a number of East Campus sites that were not even discussed which might prove desirable alternatives; these sites should be considered, with attention to safety, noise, and cumulative impacts. For example, could the stadium provide a good spot for a shared helipad for COH and UW? It is lighted, big, provides a sound barrier, and is unobstructed. With the exception of football Saturdays (during which time helicopters could land at an alternative site), it represents an important alternative. 14 15

5. BIAS: Shouldn't the EIS attempt a little more objectivity? The considerations concerning safety are clouded by the use of biased, non-objective sources. None of these sources would be considered credible by researchers, because of their involvement in the program and a resulting conflict of interest. While there may be different sides to this issue, it is clear that the Draft has done little to illuminate the controversies, differences of opinion, and points of view that characterize the issue. For example, the statements (p.65) from the Agusta marketing representative on the safety of the Aguste is not particularly convincing. Are there other sources that could be used? Further, the statement on p.68 that "there is a general perception ...in the industry.. that overall safety has improved" contrasts with other statements from Airnet (January, 1986) "The accident rate we are experiencing in EMS aviation is horrendous". It should be noted that the support for the Draft's statement of improving safety is from Hill, an ALNW pilot. The statements from Poulton and Collette indicate that the industry is committed to improving safety through the new standards from ASHE,EAMS and NEMPSA. Is ALNW a member of these organizations? Will/do they comply with their standards--please include in EIS! Lastly, the table on p. 64 should be contrasted with a table from Airnet, January, 1986. The data are not different; they are interpreted differently. From Airnet, the information is more revealing about fatalities and injuries as due to pilot error vs. the interpretation by the Draft as due to mechanical error. 16 17 18 19

6. Enforcement, jurisdiction and regulation ensuring safety are considerations that have been overlooked in the DEIS. In the "Fly Neighborly" program,sponsored by Helicopter Association International, there are agencies that have been used to set up, monitor, and trouble-shoot helicopter programs, both before and after they are operational. Shouldn't these kinds of organizations be considered in the Draft, as part of the helistop plans? Ex. FAA Rotorcraft Task Force (Houston, 1981), Helicopter Safety Advisory Conference(HSAC0), HAI Heliport Development (From Rotor News, May-June, 1981/2), Houston Aircraft Facility Review and Appeals Board. 20

RUTH ENGELBERG

1. The SEPA guildelines provide for a Final EIS to respond to comments generated by the Draft EIS and to discuss any proposed changes to a project under consideration. DCLU has determined that a new Draft EIS is not necessary.

2. The standards presented in the cited article were developed by NEMSPA. Airlift Northwest flies with six full-time pilots and one part-time pilot. The pilots work either day or night shifts, with the day shifts occurring between 7:00 a.m. and 7:00 p.m., and the night shifts occurring during the remaining twelve hours. Pilots work for five days and are off for the following five days.

   Pilots can take off-duty time any time they request.

   These standards are consistent with the NEMSPA guidelines for Minimum Staffing Requirements and for Duty Time Limitations. Please refer to Appendix B, which details the conformance of Airlift Northwest with the NEMSPA guidelines.

3. Airlift Northwest operations are consistent with these weather minimums.

4. Airlift Northwest aircraft are equipped with stability augmentation systems.

5. Please refer to the response to Liz Anderson Comment #222.

6. Airlift Northwest pilots have a minimum of 3,000 hours of helicopter pilot time, 1,000 hours of turbine helicopter experience, and 100 hours of night flying time. Airlift Northwest requirements are consistent with NEMSPA experience requirements for total helicopter time and turbine helicopter time, however they are 150 hours less than NEMSPA requirements for night flight.

7. The Airlift Northwest pilots are IFR-trained and certified, and re-train regularly (are "instrument-current").

8. At the time of the preparation of the Draft EIS, the referenced NEMSPA guidelines had not been adopted. Appendix B of the Final EIS, however, does review the consistency of Airlift operations with the adopted NEMSPA and AAMS guidelines.

9. Please refer to responses to Liz Anderson's Comments #106 and 107, above.

10. A comparison of Airlift Northwest standards with those of NEMSPA and AAMS has been added to the Final EIS. Please refer to Appendix B.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. The pilot uses his/her professional experience in evaluating weather conditions and his/her judgment in determining what course of action is most prudent.

    It is acknowledged that pilot error in marginal weather conditions has been found to be a cause of helicopter accidents. An important contributing factor has been non-Instrument Flight Rated (IFR) pilots flying in acceptable weather and then encountering adverse weather conditions that warrant instrument flight capability.

    The policy of allowing the pilot to have sole discretion as to when to fly was designed with the specific purpose of providing the pilot the authority to decide not to fly in weather that he/she was not completely comfortable flying in, even if other weather/flight guidelines would indicate that the pilot could fly under those conditions. The policy does not give the pilot the discretion to decide to fly in weather that is less than FAA minimums. Therefore, this policy reduces the pilot's vulnerability to outside pressure to fly.

12. As noted in the previous response, Airlift Northwest recognizes that external pressures have contributed to safety concerns in other EMS operations. In order to reduce the pilot's vulnerability to flying pressures, the above-referenced Airlift Northwest policy was designed to give pilots the discretion not to fly in marginal weather (weather that is acceptable for flight under FAA guidelines); not discretion to fly in poor weather (that is, weather that is unacceptable for flight under FAA guidelines).

13. Airlift Northwest specifies visual flight rule (VFR) minimums for its pilots, including:

Mode of Flight	Ceiling	Visibility
Day Local Area	800 feet	1 mile
Day Cross-Country	1,000 feet	2 miles
Day Cross-Country (mtns)	1,000 feet	2 miles
Night Local Area	800 feet	2 miles
Night Cross-Country	1,000 feet	3 miles
Night Cross-Country (mtns)	2,000 feet	5 miles

    This is an Airlift Northwest policy and is not open to discretion on the part of pilots, administrators, medical teams, or anyone else. If weather conditions are better than the specified minimum, the Airlift Northwest policy is to fly. If, under marginal conditions, the pilot decides not to fly, there is no one who can override that decision and order the pilot to fly.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

14. Please refer to response to Liz Anderson Comment #244. Also, the discussion of the relative safety of the alternative helistop sites has been expanded in the Final EIS. Please see Chapter IV.

15. The alternatives were developed by Children's and DCLU. A number of helistop sites were suggested and evaluated by University Medical Center when they considered the development of a new helistop. Please refer to response to Liz Anderson Comment #142.

16. Please refer to response to Liz Anderson Comment #212. It is acknowledged that Sue Godar, the marketing representative with Agusta, has an interest in portraying the aircraft she sells in the best possible light. Therefore, her input was limited to the facts that she was able to provide on a single accident involving the Agusta, not qualitative judgments. The other sources used in the EIS are some of the foremost authorities in the nation on the subject of EMS helicopter safety.

17. When the original research for the Draft EIS was conducted (early 1986), there was an emerging awareness of the magnitude of the safety problem that the EMS helicopter industry had been experiencing. In early 1986, it had become apparent that 1985 had been a bad year in terms of the number of EMS helicopter accidents. The perception among the sources contacted for the Draft EIS was that, in general, the accident rate for 1985 was an aberration to an otherwise improving trend. Nonetheless, there was expressed concern that in the absence of strict safety guidelines, the rapid growth of the industry was causing the number of accidents to increase to unacceptable levels. Two trade organizations, NEMSPA and AAMS (see Chapter II of the Final EIS), began to research the problem and establish guidelines to self-regulate the industry. As 1986 progressed and the number and rate of EMS helicopter accidents continued to increase, the media examined the problem on several television news programs.

    The Final EIS has updated the information on EMS helicopter safety.

18. See responses to Liz Anderson's Comments #115 and 117, above.

19. The Final EIS contains updated information on helicopter safety.

20. Please refer to the response to Liz Anderson Comment #119.

    Thank you for your comments.

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Director,
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Dear Sir/Madam,

With reference to the application for construction of a Helistop Facility accessory to Chidrens' Hospital and Medical Center,I want to protest such a construction in the strongest terms ,both as individual resident within a few hundred feet of the hospital and as Vice-president of the Laurel Crest Condominiums Home Owners Association. 1

While pretending that the use of helicopters to ferry patients to the hospital is resorted to only in emergencies,the C.O.H. administration has demonstrated the untruthfulness of that claim by arranging for almost daily helicopter landings on its grounds during the month of August, including one at around midnight during a recent weekend. To the best of my knowledge ,C.O.H. has no permit for such landings and is constantly violating ordinances of the City of Seattle .Why do you and our elected officials remain silent in the face of such overt lawbreaking by a politically powerful organization ? The recent spate of crashes by helicopters used for ferrying patients and the disastrous effects of such a crash on the lives of people residing in a densely populated part of the city,should be enough reason to outlaw even a single landing of a helicopter on the grounds of C.O.H. .In addition to which the noise of the helicopter is deafening and certainly wakes up anyone trying to sleep at night. 2 3 4 5

The original reason for C.O.H. to locate in the Laurelhurst area was to get the benefit of a quiet neighborhood.If,some decades later, the goals of C.O.H. have changed and helicopter service for patients has become an indispensible marketing tool in the competition for patients ,then Childrens' Hospital must move to where such services will not interfere with the lives and the tranquillity of people living in a quiet neighborhood.The fact that Childrens'Hospital is out there aggressively campaigning for more patients is clear to all of us who watch its advertisements on Television and its fullpage advertisement in magazines such as Newsweek 6 7

Sincerely yours,
Albert A. Feldmann

cc. Mayor Charles Royer

4873 Terrace Drive NE
Seattle,WA 98105

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

ALBERT FELDMANN

1. Your opposition to the construction of the helistop is acknowledged.

2. There were a total of 17 patients transported by helicopter to Children's in August 1986. Five of these transports landed outside the entrance to Children's Emergency Room. The remainder landed at the Intramural Field (1) and Harborview Medical Center (11).

   Dr. Nicola's (1987) review of patient transports resulted in the following determination: "review of case files of the children flown directly to Children's indicates that with one possible exception, all presented life-threatening conditions that warranted transport right to the doors of the hospital. Review of 30 additional randomly selected cases flown by helicopter to Harborview for ground transport to Children's shows that all cases met the State's proposed criteria for use of air transport but were less severe than those flown directly to the hospital" (Nicola, 1989). The choice of the most appropriate landing location was the professional judgement of the attending medical team.

3. See response to Liz Anderson Comment #51, above.

4. It should be noted that the majority of the accidents that have occurred have been located at a distance of more than one mile from the host hospital. It should also be noted that it appears that the safety record of EMS helicopters has improved dramatically since 1986. There never has been a ground fatality associated with an EMS helicopter accident. See Chapter IV of this Final EIS for revised information on helicopter safety.

5. See responses to Liz Anderson Comments #260 and 261. As noted on pages 83-84 of the Draft EIS, nighttime helicopter landings at Children's would be expected to awaken approximately 15% of a normal population. That figure could be as high as 30% for those residents immediately surrounding the landing area, depending on existing sound levels, whether windows are open, and other factors.

6. Comment acknowledged. Please refer to the response to Liz Anderson Comment #23.

7. It is acknowledged that Children's does advertise day surgery and other services. Air ambulance service has not been advertised, nor does Children's intend to use the helicopter service in its advertisement of services.

   Thank you for your comments.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

From: Anita Francis, Ph.D.
5003 45th N.E.
Seattle, WA 98105

October 15, 1986

Comments on the Draft Environmental Impact Statement for a helipad proposed by Children's Hospital of Seattle

(Page numbers refer to the page of the DEIS).

Page 2. "The patient would be removed from the helicopter, placed on a gurney, and wheeled to the E.R. entrance." COMMENT: How much distance is involved in this transfer? What personnel are involved and where do they come from? How is the patient protected from hypothermia, wind from the helicopter, and rain and snow? How much time is estimated to be involved in the patient transfer with this COH campus landing site alternative? [1] [2]

144

Page 2. "Impacts on patient outcome are expected to be more favorable under the proposed action (i.e. landing at Children's) than under the Intramural Field Helistop Alternative (or the other alternatives)." COMMENT: What are the data on patient outcome from those transported to the E.R. door? Since Children's has been landing patients at the E.R. door, this experience should be examined. [3]

Page 2. "The increased time of transport and increased manipulation of patients that would result from any of the alternatives other than the proposed action would result in suffering, the need for prolonged treatment, or even death." COMMENT: Are there ANY supporting data for these comments? [4]

Page 3. "...the noise...would not cause significant impact during daytime hour(sic), when three-quarters of the patient transports are expected to occur." COMMENT: Please explain how the hospital can make this prediction that 3/4 of the life-threatening emergencies will occur during daytime hours. Don't many emergencies occur at night? If not, why not? [5]

Page 3. "Any alternatives to the proposed action could result in ambulance sirens being used between the landing area and Children's. These sirens are approximately as loud as the helicopter." COMMENT: We have seen, in DCLU files, an agreement between the city and COH that the sirens would not be used as the ambulance approached the hospital. What has become of that agreement? Is it no longer being honored, or would it not be honored in the future? Also, as a neighbor of CHH, I can attest to the fact that the sirens are NOT as loud as the helicopter; the assertion to the contrary is ridiculous. [6] [7]

Page 3. Safety Impacts.--"The worst case expected statistical frequency of a helicopter accident...would be one in every 5,459 flights, which, assuming an average of 20 patient transports a month, translates to a worst case of an accident occurring once every 23 years."

COMMENT: Isn't this 80 flights a month, i.e., 20 x 4 landings or takeoffs which would decrease the ratio to 1 in 1366 or once every 5.75 years? [8]

NB: I have an additional comment on the expectable crash rate in my comments relevant to page 62 of the DEIS.

Page 4. "Potential for cumulative impacts...at additional Seattle area hospitals...City land use criteria...limit the use of helistops to facilities that can demonstrate that the helistop is needed to save lives. (Only a few Seattle area hospitals...are routinely involved in treating life-threatening emergencies.)"
COMMENT: Most hospitals would disagree. They are involved in treating life-threatening emergencies! 24-hour emergency care is given at Auburn General, Ballard Community Hospital, Highline Community Hospital and others listed on page 11 of this DEIS. A complete list is available in the Journal of the American Hospital Association guidebook issue. [9]

Page 7. "Children's...with 1050 active physicians..."
COMMENT: How many physicians at Children's Hospital provide tertiary care, which is the topic of this DEIS? Does the 1050 figure include courtesy staff and other who are not involved in providing care on a daily basis, and indeed, may rarely set foot in Children's Hospital? [10]

Page 7. "A summary of 1984-1985 cases indicate that of the 621 Children's patients affiliated with the Blue Cross system, 54% were categorized as unique cases (defined as patients diagnosed with illness or medical need common to no other or one other patient affiliated with the Blue Cross system)."
COMMENT: The meaning of this statement is unclear. Were these cases trauma or life-threatening or just "unique" and unrelated to this proposal? [11]

Page 7. "Children's neonatal intensive care unit (NICU) has 19 beds, the NICU at the University...Hospital has 12 beds. The only other NICU beds in the Puget Sound area are the 12 located at Tacoma General."
COMMENT: How many NICU beds are there at Swedish Hospital? [12]

Page 8. "Traumatized and severely burned children in the Puget Sound region generally go just to the region's recognized trauma center, [13]

Harborview..., but may be transferred to Children's for follow-up surgery or treatment and stabilization."
COMMENT: Harborview is fully capable of stabilizing patients requiring it. Patients would not be transferred from Harborview to COH for stabilization! 13

Page 10. "It is the opinion of the Seattle-King Co. Dept. of Public Health that any recommendations be used as guidelines and not standards. (Nicola, 1986)." COMMENT: We have not had access to this information. Has this been written, or is it verbal? What is the context in which the comment was made? What does Dr. Nicola mean by "guidelines" and "standards" here? In Dr. Nicola's report to Beatrice Ryan, Acting Dir. of DCLU, Dec. 4, 1985, Page 6, he states that "If a helistop were being used for purposes outside those expressly permitted, I believe it would be appropriate to revoke the permit at the end of the six months." If he does feel that there can only be recommendations, to be used as "guidelines", then how can "purposes outside those expressly permitted" be defined and enforced? Please discuss this dilemma, and provide the documentation to Dr. Nicola's comment as cited on page 10, DEIS. 14

Page 11. "Only 2 hospitals--Children's and University--offer neonatal services."
COMMENT: Why is Tacoma General Hospital not listed here? It is listed on page 7, paragraph 4 as having a neonatal intensive care unit. 15

Page 12. "Pediatric emergency services involving critically ill or injured patients are generally referred to Children's."
COMMENT: Since pediatric trauma cases go to Harborview and Tacoma General/Mary Bridge Children's Hospital has a pediatric care unit, this statement is inaccurate. 16

145

Page 12. "Air transport provides a rapid method for getting the appropriate medical help to the patient, not that the patient gets to the hospital quickly. (Call, 1986a)."
COMMENT: This is an important point that seems to be glossed over in by Children's Hospital in terms of their objectives for citing the helipad at their hospital E.R. doors. 17

Page 12. "Guidelines to assess need for helicopter transport." ...c. Major medical problems in a pediatric patient where time is critical for the survival of the mother and/or baby."
COMMENT: For those cases where the patient was landed off at the COH ER door, what was the survival data and the mortality data? 18

Page 13. "Under no circumstances should paramedics request dispatch center to get comparative estimated time of arrival from MAST and Airlift Northwest." COMMENT: I do not see the rationale or logic for this. If time is so important as stated throughout this DEIS, why wouldn't comparisons of time be relevant? 19

Page 13. "The Korean conflict was the first to recognize the helicopter's role in providing care..."
COMMENT: This is such a specious argument! Ground transport is hazardous during a war. Also, there were few roads and ground ambulances available in the war zones! To compare the Seattle situation with the Korean and Vietnam situations is ludicrous. 20

Page 13. "The first civilian helicopter ambulance service in the U.S. was initiated in 1972 at St. Anthony's Hospital in Denver."
COMMENT: How relevant is St. Anthony's experience to COH? Does St. Anthony's have a PICU and a NICU, level III? We understand that the helicopters take off and land at St. Anthony's and patients are transported by ground to Denver Children's Hospital or one of the other 2 nearby units. Also, nurses, not physicians conduct these transports, and terminally ill patients or newborns are not transported back to the hospital.
Please explain some questions which have arisen as a result of comparing COH's statistics to date with the Denver experience. Although the Denver hospital had 125 primary emergencies from August 1979 to February 1980, (a) only five were transported by helicopter and (b) only 14 of the 125 transported patients died after being admitted to the receiving hospital. (Dobrin, R., et al., "The Development of a Pediatric Emergency Transport System" Pediatric Clinics of North America Vol. 27, No. 3, August 1980, pages 40-41). The DEIS for COH shows a much higher rate of transport (i.e., 15-20 per month) and many more patients expiring. For example, on page 16 of the DEIS is a listing of some of the cases transported by helicopter to COH. 10 of the 21 cases presented in this listing died; 2 of the 10 went to Boeing, the other 8 went directly to COH and yet died anyway. Please explain why COH's statistics are so different from Denver's, which has a comparable population. Is it true that Airlift Northwest transports any and all regardless of the chances for survival? If so, doesn't that make it more of a business than a health service? 21

Pages 14-16. Table 2, entitled" Key characteristics of critically ill patients transported by Airlift Northwest helicopter directly to Children's". COMMENT: Although the speed of the helicopter is cited as a critical factor in providing optimal care, consultation with physicians shows that about 40% of cases which could have been treated at Mary Bridge Children's Hospital of Tacoma were flown over that hospital and taken to COH, even though that lengthened the trip and the time to obtain care. We would like an explanation of why the following cases would not have been better served by being treated at Mary Bridge/Tacoma General: 22

admitting date	referring city	presenting condition	current status
1.8/85	Chehalis	Fulminating meningitis; coma; neurologically damaged	Disch.home
2.11/85	Olympia	Subdural hematomas;	Disch.to hosp.
3.12/85	Bremerton	Severe lung dis.; overwhelming infection; respiratory failure	expired
4.12/85	Chehalis	Pneumomediastum	Disch. home
5.2/86	Grays Harbor	Near Drowning	expired
6.4/86	Federal Way	Near drowning	disch. home
7.6/86	Auburn	Chemical ingestion; respiratory distress	disch. home
8.6/86	Bremerton	Born to diabetic mother. Increasingly severe respiratory distress, acidutic.	still at COH

Of the 21 cases shown in Table 2, of the DEIS, the above 8(38 %) could have been treated at Tacoma General/Mary Bridge Hospital in terms of that hospital's capabilities. All of them were located at a site nearer Tacoma than they were to COH.

Page 17. "Surgical emergencies in the child, as well as infections, near drownings and trauma, are some of the conditions that need immediate intervention. Since time is critical, transport time has a direct bearing on the patient's prognosis. (Neff, 1986)." COMMENT: Is it possible to get a knowledgeable, unbiased judgement of this? We have been told by physicians who are experienced in emergency pediatric care, that the care needed for infections is not a matter of minutes, hours of time lapsing wouldn't be good, but a few minutes is not going to make a difference here. With near drownings, physicians tell us that the nearest hospital is the most appropriate one in which to give care and that "CPR is not all that sophisticated, and getting the patient warm will be done much more expeditiously in any hospital than in a helicopter." Finally, we know that trauma cases go to Harborview, not COH, so that condition does not belong in this list. Please comment. | 23

Page 18. "Table 3. Comparison of elapsed time for transport of a patient from Enumclaw to Children's Hospital."
COMMENT: Tacoma General is much closer to Enumclaw than is Children's. For all but heart surgery cases, Tacoma General's capabilities are similar to Children's. If speed is so essential, why was this case not taken to Tacoma General/Mary Bridge Children's Hospital? | 24

Page 19. Dr. Nicola's report cites "several studies that relate severity of illness to need for transport." These studies show mortality rates of 6%, 9% and 17.9% for these patients transported by helicopter.
COMMENT: Table 2, page 14-16, shows a mortality rate for cases helicoptered to Children's of nearly 50%. Is this because terminal patients are being (inappropriately) transported? | 25

Page 19. "Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful."
COMMENT: But who was evaluating the patient? Was it an M.D. or an EMT? This is an important question in evaluating the relevance of this citation. | 26

Page 19. Dr. Nicola's review of the literature consists almost entirely of studies of trauma victims. It is misleading to include them here; they should not be included in the FEIS. | 27

"Dr. Nicola also concluded that of the ten patients that he estimated would be transported to Children's by helicopter each month, an estimated three or four" 'may have a medical need for helicopter transport to the doors of the hospital' (Nicola, 1985))"
COMMENT: But on page 1, COH states 15 to 20 transports of critically ill children would need to be transported each month. Why is there such a discrepancy? What is the basis of Children's prediction? | 28

Page 20. "Helicopter transport in the central Puget Sound area is provided by two general services:" COMMENT: There are many more services listed in the Seattle Yellow Pages, plus there are the Coast Guard and Navy helicopters. Please include a list of all of those in the FEIS. | 29

Page 24. "The medical transport team of ICU physicians and nurses are based at Harborview, except for the pediatric team, which is based at Children's. When not flying, the pediatric medical transport team members work in the ICR at Children's."
COMMENT: The DEIS statement suggests that the physicians on the transport team are intensivists. However, this is not the case. The transport physicians are "moonlighting" pediatric residents and fellows with quite variable backgrounds. Unfortunately, these less experienced physicians are the ones who make the decision to land at the L.H. door. Please comment on this situation and show how the decision about where to land can be made by those with seasoned, careful judgement, avoiding abuse of the helicopter service. | 30

Page 36. "Transports would be limited to critically ill patients as determined by the referring physician/medical team in consultation with Airlift Northwest and/or Children's medical personnel."
COMMENT: This is a very important statement. What education about appropriate use of helicopter transport is being provided for referring physicians? What protection and guidelines will be followed so that the referring physicians do not feel pressured to order helicopter use simply in order to avoid malpractice suits? The DEIS states that any recommendations would be used as guidelines and not as standards. (DEIS, page 10). How can this be adequate protection to the referring physician and conversely, how can this be adequate to avoid the misuse and overuse of the helicopter? | 31

Page 42. "The Airlift Northwest Medical Director and/or physician assesses whether helicopter transport is warranted and, if so, provides the referring physician with an estimated time of arrival (ETA)." COMMENT: Dr. Copass, in statements made to the Laurelhurst Community Club Executive Board, stated at least twice that his role in Airlift Northwest dispatching is as a facilitator and that he never says "no" to physicians requesting the helicopter service. Dr. Copass said, "We are here to provide a service. We don't say "No." Dr. Copass' statements can be verified by witnesses as well as notes taken at the meeting when he made the statements. Please comment. How many referring physicians actually have been "dissuaded" from using the helicopter? | 32

It is also obvious from these statements that there is no screen in operation that is designed to sort out the non-emergency from the emergency patients. At Washington Hospital Center, the MedSTAR Director, Dr. Howard Champion, has developed a 10-page checklist which must be completed before a flight is approved by WHC management (Rotor and Wing International, December 1985, page 36). What sort of written guidelines does Airlift Northwest have? How do ALNW guidelines compare with those of Washington Hospital Center and other hospital based helicopter services? | 33

Page 42-43. The amount of time the helicopter spends on the ground at Children's Hospital varies greatly. It is NOT atypical for it to remain on the ground 30 minutes. During that entire time, we anticipate another pass over us, but we don't know when it is going to happen. Also,we hear the helicopter coming when it is quite a distance away and hear it for a long time as it leaves; sometimes it circles and rarely flies straight in to the landing pad. Thus, its presence is felt much longer than the minimal time alleged in the DEIS. 34

Page 43. As has been mentioned repeatedly by residents living near COH, the helicopter follows a highly variable flight path. 35

Page 49. "Children's is moving the location of its oxygen tank, thereby minimizing that potential hazard." COMMENT: COH had planned to enlarge the oxygen tank and leave it at its present location and only after adverse publicity and much concern raised by nearby residents were they finally convinced to move it! This is a prime example of the lack of concern for safety on the part of the COH administration. Please explain honestly and openly how the decision to move the oxygen tank was made. 36

Page 49. "The helistop will incorporate a fire-prevention system. Please describe this in detail. We are vitally interested! We know that the Fire Chief in Bellingham made extensive study the proposed helipad in that city and made stringent requirements. What are the details of COH's plan? 37

Page 49. "Children's has agreed in principle to the development and participation on a review panel composed of physicians and others involved in helicopter transport..." COMMENT: It is crucial that consumers and nearby residents be included on this panel. 38

Page 50. "In that Airlift Northwest would use a standard approach (as opposed to a noise abatement approach) for any of these approach patterns..." COMMENT: Please explain what is the difference between a standard approach and a noise abatement approach. Is the latter not as safe as the former? Are we being asked to trade off our safety for the noise? Isn't this an indication of the basic lack of safety of the COH landing site at their E.R. doors? 39

Page 52. para. 3, last sentence. "Exposure to adverse weather and/or field conditions increase(sic) the potential for destabilization (Andrews, 1986)." COMMENT: On page 45 of the DEIS, it is stated that the helicopter would not fly with adverse weather conditions. Please explain this apparent discrepancy. 40

Page 52. "Delays in treatment of other patients, while perhaps not a life or death situation, could result in suffering, the need for prolonged treatment, permanent disability or other unfavorable outcome." COMMENT: There seems to be a very basic problem here with keeping things in persepctive. We can't afford to do everything for everybody. We can't have a hospital on every corner to prevent needless death and suffering. Cutbacks in the availability of care IN LARGE PART BECAUSE OF THE INCREASED COST OF CARE, have also increased suffering. We know that there have been most unfortunate cutbacks in public funds for prenatal care, which will result in more neonatal problems. If Dr. Nutt is concerned about decreasing pain and suffering, any competent physician can give him a list of programs that will do more to decrease pain and suffering, for the amount of money spent, than more helicopter rides will do. 41

Page 53. "this alternative does not meet the proponent's objective to minimize transport time and the number of transfers." COMMENT: If the proponent is so concerned to minimize transport time, why do they not join with other area hospitals and develop a regional plan that will assure that care is given at the closest hospital that can appropriately give the care; i.e., develop triage guidelines? If the concern is to limit the number of transfers, why not use ground transport--then there will be no transfer at either the referring hospital nor the soccer field? 42

Page 57. Does DCLU concur with COH's interpretation of the Washington Administrative Code as presented here? This is a key point in this issue. 43

Page 58. "The potential for non-aircraft property damage or personal injury is probably the least under the secured Intramural Field Helistop Alternative followed by either Children's or the hospital helistop locations." COMMENT: The safest place should be used for landing; as agreed to by the proponents here, the Intramural Field is the safest. 44

Page 63. Major vendors are defined as vendors serving three or more hospitals. COMMENT: Number of hospitals served seems like a less relevant figure than the number of flights per year. Use of that distinction makes this entire section seem of questionable value. 45

Page 64. "In familiar landing areas, pilots and support teams know the locations of wires and obstacles and are careful to avoid them." COMMENT: We are well aware that the Airlift Northwest flights, as well as those of other vendors, come in at greatly variable directions--we've seen every direction so far--so, it they would not know the ground hazards to avoid. Often the visibility is very poor, too, since the hospital and its surrounding area is located at the top of a hill, and often has mist around it. Also, the flights do come in at dusk and at night, when visibility is almost nil. 46

Page 67. "Gene Hill...noted that under bad weather conditions, such as the fog that enveloped Seattle in December of 1985, the company does not fly at all. In fact, during that fog, Airlift Northwest refused to answer twenty calls over a two week period because they did not believe it was safe to fly." COMMENT: Here is an opportunity for a limited research study! Have the records and outcomes of the 20 patients who were not flown in been compared with patients who have been helicoptered in? What did the comparison show? What was the patient outcome of this inability to respond to the calls for the helicopter? 47

Page 68. A marketing representative with Agusta is quoted as a source of information about the Agusta accident rate. This is hardly a credible source of information. In fact, there are too few Agustas 48

currently flying to allow any generalizations about their flight safety record. Attempts to claim that the Agusta is exceptionally safe cannot be accepted until proven. | 48

Page 69 (Dr.Poulton) "speculated that some of the smaller programs operate on; more restrictive budgets that might affect their judgments regarding which flights to take and which flights not to take." COMMENT: We are concerned that the parent company of Seattle Jet, which operates Airlift Northwest, is Thousand Trails which has been having financial difficulties. What assurance is there that the maintenance of the Airlift Northwest helicopter is not compromised to save money for this (failing?) company? We know that other airlines have cut back on maintenance, which is directly related to aircraft safety, when their budgets were in deficit. | 49

Page 71. Table 14. Expected frequency of accidents for helicopters transporting patients to Children's.
COMMENT: The statistical frequency of accidents in years, is the result of a number of assumptions that are made. I will first discuss the assumptions and then show the result of using more accurate figures in those assumptions.

1.Length of trip: The DEIS uses the figure of 48 minutes. 77 minutes appears to be a more accurate figure. Exhibit 1 is a copy of the ALNW flight logs for rotary wing aircraft to Children's. Using their figures, adding them and obtaining the average time, the result is 57.28 minutes round trip. The trip from Boeing to CDH and from CDH to Boeing is more like 10 minutes each way, according to Table 2 on page 14 of the DEIS. 57 plus 20 = 77 minutes. | 50

2.Number of flights per month: Since this is a worst-case scenario, why wouldn't the figure of 40 flights per month, as mentioned in the Nicola report (letter to Beatrice Ryan, page 5, para 4) be a more accurate figure to use? | 51

3. Accident rate: In the Table 14, a number of rates are given. Since we are not concerned here with general aviation, rates for lines 1. and 2. and 3. are irrelevant. We are not concerned only with ground fatalities, nor wiith only fatal accidents, so lines 4. and 6. are also irrelevant. ALNW is hardly a major vendor, as discussed above, so line 7 is not relevant either. Line 5 is the only relevant accident rate--22.9 per 100,000 flight hours. | 52

If we use those figures we get:

97 x 40 = 3880 ÷ 60 = 64.6 (615.9)

100,000 ÷ 615.9 = 162.34 years

÷ 22.9 = 7.08 years between each accident.

Page 73. "Children's could contact Washington Natural Gas to discuss the possibility of receiving the necessary equipment..." COMMENT: I | 53

wish to point this out as a much too casual approach to the question of safety. I would think that they would want to do everything they could to ensure maximum safety. SThat they COULD contact the gas co. is not very reassuring. | 53

Page 83. "The report assumed 20 patient transports or 40 round trip flights per month." COMMENT: I wonder why they didn't assume 80 trips over the community. They have stated (in the DEIS) that each patient transported would result in 4 flights over the community. | 54

Page 87. "...The helicopter noise..would not cause significant impact...due to its infrequent short-term nature." COMMENT: The noise is not very short term. The approach and the departure are noisy and continue for some time. It is not just the point at which it passes over a residence that the helicopter is noisy. Also, this noise study does not take into account the fact that we do like to be outdoors and the helicopter noise is very disruptive then. | 55

Recently, a helicopter landed at 11:30 p.m. and then left at 12:45 p.m. Another landed at 3:30 a.m. and left around 4:00 a.m. I can assure you that more than 15-20% of the persons residing in the closest, line-of-sight residences were awakened! People on the other side (south) of the hospital were awakened both times, as well as people all around the hospital. A poll would readily show how inaccurate the statement is of only 15-20 % disruption rate. | 56

Page 88. "to avoid existing trees." COMMENT: In the interest of safety, why hasn't CDH removed these trees" | 57

Nicola letter to B. Ryan, Attachment 1: This table states that 63% of the cases were admitted to "intensive/advanced care" Why are the advanced care unit cases included in here? According to the Directory of Professional Services, (Children's Orthopedic Hospital and Medical Center, page 36), "The 23-bed advanced care unit is used for less critically ill convalescing children." It is not appropriate to fly in convalescing children, is it? Also, please explain why it was necessary to use helicopter transport for the following categories listed in attachment 1: Advanced Care Unit, Infant Floor, Surgical Floor, Medical Floor, Adolescent Floor, NMC, UH L& D, Return Flights. If these are examples of the types of patients being flown in, a description is necessary. Otherwise, it looks like only about 50% of the patients go to Intensive Care Units and therefore are the only true life-threatening emergencies being transported. | 58

Dr. Howard Champion, MedSTAR Director, and Dr. Ken Mattox, Director of Emergency Surgical Services at Ben Taub Hospital in Houston and Professor of Surgery at Baylor College of Medicine, Houston, Texas, have developed a list of standards for EMS coordination. These are applicable to ALNW and we wonder how many of them have been actually put into place and if not, why not? Here is a partial list of the standards as they applied to ALNW:
1. How does ALNW coordinate with existing services? EMS services already exist in this area and resultant rivalries and "turf wars" must be avoided as they lead to confusion, conflicts, and increased costs. | 59

(a) We have seen that 21% of ALNW helicopter flights were within 70 miles of COH. How is that justified in terms of availability of MEDIC I in less than 10 minutes in some of these same areas? 59

(b) How can conflict between ALNW and MAST be avoided? What kinds of agreements do they have? What is in writing? 60

2. Are regular audits of the air-ambulance system taking place? These would provide a degree of quality assurance. Some experts suggest forming advisory panels. 61

3. What are the specific medical and surgical criteria for determining when an air ambulance (vs. ground equipment) should be used? Most air ambulance services have specific criteria in place. Does ALNW? If not, why not? 62

4. How are problems related to the legal implications of not using a helicopter to transfer a child going to be handled? 63

5. To assure that MedSTAR flights (out of Washington D.C.) only take place when there is a real need, a 10-page checklist must be completed before a flight is approved. (Some helicopter programs fly in order to keep the hours up and the program looking o.k. in a budget sense, rather than based on real need.) What is the procedure at ALNW? 64

6. What are the realistic time-and-distance relationships for the region to justify the use of an air ambulance? 65

QUESTIONS ABOUT SAFETY:

Throughout COH's recent history, they have displayed a lack of concern for safety problems:

--Why haven't they removed the tree(s) near the COH landing site, especially since they say they will continue to allow helicopters to land there, in spite of what DCLU decides? 66

--Why haven't they shown real concern over the gas meter located 48 ft. from the landing site, and not just suggest that they might talk to the Gas Co. about specific factors, but go ahead and do it without being asked to. 67

--Why weren't they willing to move the oxygen tank located contiguous to the proposed helipad? In fact, why didn't they assume a proper level of responsibility and foresee the problem before nearby residents did? 68

--Why do they not have a trained observer at the hospital who could inform the pilot at Boeing Field as to what the visibility/weather conditions are at COH, which might be very different from Boeing? 69

--Why didn't they inform ALNW personnel about their proposed medical office building, to be located only about 100 ft. from the proposed helipad and which would impact the landing conditions? The opinions of the ALNW and the flight crew would seem to be an important consideration. But COH has apparently ignored this. 70

--Why haven't they done a better job at training the guards who supervise the landings? They are now doing a better job of keeping pedestrians away from the helicopter, but during the first 6-9 months, they did not seem to know what was really expected of them. Also, why isn't there some sort of rope that could be quickly set up as a fence, to mark off the area? Generally, only one lone guard is standing there, directing the pedestrians and cars. Signs and props are needed to help that guard. Why haven't they been supplied? 71

--Have safety measures, such as fire extinguishers near the helicopter landing site, been installed? 72

If COH is displays such a lack of real concern for the safety of the landing area, what assurance do we have that other safety measures also won't be "overlooked?" COH has a responsibility to avoid overshadowing the obvious excellence of their care with this new technology that they seem not to understand. 73

Airlift Northwest is trying to claim some special exemptions from the poor safety record of the hospital helicopter services in the U.S. However, ALNW pilots will have the same stresses on them to save lives as other pilots do, and there is a lot of trouble with poor visibility in this area. How many foggy days and how many days with wind greater than 20 knots have been recorded in various parts of Puget Sound? The answer will give an indication of the weather problems faced around here. 74 75

Who does the maintenance mechanic who services the ALNW chopper work for? Is she/he part-time or full-time? What are his/her qualifications? Does the mechanic meet the ASHBEAMS standards? These include: "should possess 2 years of experience and must be a certified air frame and power plant mechanic. ..must be properly prepared and trained in a factory-approved program to maintain the aircraft designated by the flight service for its aeromedical program,...must be assigned to the flight service as a first priority of responsibility." 76

Do the pilots also meet the reasonable guidelines set forth by ASHBEAMS? 77

Since the number of flights that COH has will effect the safety and environmental impact, we are very concerned about the projected number. How does COH arrive at the number of 15-20 flights per month? Why does this differ from Nicola's statement that there might be 30 to 40? 78

If COH develops into a trauma center, wouldn't the number of flights increase dramatically? In COH's Directory of Professional Services, on page 21, Emergency Room Services, it is pointed out that "The Emergency Room provides 24-hour immediate care for children...it is especially equipped to handle all types of pediatric emergencies, including those of a major medical and surgical nature, as well as trauma." Nancy Greenawalt, in a letter to the Laurelhurst Community Club liaison committee, states that Mr. Katz, CEO of COH, has determined that COH will develop into a pediatric trauma center. How likely is COH to develop into a trauma center and when will it do so? What would the impact of the trauma center on the helicopter service be? 79

CONCLUSIONS

this hospital is not ready to be granted the right to have a helipad at its door. A feasibility study is needed which would show tangible benefits and numbers to show that it is worthwhile over the current system. 80

It is difficult to think of how such a system could be monitored without the baseline data that are so lacking in the DEIS. Once the service to the door of this hospital is established, it will become the standard of care. But, in fact, it hasn't been proven that it is beneficial and it may even be harmful to some patients, such as neonates and patients with pneumothorax. Unless the helicopter's value is proven or disproven, physicians will not have any defence in malpractice suits of saying that there's no proof of its value. A sequential randomized study could be conducted which would help to esblish the worth of this service. 81

We are concerned that the request for a permit to use the COH site could lead to abuse in terms of stretching of the meaning "emergency," as already shown by Dr. Neff throughout the DEIS. Our concern arises because of the whole past history of this matter and our perception of past abuses by COH--flying over Tacoma General/Mary Bridge Children's Hospital, flying in non-viable cases, and flying in cases who did not go to the intensive care units, specifically. 82

We ask that approval be <u>denied</u> for the following reasons:

a. The site for which the permit is being requested is not as safe as a nearby site, on the intramural fields, would be.
b. The helicopter has been used with increasing frequency to deliver "emergency" cases. We anticipate that this trend will continue. In years past we only had 5-6 flights per year, now, all of a sudden, COH finds it necessary to fly in as many as 17 in one month.
c. We are not convinced that the cases landed so far have benefited from landing at the COH door. No hard data are forthcoming to convince us of this. 83

Thank you for the opportunity to respond to the DEIS.

Anita Francis

ANITA FRANCIS

1. This transfer involves a distance of approximately 142 feet. Depending on the patient, the personnel involved would include the flight medical crew that rode with the patient, and the ground crew, who are Children's employees.

2. Please refer to the response to Liz Anderson Comment #133 regarding patient protection. Please refer to the response to Liz Anderson Comment #176 regarding transfer time.

3. Data on patient outcomes for all Airlift Northwest patients that had landed outside the entrance to Children's Emergency Room through June 10, 1986, are included in Table 2 of the Draft EIS. Appendix D of the Final EIS updates this information through March 26, 1989.

4. See response to Liz Anderson Comment #181.

5. See response to Liz Anderson Comment #39.

6. The University Medical Center, Intramural Field, Limited Landings, No Action, and Preferred Alternatives could result in the use of sirens. See response to Liz Anderson Comments #208 and 209.

7. See response to Liz Anderson Comment #40.

8. The risk of accident has been updated based on more current data and information that were not available at the time the Draft EIS was written. The update is contained in Chapter IV of the Final EIS.

9. It is acknowledged that most hospitals are involved in life-threatening emergencies. The patients that are being transported to these community hospitals generally can be transported effectively and appropriately by ground ambulance. The Final EIS has been revised in response to this comment.

10. There are approximately 1,000 physicians, including hospital staff physicians, who use the Children's Hospital and Medical Center to provide care and/or services to their patients. In addition, there are a large number of referring physicians located throughout the Northwest who use Children's for their patients.

    A determination of the number of Children's physicians that provide tertiary care is outside the scope of this EIS. Projections of the number of future patients, as well as the possible number of helicopter transports, are based on projected populations typically referred to Children's, not on the number of physicians that could refer patients.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

11. These cases were unique in that they were uncommon in the population of patients affiliated with the Blue Cross system. Some of these cases may have been trauma patients and/or patients in another life-threatening condition. See response to Liz Anderson Comment #57, above.

    The statement on unique cases was intended to illustrate the fact that many of Children's patients face medical conditions that are not common.

12. Swedish Hospital has verbally indicated that the hospital has 30 NICU beds. A written request for confirmation has not been responded to, although a 1988 newspaper article stated that Swedish Hospital has 24 NICU beds (Rhodes, 1988).

13. Comment acknowledged. Please refer to the response to Liz Anderson Comment #62.

14. Please refer to Liz Anderson Comment #70.

15. The designations on page 11 of the Draft EIS and in Chapter II of the Final EIS indicate the hospitals that provide medical control to paramedics in King County's service area. The King County Emergency Medical Services Division has not designated hospitals outside King County.

16. According to the Manager of the King County EMS Division, generally the most critical pediatric cases that are served by the County's EMS Division are taken to Children's. Although Harborview treats pediatric trauma (and burn) patients, the EMS Division apparently usually does not have patients taken to Tacoma General or Mary Bridge (Call, 1987).

17. Comment acknowledged. Given that Airlift Northwest already works to have the appropriate medical team reach the patient in a timely manner, then the objective for minimizing transport time of critically ill or injured patients is appropriate as a secondary objective of the Airlift service.

18. These data for the Children's-destined patients transported by helicopter to the campus prior to June 10, 1986, are presented in Table 2 of the Draft EIS and Appendix D of the Final EIS.

19. Please refer to response to Liz Anderson Comment #78.

20. No comparison between Korea and Vietnam, and Seattle is being made. The statements are appropriate as historical background information.

21. It is inappropriate to compare data between Seattle's and Denver's Children's Hospitals without first adjusting the two sets of statistics based on the acuity levels of the patients. In addition, Children's in Seattle receives referrals from a greater distance than does Children's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

in Denver, which has a bearing on the number of transports to the Seattle hospital.

22. The patients were taken to the hospitals that were designated by the referring physician to be the receiving hospital. See responses to Liz Anderson Comments #50 and 58.

23. Please refer to the response to Dr. Thomas Bell's Comment #2. The medical staff of Children's acknowledge that in most cases patients with severe infections can be transported in a manner not requiring the savings of minutes. The staff also have treated patients with infections, such as fulminating meningitis, in which the patiert's outcome was affected by the timely patient transport. Airlift Northwest staff indicate that "medical success with near drownings has yet to be achieved in the general hospital. The pediatric hospital is where medical success has been shown." (Childs, 1987b)

    With respect to Children's treatment of trauma, please refer to the response to Liz Anderson Comment #62.

24. Please refer to the response to your Comment #22, above and the response to Liz Anderson Comment #83.

25. It is acknowledged that the mortality rate for the patients described in Table 2 of the Draft EIS is high. Table 2 has been updated in the Final EIS, where it appears as Appendix D. It indicates a mortality rate of approximately 40% for the patients transported by helicopter to outside the entrance to the Emergency Room at Children's. These patients are the most critical of the patients being transported by helicopter. The overall mortality rate for all patients being transported by helicopter is substantially less, although the data have not been assembled for this analysis. Only the most seriously ill and injured patients are being transported directly to the hospital with the remainder being transported by helicopter to the Intramural Field or alternate landing locations. Based on Dr. Nicola's review of a partial, random sample of cases, the patients being transported by helicopter were appropriate according to Washington Medical Society's EMS Committee's Draft Guidelines.

26. A review of the article from which the quotation is taken does not identify whether M.D.s or EMTs were responsible. The important conclusion that the authors of the article made was that it was not possible to determine which patients would benefit based on the data available at the time of EMS transport.

27. In the absence of numerous case studies of neonatal and pediatric emergency medical transport, Dr. Nicola reviewed all documents relative to transport of patients by helicopter.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

In Dr. Nicola's revised report (see Appendix A) he states the following with respect to an article that was published after the Draft EIS was issued:

> "The American Academy of Pediatrics (AAP) Committee on Hospital Care has published general guidelines on pediatric patient transport ("Guidelines for Air and Ground Transportation of Pediatric Patients," Pediatrics, 1986 Nov.; 78(5): 943-50). The AAP guidelines indicate that the factor of paramount importance in selecting mode of transport is "the optimal interhospital transport time indicated by the nature and severity of the patient's clinical condition ... if a patient's medical condition is unstable, even a minimal shortening of transport time to the referring hospital by one mode of transportation rather than another may be lifesaving." The AAP guidelines also indicate that "referrals are made and accepted based upon the judgment of the referring physicians rather than upon a specific set of criteria."

28. Dr. Nicola's conclusion is based on his determination of the number of patients that would need to be transported by helicopter directly to Children's campus. In his revised report (see Appendix A) Dr. Nicola estimates that in the next decade six patients per month may have a medical condition warranting helicopter transport to the hospital doors. While other patients may warrant helicopter transport, the ability to land at the hospital is not as critical to their outcome. See response to Liz Anderson Comment #26.

29. Comment acknowledged. The primary air ambulance services have been identified and discussed in Chapter II of the Final EIS.

30. See response to Liz Anderson Comments #66 and 68.

31. Airlift Northwest is a service to the referring physician who has requested a patient transfer to a particular physician at a particular hospital. Based on Dr. Nicola's review, referring physicians are capable of appropriately referring patients via Airlift Northwest. Physicians in rural communities are aware of the medical resources immediately available to them and the length of transport by ground and air to the nearest appropriate medical facility. In addition, they are fully capable of assessing the most appropriate mode of transport given a patient's medical condition. The Washington State Medical Association guidelines that identify types of medical conditions that warrant air transport can be used to guide the physicians' determination of appropriateness. However, no guidelines under any situation can shield physicians from potential malpractice suits.

32. Comment acknowledged. Airlift Northwest does not dissuade referring physicians from using the helicopter to transport patients in an emergency. The Final EIS has been revised accordingly.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

33. In Dr. Nicola's updated report to the Director of DCLU, he quotes the American Academy of Pediatric's Committee on Hospital Care's guidelines on pediatric patient transport ("Guidelines for Air and Ground Transportation of Pediatric Patients," Pediatrics, 1986, November; 78(5):943-50). These guidelines state "referrals are made and accepted based upon the judgment of the referring physicians rather than upon a specific set of criteria." Likewise, Airlift Northwest has no specific set of written criteria, but accepts referrals based on the judgment of the referring fire departments/medic units and the referring physicians.

Airlift Northwest contacted MEDSTAR (spoke with Terry Costello, Chief Flight Nurse, on May 28, 1987) to discuss the article that appeared in Rotor and Wing International in December 1985. Apparently, according to Airlift Northwest, MEDSTAR was misrepresented by the magazine. MEDSTAR, similar to Airlift Northwest, does not have a specific set of written criteria that they use to evaluate the medical appropriateness of referrals. All pre-hospital referrals to MEDSTAR immediately activate the helicopter and flight team. Inter-hospital referrals go through a series of six to ten questions that are more administrative in nature than judging the medical appropriateness of the referral. The questions range from: 1) what type of patient is to be transported (medical, surgical, adult, obstetric, or pediatric), to 2) whether the caller is from an official EMS agency (i.e., not someone calling from home), to 3) whether a bed is available at the receiving hospital, to 4) who the receiving physician is, etc.

34. Comment acknowledged. This section has been updated in the Final EIS.

35. Airlift Northwest pilots have been given instructions regarding flight paths. The number of complaints expressed to Children's regarding deviations has diminished over time and dropped considerably following the removal of the trees that had prevented a straight-in approach to the temporary landing area in the grassy area outside the Emergency Room.

36. The decision to move the oxygen tank was made when the hospital's Administration determined that the perceived risk was of much concern to the neighborhood.

37. See response to Liz Anderson's Comment #17. According to Robert Neale, the Fire Marshal for the Bellingham Fire Department, the only safety equipment that the Department recommended was what the fire code required: one 4A60BC ten-pound multi-purpose fire extinguisher.

38. It is Children's position that, because the purpose of the medical review committee is to assess the medical appropriateness of transports to Children's campus by helicopter, the committee is best served by individuals from the medical community. Recognizing the neighborhood's interest in assuring the appropriate use of the helistop, Children's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

has proposed that the Mayor's office appoint a citizen representative to the committee. The Medical Review Committee as proposed by Children's is described in Chapter III and Appendix C of the Final EIS. The City Council will determine the ultimate composition of the review committee, if approval is granted.

39. Refer to the response to Liz Anderson Comment #183. According to Dan Davidson, Lead Pilot with Airlift Northwest, the noise abatement flight profile is not unsafe.

40. Adverse weather conditions are described in the sentences following the cited statement on page 45 of the Draft EIS. During a transfer, the patient could be exposed to rain, snow, wind, cold and heat during a transfer and not be in adverse weather conditions from the perspective of flying. (Note, however, that the patients are protected from exposure during their transfer.) The field conditions could be muddy even if the weather conditions do not pose a problem with respect to exposure.

41. Comment acknowledged. Please refer to the response to Kate Hemer Comment #8.

42. The sponsor's objectives are to minimize transfers and transport time of patients being transported by helicopter to Children's Hospital.

    A consortium of Seattle-based hospitals have joined to extend their tertiary care services to the region through Airlift Northwest. If a program to develop a regional plan for helicopter-based EMS services is initiated, Children's and Airlift Northwest indicate that they would be pleased to participate.

    Ground transports are not always in the best interests of critically ill or injured patients.

43. See response to Liz Anderson Comment #118.

44. Comment acknowledged. Please refer to the discussion of the new alternative (the Preferred Alternative) in Chapter III and the expanded helicopter safety section in Chapter IV of the Final EIS.

45. Your opinion is acknowledged.

46. The pilots are familiar with the topography, obstructions and meteorological patterns in the vicinity of Children's. The pilots follow a designated flight path and maintain altitude on their approaches and departures so as to avoid obstacles.

47. See response to Liz Anderson Comment #219.

48. See response to Ruth Engelberg Comment #16.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

49. Hospital AirTransport is obligated by their contract with Harborview Medical Center, as agents for the consortium, to maintain in good working order all contract-mandated equipment, which includes the aircraft. This contract is on file with DCLU.

Please refer to the response to Kate Hemer Comment #3 and to Liz Anderson Comment #27. Hospital AirTransport states it is a financially sound company. The maintenance program is described in the response to Liz Anderson Comment #190, above.

50. A review of the flight logs from May 1985 - June 1986 was conducted. The flights contained in your appended material were examined. The appended data have not incorporated shorter flights, particularly those helicopter transports from Boeing Field to Children's. This omission of additional data miscalculates the actual average flight time, thereby increasing the accident rate.

In any case, Chapter IV of the Final EIS contains updated data on accident rates based on patient transports, rather than flight time.

51. Please see response to Liz Anderson's Comment #41.

52. Line 5 is the rate used for computing the risk in the Draft EIS. Airlift Northwest is a major vendor as it serves more than three hospitals. Consequently, at the time the Draft EIS was prepared, the figure presented in Line 7 was relevant. Lines 1-3 are relevant for comparison purposes. The safety estimate has been updated to reflect updated accident rate data that were not available when preparing the Draft EIS.

53. Children's has contacted Washington Natural Gas in order to develop procedures to deal with a natural gas flare. Children's is also exploring the possibility of moving the natural gas meter house. Please refer to the response to Liz Anderson Comment #243.

54. Please refer to the response to Liz Anderson Comment #26.

55. The portion of the sentence that was not cited indicates that the noise would be noticeable. It would be audible for sever inutes during approach and landing and during take-off and departu e. These events last for several minutes and, therefore, are characterized as short-term.

The noise impact assessment in the Final EIS addresses outdoor noise.

56. It is acknowledged that a poll may lend limited statistical light on the number of line-of-sight residents whose sleep actually is disrupted. See response to Liz Anderson's Comment #260.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

57. Three trees have been removed in order to make the flight path to and from the landing area outside the entrance to the Emergency Room more safe. Additional trees would be removed under the development of a helistop at the Kitchen Garden site.

58. The cited statistics were for fixed-wing and helicopter transports for the Fiscal Year 1985 and are not reflective of the patients being transported by helicopter only.

59. Airlift Northwest provides a service to referring physicians and responds to their requests for inter-hospital helicopter transports. Unlike some areas of the United States where there are competing helicopter services, Airlift Northwest does not compete for pre-hospital transports with other vendors or the public EMS system. The closest private vendor, Med-Flight, is in Bellingham.

    Transports are based on the requests from medical personnel in community hospitals, Medic Units and Fire Departments. In most instances pre-hospital transports involve ground ambulances. In some cases, however, the attending medical team determines that a helicopter is the most appropriate means of transport.

60. Airlift Northwest and MAST do not compete for patients. See response to Liz Anderson Comment #92.

61. Dr. Copass, the Executive Medical Director of Airlift Northwest, informally reviews each of the missions in which Airlift Northwest aircraft participate. For those Airlift Northwest missions that have any reported irregularity Dr. Copass examines the mission in detail. Children's physicians and nurses also review each transport to assure that an appropriate level of care is provided. Children's has proposed that a Medical Review Committee, which is described in Chapter III and Appendix C of the Final EIS, examine flight logs and patient medical records of patients who are transported by helicopter directly to the Children's campus in order to determine whether the Kitchen Garden Helistop is being used appropriately.

62. The guidelines that have been established for South King County paramedics are presented on page 12 of the Draft EIS. Airlift Northwest does not have criteria for use by the referring physicians, nor is it true that most air ambulance services have criteria for use (see response to Comment #33 above). Airlift Northwest has determined that the decision to transport a patient by helicopter must rest with the referring physician. Please refer to response to Comment #27.

63. The legal implications of the decision to transport by helicopter are the responsibility of the attending medical personnel. See also response to Liz Anderson Comment #182.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

64. See response to Comment #33, above.

The financial health of the Airlift Northwest program is not dependent upon the number of transports that are undertaken by the service, consequently Airlift Northwest does not need to add flights in order to be financially sound.

65. A determination of this relationship is outside the scope of this EIS.

66. See response to your Comment #57, above.

67. Children's contacted Washington Natural Gas (WNG) prior to environmental review being initiated. During the SEPA process the Seattle Fire Department and WNG were again contacted in order to determine their concerns, if any, and to determine what safety steps were deemed appropriate. See response to Comment #53, above.

68. Please refer to the response to Liz Anderson Comment #11.

69. Please refer to the response to Liz Anderson Comment #6.

70. Airlift Northwest was informed and consulted about safety implications of the Medical Pavilion. The safety implications of the new Medical Pavilion has been considered in the Final EIS.

71. The security personnel have been instructed to provide more clear direction and limit access to the helicopter landing area, as appropriate. Airlift Northwest has requested that ropes not be used to secure the area. In general, there is concern about any loose objects in the operations area. Signs to warn motorists will be installed on Penny Drive, if the Council Conditional Use Permit is granted.

72. Fire extinguishers are installed inside the Emergency Room, and two more would be installed within the helistop. There is a fire hydrant adjacent to the site as well.

73. The Council Conditional Use Permit application to construct a secured, lit, and surfaced helistop is designed to make helicopter landings at the hospital as safe as possible for the aircraft crew and patient, and also for people and improvements on the ground. An important part of the permit review process includes a thorough examination of operational safety. Every effort has been made to be as comprehensive as possible in examining the safety issue.

74. Airlift Northwest is not trying to claim special exemptions from the overall safety record of air ambulance services. Please refer to Appendix B for discussion of Airlift Northwest operations' consistency with industry guidelines concerning safety.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

75. At Sea-Tac, there are an estimated 44 days with fog per year. At Sea-Tac wind speed exceeds 21 knots 0.2% of the time, and less than 0.1% of the time during IFR weather. Historic data for Sand Point indicate that fog occurs approximately 12.3% of the year, and that wind speeds in excess of 21 knots occurs 1.1% of the time.

A further climatological survey of the Puget Sound region is outside the scope of this EIS.

76. See response to Liz Anderson Comment #190.

77. A comparison of Airlift Northwest policies and guidelines with AAMS and NEMSPA guidelines is presented in Appendix B of the Final EIS.

78. Please see response to Liz Anderson Comments #26 and 41.

79. Please see responses to Liz Anderson Comments #62 and 63.

80. Your conclusion is acknowledged.

81. Dr. Nicola has determined that a helistop is beneficial (refer to his report in Appendix A of this Final EIS).

A Medical Review Committee, such as that proposed by Children's, would be able to assess the medical appropriateness of transports to the hospital.

By landing patients via helicopter at the door of tertiary care hospitals, it could be determined that a standard of care already has been established.

82. Your concern is acknowledged. The intent of the proposed Medical Review Committee is to ensure that the patients being transported directly to Children's are those that involve life-threatening emergencies. As Dr. Nicola acknowledges, a random review of helicopter transports both directly to Children's as well as to the hospital via helicopter and ground ambulance indicated that the patients were being sorted appropriately. As indicated above, it is the referring physician who makes the determination of the most appropriate receiving hospital. See also response to your Comment #58 regarding the helicopter transport of patients to intensive care units.

83. Your request for denial is acknowledged.

Thank you for your comments.

Dear Ms. Gibb.

This is to express my concern about the possible banning of helicopter landing at Children's Hospital. My husband is a U.S.Air. surveyor and, while this is not necessarily his opinion in this case, we have been made aware many times of the great need for this service at many facilities in times of emergency. I believe the positive factors far outweigh neighborhood objections. Please convey my thoughts on this matter to the city Council. Thank you.

Mayor Royer:

I'm writing you to urge you to support having the Heliport built at Children's Orthopedic Hospital. The good they do for the children in that hospital is remarkable and the heliport would get some children there faster when time is so important to an ill or injured child.

Thank you for reading this letter. I've never written to you before but this seemed such an important issue.

Dear Julie.

As a mother of four children, I know what it is to have a very sick child. Therefore, I am very much in favor of building a helistop near The Children's Hospital emergency room. We live on Bainbridge Island in the summer and have many friends who are here all year. We are dependent on the ferries, but in an emergency too much time is lost.

Sincerely,
Ann H. Houberg

Subject: DEIS on Helistop Proposed by Children's Hospital

Dear Director Miller:

The DEIS is seriously inadequate.

The environmental disclosure should be accompanied by a master plan to enable the community and the City Council to evaluate the proposed helistop in light of the proponent's long range planned use of the site. The major institutions policy states that a master plan shall be required when development is planned which, when taken into account with other recent development within the boundaries, creates a significant cumulative impact on the surrounding area. Recent development within the COH boundaries includes an increase in the Hospital's short stay facilities, doubling of its oxygen storage capactiy, development of an employee center and a proposed mixed use development to cover more than 132,000 sq.ft. and have more than 600 occupants and an undisclosed number of visitors. A program change to staff a trauma center is also underway. 1

The environmental effects of the proposed helistop operation must be analyzed in conjunction with the application for a helistop by the University of Washington Hospital and the proposal for a master plan by Harborview Hospital. SEPA requires that proposals that are related to each other closely enough to be in effect, a single course of action shall be evaluated in the same environmental document. SEPA also provides that agencies may analyze similar actions in a single environmental document. 2

The helistops proposed by all three hospitals are specifically intended to serve Airlift Northwest. Only through a consolidated review of the need, projected use, and environmental consequences can alternatives be evaluated which supercede the corporate turf and financial interests of the individual hospitals. One such alternative which should be evaluated to determine if it would provide superior medical care while minimizing adverse effects on residential communities is the proposal to centralize emergency medical care requiring helicopter transport at Harborview, the region's trauma center. 3

The DEIS does not address the City's residential land use policies or other pertinent policies such as Goals of Seattle 2000. A more complete discussion of the proposal in relation to the major institution policies is needed including a review of implementation guideline seven which calls for decentralization of facilities. 4

The proposal is based upon an unsubstantiated assumption of need making the projections for use and environmental impact determinations problematic. An analysis of the need must be accomplished. 5

If credibility is to be given Dr. Nicola's determination of need, it must be documented. What questions were asked? Of whom? What control of bias was maintained? How do Nicola's findings compare with other researchers investigating the relative benefits of interhospital transport of patients by helicopter compared with ground transport?

In light of testimony in September's AMA News by Dr. Ronald Stewart, (President of the National Association of EMS Physicians), the Nicola recommendation is highly questionnable. Stewart states that data is sparce and that "we are not certain that air transport improves patients outcomes; (in fact) preliminary data suggests that it may be detrimental."

Because it is natural to assume there is a need for helicopters when health and safety issues are involved, I will remind you of some local history. In the early 1970s, the Seattle Police Department operated two helicopters. As I recall, the hard questions on need came only after an accident during a "joyride" to view skinny-dipping off the Arboreteum freeway ramp. An analysis of need (the Clayton Report) established that for the police work, the helicopter was one-half as effective and twice as costly as the patrol car. It's been more than a decade since we've "needed" police helicopters. 6

Not only is the need unsubstantiated but the projections for use and therefore the expected environmental impacts are purely speculative. Children's Hospital, which advertizes widely on TV and in both Time and Newsweek, has proposed no limitations on the use of the proposed helistop. 7

How does the proponent intend to restrict occurrences to life threatening emergencies? What are the triage guidelines which will be used in the operation of helicopters coming into the helistop? What is the protocol which will govern the dispatch of service? What review of the use is proposed? 8

Do the projections exclude transfers of patients who could be safely transferred by ground or to a closer qualified 9

hospital? Do the projections exclude trauma and burn patients who should be sent to Harborview? | 9

What marketing activities will COH pursue which will affect the level of hallstop activity.? Has this proposal been integrated into state, and regional and local EMS programs to assure that the projections of COH's share of the market are reliable? | 10 | 11

What charges will be imposed on patients using the service? And what ramifications will the charges have on the patient or physician either in selecting the helicopter as a means of transportation or in determining that COH is the appropriate hospital? | 12

The hospital should define the patients for whom the service is intended, detail the triage practices it will impose, develop use projections which are tied to population data and regional service areas and provide for a strong internal audit function before a meaningful analysis of the environemntal impact can be made. | 13

Just as with the projections of use, the projections of impacts based on the proposed flight paths are speculative. No one but the pilot has control over landing and departure. | 14
The impacts projected based on the type of helicopter use is also conjecture as COH has no control over the type of helicopter landing at the site. | 15

Because of the impacts which cannot be mitigated, the proposal should be revised to strictly define the need, establish enforceable means of restricting occurences and give weight to alternatives which limit the number of sites and locate the site(s) so as to minimize impacts on residential communities. Such a revision is needed if the proposal is to be described in terms of the objective rather than the proponent's preferred solution. | 16

Sincerely,

Kate W. Hemer

Kate W. Hemer
4537 55th Northeast
Seattle, WA 98105

170

KATE HEMER

1. The short-stay unit and 55,000-square-foot Medical Pavilion were subject to environmental review. The referenced "employee center" was closed. Please refer to response to Liz Anderson Comment #242 regarding pending development on the Children's campus. The Department of Construction and Land Use has determined, based on the Master Plan "triggers" cited in the Land Use Code, that an Institutional Master Plan is not required at this time. With respect to trauma capabilities, please refer to response to Liz Anderson Comments #62 and 63.

2. The University of Washington does not have a pending application for a helistop on its campus; however, minor improvements may be made to the existing helistop at the Intramural Field.

   SEPA (Seattle Municipal Code 25.05.060(3)(b)) states that:

   > "Proposals or parts of proposals that are related to each other closely enough to be, in effect, a single course of action shall be evaluated in the same environmental document, if they:
   >
   > (i) Cannot or will not proceed unless the other proposals (or parts of proposals) are implemented simultaneously with them; or
   >
   > (ii) Are interdependent parts of a larger proposal and depend on the larger proposal as their justification or for their implementation."

   Although an inter-relationship between the institutions is acknowledged, the helistop proposal at Children's does not fall under the categories in 25.05.060(3)(b)(i) and (ii).

3. Airlift Northwest is a consortium of the three regional hospitals and Providence Medical Center. Since the issuance of the Draft EIS, St. Joseph Hospital and Health Care Center in Tacoma and Virginia Mason and Swedish Hospital in Seattle have become Associate Members of the Airlift Northwest Consortium. Airlift Northwest serves these hospitals and the physicians who refer their patients to these tertiary care centers. The hospitals do not serve Airlift Northwest.

   The EIS evaluates probable significant impacts of the Proposed Action and alternatives. These alternatives involve a variety of options for transporting the patients to Children's using helistops at Children's, the Intramural Field, University Medical Center and Harborview and, as necessary, using ground ambulance.

   Based on the Categorical Exemptions set forth in Section 25.05.800 of the Seattle Municipal Code, the granting of a business license to operate Airlift Northwest would be exempt from EIS requirements, which

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

includes an exemption for (14)(f) "All [business and other regulatory] licenses for vehicles for-hire and other vehicle related activities, including but not limited to taxicabs, ambulances, and tow trucks..."

Section 25.05.448 of the Seattle Municipal Code states the following:

> "RELATIONSHIP OF EIS TO OTHER CONSIDERATIONS.
> (1) SEPA contemplates that the general welfare, social, economic, and other requirements and essential considerations of state policy will be taken into account in weighing and balancing alternatives and in making final decisions. However, the environmental impact statement is not required to evaluate and document all of the possible effects and considerations of a decision or to contain the balancing judgments that must ultimately be made by the decisionmakers. Rather, an environmental impact statement analyzes environmental impacts and must be used by agency decisionmakers, along with other relevant considerations or documents, in making final decisions on a proposal. The EIS provides a basis upon which the responsible agency and officials can make the balancing judgment mandated by SEPA, because it provides information on the environmental costs and impacts. SEPA does not require that an EIS be an agency's only decision-making document.
>
> (3) Examples of information that are not required to be discussed in an EIS are: Methods of financing proposals, economic competition, profits and personal income and wages, and social policy analysis..."

Thus, this EIS addresses the impacts from constructing the helistop and of flights associated with the transport of patients to the helistop. The issue of centralized medical services and relocating Children's equipment and staff is outside the scope of this EIS, although the issue of shared use of helistops is discussed.

4. Please refer to the response to Laurelhurst Community Club (Peter Eglick) Comment #2.

5. Please refer to the responses to Liz Anderson Comments #49, 124, 125, regarding medical need.

6. Please refer to the responses to Liz Anderson Comment #87 and Bart Baxter Comment #9 regarding helicopter transports having an adverse effect on patients. Police helicopters in an urban community and EMS helicopters that serve a large region with geographic obstructions to ground movement are not comparable.

7. See response to Liz Anderson Comment #26.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's proposes that the use of the helistop be limited to patients experiencing life-threatening emergencies. Actual numbers of patients being appropriately transported by helicopter could vary from the estimates. Children's has deliberately not proposed limits on use in the recognition that a catastrophe or outbreak of some illness (e.g., meningitis) or change in medical technology may result in transports that would exceed projections over a given time period.

8. Please see response to Liz Anderson Comment #64 regarding the decision to transport by helicopter. As outlined in Chapter III and Appendix C of the Final EIS, a Medical Review Committee would examine flight logs and patient medical records in order to determine whether the Children's Kitchen Garden Helistop is being used appropriately. Please refer to Liz Anderson Comment #32 for discussion of decisions regarding the condition of the patient and the appropriate landing area. A description of the dispatch protocol is contained in the response to Liz Anderson Comment #77.

9. The projections exclude trauma and burn patients that would be treated at Harborview, and exclude those patients judged by the referring physician to warrant ground transport. Refer to response to Liz Anderson Comment #62.

10. Please refer to the response to Liz Anderson Comment #23.

11. The projections have been confirmed by Dr. Nicola, the former Director of the Seattle-King County Department of Public Health. There are no state, regional or local EMS programs that determine appropriate market shares of helicopter transported patients.

12. These questions are outside the scope of this document. Please refer to the response to your Comment #3.

13. The EIS provides information on patient profiles and areas of referral. It also describes the referral procedures and how referral decisions are made. Future use projections have been made based upon population trends in counties where referrals occur.

14. The proposed flight paths are assumed to be correct. It is acknowledged that the ultimate decisions regarding deviations from the proposed flight plan rest with the pilots. However, the Airlift Northwest pilots were primarily responsible for the planning of the proposed flight paths and would follow them whenever practicable. Consequently, the projections of impacts are reasonable.

15. See response to Liz Anderson Comment #35. Children's, as a member of the consortium that operates Airlift Northwest (ALNW), has some control over the type of helicopter used by ALNW.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

16. Your comment is acknowledged. The project sponsor has created a new alternative (the Preferred Alternative), which reduces the potential adverse environmental impacts by transporting the majority of Children's-destined patients to the Intramural Field helistop site, if allowed, or Harborview. Under this alternative, only the most critical patients would land at Children's.

Thank you for your comments.

Re: CHMC Helipad

Dear Ms. Gibb:

Even though I can understand the residents' feelings, fears and concerns about the noise and possible devaluation of their property in that exclusive area, I feel that perhaps they have over reacted, as my understanding is that the helicopter would be used only for emergency purposes, so it would not be a constant thing and should not affect them that much. CHMC should have the latest and best facilities for saving lives and I would, therefore, like to add my support for building the helipad outside the emergency room of CHMC. 1

Please convey my support to the City Council.

Very truly yours

RE: DEIS for Proposed Helipad at Children's Hospital
Comments due by October 17, 1986

The "Cumulative Impacts" section of the DEIS is deficient, inconsistent, inaccurate, and vague for the following reasons:

- It is deficient in failing to specify how Airlift Northwest and the proposed helipad would be integrated into the proposed Puget Sound Health Systems Agency (PSHSA) regional transport plan. Although the DEIS states on page 31 that the status of the PSHSA proposal is unclear, the DEIS goes on to say on page 91 that Children's would be included in a regional helicopter transport plan. What is the exact relationship between these two statements? 1

- It is inconsistent in asserting that the City's land use criteria so limit the use of helistops that they will discourage the improper use and proliferation of helicopter service (page 90), when it has previously cited WAC 248-18-285 to mean that a hospital cannot prohibit a helicopter from landing, even if by doing so it would violate land use laws (pages 41, 57). If this were indeed a correct interpretation of the WAC, what is to prevent other hospitals from also construing the WAC as permission to land helicopters and overriding City land use regulations? 2

- It is inaccurate in stating that University Hospital already has received its Certificate of Need for a helistop (page 90); in fact, UH has not yet prepared its Certificate of Need. 3

- It is vague in stating throughout that flights would be limited to "critically ill" cases, but that guidelines to restrict landings to critical cases haven't been established. It admits that guidelines are only now being discussed with MAST (page 42), Airlift Northwest (page 49) and the Washington State Medical Association (pages 31, 91). The DEIS says that as doctors hear of Airlift Northwest services, they will become more likely to use Airlift for inter-hospital transfers (page 41), but does not distinguish adequately between cases brought in from "the field" and those brought as interhospital transfers (page 42), and what guidelines would apply to any of these cases. 4

The Puget Sound Health Systems Agency has expressed concern about the proliferation of helicopter services in the region, and cautioned that there is no agreement on when medical conditions warrant helicopter use, and that triage guidelines have not yet been developed. In a February 1985 report to Major Royer (attached), from which the DEIS quotes on pages 17-19, PSHSA recommended transport to only the most specialized trauma centers in Seattle, namely University Hospital and Harborview, and that consideration of other sites should evaluate community costs and benefits in meeting patient needs. The PSHSA report stated that "...limiting the number of helipads may be an important component in ensuring limits on the growth of helicopter services..." and goes on to say that "...inappropriate use and proliferation of helicopter transport services [should] be discouraged," but that "...unfortunately, we are in the midst of 'air wars'...as hospitals vie with one another to establish helicopter programs." 5

Bud Nicola, author of the Seattle-King County Department of Public Health assessment of the proposed helipad, also encourages PSHSA to develop a statewide and regional helicopter transport plan. He wrote to PSHSA in April 1986, encouraging that agency to work with the Washington State Medical Association to develop triage guidelines for helicopter transport. 6

Unfortunately PSHSA's effort to conduct an assessment of helicopter transport and develop a regional plan has been delayed and scaled back. In May 1986 PSHSA proposed to develop a state plan that would integrate helicopter service with the statewide Emergency Medical Services (EMS) system; by September 1986 this proposal had been reduced to a mere data collection effort for King County only. 7

In order to correct the deficiencies and other problems in the "Cumulative Impacts" section of the DEIS Children's Hospital must:

1. Ascertain the status of the PSHSA proposed state and regional plan, and triage guidelines that will intregrate helicopter services with the existing statewide EMS system. 8

2. Await the completion of the regional and state plan before finalizing its EIS for its proposed helipad. If the plan and triage guidelines are not to be developed after all, then Children's should under no circumstances be allowed to build a helipad or land helicopters on its campus. 9

3. Explore jointly with University Hospital the possibility of landing patients at a joint pad in Graves Field, instead of simply assuming that UH would not allow Children's-destined patients to land (p. 53). 10

4. Demonstrate definitively that WAC 248-18-285 could not be used by other institutions as it has been used by Children's to violate City land use regulations. 11

5. Include copies of all material cited in the DEIS Bibliography and Personal Communications sections, since discrepancies exist. For example, a 1986 Thompson reference is cited on page 91, whereas the sole Thompson reference in the references sections is 1985. Is this a typographical error or a different reference? 12

Sincerely,

Jane L. Johnson

177

Report to Mayor from PSHSA

February 21, 1985

Charles Royer, Mayor
City of Seattle
1200 Municipal Building
Seattle, Washington 98104

Dear Mayor Royer:

The Puget Sound Health Systems Agency (PSHSA) has prepared the following in response to your questions about the appropriate use of helicopter transport in emergency medical situations.

1. In what circumstances is it appropriate to use a helicopter in emergency medical transport to Seattle health care facilities?

178

Helicopter transport is appropriate when it operates within a regional emergency medical service (EMS) system. It is most valuable in linking rural and other isolated populations and medical facilities to tertiary trauma centers in Seattle.

Medical conditions which require helicopter transport are those in which more rapid transport and the availability of highly specialized care enroute can affect outcomes when compared to alternative methods of transportation. Helicopter transport is not inherently better than ground transport in ensuring survival and recovery.

Emergency services have developed as part of a regional system in Washington, and helicopter transport is integral to the provision of these services. The EMS system features substantial ground transport services throughout the northwest region, each of which is capable of responding rapidly to calls in the area it serves. Military Assistance to Safety and Traffic (MAST) helicopters transfer patients from accident sites within a 100-mile radius of Fort Lewis to Harborview in Seattle and to St. Joseph in Tacoma. Interhospital transfers and service to areas outside the range of MAST are provided by the fixed-wing transport of Airlift Northwest. Private helicopter service operating out of Bellingham further supports counties in the northwest section of our region.

this much is quoted in DEIS — p.1719

The existing EMS system is founded on comprehensive ground transport services and has developed into a well coordinated regional network. As a result, the use of helicopter services can be managed within the present system to better ensure that their use is limited to cases not adequately served by ambulance or plane transport.

2. How frequently is this means of emergency transport required?

Agreement on when medical conditions warrant the use of helicopters has not been reached. The introduction of helicopter transport [illegible] that triage guidelines have not yet been developed which might help establish the frequency with which helicopter transport would appropriately be expected.

In the last year MAST completed approximately 220 field trips, most of which were to provide transport of patients from south King, Pierce, and Kitsap counties. Some of these patients were taken to St. Joseph Hospital. Approximately 120 were taken to Seattle hospitals, most of these to Harborview.

The extent to which this level of service approximates the expected need for helicopter transport is not presently known. Efforts are underway to formulate a method to determine the need for helicopter transport and to establish the resources necessary to meet that need. These efforts in Washington and in other parts of the country should be evaluated by clinicians, planners, and administrators in order to prepare guidelines tailored to the special requirements of our region.

3. How many facilities in Seattle and King County should be equipped with helipads to meet the medical need?

Which Seattle hospitals are best suited to meet the medical need?

Helicopter transport is only appropriate for the most critical cases. An evaluation of helicopter transport often cited to support its efficacy in improving outcomes suggests that major improvement occurs only in the more severe classifications representing a fraction of all trauma patients. This study by William G. Baxt and Peggy Moody indicates that helicopter transport is required for only a small subset of trauma patients especially when high quality ground transport systems are available.

MAST helicopters are presently transporting patients within King County directly to Harborview or to University Hospital (and occasionally other hospitals) by way of ambulance from the University of Washington soccer field.

While we cannot confirm that this arrangement is adequate, PSHSA recommends transport to only the most specialized trauma centers in Seattle, of which University and Harborview hospitals are excellent examples. Consideration of additional sites should evaluate not only unmet patient

care needs, but also the trade-offs which will result in meeting those needs. Limiting the number of helipads may be an important component in ensuring limits on the growth of helicopter services and in fostering effective and cooperative use of the EMS system as a whole.

It is critical that the inappropriate use and proliferation of helicopter transport services be discouraged. Unfortunately, we are in the midst of "air wars" throughout the country as hospitals vie with one another to establish helicopter programs. The number of programs in the country doubled between 1980 and 1983, and the National Medevac Conference in 1983 opened with spokesmen suggesting that the number of programs would (and should) double again in five years. It is not at all evident, especially in areas served by MAST, that additional programs are needed and the impact of further growth may be adverse for the community as a whole. Particular patient care requirements of an institution may not be sufficient to outweigh the additional direct and indirect costs which may result from expanded helicopter services.

PSRSA is especially concerned that individual institutions will establish helipads and eventually separate helicopter programs in an effort to meet particular patient care objectives which might be met satisfactorily under the current arrangement of emergency services.

A conservative approach to the development of helicopter transport programs is advised for several reasons:

a) The present system is extremely cost-effective. MAST operations are provided at no additional cost to residents above the support of federal tax subsidies.

b) In our region, the need for additional helicopter services which would be sufficient to support such an expensive service at an individual institution is unlikely. To justify the program, transportation services would tend to be over-utilized with transport provided in cases which would more appropriately be handled at other levels in the EMS system.

c) Facility costs would tend to increase since helicopter services are generally "loss leaders," powerful marketing tools which may increase hospital utilization but which would not necessarily guarantee the additional revenues required to cover the additional costs incurred.

d) If unnecessary and used inappropriately, helicopter transport services established outside the current system have the potential to adversely affect the EMS programs now serving the region. The development of private programs could result in the elimination of MAST (as specified in federal guidelines). Second, the ambulance

Puget Sound Health Systems Agency
601 Valley Street
Seattle, Washington 98109

Dear Larry:

I am writing to give you my comments on the Puget Sound Health Systems Agency's proposed plan for air ambulance (helicopter) services. First, let me apologize for the delay in responding. In the last month, my staff and I have had an opportunity to review the proposal and the issue generally with County Executive Tim Hill, representatives of the Mayor's Office and key County Council members. I would summarize our general comments as follows:

1) There is a consensus on the need to develop such a plan. We are on the threshold of a major change in pre-hospital emergency medical services and in the relationship between providers and the hospital community. In addition, inter-hospital relationships are being affected by the introduction of air ambulance services. The relationship of local community hospitals throughout the Puget Sound basin to the tertiary care centers in the Seattle-Tacoma metropolitan area may be the major factor influencing the development of air ambulance services. what is that relationship + how is it changing?

2) There is a need to coordinate the development of such a plan with others who are already working on this issue. The Washington State Medical Association Emergency Medical Services Standards Committee has appointed a special Task Force to deal with helicopter medical standards. Their charge is to develop medical indications or "user guidelines" for the use of helicopters in patient transportation. I have attached for your information a memorandum from Lothar Pinkers, M.D., dated February 21, 1986, that outlines the Task Force's agenda.

   The WSMA Task Force will be addressing many of the items identified in your proposal. I believe they will be establishing a framework for further planning. They are hoping to have a final report by June, 1986.

   There is also talk of incorporating air ambulance service planning into a statewide EMS planning effort.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

3) It seems essential that any planning effort be broader in scope than just Seattle and King County. I realize this is a change from what we discussed previously, but upon further reflection, it just does not seem realistic to focus on Seattle and King County when the operation of air ambulance services will undoubtably be multi-county in scope. If the planning process is too narrow, it will lack credibility with other potential users on our borders and beyond.

In summary, it is my recommendation that the Puget Sound Health Systems Agency look to broadening the geographical scope of a plan for air ambulance services. It is imperative that those entities outside of Seattle and King County with an interest in such a plan be included in the process from the beginning. Secondly, the Health Systems Agency's planning effort should ~~compliment~~ complement the Washington State Medical Association's activities. In fact, it should probably follow and expand upon their work.

Finally, I understand your agency is involved in reviewing a Certificate of Need for helicopter services in Bellingham. How does that fit into this evolving situation?

I would ask that you contact Steve Call, Manager of the Emergency Medical Services Division, at 344-4293, to schedule a meeting to discuss where we go from here.

Thanks for your efforts to date. I look forward to working with you.

Sincerely,

Bud

Bud Nicola, M.D.

JANE L. JOHNSON
(September 30, 1986)

1. See response to Liz Anderson Comment #52. The statements regarding the relationship of the Proposed Action and alternatives with the referenced statements have been clarified in Chapters II and IV of the Final EIS.

2. Comment acknowledged. It is unclear if the land use review process would prevent the landings of helicopters at medical institutions, based on WAC 248-18-285; however, the land use review process probably will prevent the inappropriate development of helistops at other medical institutions. See response to Liz Anderson Comment #118. This language has been clarified in the Final EIS.

3. See response to Liz Anderson Comment #266.

4. Critically ill or injured patients being transported by Airlift Northwest helicopter would be transported at the request of the referring physician whether they are inter-hospital transports or pre-hospital (in "the field") transports.

   According to Dr. Nicola's (partial) review of the Airlift Northwest flight logs and medical records, the transports appear to have been warranted based on the preliminary Washington State Medical Association guidelines. According to Dr. Nicola's review of randomly selected transports, the helicopter medical crew's determination of which patients being transported by helicopter should go directly to Children's campus and which could go to an alternate location and then be transported to Children's via ground ambulance have been appropriate.

5. Comment acknowledged. It should be recognized that the Proposed Action and alternatives address the establishment of a helistop and not the establishment of a new helicopter ambulance service. (See response to Kate Hemer's Comment #3.)

   Since February 1985 there have been two sets of guidelines that have been developed that can assist the referring physicians in making decisions regarding the appropriateness of transport modes. These are the pre-hospital and inter-hospital transport modes guidelines developed by the Washington State Medical Association (see Appendix A). It is agreed that "The inappropriate use and proliferation of helicopter transport services [should] be discouraged." The consortium approach is one means by which competition from a number of air ambulance services used by a number of hospitals can be discouraged. Mr. Thompson indicated that, "Unfortunately, we are in the midst of 'air wars' throughout the country as hospitals vie with one another to establish helicopter programs (emphasis added)." The private air ambulance service nearest to Airlift Northwest is Med-Flight in

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Bellingham. Because Airlift Northwest service is initiated by the referring physician, rather than emergency air carriers responding to aid calls, there is no other helicopter service vying for individual patients.

6. Comment acknowledged. See response to your Comment #5.

7. Comment acknowledged. The establishment of a helistop at Children's is intended to increase the safety and responsiveness of an existing (Airlift Northwest) program rather than to provide a helistop for a new program. See also the response to Montlake Community Club Comment #9.

8. The PSHSA is no longer an active entity (see Chapter II). The Cumulative Impacts section has been revised to reflect the current status of the proposed Washington State Medical Association Guidelines.

9. Please refer to the response to Montlake Community Club Comment #9.

10. Please refer to the response to the Seattle Department of Community Development Comment #3. The Draft EIS does not presume that the University Medical Center would not allow Children's-destined patients to land at the Intramural Field; rather, it indicates that it is unlikely that Children's-destined patients would be allowed to land at the University Medical Center Helistop, if its use were proposed. It should be noted that the University is not considering use of the rooftop helistop at this time.

11. Children's does not have the authority to control other medical institutions and, therefore, Children's contends they cannot demonstrate as a rationale that WAC 248-18-285 would not be used by other medical institutions to allow helicopters to land. Please refer to response to Liz Anderson Comment #118.

12. Correspondence cited in the "references" section of the EIS are available for review at DCLU. The 1986 reference is to a telephone conversation between Larry Thompson and Nancy Greenawalt. It has been deleted from the EIS.

Thank you for your comments.

RE: DEIS for Proposed Helipad at Children's Hospital:
Failure to address all issues specified in Feb. 1986 scoping list

The DEIS for the proposed helipad at Children's Hospital fails to address adequately the issues specified in the February 13, 1986, scoping letter from Julia Gibb of DCLU to Nancy Greenawalt of CCH. I quote from the scoping letter section regarding mitigating measures:

"MITIGATION MEASURES

Possible mitigation measures discussed in the EIS shall include the following:
- flight paths
- number of flights
- usage and location of U.S. Army (M.A.S.T.) or other agency helicopter landings
- off-campus pick-up of medical teams
- liability insurance
- criteria for use of helicopters
- plan for monitoring use"

Within the DEIS itself, mitigation measures referred to on pages 73 and 88 only address safety and noise impacts, and then only perfunctorily. These short sections in Chapter IV of the DEIS mention specifically only flight paths and number of flights, the first two of the seven topics in the passage quoted above. 1

Passing references were made in the DEIS to MAST helicopters and possible off-campus pick-up of medical teams, the third and fourth items. References were made obliquely to criteria for use of helicopters and plan for monitoring use (the sixth and seventh topics), but with no specific information given on how mitigation could be accomplished. 2 3 4 5

Lastly, the fifth item, liability insurance, was not addressed at all in the DEIS. If is most unfortunate that DCLU did not catch this major omission from the DEIS. Please make sure that the final EIS addresses this important topic, and that it also addresses completely and separately the six other mitigating measures included in the February 13, 1986, scoping letter. 6

Sincerely,

Jane L. Johnson

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

JANE L. JOHNSON
(October 10, 1986)

1. Possible mitigation measures are presented in Chapters II and IV of the Draft and Final EIS. See also responses below.

2. MAST was discussed in detail on pages 20, 21 and 41, and throughout the remainder of the Draft EIS. In Chapter III of the Final EIS, there is an expanded discussion of other potential helicopter services and their aircraft that could possibly use the helistop. Refer to the response to Liz Anderson Comment #35 regarding the design of the helistop with respect to MAST aircraft. For additional discussion of MAST please see responses to Liz Anderson Comments #90, 91, 92, 93, 94, 95, 106, 107, 161, 251, and 257.

3. Off-campus pick up of the medical team is discussed on page 89 of the Draft EIS and in Chapter IV of the Final EIS. This is a mitigation measure that has been incorporated into current Airlift Northwest operations and the new alternative (the Preferred Alternative).

4. The topic of criteria for use of helicopters is discussed in terms of Dr. Nicola's findings, which have been updated and incorporated into the Final EIS.

5. Children's proposed Medical Review Committee is described in greater detail in Appendix C of the Final EIS.

6. Thank you for noting this omission. See responses to Liz Anderson Comments #29 and #44.

Thank you for your comments.

LAURELHURST COMMUNITY CLUB

Serving over 1600 homes.

4326 N.E. 42nd
Seattle, WA 98105
October 15, 1986

Holly Miller, Director
Dept. of Construction and Land Use
400 Municipal Building
Seattle, Wash. 98104

Dear Ms. Miller:

I would like to submit my testimony at the public hearing on September 23, 1986 to serve as my comments on the draft environmental impact statement by Children's Hospital.

"I am here to speak as the president and the representative of the Board of the Laurelhurst Community Club.

In my remarks, I intend to highlight two specific issues (1) the certificate of need (CON) process and the absence or lack of reliable information about the medical need for the proposed helipad and (2) the safety risks of 60 to 80 flights per month into and out of the facility; basically, the probability of a crash with an emergency medical helicopter which makes their use within a single-family neighborhood unacceptable.

186

Initially, I'd like to talk about the CON process. Children's Hospital has consistently tried to avoid the preparation of a CON application to such an extent that their attorneys filed a lawsuit against the state to prevent it. The Laurelhurst Community Club Board has requested the CON because it is our opinion that it would provide important information to the decision-making process in connection with this conditional use permit request. 1

In large part, the CON process would provide data or information about need that is not in the draft EIS or the Nicola report. There are 15 specific questions that the CON process would answer and which should be in the final EIS.

1. Identify and analyze the UNMET health services needs which the project would serve.

2. Identify the relationship of the project to the appropriate availability and accessibility sections of the State Health Plan, Health Systems Agency Plan, or the Annual Implementation Plan.

3. Define the population that is expected to be served for the next 10 years and its geographic location, broken down into age and sex categories.

4. Include a patient origin analysis for at least the most recent 3 month period with origins indicated by zipcode.

5. Provide information on the availability and accessibility of similar existing services to the defined population expected to be served. Identify all existing providers or services similar to those proposed and include sufficient information to prove that such existing services are not currently available or accessible. Time and distance factors are to be analyzed in detail in this section. 1

5. Provide utilization forecasts for at least five years following project completion, describe the methodology used to prepare the forecasts, identify and justify all assumptions related to changes in use rate, market share, and intensity of service.

7. Justify why the project does not constitute an unnecessary duplication of services, if existing services are available and accessible to the defined population.

8. Document the manner in which access of low income, racial and ethnic minorities and other underserved groups would be served in relation to their need for them.

9. Break out proposed capital expenditures in detail and explain fully the methods used to calculate them. Document the expected project impacts on capital costs, operating costs, and charges for health services.

10. Indicate the expected sources of financing and the expected sources of revenue associated with the operation of the service. Will cross-subsidies be required? (i.e., will one group of patients be asked to subsidize another group?)

11. Describe the relationship of the project to the appropriate cost sections of the State Health Plan, the HSA Health Plan or Annual Implementation Plan.

12. Show that there will be sufficient numbers of qualified health manpower and management personnel to operate a high quality service.

13. Show that the service will be provided in a manner that ensures safe and adequate care and in accordance with applicable Federal and State laws, rules and regulations.

14. Explore alternatives to the project, including postponing action, shared service arrangements, merger, and contract services. Alternatives should be compared with each other using specific criteria and the manner in which the preferred alternative has been selected should be indicated.

15. Show the specific ways that the project will promote staff or system efficiency or improve productivity.

The LCC Board specifically requests that the city (DCLU), require Children's Hospital to prepare Certificate of Need data within this process and include it in the final EIS

Safety concerns:

1. Should the data be true that between 1980 and 1985, one of every 10 emergency medical helicoptors in operation crashed, that accident rate is unacceptable. The accident rate suggests that the helipad should not be used in a narrow confined area between houses, apartments, and hospital, but in an area where the flight path is clearand unobstructed. 2

2. In effect, this proposal to save lives puts more lives at risk.

3. The proposed site is much too close to the houses in this area and to two elementary schools.

Thank you for your attention to these matters.

Sincerely,

Bob Klug

Robert Klug
President, Laurelhurst Community Club

LAURELHURST COMMUNITY CLUB - ROBERT KLUG

1. Please refer to the response to Liz Anderson Comment #53. The City of Seattle has requested that Dr. Nicola assist in the determination of whether the proposed helistop at Children's meets the medically-oriented criteria of the Council Conditional Use Permit. The City of Seattle has determined that the provision of the requested information, with the exception of the following items, is outside the scope of the EIS:

   Your points 3, 4, 6 - Please refer to the response to Liz Anderson Comment #26.

   Your point 5 - Please refer to the responses to Anita Francis Comments #59 and 60.

   Your points 7, 8, 9, 10, 11, 15 - Please refer to the response to Kate Hemer Comment #3.

   Your point 12 - Please refer to the response to Liz Anderson Comment #68.

   Your points 13 and 14 are discussed in the Draft and Final EIS.

2. Your safety concerns are acknowledged. Please refer to the discussion of the new alternative (the Preferred Alternative) in the Final EIS, as well as updated information on helicopter safety in Chapter IV.

   Thank you for your comments.

Re: Comments on DEIS Children's Hospital Heli-Stop

Dear Ms. Gibb:

I have reviewed all MAST Flights for the past ten years as a part of my regular duties with the MAST Coordinating Committee. 1

On only one occasion, in the winter of 1986, was it necessary to deliver an infant directly to the hospital's door, rather than landing at Graves' Field.

My data shows no other bad patient outcome resulting from landing at the Grave Field site.

Last winter I asked the Seattle Fire Department, Chief Jerry Burt and Shepard Ambulance, Mr. Ken Ruef, if they knew of any bad outcomes occuring during the transport of pediatric patients from a MAST helicopter at Graves' Field to Children's Hospital. 2

Neither activity knew of any of any bad result at that time.

Warm regards,

Jay M. Kranz, MD., Chairman
MAST Coordinating Committee

Re: Children's Orthopedic Hospital
Helipad

To Director Holly Miller:

I am the owner of an apartment in the Laurelon Terrace Condominium complex, which is next door to the proposed Children's Orthopedic Hospital helipad.

I was present at the meeting of September 23, held at Laurelhurst Elementary School, at which this plan was discussed. According to COH there should be about ten emergency cases brought in by helicopter a month - a total of twenty trips. I believe there will be many more than that once the helipad is in place. Doctors will order helicopter service for their patients more often than they now anticipate as a defense against the possibility of any legal action against them by the child's parents in the event the child does not survive. 1

There is great concern by the residents of this condominium about having these helicopters coming down for a landing next door to us. Many have shown their concern by moving. I have lived in many neighborhoods in my life but never before have I seen so many "For Sale" signs appear in one neighborhood as there have been here since we all became aware of the proposed helipad two years ago. The Port of Seattle has been in the practice of buying up houses of people living in the flight pattern of SeaTac when they have been unable to sell them to anyone else. Now the City of Seattle is finding itself obligated to buy houses of people living near the Midway landfill. Will Seattle also come to the rescue and buy up the apartments of Laurelon Terrace residents when the frequency of helicopter flights overhead becomes unbearable and we are unable to find buyers? Had I known three-and-a-half years ago when I bought my apartment that there would be helicopters landing next door, I wouldn't have even made the trip over here to see the place. 2

Yours very truly,

Marjorie D. Kresge

RECEIVED
OCT 3 1986
DEPT. OF CONST. & LAND USE

Holly Miller, Director
Department of Construction and Land Use
408 Municipal Building
Seattle, Washington 98104

Dear Ms. Miller:

It is becoming quite apparent that the Childrens Orthopedic Hospital is making every effort to proceed with a Heliport on the C.O.H. grounds without d e regard to the risk to the surrounding neighborhood. 1

First of all, the Laurelhurst Elementary School, containing approximately 250 children, is located less than two blocks from the proposed Heliport. 2

The physical risk to these children cannot be ignored. Also let us not overlook the noise and vibration factor that would surely disrupt school activities during landings and takeoffs. In addition to this, there is no approach route to this proposed landing site that would not jeopardize residences and business in the surrounding area. 3

The fact that many structural obstructions, as well as trees, in the area certainly do not enhance the safety of this proposed landing site. 4

One accident would certainly negate any value claimed by the use of this proposal. 5

For years the C.O.H. has been using the University of Washington East Campus Intramural Field for emergency helicopter landing sites. This area is totally unobstructed and approaches over water would certainly be safer with no risks to any ground personnel or structures. Transportation by ambulance from the Intramural Field to the hospital has been timed at two and a half minutes. This includes during rush hour traffic. Two and a half additional minutes to a forty-five minute or so helicopter trip is quite inconsequential particularly when we consider the overall risk. The jostling of the patient in the transfer is certainly no greater than the jostling suffered during the helicopter ride. 6

There can be no apparent advantage to transferring a patient from the Harborview Trauma Center to C.O.H. by helicopter--in these cases the time element is not a factor. 7

We must also consider a proposed heliport for the University of Washington Hospital. A centrally located heliport on the University of Washington Intramural Field would serve both institutions very well. 8

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

If these proposals for individual heliports are not controlled, it is not inconceivable that many hospitals in this area (Seattle) will claim the necessity of such a convenience and the precedent will have been established. 9

Finally, it has come to our attention that the C.O.H. has filed Application #8602396 to build a four story medical office. Should not this application be included in the same Environmental Impact Statement as the one for the Heliport? 10

Let us please consider objectively the overall risk to the many as opposed to any claimed advantages to a few. 11

Thank you.

Sincerely,

Harold Kurtz

Mildred Kurtz

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

MILDRED KURTZ AND HAROLD KURTZ

1. One of the purposes of preparing this EIS is to assess any risk to the surrounding neighborhood that may exist. The City permit process will ensure the hospital takes reasonable and prudent measures to protect the surrounding neighborhood from undue risk.

2. Comment acknowledged. Please refer to the response to Liz Anderson Comment #18 with respect to the relationship of flight paths to schools, and Laurelhurst School PTA Board Comments #1 and 2 regarding noise. The risk to school children is not ignored.

3. It is not possible to eliminate the risk of accident, anywhere. Please refer to the response to Bruce Balick Comment #10.

4. Comment acknowledged. Please refer to the response to Liz Anderson Comment #24 regarding tree removal and to Comment #149 for a comparison of the relative safety of the alternatives.

5. An accident may or may not involve injury/fatality or property damage. It is not apparent that an accident would negate the benefits of the proposal.

6. Please refer to the responses to Bart Baxter Comments #2 and 16 regarding transfer times and Liz Anderson Comment #37 regarding patient outcome of landing at the Intramural Field. Although there are obstructions at the Intramural Field (see response to Liz Anderson Comment #244), there is an acceptable level of safety at that facility (see response to Liz Anderson Comment #149). See response to Liz Anderson Comment #132 regarding patient jostling.

7. In the vast majority of cases, a patient at Harborview could be effectively transported to Children's by ground ambulance. In some limited instances, it may be medically necessary to transport the patient by helicopter.

8. Comment acknowledged. The University has not submitted an application for a Council Conditional Use Permit that would allow for the development and use of a new helistop. However, the University may make minor improvements to its existing helistop at the Intramural Field. Please refer to the response to Seattle Department of Community Development Comment #3.

9. Please refer to the response to Liz Anderson Comment #210.

10. The Medical Pavilion received a separate environmental review. See response to Kate Hemer's Comment #1.

11. Comment acknowledged.

Thank you for your comments.

Director
Department of Construction and Land Use
400 Municipal Building
Seattle, Washington 98104

To whom it may concern:

I am concerned about the possibility of small, private helicopters landing in a residential neighborhood within two blocks of an elementary school and several apartment complexes. It is my understanding that the MAST helicopter service which COH has utilized for the past ten years has been more than adequate to cover all emergencies. I question the motivation of people involved in this new project, and I hope you will vote against granting a conditional use permit to Airlift Northwest or any other private company to land on the grounds of COH. I am in favor of continuing the current helicopter service exactly the way it is now operated or constructing a new helipad in a less residential location. 1 2 3

Sincerely yours,

Carolyn Margon

Carolyn Margon

Re: Helistop, CHMC
4800 Sand Point Way N.E.

Dear Ms. Miller:

The DEIS on CHMC Helistop raises many questions which are not answered sufficiently and ignores many more which have been raised during the hue and cry over this extremely sensitive issue. Time permits me to raise only a few items which bother me.

1 P.x indicates that only 3 of the 46 Elements of the Environment were reviewed by DCLU. These elements are set forth in the Seattle Municipal Code. Unexplained is who/what the determinant of non-review is/was. Yet, some of these are discussed in the text, but hardly reviewed, since they are "deemed nonsignificant."

2 The most specious nonsignificant is d.iii. Schools are dismissed as "no significant increase in school population is anticipated from development of this project." Of course not! The obvious significance of schools has been raised in every hearing, newspaper/tv discussion: parents do worry about their children's safety. This safety has threats in any community with accidents, whether by car, bus, bike, playground, now compounded by an omnipresent fear of threat to either Laurelhurst School or the Villa Academy in the immediate vicinity of Children's proposed helistop. If DCLU had reviewed schools, it would have found that parents in neighboring communities worry about the possibility of harm to their schools near the proposed flight patterns depicted in the DEIS. This worry and fear must not be dismissed as irrational nor should DCLU believe that accident rates given in the DEIS immediately calm these worries and fears. Pp. 66 and 67 offer cold comfort with "flew into the ground" statistics predominantly in daytime hours.

3 DCLU's Distribution List, pp. xiv and xv, shows strange omissions. None of the neighboring community organizations, whether club or council in Montlake, University District, Windermere, Belvedere Terrace, Ravenna-Bryant, Hawthorne Hills, View Ridge, not even Laurelhurst! were included. Also omitted were Seattle School District, Villa Academy, management boards of Burke-Gilman Place, Laurelon Terrace and other living groups, as well as neighborhood businesses and the University Herald. No wonder there are loud outcries.

4 I question the omission of any statistics for the first alternative, the UW Intramural Field, equivalent to those provided in Table 2, pp. 14-16, for direct landings at CHMC (albeit they are contrary to City regulations).

5 Other omissions: MAST landings at the UW area have been a long-time emergency provider for the CHMC, yet MAST is summarily treated and dismissed. Nothing is stated, except in an appendix letter about comparative costs of ground travel teams and Airlift Northwest. Presumably, meaning I don't know, costs are billed to parents, hospital involved, medical insurance? Nothing is stated, nor is mention made that MAST traditionally does not charge for its services. Will MAST

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

coexist with Airlift Northwest?

Also omitted is any correlation of jurisdiction over helistop siting and emergency airborne patient services with CHMC's assertion that it will continue to land on its property despite regulations. It cites its authority as WAC 248.18.285 and RCW 7.70.040 yet neither one is presented, pp.41,57. They should be. 6

It is unclear what medical support is provided to a patient who has been removed from monitoring/sustaining equipment in a helicopter to a gurney for the 120 feet journey to the CHMC Emergency Room. 7

If the UW Hospital is"unlikely to allow CHMC" use of its proposed building-top helistop, then it ceases to be a feasible alternative and should not be listed as such, p. 53. Conversely, and not addressed, will CHMC allow the UW to use its helistop? 8

In view of so many omissions (and even commissions) raised above, as those which will be raised by other DEIS readers, I believe a Supplemental EIS is necessary and so request. 9

Sincerely,

Dorothy McCormick

DOROTHY McCORMICK

1. The three elements of the environment that are examined in the EIS (Noise and Vibration, Safety, and Cumulative Impacts) were determined by the Department of Construction and Land Use as a result of the scoping process. These elements were identified as ones that could be significantly adversely impacted by implementation of the Proposed Action.

2. Please refer to the response to Liz Anderson Comment #18.

3. See response to Liz Anderson Comment #22.

4. See response to Liz Anderson Comment #80.

5. MAST helicopter flights are examined on pages 20, 21, and 41 of the Draft EIS and in Chapters II, III, and IV of the Final EIS. MAST could continue to coexist with Airlift Northwest. Children's would encourage MAST missions to land at the Intramural Field helistop, rather than at Children's. The issue of the relationship of MAST and Airlift Northwest also is discussed in the responses to Liz Anderson's Comments #92, 94 and 95.

   As identified in the response to Kate Hemer's Comment #3, the issue of economics does not need to be addressed in this EIS.

6. Comment acknowledged. The WAC was presented in the Draft EIS (see page 27), however, the cited RCW was not. Both citations are included in the Final EIS. Please refer to the responses to Liz Anderson Comments #118 and 207.

7. Patients in isolettes could be sustained by the systems in the isolette, which would be battery-powered during the 142-foot journey. Depending on specific medical conditions, other patients could be receiving forced respiration, have CPR being administered or be receiving other treatment (e.g., IVs) during the transport. The patient also would be supported by the medical transport team and by ground-based medical personnel, as warranted.

8. Although the project sponsor indicated that the University Medical Center rooftop helistop was not an acceptable location for landings of Children's-destined patients, the City of Seattle required that the alternative be explored in the EIS. Contact with representatives of the University Medical Center during the process of analyzing the alternative in the Draft EIS revealed that the University probably would not allow Children's-destined patients to land on the roof of the University Medical Center, if permitted. It should be noted that the University is not considering use of the rooftop helistop at this time.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Children's has not received a request from the University to land helicopters at the Children's campus. Children's and the University have initiated discussions to share a helistop on the Intramural Field, where the majority of Children's-destined patients being transported by helicopter could land without sacrificing appropriate medical care.

9. Your request is acknowledged. A Supplemental EIS has been determined by DCLU to be not necessary.

Thank you for your comments.

RECEIVED
OCT 20 1986
DEPT OF CONSTRUCTION & LAND USE

Dear Ms. Miller

Re. Children's Hospital, DEIS.

202

I would like to question Children's objective as stated in the EIS introduction (page 1 par. 2) "to create a landing pad for helicopters transporting critically ill or injured children" or "the specific objective of this proposed action is to minimize both the patient transfer time and the number of potentially destabilizing patient transfers---." Children's position in this EIS is that they are transporting patients in critical condition (page 13 bottom). The County EMS Guidelines defines the conditions for helicopter use page 12 #1 the patient "must be an extremely ill patient such that the arrival at a hospital capable of providing specialized care will immediately save their life or reverse their medical deterioration." 1

In Reference to table II, pages 14, 15, & 16, titled "Key characteristics of critically ill patient transfered by ALNW directly to Children's Aug 1, 1985, to June 10, 1986", I looked for references to table II in the text and where the patients were transported from. I found the following references:
Page 17 par 1. "table II presents data on the medical condition of patients who where transplated directly to CoH by helicopter".
Page 24 par. 4. "table II describes ALNW helicopter transports to CoH through Mid June 1986" from this table's data, CoH states that 63% of the transports to CoH were newborns. The data agreed, 13 of the 21 listed transports were newborns.
P A1. par. 1 "Based on data from existing flights (table II) it is estimated that 20% of the flights would occure at night time hrs. (10pm-7am)." The data does not agree. Table II is used to extract data for use in other sections of the EIS, therefore this table must be accurate. 2

Now's the time to ask two questions: is the table accurate? and were all the patients transfered to the nearest capable hospital? I've subsequently found the answer to both questions to be No. 3

In Reference to table II, pages 14, 15, & 16, titled

The ALNW pilots log shows 64 not 21 flights 2

FROM AUG 1, 1985, & MAY 30, 1986. COH ACKNOWLEDGES ONLY 21 IN TABLE TWO. CALENDARS MARKED BY LOCAL RESIDENTS PROVIDE A NUMBER OF FLIGHTS IN THE THIRTY'S. COH'S NUMBERS ARE INCORRECT, I'LL USE NUMBERS FROM ALNW PILOTS LOG (G4). 2

OUT OF THE 64 FLIGHTS 17 OR 25% EITHER OVERFLEW TACOMA GENERAL - MARY BRIDGE (A CAPABLE FACILITY) OR THE FLIGHT DISTANCE WAS CLOSER TO TACOMA THAN COH. THERE MAY HAVE BEEN MORE FLIGHTS AS IT IS DIFFICULT TO DETERMINE FROM THE FLIGHT LOGS FLIGHTS THAT ORIGINATED VIA FIXED-WING AND THE LOG DATA DOES NOT INCLUDE JUNE 1986. 3

THE EIS STATES THAT "ALNW ALSO WILL TRANSPORT PATIENTS TO NON-CONSORTIUM HOSPITALS" (PAGE 22 two) WHICH ACCORDING TO THIS DATA IS NOT BEING DONE. COH CLAIMS ITS OBJECTIVE IS TO SAVE LIFES BY SAVING TRANSPORT TIME. DR NEFF, COH'S MEDICAL DIRECTOR, SAID "FOR CRITICAL PATIENTS EVERY MOMENT LOST INCREASES MORTALITY" (PAGE 19 PART). THE EIS CONTAINS SEVERAL STATEMENTS LIKE "THIS TIME SAVINGS CAN REDUCE SUFFERING, DECREASE HOSPITAL STAY TIME AND IN THE MOST SEVERE CASES CAN MEAN THE DIFFERENCE BETWEEN LIFE AND DEATH (PAGE 46 PS) 4 5

IF 25% OF THE PATIENTS TRANSPORTED BY CHOPPER TO COH COULD HAVE BEEN IN ANOTHER CAPABLE HOSPITAL SOONER, THIS IS NOT SAVING LIFES; THIS IS MARKETING, AND BY COH'S DEFINITIONS, IN THIS 25% THEY ARE INCREASING SUFFERING, INCREASING HOSPITAL STAY TIME ETC. 5

ON JAN 22, 1986, DAVID HUNTER, SPEAKING FOR COH, GAVE A PRESENTATION TITLED "COH STRATEGIC DIRECTION STUDY" IN SECTION 5, STRATEGIC DIRECTIONS, PART A. NETWORKING. FIVE GOALS ARE SET, TWO OF WHICH ARE DECENTRALIZATION AND EMERGENCY TRANSPORTATION SYSTEM, GROUND, FIXED-WING AND ROTARY TO COH AS WELL AS BACK TO THE COMMUNITY OF ORIGIN. I GAVE A COPY OF A COH OUTLINE OF MR. HUNTER'S PRESENTATION TO JULIA GIBBS. 6

MR HUNTERS TALK WAS A GENERALIZATION OF A REPORT TO A GOVERNMENTAL AGENCY WHICH HE SAID WAS CONFIDENTIAL. PLEASE OBTAIN THIS REPORT AND DISCLOSE YOUR OPINION AS TO THE EXTENT THAT MARKETING, NOT SAVING LIFES, IS COH'S INTENT FOR OBTAINING HELICOPTER SERVICE.

TO REPEAT MYSELF, DATA SHOWS THAT THIS IS MARKETING, NOT SAVING LIFES, OR TO QUOTE DR. PINKER FROM HIS LETTER IN THE EIS APPENDIX "DIVIDING UP THE BABIES"! 7

IN SUMMARY I ASK THAT COH CORRECT TABLE II

AND CONCLUSIONS FROM THE DATA, INCLUDE ALNLO PILOTS ECG IN THE APPENDIX, AND THAT ALL REFERENCES LISTED IN THE APPENDIX BE INCLUDED IN THE APPENDIX IN TOTAL. 7

John Mandenhall
5033-44th N.E.
SEATTLE, WA. 98105

JOHN MENDENHALL

1. Please note that the full statement referenced in your comment is the following: "The specific objectives of the Proposed Action are to minimize both the patient transport time and the number of potentially destabilizing patient transfers from place of patient pickup to the Emergency Room entrance at Children's while maintaining appropriate medical treatment and to construct a helistop and to operate the medical service so as to minimize potential environmental impacts (emphasis added)."

   The new Preferred Alternative would limit use of the on-campus helistop to transports involving the most critical patients. A Medical Review Committee would review flights to ensure the helistop is used appropriately.

2. See responses to Liz Anderson Comments #39, 80, and 101.

   Table 2 has been updated and is included as Appendix D of the Final EIS. It indicates that 18.4% of the transports directly to Children's Emergency Room entrance occurred during the nighttime.

3. The patients being transported by Airlift Northwest are being transported to the facility that has been designated as the receiving hospital by the referring physician. The helicopter is being used to reduce the amount of transport time from the patient's place of origin to the receiving hospital. Please refer to the response to Liz Anderson Comment #50.

4. Airlift Northwest does transport patients to non-consortium hospitals. Data on these transports are not provided in the EIS.

5. Please refer to the response to Liz Anderson Comment #180.

6. As noted in the comment, David Hunter's full report is confidential. David Hunter's report was an internal hospital document prepared for the Board of Directors and key management staff of Children's Hospital and Medical Center. It was not prepared for a governmental agency. Please refer to the response to Liz Anderson Comment #23.

7. Please refer to the response to your Comment #2. The Airlift Northwest log of all transports is outside the scope of this EIS and is not included.

   Thank you for your comments.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

SEPT 23, 1986

I WOULD APPRECIATE THE FOLLOWING QUESTIONS BEING RAISED/ANSWERED AT THE SEPT 23 DCLU HELISTOP HEARING. THE QUESTIONS PERTAIN TO STATEMENTS IN THE COH DRAFT E.I.S. REGARDING HELICOPTER OPERATIONS.

1. Pg 45, para 2 : WILL THERE BE NIGHT LANDINGS AT COH? 1
   para 3 : SURFACE WIND DATA FOR LANDINGS AT COH SHOULD NOT APPLY AS SANDPOINT IS APPROX 1½ MILES N.E. ON FLAT TERRAIN. WILL AIRLIFT NORTHWEST OR COH HAVE A TRAINED WEATHER OBSERVER AT THE HOSPITAL TO ACCURATELY REPORT ACTUAL WEATHER CONDITIONS AT THE HELIPAD DURING ADVERSE WEATHER? IF NOT, WHY NOT? 2

   ARE ALL AIRLIFT NORTHWEST PILOTS INSTRUMENT QUALIFIED? I.E. "IFR RATED" PILOTS. 3

2. pg 67, para 3 : WHY DO AN PILOTS HAVE THE "OPTION" OF USING FAA WEATHER MINIMUMS OR A.N. WEATHER MINIMUMS? TWO SETS OF STANDARDS MAY LEAD PILOTS TO FEEL PRESSURE TO FLY UNDER MARGINAL WEATHER CONDITIONS. 4

3. pg 68, para 1 : "AIRLIFT NORTHWEST WOULD ONLY LAND AT COH IN CONDITIONS OF GOOD VISIBILITY." WHAT EXACTLY DOES A.N. CONSIDER "GOOD VISIBILITY"? CEILING AND HORIZONTAL VISIBILITY? 5

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

2-

. 6 para 3 : EIS STATES THAT "AIR TAXI HELICOPTERS ARE EXAMINED AND FLIGHT TESTED BY THE FAA AT LEAST ANNUALLY." THIS STATEMENT IS INCORRECT. FAA DOES NOT FLIGHT TEST HELICOPTERS ANNUALLY. AIRLIFT NORTHWEST SHOULD CLARIFY THIS STATEMENT. 6

THANK YOU.

RICHARD MERRELL

1. Updated transport data (see Appendix D) indicate that over an extended period approximately 18.4% of Children's-destined transports occurred during nighttime hours (between 10:00 p.m. and 7:00 a.m.).

2. See the response to the Laurelhurst School PTA Board Comment #4 regarding weather data, and the response to Liz Anderson Comment #6 regarding weather observers stationed at Children's.

   In adverse or marginal weather, Airlift Northwest would not attempt landing at Children's. In marginal weather, instrument guided landings would occur at locations capable of accommodating instrument-guided aircraft, such as Boeing Field or Sea-Tac Airport.

3. Please refer to the response to Ruth Engelberg Comment #7.

4. The Airlift Northwest weather standards were instituted specifically so the pilots would not be pressured to fly under marginal weather conditions. The Airlift Northwest standards are more stringent than those imposed by the FAA.

5. See response to Liz Anderson Comment #221.

6. Correction noted. Please refer to the response to Liz Anderson Comment #193.

   Thank you for your comments.

Re: Helipad proposal at
Children's Orthopedic
Hospital (COH)

Dear Ms. Miller & Gibbs:

I am enclosing my correspondence with Dr. Nicola to show you my concern about disrespecting the health and lives of a whole neighborhood, including two schools, apartment buildings which border the proposed helipad site at COH. Also, electrical wiring is overhead on the parking lots of COH and a park with high trees and a substation on it is nearby. 1

Dr. Nicola could not or did not volunteer even how many lives were saved in endangering us all. As a matter of fact, he gave the hospital permission to land up to eight times per month, which the hospital finds unsatisfactory. They want about 50-60 landings a month. I call this an airport. And all this without knowledge of how many lives are saved. 2

This is incredible carelessness of the appointed health directors and shows lack of investigation into the situation. 3

I hope you all will intervene to make a bad situation better.

Thanks for listening.

Sincerely,

Helen Newman

Seattle, Washington 98105

Ms. Helen Newman:

In your letter of August 23, 1986, you asked me to respond to three specific questions regarding the transport of patients to Children's Orthopedic Hospital by helicopter: 1) How many children have been helped by helicopter transport?; 2) How many children have died?; and, 3) What medical problems have there been with landings at the nearby soccer fields?

When I was asked by the Department of Construction and Land Use to comment on the medical need for helicopters at Children's Orthopedic Hospital, I reviewed the previous year's transport records of Airlift Northwest, talked to transporting physicians, and witnessed the helicopter and emergency department staff in operation. All of the six patients per month transported to Children's Orthopedic Hospital by helicopter during 1985 were "helped."

Was a landing at the hospital parking lot rather than the soccer field the difference between life and death? This question is not possible to answer given the number of variables involved in the care of an acutely ill or injured child. We do know that time is an extremely critical variable in determining the outcome of persons acutely ill or injured. As a generalization, helicopter transport can reduce the time for a patient to receive definitive medical care.

It is my opinion after reviewing the diagnoses of the ill children transported by helicopter and speaking to their attending physicians that one might expect 5% of comparable cases to develop life-threatening complications during flight where several minutes difference in reaching care may indeed be the difference between life and death or severe disability.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The main problem associated with landing at the soccer field has been the trauma involved on a fragile incubator baby in making mechanical connections with oxygen, ventilator, intravenous equipment between the helicopter and the ambulance in an open field. This is one more variable which may increase the risk of problems in an ill baby. I do not have sufficient information to answer your questions more definitively.

I would reiterate that the Draft Environmental Impact Statement to be released by the City of Seattle Department of Construction and Land Use addresses many of the questions you have raised.

Thank you again for writing.

Sincerely,

Bud Nicola

Seattle

Dear Ms Miller:

It seems apparent that the Helipad concern by Laurelhurst residents, including myself, is quite high. In addition it seems questionable as to the benefit it would provide.

I am opposed to this effort: the safety aspect, increased congestion and noise and questionable benefits vs all costs, are the reason.

Sincerely -

Dear Director:

I am writing to register my comment on the Draft EIS for the Children's Hospital Helipad.

The inadequacies of the DEIS has been pointed out by many residents who testified at the hearing. I simply want to say that the way the document was prepared tends to focus on the helipad rather than on the helicoptors which will use the pad and which are the cause of concern. In other words, the DEIS does not dwell firmly enough on the question of the risk of helicoptor accidents and why the risks are worth-taking. 1

Also, the DEIS goes through the routing of "addressing" various impacts but totally misses the point.

Examples:

Page xiii, d.i. Fire. "...service not significantly affected."

-- Granted that fire services may not be affected by the HELIPAD. Would the HELICOPTOR not cause additional fire concern? 2

Schools. "... no significant increase in school population...." Funny! No one has ever raised a school population question here. But we have asked a lot of questions about what happens to the schoc' and students in case of a helicoptor accident. Why not dwell on the impact from the HELICOPTORS instead of HELIPAD? 3

Similar ironies abound in the DEIS.

In sum, do you really think it is good land-use to introduce emergency helicoptors with their high rate of accidents to a residential neighborhood of mostly wooden-frame houses? 4

Please address these questions and demonstrate why the Hospital needs such a facility when there is already a good alternative site at the University of Washington grounds ~~five~~ 9 1/2 minutes away. 5

Sincerely,

S. Kenneth Pai

RE: Comments on Draft EIS Statement for Children's Hospital Helistop

Dear Ms Miller,

I have read the material in the environmental impact statement and additional material submitted to me by one Jerry B. Schneider who is a member of the Laurelhurst Citizens Group discussing this issue. The additional material that Mr. Schneider submits is a letter from Kenneth L. Mattox, M.D., professor of surgery, Baylor College of Medicine, and a photocopy of an article in the Journal of Emergency Medicine date May 30, 1986 by Dr. Mattox.

217

First of all, let me say that issue is quite complex, it is heavily clouded by emotion, both on the part of the Children's Orthopedic Hospital, Airlift Northwest, and the Laurelhurst citizens. In doing an extensive literature search on the use of Helicopters for prehospital transportation and interhospital transportation, the bibliography of which has been used in part by Dr. Nicola has shown clearly that there are not adequate criteria for the use of helicopters as a mode of transport. Most of the articles are self serving written to demonstrate how good that particular service is. The Washington State Medical Association, since it is a State wide organization which looks at the needs of the entire State cannot specifically deal with local issues. However, I believe that I can as a well educated observer, make comment on the Children's Orthopedic program. These comments stem from opposite areas. In the first place, helicopters are expensive to own and operate. This tends to ask for over utilization in order to offset costs. There is an inherent danger in their operation, particularly with pilots that have inadequate training and hours of flight time. On the opposite side of the coin, these instruments are exceedingly useful when properly employed both in prehospital and interhospital care. It is this very latter question which is so difficult to really assess. The comments made by Dr. Mattox and by Dr. Nicola summarize the problem quite well. 1

Children's Orthopedic as a tertiary care center needs to have the ability to deliver critically ill or injured children to its door. For a small number in any years time, there needs to be direct transportation without an intervening additional ambulance ride. Children's Orthopedic Hospital has been placed in a residential area long years ago and, shy of moving it out of that area completely, the primary mission of the hospital has to be recognized. That time of discussion has long since passed. I am quite skeptical about the commentary made by the Children's Orthopedic administration. They tend to overinflate their importance and try to bulldoze the community into submission by waving the flag of suffering children. Dr. Nicola, I think, has a better handle on this and utilization figures that he discussed seem reasonable to me. The Laurelhurst Community, on the other hand, is equally over emotional in its opposition to helicopter flights and their attempt to simplify the transportation of critically ill children or adults to mere safety factors. I personally believe that there is a combination of points which are really the more satisfactory. One, I think Dr. Nicola's suggestion for limited access is quite good. On the other hand, I think the Children's Orthopedic Hospital needs to construct an adequately safe and permanent landing ground outside of its emergency entrance so that those limited permitted flights can arrive directly and safely without intervening ground transportation. 2 3

Lastly, I will send to you under separate cover what is only a working copy of WSMA committee dealing with helicopter standards. These are really not for publication yet, because they will be couched in terms of Washington Administrative Code in the relatively near future. Significant points however, are as follows:

1. Helicopter transportation or air transportation services should be integrated completely with the EMS program in the county of origin. 4

2. The dispatch should be under medical control and follows the same guide lines and criteria (and be integrated with) the dispatch guidelines existing in the County for land units. 5

3. The run reviews specifically should be reviewed by the County Medical Program Director or his designé. In a politically sensitive area like King County and the City of Seattle, I would advise that Dr. Nicola not only to do this himself, but make sure that a non involved [illegible] joins him in the review of these run records for appropriateness and quality of care. It would be totally inappropriate if the the review was only by Children's Orthopedic Hospital and the medical director for Airlift Northwest. 6

4. There is great concern in the Washington State Medical Association EMS Standards Committee for the safety of flights on emergency runs. We are currently looking at a recommendation of three thousand to four thousand pilot hours of additional training for EMS helicopter pilots. It 7

is felt that this additional training may well reduce the hazards. 7

5. It will be a point of the administrative code that the decision to lift off, will be that of the pilot's alone, protecting that pilot from the overzealous orders of the air transport unit's medical director. 8

It is my impression that allowing the Children's Orthopedic hospital to construct an adequate heliport for safety is necessary. It is also necessary in their conditional use permit to insist upon adequate run review, dispatch standards, preplanned interplay between the proposed helicopter unit and existing EMS systems to minimize "overutilization" and focus public attention on the appropriateness of air transport when it is properly used. 9

I would be happy to discuss any of these concepts with you or the draft material which I will submit to you as additional resource material.

Sincerely yours,

L.H. Pinkers, M.D. FACS

Dear Ms. Miller,

I attended the public hearing last Tuesday evening on the Draft Environmental Impact Statement for the proposed helipad at Children's Orthopedic Hospital.

As a result of that hearing I ask you, I beg you, to order a new draft that is less full of inaccuracies, specious judgments, undocumented conclusions, and prejudicial statements. I find it impossible to understand why DCL accepts an EIS prepared by a firm employed by one of the conflicting parties. An impartial draft is impossible under such a system. 1

Since the city bears responsibility for the document, won't you order a new draft in the interest of justice to both sides and urge that it be as accurate and impartial as is possible to obtain under the present system? 2

Very sincerely yours,

Helen R. Pinkney

Sept. 15, 1986

To Whom It May Concern:

Please incorporate the following comments into your EIS on the proposed Children's Hospital Helipad.

For starters, let it be known we are NOT opposed to the development of health care services generally at Children's Hospital. We applaud the expertise and care of this institution to children of the Northwest. 1

What we DO object to though is the unreasonable expansion of the hospital into the community under the guise of improved health care. It has NOT been clearly demonstrated yet that there exists substantial benefits to patients in helicopter transit directly to the hospital versus landing at Graves Field and being ushered into the care of an awaiting team of physicians, etc via an ambulance. 2

Secondly, are we to believe the hospital personnel that the helipad will be used for only extreme cases once the proposed service begins? Will the expense of this service be paid for by using the helipad route for non-emergent cases simply because its there and it's an "advanced " way to handle a case? Physicians in my neighborhood have serious doubts that either of the above two concerns are satisfactorily met with the proposed helipad. In our opinion it is high tech above reasonable judgement. 3

Next,we are angered with the arrogant attitude of COH displayed towards the community in resisting the proper channels of documenting their needs for the proposed helipad. Why have the administrators objected to complying with a standard documentation of need for this helipad? Are they concerned that we will become educated and protest this action en masse? Let's play by the rules of a free and open democracy and discuss the issue honestly and openly. 4

Lastly, we look to you to fairly portray our concerns and not be unduly affected by the deserved admiration of the entire community towards COH. Yes...they are a valuable part of the Northwest, but this stature must not obscure their responsibility to all our citizens to develop in a fair, honest way, accountable to all. We urge you to deny COH the helipad permit. 5

Sincerely,

Mark Plunkett Janette Plunkett

P.S. Please send a copy of the final EIS.

1. Comment acknowledged.

2. Please refer to the responses to Liz Anderson Comments #49 and 124.

   Children's believes the best alternative from a patient care perspective is that all patients transported to Children's by helicopter land outside the entrance to the Emergency Room; nowever, Children's further believes that without inordinately sacrificing patient care, the majority of Children's-destined patients can land at the Intramural Field, if allowed, or Harborview and then be transported to the hospital by ambulance. According to Dr. Nicola (see Appendix A), only the most critical patients would have a medical need to land at the hospital. These foundations are the premise of a new alternative (the Preferred Alternative) that is presented in the Final EIS.

3. Your opinion is acknowledged. The Preferred Alternative that has been advanced in the Final EIS is designed to allow only the most critical patients to land at the Children's campus. A Medical Review Committee, as described in Chapter III and Appendix C of the Final EIS, would review transports that land patients at the hospital in order to ascertain their medical appropriateness.

4. Please refer to the response to Liz Anderson Comment #53.

5. Your request for denial is acknowledged.

Thank you for your comments.

Re: Draft Environmental Impact Statement
for Children's Hospital Helistop
4800 Sandpoint Way N. E.
Application #8405870

Dear Director Miller:

I attended the Hearing on September 23, 1986 at the Laurelhurst Elementary School where ample evidence was presented to establish the fact this is only a commercial endeavor by the three hospitals. 1

I live on 42nd N. E. about half a block directly south of the hospital. The helicopters are presently still making landings in violation of City ordinances. Their approaches are often made directly over our house as they swing around into the hospital grounds. 2

I have called Ms. Greenawalt at the Hospital and she first tries the tear-jerking need to save lives. When pinned down she will not confirm that an extra ten minutes for the maximum possible use of Graves Field would make any difference. 3

Then she swings into their usual arrogant explosion of not needing a permit because of their size, and that the citizens of Laurelhurst will just have to put up with the problem.

PLEASE, in the interest of safety for the school, the school children, and home-owners in this area, do NOT issue a permit for this heliport, but leave it at Graves where it has been for many years. Also, be sure that the approaches are restricted to Union Bay and the playfield. 4

Thank you for your consideration in this very important matter.

Sincerely,

A. WESLEY ROBERTS

Department of Construction and Land Use
400 Municipal Building
Seattle, Washington 98104

OCT 17 1986

Dear Ms. Miller

The following are comments on the Draft Environmental Impact Statement prepared by Children's Hospital as part of its application for a permit to build and operate a helistop on its campus:

1. The DEIS contains information only on those Airlift NW helicopter flights that landed on the CHMC campus. During the past 15 months, the great majority of patients transported to CHMC via helicopter were landed at Harborview's helipad. The FEIS should include a full description of the total travel times (from the time the call for service was received until the patient entered CHMC), the flight times, the origins, the diagnosis and other pertinent characteristics of the patients and the reasons why the patient was not taken to Mary Bridge Children's Hospital for those cases where it was closer than CHMC (for all cases transported by helicopter to CHMC) since the service was initiated by Airlift Northwest. This data should be reviewed by a group of persons not directly connected with any of the actors and institutions involved in providing the transport service to ascertain the appropriateness and effects on the patient of the method of transport in each case. Particular attention should be give to revieving the experience gained with transferring patients at the Harborview helipad as it is expecially relevant to the analysis of the East Campus helipad alternative. 1

The results of this review should be included in the FEIS as should the basic elements of the data used by the review group. This review would provide a much better basis for making judgments about the need for the proposed helipad and its likely level of use in the future than is currently available.

2. A full discussion of the interrelationships between the medical and research activities at the UW Hospital and CHMC in treating pediatric patients is needed in order to assess the prospects for a helipad that could be used by both hospitals. Such a helipad could be located somewhere in the East Campus area of the UW. Since the UW Hospital is currently preparing a DEIS for a permit to operate a helipad on the roof of its new East Wing building, it is apparent that DCLU should require that both permits be considered jointly rather than sequentially. This is not a new idea. You will find several letters in the file that have suggested that DCLU require that these two permit requests be considered together. The DEIS has not given serious 2

consideration to the alternative that calls for a joint use helipad located somewhere in the East Campus area of the UW. The FEIS should contain a much more detailed investigation of this alternative. 2

3. The DEIS contains no discussion of the standards and procedures for dispatching the Airlift NW helicopter. Dispatching is a vital part of the operation of any EMS service and can strongly influence the frequency with which the helicopter is used, decisions regarding the use of MAST instead of ALNW helicopters, decisions regarding the use of MEDIC I or private ambulance vehicles instead of the helicopter and the selection of landing sites when a choice exists. Ideally, the dispatching of all EMS services in the Central Puget Sound Region should be centralized and integrated. This is particularly important with regard to helicopters which can range up to 150 miles (i.e. south to Portland and north to the Canadian border). When emergency transport is required, a well-trained dispatcher should be able to quickly determine which EMS service can provide the appropriate assistance at the scene most rapidly so that the patient can be properly stabilized for transport. The DEIS provides no evidence that this most difficult problem has been solved in a way that will assure that the needs of the patient are given top priority. The FEIS should provide such evidence because of the close relationship between dispatching standards and procedures and the prospective use of the proposed helipad. 3

4. The DEIS does not mention the capabilities of Mary Bridge Children's Hospital to handle emergency pediatric cases. Yet, even the scant data on the actual use of the helicopter shows that many of the patients flown via helicopter to CHMC could have reached the facilities at Mary Bridge Children's Hospital much sooner, even if they had been transported by ground ambulance. A comparison of the capabilities of both hospitals to treat emergency pediatric cases should be included in the FEIS. Without this information, sound judgements about the proper role of each hospital in the care of the emergency pediatric patients that arise in the region cannot be made. 4

5. Throughout the DEIS, no distinction is drawn between the needs of different kinds of patients. There are at least three types that ought to be recognized: neonates, infants and pediatric patients. Neonates have special problems that most infants and pediatric patients do not have. Yet the discussion of alternatives in the DEIS seems to assume that all patients are alike and have the same problems that neonates have. All patients do not arrive in an isolette and do not have the same intubation problems as premature neonates. Data are needed on the number of emergency cases expected by patient type before one can properly assess many of the questions raised regarding the transfer of the patient from the helicopter to a nearby ground ambulance. This 5

transfer requirement is a key issue in evaluating the East Campus helipad alternative. Neonates are already a very small proportion of the patient population that is expected to transported via helicopter. As the perinatal programs at UW Hospital, Swedish and other regional hospitals grow and develop, one can reasonably expect even fewer premature neonates to arrive by helicopter in the future. 5

6. An extensive assessment of the noise study included in the DEIS has been prepared by JGL Associates, Inc. located in Redmond, Washington. A copy of this study is enclosed with this letter. Its overall conclusion is that the noise study contained in the DEIS is quite inadequate and should be redone. As noted in the DEIS, there have been 21 landings on the COH campus during the past several months. If acoustical monitors has been installed inside and outside of several of the nearby residences during this period, some substantial amount of data would be available to assess the noise impacts associated with the operation of the Augusta 109. The noise testing accomplished to date by the applicant is clearly insufficient to provide the City Council with the information it needs to make its decision on this issue. This is especially true with regard to the Blackhawk helicopter that MAST expects to be using in the near future. 6

7. It is the purpose of an EIS to identify and describe the attributes of alternative solutions to the "problem" at some point in the future and then to compare them using a set of evaluation criteria. The results of this comparison provide a basis for the selection of the "preferred alternative" which is then normally discussed in some greater detail. The DEIS contains no such comparison, as the selection of the preferred alternative is identified early on in the document. This choice has not resulted from a careful and through comparison of alternatives. This deficiency should be corrected in the FEIS so that the City Council will have a clear presentation of the reasons why the Preferred Alternative is superior to the other possible solutions to the "problem". 7

8. The DEIS contains no discussion of the liability of the parties involved in the operation of the helicopter in the event of a crash in a residential or other populated area. It is known that Hospital Air Transport is required to carry liability insurance of $20 million dollars. Does this mean that Hospital Air Transport (headquartered in Beaverton, Oregon) is solely liable? Or, since Hospital Air Transport is a subcontractor to Seattle Jet, does Seattle Jet share in this liability? Are Harborview, Airlift Northwest, the other participating hospitals or the State of Washington liable in the event of a crash? It would be especially helpful to know how the insurer calculated the risk factors used to determine the premiums for this policy and who the insurer is. These questions are relevant to the safety issue and answers should be provided (in depth) in the FEIS. 8

227

9. Airlift Northwest has been bringing patients to COH via helicopter for about 15 months. There have been approximately 100 patients transported during this time. A review of the appropriateness of these transports conducted by an independent review panel should be included in the FEIS. This review should include at a minimum the following items: reason for transport, mechanism of injury or illness, interventions performed or maintained, outcome of patients transported and timeliness of transport. An analysis of these data by a well-qualified and credible panel would provide a much more reasonable basis for making judgments about the medical need and selection of destination hospital questions that are such key elements in matter. A case in point is data on the total travel time involved in these helicopter transports. How can one assess the disutility of the time required for a transfer at the UW East Campus area without being able to compare it with the total travel time involved? Does the transfer add 2%, 5% or some other figure to the total travel time? The DEIS does not contain this vital information. Please ask that it be included in the FEIS. 9 10

10. The forecasts of the probable use of the helipad contained in the DEIS are supported by no visible methodology. It is not reasonable to use data for the first 15 months of a start-up operation to extrapolate 10 years into the future. The only reasonable approach to this important problem is to forecast by analogy. This means that other Children's Hospitals that are similarly situated in a metropolitan area of comparable size that have some similarities in terms of topography should be located and their experience with pediatric transports over several years examined. Ideally, a population-based methodology should be developed that could be used to estimate the numbers of emergency cases that can be expected to be generated by a population as it evolves through time in response to the variety of factors that together define its demographic and socioeconomic characteristics. Examples of metropolitan areas that have characteristics similar to Seattle are San Diego, the San Francisco Bay Area, Portland and a few Eastern coastal cities. 11

11. The DEIS contains no references to the publication entitled Air Ambulance Guidelines published in May 1986 by the U.S. Department of Transportation and the American Medical Association. The FEIS should discuss in detail how the proposed air ambulance service would satisfy these guidelines. A copy of the table of contents of this publication is enclosed with this letter for your interest. 12

12. The DEIS includes a description of the time required for transport of a patient from Enumclaw to Children's (Table 3, page 18). This illustration should be modified to include the dispatch time for the helicopter which can be considerable. It should also include estimates for transport to Mary Bridge 13

Children's Hospital in Tacoma. If minutes do make a difference, then it may be that this patient would be better off being transported to the closer hospital. Beyond these obvious deficiences of this part of the DEIS lies the larger and more important question of how one defines the appropriate service area for helicopter transport. Dr. Nicola uses a figure of 75 miles as defining the distance from Children's within which ground transport is probably going to be superior. How many times has Airlift Northwest been used to transport patients originating within 75 miles of Children's since June of 1985? The FEIS should contain such data as well as several analyses of the comparative advantages of ground versus helicopter transport from several representative locations in Western Washington. It is obvious that if minutes matter, all but very exceptional patients from Bremerton and other Kitsap County locations should be taken to Mary Bridge Children's hospital via ground ambulance. Yet, the information in the DEIS suggests that just the opposite is happening - they are being taken to Children's via helicopter. Such comparative advantage studies are needed to establish service area boundaries for those few pediatric services available only at Children's and Mary Bridge. Once such service area boundaries are established, population-based forecasting of patient volumes becomes much more feasible and rational planning becomes more possible. 13 14

13. A serious deficiency in the DEIS is its total unconcern with where the helicopter is supposed to land when it is sent to some hospital in Western Washington. Since about 90% of the helicopter flights are supposed to be interhospital transfers, one must assume that every hospital in Western Washington will need a helipad. A survey should be conducted that will show how many of these hospitals now have or contemplate having a helipad. For those that do not now have a helipad and have no plans to construct one, some other suitable landing place that has the approval of the FAA and other local and state officials should be identified in the FEIS. 15

There is much information that is still needed before the City Council can be expected to make an informed decision on this issue and I hope that you will require that the DEIS be largely redone in the near future. 16

Yours sincerely,

Jerry Schneider

Attention: Mr. Jerry Schneider
Subject: Children's Hospital and Medical Center Helistop
Review of Noise & Vibration Studies

Gentlemen:

At your request I have reviewed the following documents relative to the previous noise studies prepared for the subject project:

232 Helipad Noise Evaluation for Children's Orthopedic Hospital
prepared by: Seton, Johnson & Odell, Inc.
dated: October 8, 1985.

Children's Hospital and Medical Center Helistop
Draft Environmental Impact Statement, Chapter IV, pp. 74-89
prepared by: Towne, Richards, & Chaudiere, Inc.
dated: September 1986.

Based upon this review, I have the following comments:

1. Determination of the existing ambient noise characteristics of the residential properties affected by the project is inadequate to accurately determine the acoustical impact. There are several reasons for this:

   a. The instrumentation used in the measurements is not suitable for determining the acoustical parameters of interest (i.e. Leq and Lmax). The B&K 2209 sound level meter can only display the instantaneous sound pressure level (slow or fast response); it is up to the operator to view the indicating needle and estimate "by eye" the average and maximum noise levels during the measurement period. | 17

   b. The measurement period at each location is inadequate to determine the necessary acoustical parameters with the required degree of accuracy. For this type of project the absolute minimum monitoring period should be 24 continuous hours at each location. The recommended monitoring period is 3 days at each location. The 10 to 15 minute measurement period used by Seton, Johnson & Odell cannot even begin to determine the necessary statistics about the existing Lmax levels in the area. The existing and predicted Lmax levels in the adjacent residential community is one of the most important parameters necessary to evaluate impact (particularly sleep interference). The DEIS suggests that existing Lmax levels are in the 75 to 85 dBA range. This should be verified by direct measurement. The short measurement period (along with the improper instrumentation) also lends considerable doubt to the accuracy of the Leq values reported. It is certainly presumptuous (and misleading) to publish an estimated monthly Ldn based upon less than 2 hours of data. | 18

   c. The ambient noise measurement locations are not adequately specified in either of the reviewed reports. The precise location of the microphone should be specified at each measurement location. From the verbal description presented in the Seton, Johnson & Odell report it appears that some of the measurement locations were inappropriate. For example, site 1 is said to be "in the parking strip on the east side of 44th Ave. N.E. between N.E. 47th St. and N.E. 50th St." Ambient noise measurements should never be made this close to a street because of the effect of street traffic. It is a well known fact that the Leq and Lmax levels close to the street are not representative of the levels which occur at typical house setbacks. I suspect that this same problem occurs with all of the five sites reported in the DEIS. | 19

2. Presumably, the helicopter noise tests conducted in May of 1985 were run to determine the pertinent helicopter noise descriptors as they pertain to the impact on the adjacent residential property. Unfortunately, the measurements were taken at only one point with only one landing/take-off, and the data was not analyzed for frequency content. The frequency content of the noise is critical if projections of interior noise levels are to be made. The interior/exterior noise reduction estimates presented in the DEIS and the Seton, Johnson & Odell report are taken from the EPA Noise Guidelines Document which is based on a national average for all types of noise. It is a well known fact that typical exterior construction provides more noise reduction at high frequencies (above 500 Hz) than low frequencies. The fact that helicopter noise has more low frequency energy than typical traffic noise would suggest that the interior/exterior A-weighted noise reduction values for helicopter noise would be below that of the national average for all types of noise. The only way to legitimately estimate the interior noise levels (without direct measurement, which is the preferred technique) is to measure the frequency content of the helicopter noise at carefully selected receiving locations as the helicopter goes through its typical operating maneuvers. From these data it is possible to calculate the interior noise levels as a function of frequency assuming typical exterior building construction for the residential area in question. A minimum of three landing/take-offs should have been measured (and tape recorded) in order to get an estimate of the frequency content and range of noise levels created by the helicopter due to slight changes in flight path, approach rate, and altitude. | 20

3. Estimates of the average exterior Ldn from helicopter traffic using the proposed helistop are based upon FAA noise test data which provides Lmax and SEL statistics for various maneuvers with the Agusta A109 Mark II. All noise level predictions are apparently based upon 100% use of this aircraft. If other aircraft are expected to use the facility, the noise levels and percentage of use for each of these aircraft should be factored into the analysis if an accurate assessment of the impact is to be made possible. 21

4. Estimates of the maximum exterior noise levels from helicopter traffic are based upon the field test conducted in May 1985 as well as the FAA data on the Agusta A109 Mark II. Unfortunately, the maximum noise levels presented in this report are not clearly reported. There are three different maximum noise level statistics in common use: 22

   i) Lmax (slow response). This is the maximum sound pressure level detected during a measurement period with the sound level meter time weighting factor set to "slow response". The "slow response" setting causes the meter needle to respond slowly to rapid changes in the noise level (missing the true maxima) and it is normally used to determine compliance with environmental noise ordinances. It should not be used to estimate actual maximum noise levels when sleep interference is an issue. It is commonly used with non-integrating sound level meters (such as the Bruel & Kjaer 2209 which was used by Seton, Johnson & Odell) because the indicating needle movement is too rapid to follow with the eye using other settings.

   ii) Lmax (fast response). This reading is similar except the meter time weighting is set to "fast response". Lmax values determined with the "fast response" setting are almost always higher than those taken with the "slow response" setting, and the difference between the two depends upon the nature of the noise.

   iii) Lmax (peak detector). This reading bypasses the rms detector circuit in the sound level meter and captures the true "peak" sound pressure level. This setting is normally used to measure impulsive noise, but it is of interest here because some researchers have conducted laboratory sleep interference studies using the peak A-weighted sound pressure level as the primary control variable.

   There is a significant difference between each of these noise descriptors (as much as 15 dBA between Lmax (slow) and Lmax (peak) for any one single event), and unless the existing and predicted future Lmax levels are based upon the same time weighting factor, it is not possible to assess the impact.

5. The methodology used to evaluate impact in the DEIS is generally appropriate, but there are two major omissions:

233

   a. The DEIS fails to compensate for the character of the helicopter noise. It is a well known fact that some types of sound create higher levels of annoyance than others even if the A-weighted sound pressure level of the two sounds is the same. Sounds containing single frequency components (tones) and impulsive sounds generally fall into this category. Helicopter noise is known to possess both of these characteristics. The City of Seattle Noise Ordinance accounts for this fact by applying a 5 dBA penalty in determining compliance. Even though emergency helicopters are exempt from meeting the requirements of the noise ordinance, it would be necessary to apply a similar penalty if the intent of the study is to determine true impact by the use of Lmax and Ldn noise descriptors. 23

   b. The DEIS fails to provide a projected helicopter noise contour map and a discussion regarding the geographical area of impact. Reading these reports one gets the impression that the helicopter noise will impact only the front row of houses directly adjacent to the helistop. This is probably not the case, and in fact, if a significant or moderate impact is expected at Site 1, I would expect the impacted area to include most of the homes bounded by N.E. 50th St. on the north, 46th Ave. N.E. on the east, and N.E. 45th St. on the south. 24

In summary, my opinion is that these noise studies rely too much on general data and not enough on information which is specific and relevant to the project in question. This is sometimes the case for an environmental checklist report, but it is not at all appropriate for an environmental impact statement. 25

If you have any questions regarding these comments, or if I can be of any further assistance, please give me a call.

Very truly yours,
JGL Acoustics, Inc.

Jerry G. Lilly

Jerry G. Lilly, P.E.
President

JERRY SCHNEIDER

1. Please refer to the response to Liz Anderson Comment #32 with respect to the presenting conditions of patients transported by helicopter to Children's.

   Please refer to the response to Liz Anderson Comment #50 with respect to overflight of other hospitals.

2. A full discussion of the interrelationships between the medical and research activities at the two institutions is not necessary to determine the environmental effects of a shared helistop. A helistop that could be shared by both institutions is discussed as the Intramural Field Alternative in the Draft and Final EIS and also as the Preferred Alternative in the Final EIS. The University Medical Center Rooftop Helistop Alternative also provides for shared use and is analyzed in this Final EIS. However, the Rooftop Helistop is not considered a feasible alternative at this time.

   Please refer to the response to Kate Hemer Comment #2.

3. See response to Liz Anderson Comment #77. The development of a regional plan for dispatching EMS helicopter services theoretically would reduce the potential for different helicopter services to "compete" for patients. In actuality, there are three primary EMS helicopter services that can transport patients in the Puget Sound area: Airlift Northwest, Med-Flight out of Bellingham, and MAST. MAST does not compete with private EMS transport systems. The Airlift Northwest service also provides benefits that are not available with MAST (see response to Liz Anderson Comment #92). Because transports are initiated by the referring physician, the selection of the most appropriate carrier is the referring physician's responsibility (see response to Jane Johnson Comment #5 in her letter of September 30, 1986). A central dispatcher or set of transport protocols that are available to referring physicians in the region could provide a benefit to their patients; however, an analysis of the value of an integrated central dispatching system is beyond the scope of this EIS.

4. Please refer to the responses to Liz Anderson Comments #50 and 58 for a discussion of the capabilities of the two institutions.

   It should be noted that Airlift Northwest transports are initiated by referring physicians. An analysis of the relative role of these hospitals in treating emergency pediatric patients is beyond the scope of this document.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

5. It is acknowledged that there are medical distinctions among the different types of patients being transported to Children's by helicopter. Irrespective of whether the patient is necnatal, infant or pediatric, the key distinction for the purposes of evaluating the helistop alternatives is whether for medical reasons the patient needs to be transported by helicopter and, if so, then does the patient need to land directly at the Children's campus.

   Administrative staff of Children's indicate that approximately one-half of the patients landing at the Children's campus are neonates. It is not known if this pattern would continue.

6. Please refer to responses to Comments #17-25 in this letter for discussion of these topics.

7. The purpose of the EIS is to provide the public and decision-makers with an objective discussion of reasonable alternatives, their environmental impacts, and mitigation measures that would avoid or reduce adverse impacts. The Proposed Action, as discussed in the Draft EIS, was one of three development alternatives evaluated in the document, along with a No Action Alternative.

   Subsequent to the issuance of the Draft EIS, a new alternative has been proposed. This new alternative would result in the majority of patients landing at Harborview or the Intramural Field, if permitted, with the most critical patients landing at Children's campus. This alternative is advanced as the Preferred Alternative, as it reduces noise and risk of accident for the neighborhoods surrounding Children's without inordinately sacrificing patient care. No decision has yet been made as to which, if any, alternative will be approved.

8. See responses to Liz Anderson Comments #29, 35, and 44.

9. DCLU requested that Dr. Nicola assist DCLU in its deliberations regarding the medical need for the helistop. In response, Dr. Nicola stated that a "review of the case files of the children flown directly to Children's indicates that with one possible exception, all presented life-threatening conditions that warranted transport right to the doors of the hospital. Review of 30 additional randomly selected cases flown by helicopter to Harborview for ground transport to Children's shows that all cases met the State's proposed criteria for use of air tranport but were less severe than those flown directly to the hospital" (Nicola, 1987). Please refer to the response to Central Seattle Community Council Comment #4.

10. The relative disutility of the additional time and manipulation associated with the transport of a patient from the Intramural Field site to the Children's Emergency Room entrance has less to do with the percentage of the total transport time that this transfer represents than with the medical condition of the patient. A review of what

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

percentage of time traveled would have been represented by the transport of patients from the Intramural Field site to Children's is not within the scope of this study. Please refer to the response to Liz Anderson Comment #37 with respect to transport time savings.

11. Please refer to the response to Liz Anderson Comment #26.

12. This document was examined for the preparation of the Final EIS. A detailed examination of Airlift Northwest's consistency with the voluntary guidelines is outside the scope of this document. It should be noted, however, that the consistency of Airlift's operations with AAMS and NEMSPA guidelines has been addressed and is incorporated into Appendix C of the FEIS.

13. Please refer to the response to Liz Anderson Comment #38.

14. Dr. Nicola indicated in his original report to DCLU that "Less than 70 miles, depending on geography, ground transport is the generally agreed preference." Because of topography and the characteristics of the road/ferry networks, distance is not the only factor that influences travel time. In his revised report to DCLU, Dr. Nicola deleted the reference to a distance limit.

    Airlift Northwest is a service that allows specialized medical teams to reach patients and also to enable referring physicians to transport their patients to advanced care facilities. Airlift Northwest transports patients to the facility identified by the referring physicians. This facility may be Mary Bridge. Please refer to response to Liz Anderson Comment #58.

    This document is not intended to address the environmental impacts of the provision of an air ambulance service. Please refer to the response to Kate Hemer Comment #3.

15. An examination of potential landing facilities at other hospitals in western Washington is beyond the scope of this study.

    The proposal is for the approval of a helistop to enable critically ill and injured patients to be transported to Children's.

16. Please refer to the response to Ruth Engelberg Comment #1.

17. The instrumentation used in the measurements is suitable and is commonly used in the acoustics profession to measure the acoustical parameters of interest (i.e., Leq and Lmax). The operator does not estimate "by eye" the average and maximum levels. Instead, the instantaneous sound level displayed by the sound level meter is tabulated by the operator at fixed intervals, such as every ten seconds. These levels are then used to calculate the Leq and other descriptors of interest. The Lmax is at least as high as the highest

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

sound level recorded, but may be higher if the number or duration of events causing Lmax is small relative to the number of measurement samples. In such cases, the Lmax can be estimated by knowing the types of noise sources that would typically cause the Lmax (e.g., trucks, buses or aircraft operating at known distances from the receiver). The noise measurement procedure and method for determining existing noise are consistent with recommendations of Guidelines for Preparing Environmental Impact Statements on Noise (National Research Council, Committee on Hearing, Bioacoustics and Biomechanics, 1977).

The technique for measuring existing noise used by Seton, Johnson & Odell, Inc. (SJO) was to sample the instantaneous sound level at 10-second intervals over four 10- to 15-minute periods separated by approximately six hours. The 60 to 90 samples for each period were used to calculate the equivalent sound level, Leq, for the period. The Leq's for the four periods were then used to calculate the day-night average sound level, Ldn. This measurement procedure is a commonly accepted procedure that is consistent with recommendations on pages IV-7 and IV-8 of the National Research Council guidelines. In locations such as those near Children's, existing noise is substantially the same from day to day, since the noise is caused primarily by well-established motor vehicle traffic patterns. At such locations, noise measurements during a single 24-hour period are considered adequate, based on the guidelines.

The SJO measurement procedure did not provide true measurements of existing maximum sound levels, Lmax, because of the limited number of measurement samples and the brief and infrequent occurrences of the noisiest events during each day. The National Research Council guidelines do, however, allow prediction of existing noise based on current noise source data, as was done in the Draft EIS, to estimate the existing Lmax based on U.S. Department of Transportation motor vehicle noise emission data.

18. See response to Comment #17, above, for a discussion of the measurement procedure and method for determining existing noise.

There is no strong evidence that Lmax is "one of the most important parameters necessary to evaluate impact." Noise impact criteria used by governmental agencies, such as the U.S. Environmental Protection Agency (EPA), U.S. Department of Housing and Urban Development (HUD) and U.S. Department of Transportation (DOT), are not based on the Lmax, but instead are based on the average energy descriptors Leq and Ldn. The reason for adoption of these descriptors rather than Lmax is the overwhelming evidence from studies over the past 15 years that activity interference (including sleep interference) and annoyance reactions correlate most closely with average or cumulative sound energy, as measured by Leq and Ldn, whereas correlations with Lmax and various other noise descriptors are not as good. Although some researchers have proposed use of an Lmax noise descriptor, social surveys have

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

indicated that the noise impact correlation for this descriptor is especially poor.

The Lmax has been used in studies of sleep interference. These studies have been conducted under a variety of conditions. For example, some are laboratory studies in which subjects are motivated to awaken in response to noise, whereas others are conducted in residences or institutions. The types, levels and durations of sound have differed from one study to the next. The thresholds and rates of sleep interference relative to sound level, therefore, have been variable from one study to the next, as shown by the differences between Figures 10 and 11 in the Draft EIS and Figures 19 and 20 in the Final EIS. There are no commonly accepted criteria for sleep interferences or other environmental impacts based on Lmax.

Criteria based on the Leq and Ldn descriptors are commonly accepted by acoustics professionals and governmental agencies. They, nevertheless, have been difficult to accept by some lay persons and consultants who believe that an average sound level does not show "true" impact of noise, since individual noise events become a part of an average. It should, therefore, be noted that Leq and Ldn are not arithmetic averages of the sound level, influenced equally by the lower and higher sound levels, but are instead more heavily influenced by the higher noise events. It also should be noted that criteria using Leq and Ldn were developed initially using aircraft noise and, therefore, intermittent higher sound levels, rather than the more constant surface traffic noise. The use of Leq and Ldn descriptors, and the concept that impacts of noise (whether steady or fluctuating) are best gauged by the average or cumulative sound energy, are today generally accepted throughout the world.

19. Measurement Locations 1 and 2 were in parking strips along 44th Avenue N.E. and 45th Avenue N.E., respectively. These streets are residential streets with relatively light traffic. Based on the small amount of fluctuation as indicated by standard deviation in measured sound levels at these two locations (see Table 2 in the SJO report), it is evident that the measured noise was caused by distant arterial traffic on Sand Point Way and N.E. 45th Street, not by local traffic. The measured noise at the two locations, therefore, would be similar to the noise at a house setback.

The remaining three measurement locations were at representative residential distances from Sand Point Way N.E., the predominant noise source in the area.

The estimated existing Lmax discussed in the Draft EIS were for receptor location 15 meters (about 50 feet) from traffic, not locations in parking strips.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

20. Measurements of the frequency content were requested from the manufacturer of the Agusta 109 Mark II, but were not available. The frequency content for the Bell UH-1V, however, were provided by Bell Helicopter. The Bell would be expected to have more low frequency noise than the Agusta, since it does not have the low-noise design features of the Agusta for controlling the low frequency blade noise. The Bell data indicate that the octave band sound pressure levels at the low frequencies of 31.5 and 125 hertz are 10 dB and 2.5 dB higher, respectively, than the A-weighted sound level. Measurements of surface traffic noise by Towne, Richards and Chaudiere, Inc. and others indicate that octave band sound pressure levels at 31.5 and 125 hertz are about 1 to 3 dB and 2 to 3 dB higher, respectively, than the A-weighted sound level. (For trucks, however, the low frequency noise is higher still.) Therefore, the primary differences between the Bell helicopter spectrum and a typical traffic spectrum with similar A-weighted sound levels is the Bell's 7 to 9 dB higher sound pressure level compared to traffic noise at 31.5 hertz.

The typical outside-to-inside sound level reduction of residences in the Northwest is 25 dBA. The outside-to-inside sound level reduction in the 31.5 hertz octave band is about 10 dB less than the sound level reduction of A-weighted levels, based on measurements by Towne, Richards and Chaudiere, Inc. in 12 rooms with different window configurations.

In calculating the 31.5 hertz octave band's contribution to the A-weighted sound level, 39 dB is subtracted from the 31.5 hertz octave band sound pressure level because of the human ear's relative lack of sensitivity at this low frequency.

Considering all of these factors, the indoor A-weighted sound level contribution of the 31.5 hertz octave band for the Bell UH-1V producing an exterior A-weighted sound level of 84 dBA would be 84 plus 9 minus 25 plus 10 minus 39, or 39 dBA. The A-weighted indoor sound level, including all of the higher frequencies, would be 84 minus 25, or 59 dBA. Because of the way sound levels combine, the 39 dBA contribution of the 31.5 hertz low frequency octave band increases sound levels by only 0.1 dBA compared to the 59 dBA contribution of the higher frequencies. This amount of increase is imperceptible. The contribution of the low frequencies also would be small with windows partly open for ventilation. The fact that the Bell helicopter has more low frequency sound energy than typical traffic noise, therefore, does <u>not</u> have any significant effect on the predicted interior sound levels.

The SJO report indicated that helicopters configured similarily to the Agusta have sound pressure levels in the 31.5 hertz octave band, which are 0 to 10 dBA lower than the A-weighted sound level. Low frequency noise is, therefore, expected to have less effect with the Agusta, which would be the aircraft used in the vast majority of the transports.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

21. For the purpose of this analysis, it is estimated that approximately 10% of the flights would be MAST Bell UH-1V helicopters (which rarely would land on the Children's campus), and about 90% Airlift Northwest Agusta 109 Mark II helicopters. The A-weighted noise emissions of these two helicopters are not significantly different. For example, noise monitoring at Harborview Medical Center indicated that the sound levels were similar for landings, and that the MAST helicopter was 3 dBA noisier when taking off. These small differences, and the fact that MAST flights would comprise less than 10% of total flights, would have negligible effect if factored in.

22. The measurements discussed in the Draft EIS were made on either a "slow response" or "fast response" sound level meter setting. Environmental noise measurements are generally made using the "slow response" setting, which has a time constant of 0.5 seconds. Sometimes a "fast response" setting is used in situations where there may be rapid changes in sound level. The "fast response" time constant is 0.25 seconds. If measuring a single brief noise event lasting only a fraction of a second, the "fast response" setting would usually give a slightly higher reading than a "slow response" setting. When measuring traffic noise or helicopter noise, however, there would generally be no difference between the "slow response" and "fast response" readings.

    The "peak" meter setting was not used in the Draft EIS study. The "peak" time constant is 50 microseconds (50 millionths of a second). This time constant is primarily used to measure very short impulse noises caused by blasts, gunshots or metal-to-metal impacts in industry. The peak linear sound pressure level of these short, high-level noises is used to evaluate their potentially damaging effect on structures or on hearing in the 3,000 to 4,000 hertz frequency range, which are critical for speech intelligibility. The current occupational noise limit for impulse noise is 140 dB measured on the peak linear setting. A safe airblast level for structures is about 135 dB. The proposed helistop would not result in sounds calling for measurements using the "peak" setting.

    Researchers often use the term "peak A-weighted sound level" incorrectly when they are in fact referring to a maximum A-weighted sound level, Lmax, measured using either the slow or fast meter setting. This common but incorrect usage of the term "peak" should not be confused with the "peak" meter setting and its limited applications.

23. Helicopter noise is usually considered to be impulsive because of its discrete blade passage sounds. Towne, Richards and Chaudicre, Inc. are unaware of any evidence that there would be single frequency tone components. It is currently the common practice not to include any tone corrections when evaluating A-weighted aircraft noise.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

As discussed in the Draft EIS, research to determine whether an adjustment should be made to the sound level based on the impulsivity of the helicopter sound has led to conflicting results. The current position of the FAA and the International Civil Aviation Organization is that an impulsivity adjustment is unnecessary to certify aircraft properly and assess human response adequately.

It is not clear that the blade noise from the Airlift Northwest Agusta 109 Mark II, which would comprise at least 90% of the flights, should be considered impulsive. Because of the persistence of auditory stimuli, sound separated in time by less than 50 milliseconds (thousandths of a second) are not heard as discrete signals, but merge into a single signal. The Agusta, with four-bladed roto., operates at 393 revolutions per minute, which yields a blade passage interval of 38 milliseconds. The blade sound of the Agusta helicopter, therefore, would be heard as something approaching a single, continuous signal.

The MAST Bell UH-1V with two-bladed rotor operates between 294 and 324 revolutions per minute, which yields a blade passage interval of 93 to 102 milliseconds. The blade sound of the Bell helicopter, therefore, would be heard as discrete signals and considered impulsive. It should be noted, however, that the Bell UH-1V would comprise less than 10% of the flights, and that MAST is currently planning to replace the Bell UH-1V with a Sikorsky UH-60, which has a four-bladed rotor and, according to FAA data, is slightly quieter than the Agusta 109 Mark II.

24. The Draft EIS analysis is a "worst case" analysis that evaluated impacts at the residential and hospital locations closest to the helistop. The few nearest residences would be within about 200 feet of the flight path. For each doubling of distance from the flight path, helicopter sound levels are reduced by 4 dBA or more (for Leq and Ldn) to 6 dBA or more (for Lmax). Residences even one block away, therefore, would receive significantly less helicopter noise than the nearest residences. This difference is evident by comparing the predicted helicopter noise at Location 1 and the more distant Location 2.

25. The noise studies relied on:

    a. measurements of existing sound levels at five locations near the helistop site, selected in coordination with the City of Seattle Department of Construction and Land Use and the Seattle-King County Department of Public Health

    b. identification of the exisiting noise-sensitive land uses and of existing noise sources and sound levels in the site vicinity

    c. identification of the noise standards, guidelines and governmental policies that might be applicable to this project

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

d. field measurements of the helicopter noise at Children's and at Harborview Medical Center

e. development of detailed flight path and flight speed data for Children's and the alternative landing sites, and development of preferred flight paths, based on several meetings and communications with the helicopter operators

f. independent predictions of helicopter noise by SJO using helicopter noise data measured at Children's, and by Towne, Richards and Chaudiere, Inc. using Federal Aviation Administration (FAA) measurements verified by additional measurements made at Harborview Medical Center

g. evaluation of noise impacts using EPA noise impact criteria, sleep interference data, and various governmental criteria.

The letter of comment from the Seattle-King County Department of Public Health in this document indicates the noise information is adequate.

Thank you for your comments.

Dear Ms. Gibb:

It is time to resolve the question of making it possible for critically sick children to be lifted by helicopter to Children's Orthopedic Hospital and Medical Center. Any critically sick child residing in the vicinity of Puget Sound or areas depending on bridge access risk not reaching the Hospital in time to save a life, with the expertise offered there by its physicians, surgeons, and equipment. 1

It only requires the imagination of a parent or grandparent to find the answer which resides in the use of a tool like the helicopter to save a life.

Sincerely,

Emilie Schwabacher

DEPT OF CONSTRUCTION & LAND USE
LAND USE DIVISION

Ms. Holly Miller, Director
Department of Construction and Land Use
408 Municipal Bldg.
Seattle, WA 98104

Dear Ms. Miller,

I have just returned to Seattle after nine months of teaching at Shanghai University in China. As on my previous trips to China, I was deeply impressed with the friendliness and perseverance of the Chinese people. But, much more than on my earlier trips, I was impressed with the absolute power of the Chinese government.

I mention the above only because of the resemblance of the methods used by the Chinese government and those methods used by the Children's Orthopedic Hospital in its recent project - the helistop. The methods I mean are secrecy and almost total disregard for the consensus of the citizens concerned.

1. Secrecy - Unlike past COH expansion projects for which somewhat advance notice was given to the community surrounding the hospital, the helistop was shrouded in mystery from the beginning. Only after the understandable indignation of the community was aroused two years ago did COH slowly acknowledge a vague outline of their plans to fly helicopters "a few times a month" into the densely populated area around the hospital. Recently we have been told that the hospital administration has admitted that flights may occur as frequently as 80 times a month. 1

COH has repeatedly refused to give information or else has given only partial or misleading information to persons asking about the legality and funding of and the adequate exploration of alternatives to the helistop. 2

2. Disregard for Citizens - After a demonstration flight for which little advance notice was given and in which a light, single-blade helicopter landed at COH, large double-blade helicopters have begun to land at the hospital before even the most preliminary requirements (i.e. the draft EIS) have been considered fully. 3

The statements above cannot begin to encompass the myriad powers COH has assumed in its campaign to install its helistop. Yet these statements are adequate evidence of the kind of battle being waged by COH with its undisclosed moneys to hire lawyers to try to justify its goal - and all under the guise of helping little children.

A neighbor of mine said recently, "Would it be possible to set up a small airport in downtown Seattle without meeting every require- 4

Business/Asia
4339 NE 45 Street
Seattle. WA 98105
USA

ment for safety and for environmental concern?" The answer is obvious. Yet this is just what COH is determined to do. And the losers in the establishment of this thinly-veiled marketing device, should a helicopter accident very possibly occur, will be the neighbors along the flight path, the children at nearby elementary schools, and the little patients that COH has promised to protect.

We are not living in China. This is supposedly a free country where the voice of the people counts for a lot. Our city government must realize the truth about a helistop at COH, no matter how smoothly its supporters speak. A helistop at COH is unnnecessary, unjustifiably expensive, and clearly dangerous to the community, most of all to the children in COH itself.

Sincerely,

Joy Scott

JOY SCOTT

1. Please refer to the response to Montlake Community Club Comment #2.

2. Children's has cooperated with the regulatory agencies in providing the information necessary to consider the required permit applications.

3. Children's scheduled the demonstration for the benefit of Dr. Nicola, so that he could observe Airlift Northwest landing procedures for the purpose of preparation of his report to DCLU. Since the flignt referred to was not intended as a public demonstration, Children's did not provide advance notice to residents regarding the flight.

   The Agusta 109 used for the demonstration flight has been used for nearly all of the helicopter transports directly to Children's campus. The four-bladed Agusta rotor creates less impulsive noise energy than a rotor with two blades. (See response to Jerry Schneider Comment #23.)

4. A similar sized helistop proposed for a downtown Seattle location would be required to undergo environmental review. The City of Seattle issued Environmental Declarations of Nonsignificance for helistops on Elliott Avenue and Airport Way that would be used more often than the Children's helistop.

   An inventory of existing helistops and pending applications for helistops and heliports in Seattle has been incorporated into Chapter IV of this Final EIS.

   Your opposition to the project is acknowledged.

   Thank you for your comments.

Re: COH's Proposed Helipad Draft Environmental Impact Statement

Dear Ms. Miller:

One environmental impact that should be addressed, because it is of great concern to the city and its people, is the liability incurred by the City if the Impact statement were approved.

Does the City have liability insurance? Would the insurance premiums rise if the Helipad goes into operation? Would the city incur liability in case an accident occurred -- liability because the City failed to enforce its laws on land use. 1

I believe the City may currently be exposed to great risk of liability because knowledge of risk exists but landings are now taking place. Even if permits were issued, the City would still be at risk because it could be argued that the City was negligent in issuing a permit. Just what is the City's exposure and what is its insurance situation? 2 3

These questions should be addressed and brought to the attention of those responsible for making decisions about land use.

Sincerely yours,

Robert Haney Scott

Dear Miss Miller,

I wish to inform you of our objection to the proposal by Children's Hospital Hospital to construct & use a helipad at their site. We, as long time residents of this once quiet residential neighborhood, are so very concerned. The objections at the hearing by the D.C.L. were the same as ours:

Safety factor - dangerous flight over school, condominiums & private homes.
Weather factor - Pilot error
Expense to patient - $2000.00 per hour
Need for frequent landings - one to pick up pedestrian team, depart, one to land & discharge patient & one to depart.
Heat of turbulence to a newborn baby.
Horrendous noise over neighborhood.

BARBARA H. SMITH

1. Your objection is acknowledged.

2. Although safety is an important factor, the Airlift Northwest helicopter would not fly directly over neighborhood schools. The helicopter, however, would follow a flight path close to dwellings, particularly on those rare occasions when the secondary approach and departure paths are followed. See Chapter IV of this Final EIS for an updated analysis of helicopter safety.

3. Please refer to the response to Ruth Engelberg Comment #11.

4. See response to Kate Hemer Comment #12.

5. The four flight segments per patient transport are characteristic of the Proposed Action. One mitigation measure that has been implemented already is to have the medical team based with the Airlift Northwest helicopters located at Harborview or Boeing Field. In the event that a specialized medical transport team is located at Children's, those team members could be picked up at Children's or the Intramural Field. Thus, only flight activity that would occur at the Children's helistop would be to deliver the patient and then to depart.

6. See response to Bart Baxter Comment #7.

7. Noise is addressed in Chapter IV of the Final EIS.

8. Please refer to the response to Liz Anderson Comment #53.

9. Please refer to the response to Liz Anderson Comment #124.

10. Your opinion is acknowledged. Especially complex illnesses and injuries may exceed the ability of some personnel at community hospitals to stabilize the patient.

Thank you for your comments.

Re: Proposed helipad at Children's Orthopedic Hospital & Medical Center (COH)

Dear Ms. Miller and Ms. Julie Gibbs:

In addition to the recorded testimonies heard at the draft EIS hearing held 9-23-86 in the Laurelhurst Elementary School auditorium, and in addition to previous letters from me, please read and add this letter to your permanent files on the above-named issue.

By definition, the word environment means "one's surroundings or external circumstances collectively." Be it noted in the draft EIS on the proposed helipad at COH that the phrase "no significant impact" is repeatedly used per page. "No significant impact" is not the same as "no impact," which phrase is not used. Collectively, the repeated "no significant impacts" add up to great cumulative impact on the surrounding neighborhood--the environment of individuals, families, school children. 1

The draft EIS document is inadequate coverage of the serious impacts on the neighborhood. It is based on faulty research and statistics. Dr. Nicola is often quoted--and he quotes himself as reference. The document shows a strong bias (COH); it is not an objective, impartial review; it does not equally present the two sides. I hereby concur with specific citings and details and examples to support the claim of deficient data as presented in testimonies at the 9-23-86 public meeting. the the draft EIS 2

The most serious problem is that of safety (or lack of same). Frequency rate of helicopter crashes exceeds other aircraft as well-documented nationally by news media (magazines, newspapers, radio and TV). Factors causing crashes include pilot error, pilot fatigue, obstructions (such as power lines, building and trees), weather conditions. 3

The proposed landing site is located in a high-density, residential neighborhood including: single-family homes; an elementary school (200 children plus faculty and staff); Laurelon Terrace Condominiums (136 units); Laurel Crest Condominiums (82 units); Laurelhurst West Condominiums (54 units). The Laurelon Terrace units are contiguous to COH property and helicopter site. The 60-80 landings--estimated at 15-20 patients per month with 4 flights-landings for each patient--would be a mini-airport in our midst. It would be like a helicopter landing on Laurelon Terrace rooftops or landing in Laurelon residents' yard. These could occur any time day or night. 4

A helicopter crash at COH site would kill: patient, pilot, medical personnel aboard; children and personnel in COH; neighborhood residents; school children. 5
In addition to loss of life and property damage, fire could rage as a result of a crash on this site. An oxygen tank and a natural gas main are located near site on COH property. 6

Weather is another factor which could cause crash. Weather is unpredictable, uncontrollable, including wind, fog, mist, rain making for poor visibility. 7

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

-iler and Gibbs; from Spangler

Noise of the helicopter is far greater than traffic--auto or ambulance (latter shuts off siren in neighborhood). Helicopter noise decibels are above health and acceptability levels for individual residents, school classes, hospital patients' welfare. 8

Another real concern is the lack of standards for decision-making processes involved in helicopter usage and flights. Lack of designated/named responsible persons to make decisions is a serious flaw in the proposed plan(s). 9

I am also concerned about the lack of reference related to insurance. For example: Who carries policy/policies? Who pays the premiums? What is the amount of coverage? Who and what is covered? 10

The extreme expense related to initiation and maintenance of helicopters and their services is another concern. The millions spent on this marketing tool to be competitive with other hospitals could and should better be spent on patient care, programs, personnel, research. Duplication of these expenses across city and state as hospitals compete for business is wasteful and wrong. 11

The helipad proposed at COH is just one more example of institutional encroachment in a residential neighborhood. The helipad would be a veritable mini-airport wantonly endangering the lives of hundreds of residents each time a flight was made (often circling several times--losing precious time--over homes, condos, school before landing at a rate of approximately 1,500 feet per minute endangering the life of baby patient aboard). 12

In the face of mounting evidence of: (a) the unsafe record of factors involved in medical helicopter crashes; (b) the uncertain benefit derived from usage of helicopters for critical patients--documented by the medical profession; (c) the lack of standards for decision-making; (d) the excessive expense of helicopters; and (e) strong and widespread community objection, this proposal must be rethought and cancelled permanently. 13

I thus recommend:

1. <u>Absolutely NO helicopter landings at COH</u>.

2. OOH and University Hospital-UW Medical School cooperatively construct and use a helipad on UW soccer field or adjacent UW land only if a need can be proved for this unsafe and expensive service. (The jostling and rapid descent by helicopter is far more injurious to patient than ambulance transport -- Seattle ambulance service second to none in the nation.) 14

   The University Hospital and UW Medical School currently are doing and plan to expand research on COH campus. COH could share a helipad with University Hospital on UW property where the approach is wide open. It is ridiculous that there be two helipads within one mile of each other.

We all -- citizens, neighbors, COH--have a moral responsibility to <u>STOP TRAGEDY BEFORE IT HAPPENS</u>. A helipad at COH must not be further considered a viable option and never constructed. Helicopter landings in parking lot and/or any part of COH grounds must not be permitted, must be stopped. 15

Thank you.

Sincerely,
Maryann E. Spangler

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

1. For the purposes of complying with SEPA, the City defines environment as "... those elements listed in [SMC] 25.05.444, as required by RCW 43.21C.110(1)(f). Environment and environmental quality refer to the state of the environment and are synonomous as used in these rules and refer basically to physical environmental quality." It is acknowledged that "no significant impact" is not the same as "no impact;" however, those elements that are judged to have no significant impact do not combine to result in a significant cumulative impact. The elements that have been determined to have potential significant adverse impact were determined by the City of Seattle and are the topics of this EIS.

2. Your concurrence with the statements regarding the data that were presented by commentors at the public hearing is acknowledged.

3. The EIS identifies that the frequency of EMS helicopter accidents has exceeded the frequency of helicopter accidents, as a whole. See Chapter IV of this Final EIS for updated analysis of helicopter safety.

4. Children's is located in an urban residential area. Discussion of the land uses that are in the vicinity of the alternate helistop locations and flight paths has been incorporated into Chapter III of the Final EIS.

5. An EMS helicopter accident at Children's may or may not involve fatalities, injuries or property damage.

6. With respect to the oxygen tank please refer to the response to Liz Anderson Comment #11. With respect to the natural gas meter house please refer to the responses to Liz Anderson Comments #46 and 243, and Anita Francis Comment #53.

7. Please refer to the response to Ruth Engelberg Comment #11.

8. As presented in Table 18 of the Draft EIS and Table 19 of the Final EIS, the noise levels of the helicopter landing or taking off (Lmax) are greater than the average conditions (monthly Ldn) at all receptor locations. The Lmax, however, at each receptor location was not always caused by the helicopter; some other noise source, such as a particularly loud vehicle, may have been the cause of the loudest sounds measured at three receptor locations (along Sand Point Way N.E. and on N.E. 45th Street). Section 25.08.510 of the Seattle Municipal Code exempts emergency vehicles from the Seattle Noise Ordinance.

9. Medical and aviation decisions are being made by the referring physician, the medical transport team, the Airlift Northwest Medical Director, and the pilots, all of which are responsible for components of the flight and/or medical care. The Washington State Medical

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Association has generated guidelines to assist in the decision of selecting an appropriate transport mode. FAA has regulations for aircraft, pilots and design guidelines for helistops. NEMSPA and AAMS have developed guidelines with respect to aeromedical services (see Appendix C for Airlift Northwest's consistency with these guidelines).

10. See responses to Liz Anderson Comments #29 and 44.

11. Airlift Northwest was initiated to provide a service to referring physicians throughout the region. Please refer to the response to Liz Anderson Comment #23 with respect to helicopters as a marketing tool. Please refer to the responses to Liz Anderson Comment #269 and Anita Francis Comment #59 with respect to competition. It is acknowledged that the duplication of Airlift Northwest services would generate competition and might have adverse financial impacts on health care.

12. Noise from the aircraft would encroach upon the neighborhood. The aircraft in its approach to the helistop descends at a rate of 1,500 feet per minute. It does not land at that descent rate.

13. Your opposition to the landings of helicopters at Children's is acknowledged.

14. Your recommendation that a shared (Children's and University Medical Center) helistop be constructed and used, if the need can be proved, is acknowledged.

    Please refer to responses to Bart Baxter Comments #7 and 9. The jostling of the patient caused by aircraft vibration is expected to be minimal in the Agusta. If the medical outcome of a patient would not be affected by the availability of a specialized medical transport team provided through Airlift or by reduced transport time to advanced care capabilities, then ground ambulance would be a superior mode of transport for the patient.

15. Your opposition to the landings of helicopters at Children's is acknowledged.

    Thank you for your comments.

October 13, 1986

Polly Miller
Director, Dept. of Construction and Land Use
408 Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

I am concerned about the proposal to allow construction of a helipad in the Laurelhurst community on the Children's Hospital grounds. Making this decision involves balancing the resulting disruption and safety risk to the transported patients and to the neighborhood against the benefit that patients might receive from transport that would be more rapid than that by ground. The decision has greater than simply local implications, in that many other hospitals in the state are clearly interested in transporting patients to their institutions by helicopter as well. Others will look to this decision for guidance. It will become a precedent, whether justified of not. 1

My overriding concern about this situation is that the EIS is not the proper forum in which to consider this decision. Unfortunately, it appears that it is the only approval that Children's will be required to obtain. Assessment of the environmental impact cannot adequately address issues of medical need and medical decision-making, which are the real issues in this case. However, since medical justification of this undertaking is addressed in the text and in Dr. Nicola's appended letter, I wish to take issue with some of the conclusions reached, and request some revisions. 2

I have reviewed the literature cited in the EIS and Dr. Nicola's letter regarding medical justification, and disagree strongly with the conclusions reached. The EIS clearly states (p. 8) that Children's Hospital is not a trauma center, and that emergent trauma and burn cases in children go to Harborview. Therefore, the patients for whom Children's is requesting their helipad are critically ill children and neonates outside of the trauma or burn setting. The literature cited in the EIS and Nicola's letter, however, examines primarily helicopter transport of trauma victims. The only studies allowing conclusions to be drawn about whether helicopter transport of patients is better for them than ground transport deal soley with trauma cases. The only study cited outside of the trauma setting is mentioned in passing in Dr. Nicola's letter, but not commented upon. (p. 3: Resp Ther 15(2): 47-50, 1985). This is published in a journal that is not considered of 3 4 5

JOHN B. STIMSON, M.D.
4710 40TH AVENUE N.E.
SEATTLE, WA 98105

sufficient quality to be carried by the Health Sciences Library at the UW (approximately 3300 journals carried), or the respiratory therapy departments of the University of Washington, Harborview Hospital, or the VA Medical Center. It is viewed as more of a magazine than a scholarly journal. 5

The justification offered for construction of the helipad, therefore, is no justification at all. I ask that the DCIU alter their sections of the EIS on pages 19 and 20 to state clearly that, although some trauma cases appear to benefit from helicopter transport, there is no published evidence that such transport of non-traumatized children or neonates improves, or in fact is not detrimental, to their health. In addition, it would be appropriate to ask Dr. Nicola to re-examine the literature and direct his conclusions to the type of patient that Children's proposes to transfer, rather than to helicopter transport in general. 6

The latter possibility, that helicopter transport could be detrimental to some patients, is quite real. (Am Med News, p. 33; Sept 5, 1986). This evidence has appeared since Dr. Nicola's letter, and I cannot fault its omission, but I think it should now be included and addressed. 7

Lastly, table 2 in the EIS (pp. 14-16) is extremely misleading, and should be corrected or clarified. Attatchment "A" suggests that about 20% of patients transported in 1985 (once return flights have been eliminated) were admitted to floors and not to an ICU. However, all of the cases in table 2 are listed as either expiring in the ER, or admitted an ICU. This suggests that the cases have been selected for severity of illness, and are not in fact representative of all patients transported directly to Children's Hospital. If this is the case, the table should read that the cases are selected, and state what characteristics they have been selected for, or be altered to show consecutive unselected cases transported. If I am in error, then the table should state that these are in fact unselected, consecutive cases. 8

I wish to emphasize that I have the utmost respect for our emergency medical service and its supervisors, and I recognize the contribution that Children's makes to the care of sick children in our state. However, in order to make a major change in the manner in which patients are cared for, it should be necessary to show that patients will benefit from the change, and that it can be done without undue risk to others. Children's has refused to do the former, and has not done a good job of doing the latter. If it is not within the scope of the DCIU to address these specific deficiencies, then it should be taken up by a more appropriate section of city or state government prior to approval. If helicopter transport of non-traumatized children and neonates turns out not to be in 9

JOHN S. STIMSON, M.D.
4715 45TH AVENUE N.E.
SEATTLE, WA 98105

patients' best interest, it will be very difficult to alter hospital behavior and patient expectations after the fact. Please consider wisely. 9

Sincerely,

John S. Stimson, MD

1. Comment acknowledged.

2. The issue of medical need is directly related to the criteria for the Council Conditional Use Permit that is required in order to construct the helistop. The EIS is intended to serve as a forum for the presentation of reasonable alternatives and to evaluate probable significant impacts on the environment. Also see response to Kate Hemer Comment #3.

3. Your disagreement with the conclusions reached by Dr. Nicola is acknowledged.

4. Children's does treat some trauma cases. The EIS states that "traumatized and severely burned children in the Puget Sound region generally go first to the region's trauma center, Harborview Medical Center..." (emphasis added). See also responses to Liz Anderson Comments #56, 60, 62 and 63.

5. Comment acknowledged.

6. Please refer to Dr. Nicola's updated report to DCLU, which has been appended to this Final EIS Appendix A. This report acknowledges that "there is very little in the literature concerning the hospital transport of non-trauma patients."

7. Comment acknowledged. See responses to Liz Anderson Comment #87 and Bart Baxter Comment #7.

8. Please refer to the response to Liz Anderson Comment #80.

9. Comments acknowledged.

Thank you for your comments.

Seattle. WA 98105
September 1, 1986

Director
Department of Construction and Land Use
400 Municipal Building
Seattle. WA 98014

Dear Director:

I have a unique perspective on the issue of the helistop at CHMC. I. my wife and two children are neighbors of the hospital. living about two blocks from the site of the proposed helistop. In addition to this I am a physician employed at the hospital. who also works as a flight physician with Airlift Northwest.

Children's Hospital and Medical Center offers unique services to patients throughout Washington and the Northwest. Children who are critically ill often can not be treated appropriately anywhere else in Western Washington. These critically ill children should not be put at added risk by having them endure multiple transfers in and out of ambulances. let alone the added time needed to reach the hospital. necessitated by landing elsewhere. 1

I am glad that as a Laurelhurst resident my two girls are so very close to one of the nation's outstanding children's hospitals. In my experience as a flight physician I know that residents throughout Western Washington are also very grateful that it is possible to get their child to Children's Hospital rapidly and safely through the use of air transport. This helistop is for them and their children. 2

The risk of having a helistop in the Laurelhurst neighborhood and the inconvenience of the sound of a helicopte landing are trivial in comparison to the good it provides children throughout this state and beyond. It should be built well, to provide the maximum safety and minimal disturbance to the neighborhood. but it must be built and put into service as soon as possible. 3

Thank you for your consideration.

Sincerely.

Thomas L. Strandford

Seattle, WA 98104

Ms. Gibb:

I am writing in support of Children's Orthopedic Hospital and Medical Center's request for a conditional land use permit to build a heliston outside their emergency room. 1

I just became a parent last month to a healthy baby boy. If something where to happen, such as an emergency situation, I would really appreciate knowing that he could be rushed over to COHMC via helicopter to receive emergency treatment. This service is especially needed in places like Port Townsend, which is where we live, because we do not have the emergency facilities that COHMC has. And if we where to have to drive over to Seattle in an emergency situation it might just be too late. 2

I understand the concerns of those who are objecting, but I truly believe that having this helistop service could save many lives, maybe even the life of my own son! 3

Thank you for the opportunity to comment. Please convey my opinions to the Seattle City Council.

Sincerely,

Lisa Talley

Seattle City Council
Mr. Sam Smith, President
600 Fourth Avenue, Seattle 98104

Dear Mr. Smith and City Council Members:

Please allow me to add my voice to many others you must be hearing, in favor of allowing a permanent heliport at Childrens Hospital & Medical Center. 1

We all already owe you tremendous thanks for permitting helicopters to land at the Hospital during the past year. The privilege was not used more often than absolutely negessary to save a life; and the infrequent landings were neither heard nor noticed by the neighborhood above the usual high-decibel background of daytime city sounds.

Our darling grand-daughter became crucially ill last summer, and was rushed by ferry (which waited!) and by car out to the Hospital in time for her life to be saved. If this emergency had occurred very late when the ferries are several hours apart, we would surely have hired a helicopter, and have been forever grateful that it could take her right out to the Hospital. 2

We are lucky: our little one is now fine. But we do think about other frantic parents (and grand-parents).

PLEASE DO ALLOW THE PERMANENT HELIPORT.

Very sincerely yours,

Prudence L Trudgian

RECEIVED OCT 2 1986

OCT 21986

DEAR DIRECTOR

I AM WRITING TO ~~PROTEST~~ THE HELISTOP PROPOSAL FOR CH MC. THERE IS NO MEDICAL NECESSITY FOR IT: IT IS A PUBLICITY MANEUVER BY THE CH ADMINISTRATION. THEY WANT TO ADVERTISE IT TO HELP FILL BEDS. THE PHYSICIANS KNOW THERE IS NO NEED FOR LANDING ON THE GROUND, & SAID SO IN A P.I. INTERVIEW LAST YEAR.

I WORK IN THE NEONATAL ICU AT UNIVERSITY HOSPITAL. WE RECEIVE THE SAME TYPE OF TRANSPORTS, BUT THEY LAND AT HARBORVIEW, OR IN EXTREME EMERGENCIES, AT UW SOCCERFIELDS. THE TRANSPORT BY AMBULANCE IS FAR BETTER FOR THE PATIENT: HELICOPTERS ARE TOO NOISY FOR THE DOCTOR TO HEAR THE HEART & LUNG SOUNDS, WHICH ARE CRUCIAL TOOLS FOR THE CORRECT TREATMENT OF THE BABY.

BUT BEYOND THE FACT OF THE LACK OF NEED FOR THE HELISTOP, IS THE LOCATION. IT IS A SMALL AREA WITH A LOT OF PEDESTRIAN & VEHICULAR TRAFFIC, & IN A HEAVILY POPULATED AREA. TO INSIST ON LANDING HELICOPTERS THERE IS TO CREATE POTENTIAL DISASTER. A WITNESS TOLD ME OF ONE INCIDENT WHERE A MAST HELICOPTER WAS UNABLE TO SET DOWN ON THE FIRST TRY, & WENT UP THE HILL TO HOVER OVER THE GRADE SCHOOL & TURN AROUND. CONSIDERING THE HIGH NUMBER OF HELICOPTERS THAT CRASH, I THINK THAT IS NEEDLESSLY ENDANGERING THE SCHOOL CHILDREN — THEY COULD HAVE LANDED ELSEWHERE WITHOUT ENDANGERMENT.

SEVERAL MONTHS AGO I WAS WAKENED @ 3 AM BY ONE FLYING OVER MY HOUSE — I WAS TERRIFIED, AS IT WAS VERY LOW & THERE ARE MANY TALL TREES AROUND HERE. THEN I WAS SO ANGRY I NEVER DID GET BACK TO SLEEP. THEY WEREN'T FOLLOWING THE "APPROVED" ROUTE, WHICH IS OVER THE MONTLAKE FILL & ALONG THE CITY STREETS. THAT WAY, ONLY A HAPLESS MOTORIST OR TWO & A STRAY PEDESTRIAN WILL BE WIPED OUT IN EVENT OF A CRASH. FAR LESS THAN IF THEY CRASH ON A HOUSE OR ONE OF

266

III

THE ADJACENT APARTMENTS & CONDOS. THERE THE EXPLOSION & SUBSEQUENT FIRE CAN TAKE A GREAT MANY LIVES. I JUST DON'T THINK SUCH A DANGEROUS SET-UP SHOULD BE PERMITTED. 7

THE UH HELIPAD IS NOT IN SUCH A STUPID LOCATION AS THE CH MC, BUT THAT ROOF ISN'T ALL THAT BIG, & I FOR ONE WOULD HATE TO BE BROUGHT IN THAT WAY. LAST YEAR 62 PATIENTS WERE TAKEN TO UH BY AIRLIFT NORTHWEST. ALL LANDED AT HARBORVIEW OR THE IMA FIELD, & SURVIVED INTACT. I DON'T THINK ANY ADDITIONAL HELIPORTS ARE NEEDED. 8

THANKS FOR YOUR ATTENTION.

8

MARY L. VANECEK

MARY L. VANECER

1. Your opposition is acknowledged.

2. Please refer to the response to Liz Anderson Comment #23.

3. Please refer to the response to Liz Anderson Comment #49.

4. See response to Liz Anderson Comment #65.

5. It is acknowledged that the proposed helistop is relatively small and that there is considerable pedestrian and vehicular traffic in the campus area. The area of the helistop is sufficient to safely accommodate the Agusta 109, which is the primary helicopter that would be using the helistop. A secured helistop would reduce the potential for pedestrian and vehicular conflicts, while signage would inform motorists of possible helicopter operations in the Children's campus area.

6. The referenced MAST mission involved a communications equipment failure that resulted in no attending ambulance being available to transport the patient from the Intramural Field to Children's. The MAST crew then elected to transport the patient directly to the Children's campus. It is not evident whether there were landing difficulties at the campus and subsequent overflight of Laurelhurst Elementary School.

Dear Ms. Miller and Ms. Julie Gibbs,

I am writing to you in regards to the proposed helipad at Childrens Orthopedic Hospital. I am particularly concerned about the safety issue. My son attends Villa Academy which is located in the Laurelhurst neighborhood, near Childrens Hospital. My fear is that a helicopter crash could seriously jeopardize the life of my son and other children. The proposed landing site is in a high density, residential neighborhood. 1

I strongly oppose helicopter landings at COH. I also oppose landings at the University Hospital. I do not believe that helipads have been proven safe or cost effective. We have excellent ambulance transport in Seattle. Let's stay safe and sane. 2 3

Thank you.

Sincerely,
Carol Wilkinson

SEP 26 1986

To Whom it my Concern:

We hope a careful study will be made of the Evidence & Testimony given at the Scoping Sept 23, 1986 at Laurelbrook School regarding the Helicopter; by several people who are Experts in the use of helicopters - This has been a major Concern to us - The weather and winds make it impossible to predict which way an aircraft approaches a Landing Site -

One point we did not hear addressed at the hearing was the close proximity of the large Oxygen storage tank to the Helipad site - This could be Hazardous.

Our city and its residential areas are already impacted by too many (private planes flying at uncontrolled altitudes) Should another be added When the need for the Helicopter has not been proven.

Again we say who will pay for the service?

Sincerely
Mr and Mrs Fred M Wright
271 [illegible] Ave NE

Holly Miller, Director
Department of Construction and Land Use
400 Municipal Building
Seattle, WA 98104

Dear Ms. Miller:

This letter responds to your request for an updated response to Beatrice Ryan's August 30, 1985 request for an opinion about the medical need for the Children's Hospital and Medical Center to establish a helistop on hospital grounds. I've enclosed a copy of Ms. Ryan's letter for your convenience.

As indicated to me by the Department of Construction and Land Use (DCLU), the City of Seattle's Land Use Code permits the establishment of a helistop at a major institution like Children's as a conditional use, if the City Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

I was asked for my opinion on the question of medical need in my role as Director of the Seattle-King County Department of Public Health, as a licensed physician, and as Medical Program Director for Emergency Medical Services in King County, pursuant to State law. My response should be viewed as an informed opinion rather than an expert opinion, however, since I am not a pediatric or emergency medical specialist.

In order to review the facts of this issue, I have spoken with numerous physicians, administrators, community residents, and former patients. Because this is an informed opinion, and not a scientific survey, I did not employ formal bias control techniques or a standard question format. I have

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

400 Yesler Building Seventh Floor Seattle, Washington 98104 (206) 587-4600

reviewed the medical literature on emergency medical services delivered by helicopter, viewed a simulated transport/helicopter landing at Graves Field and near the Children's proposed helistop site, examined helicopter and transport equipment, toured the Children's facility, and reviewed Airlift Northwest logs and individual patient charts. To obtain additional information, I also held a fact-finding public hearing October 24, 1985 in the City Council chambers from 6:00 to 9:00 p.m. The written testimony and tape recording of this hearing are available upon request.

Existing Pediatric Emergency Medical Services System in Seattle

Personal health care can, in general, be subdivided into three functional levels: a primary level, where the health care system is entered and basic service received and where all health services are mobilized and coordinated; a secondary level, represented by ambulatory services of a specialist nature and inpatient services provided in a community hospital-type facility; and the tertiary level, which includes the highly complex and sophisticated services available only at a "medical center" (Alberta Parker, "The Dimensions of Primary Care" in Primary Care: Where Medicine Fails, 1974, New York, John Wiley and Sons).

Although there is no formal classification system, by industry standards Children's is a tertiary care center. Based on a self-assessment questionnaire prepared by nearly all Washington hospitals, the State of Washington's Profile of Critical Care Hospital Facilities (Second Edition, January 1980) lists Children's as a level 3 facility for all services profiled (trauma, burns, cardiac, respiratory, neonatal, and head and spinal). Under the State's classification scheme, level 3 generally indicates in-house, 24-hour availability of a physician, supervision and 24-hour on-call availability of specialists, specialized facilities, capability to perform specialized surgery and special therapies, and availability of special transport teams. The State's level 3 corresponds with the generally accepted definition of tertiary care.

One of the purposes of the State's Profile of Critical Care Hospital Facilities is to provide assistance to physicians in selecting the most appropriate facility and corresponding treatment level for their patients. Physicians caring for critically ill patients in areas served only by secondary or community hospitals will refer those patients to tertiary care centers when their conditions require treatments that other hospitals cannot provide. Another source of assistance in making patient referrals is the referral "hotline" offered by the University of Washington (UW) Hospital. By calling this hotline, attending physicians can obtain help making diagnoses and planning treatment, including transport of their patients to more appropriate facilities for their presenting condition. In some cases, attending physicians will refer their patients based on professional associations with specialists affiliated with particular tertiary facilities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Pediatric and neonatal emergencies within Seattle which are hospitalized are generally admitted at one of the 19 neonatal intensive care (NICU) or 17 pediatric intensive care beds (PICU) at Children's or one of the 19 neonatal intensive care unit beds at the University of Washington Medical School Hospital. Other pediatric intensive care units in the Western Washington region are a 25-bed NICU at Tacoma General Hospital, a 6-bed PICU at the affiliated Mary Bridge Children's Hospital, and an NICU at Madigan Army Medical Center. Tacoma General and Mary Bridge have a wide range of pediatric specialties represented on their staff, and handle most neonatal and pediatric emergencies, generally referring only those patients requiring sophisticated pediatric surgery, such as cardiac surgery, to Children's or the UW Hospital. According to Dr. Robert Scherz, President of Medical Affairs at Mary Bridge, and Dr. John Coombs, Vice President of Medical Affairs at Tacoma General, most of the patients admitted to these hospitals come from South King, Pierce, Thurston, and Mason Counties. The only other pediatric or neonatal intensive care beds in the State are located in Spokane. Pediatricians and neonatologists from within the State and from surrounding states (Alaska, Montana, Idaho) generally use Children's and the UW as referral centers for the most seriously ill children and neonates requiring tertiary specialty care. Most highly sophisticated pediatric surgery in the region is done at Children's.

The University of Washington has a program which admits high-risk mothers so that low birthweight babies do not have to be transported between hospitals. This method of delivering high-risk mothers has been found to substantially reduce the morbidity and mortality associated with the delivery of low birthweight babies (Hickok, D. et al., "Decreased Mortality of Very Low Birthweight Infants After Maternal Transport," Department of Obstetrics and Gynecology, University of Washington School of Medicine, unpublished paper).

But even with an excellent maternal transport program, there will still be individual patients who deliver small birthweight babies at small community hospitals throughout the State, where the infant needs to be stabilized and transported to a tertiary care hospital. Children's is the hospital generally designated for the care of these infants. The University Hospital and Children's also refer patients to each other, when beds are full. The same pediatric medical staff, including interns and residents, delivers services at both hospitals. In addition to small birthweight babies who have undeveloped lungs and intestines and require intensive support for survival and growth, there are transfers from hospitals around the State to Children's for pediatric surgery or acute infection. Trauma patients generally go first to the region's trauma center, Harborview Medical Center, but may be transferred to Children's for follow-up after surgery and stabilization.

This referral pattern exists regardless of transportation mode.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Helicopter Transport

The American Academy of Pediatrics (AAP) Committee on Hospital Care has published general guidelines on pediatric patient transport ("Guidelines for Air and Ground Transportation of Pediatric Patients," Pediatrics, 1986 Nov.; 78(5): 943-50). The AAP guidelines indicate that the factor of paramount importance in selecting mode of transport is "the optimal interhospital transport time indicated by the nature and severity of the patient's clinical condition...If a patient's medical condition is unstable, even a minimal shortening of transport time to the referring hospital by one mode of transportation rather than another may be lifesaving." The AAP guidelines also indicate that "referrals are made and accepted based upon the judgment of the referring physicians rather than upon a specific set of criteria."

The State Medical Society's EMS Committee is working on the delineation of medical necessity or medical reasonableness for medical transport and under Dr. Lothar Pinker's direction is hoping to have guidelines published into the Washington Administrative Code (WAC) in 1987. As proposed in the enclosed February 18, 1987 draft of the guidelines, the selection and utilization of an air ambulance service should be based on the level of medical care the patient's illness or injury requires during the transport, the urgency of transport, and on dispatch protocols adopted in each county. The proposed guidelines include general examples of critical cases and conditions, and require review of treatment protocols, assessment of field performance, and critique of air ambulance runs by an air ambulance medical director functioning through the delegation of statutory responsibility by the local Medical Program Director. As Medical Program Director for King County, I would be responsible for developing and supervising the review process.

There are several studies in the literature that assess the severity of illness and injury in pediatric air transport. In one study, Mayer and Wallie prospectively evaluated 636 patients transported over 79 months of service to a regional children's center. Of these patients, 57.5% were transported by helicopter. Eighty-one percent of patients were taken to surgery or admitted to the intensive care unit immediately on arrival at the regional children's hospital. Overall mortality was 9%; a trauma score was used to classify patients (Ann. Emerg. Med. 1984 Feb.; 13(2):108-11). At Johns Hopkins, Dr. Columbani et al., reviewed 267 children over a one-year period; 46% of patients arriving directly from the injury scene were delivered by helicopter. Fourteen of seventeen deaths resulted from head injury; a more aggressive approach to the management of brain trauma was advocated (J. Pediatric Surg. 1985 Feb.;20(1):8-13).

Another study evaluating air transport in a rural EMS system looked at 569 patients with multisystemic injuries. The emergency helicopter service was rated, utilizing strict specific guidelines as either essential, helpful, or not a factor in the preservation of life. The helicopter was essential to 16.5% and helpful to 10.9% of patients. In spite of rapid evaluation and maximal intervention, 102 (17.9%) of the patients died. The group for which

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

air transport was judged "not a factor" (54.7%) consisted of patients whose injuries would not have proven fatal had their transportation to the tertiary care center been delayed. Retrospective analysis of the data available to the tertiary care center at the time of the decision to transfer the patients by air revealed that it was not possible to differentiate those patients who did not benefit from the service from those for whom the service was judged essential or helpful (Am. Surg. 1984 Apr.; 3-1348:183-8).

Similarly, in a study in Michigan, Rhee et al., found that based on an objective Trauma Intervention Scoring System (TISS) which measures the intensity of medical care provided in a 24-hour period, 65% of patient transports by helicopter were thought to be medically necessary both at the time of the flight and later; 17% were thought to be appropriate using the information available at flight time, but were later found not to be; and 18% were found not to be necessary. These researchers concluded that TISS is a useful, objective measure of helicopter transport program performance and should be tested in other helicopter transport programs (Annals Em. Med. 1986 Jan; 15:1;79-82).

Baxt et al., looked at a group of 1,273 blunt trauma patients who were treated and transported from the site by seven different hospital-based rotorcraft aeromedical emergency care services and saw a 21% reduction in expected mortality ($p<.05$) in five of the seven services. There is some debate about methodologic errors in the study. An editorial in the same journal issue (Annals Em. Med. 1985 Sept.; 14:9;859-61) states that

> The effectiveness of aeromedical evacuation of battlefield casualties is well established; the transfer of this technology to the civilian setting is a logical event. Its effectiveness for civilian trauma care should be based on the following three principles; 1) early field resuscitation; 2) rapid transport; and 3) delivery to the hospital best suited to admit and treat the patient definitely and without delay. As Baxt and colleagues point out, helicopter emergency medical service (HEMS) patients may benefit from a highly integrated team effort at the receiving trauma center that is the direct or indirect result of a program but for which the helicopter (unless distance is a factor) is the least important component. This is a strong argument for the concept of regional trauma care that concentrates multiply injured patients in trauma centers organized to best care for them. The potential role of HEMS in making regional trauma care a reality should be explored by EMS systems.

My conclusions from the literature review are that there are medical conditions (especially trauma) where time of transport is critical regardless of mode of transportation, that specific clinical criteria may be helpful in selecting a helicopter versus ground ambulance transport but do not help in

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

predicting patient outcome, and that the experience of other tertiary centers, while helpful in describing the seriousness of injury seen in the usual patient populations transported, does not clearly shed any statistical light on your question at issue, the Graves field site versus the hospital site a minimum of 10 minutes away (patient transfer and driving time). There is very little in the literature concerning the interhospital transport of non-trauma patients.

Current Data

Children's admits approximately 700 patients per month in 200 beds, including 36 intensive care beds. In Children's Fiscal Year 1986 (October 1 - September 30), 283 patients were admitted after air transport; 166 were fixed-wing transports and 117 were rotary-wing transports (115 Airlift Northwest, 1 MAST, and 1 KIRO). Of the 117 patients transported by rotary-wing, 32 landed at the emergency room entrance of the hospital. Nineteen of those 32 died; the remaining 13 had an average length-of-stay of 17.5 days, compared to the average 7.1 days for all admissions.

Review of the case files of the children flown directly to Children's indicates that with one possible exception, all presented life-threatening conditions that warranted transport right to the doors of the hospital. Review of 30 additional randomly selected cases flown by helicopter to Harborview for ground transport to Children's shows that all cases met the State's proposed criteria for use of air transport but were less severe than those flown directly to the hospital. Referring physicians and Children's appear to be sorting patients appropriately.

Recommendations

It is my professional opinion that there are hospital transfers to Children's where 10 minutes are critical to a severely ill infant or youngster, but the actual number of such cases is small. Decisions regarding air transport of these patients must rest on the judgment of the attending physician and consider distance, stable clinical condition during transport, severe injury or illness requiring tertiary center treatment (rather than secondary or community hospital level), and the possibility of decompensation (severe clinical deterioration) during transport. The most important part of the transport, in most cases, will be in getting a specially trained team out to community hospitals around the State. The key to any transportation of sick people is the stabilization of the patient, making sure that vital signs are stable and that the general physical condition is not deteriorating. One of the most important aspects in the case of the critically ill neonate is the

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

transport of a specially trained medical team, the neonatologist/pediatrician and neonatal nurse, to the community hospital to stabilize a deteriorating baby. Once stable, a patient can be transported much more safely.

In most cases, Harborview or Graves Field would be adequate sites for most patients transported by helicopter to Children's; however, there will be a small number of cases where the ability to land at the hospital may be life-saving.

It is difficult to derive reliable projections of total numbers of patients who would be transported by helicopter to Children's. Given that a medical breakthrough, catastrophe, addition of competing helicopter service, increasing specialization, or some other situation might change their projection, Children's estimates that by 1990 the number of children transported by helicopter for admission to Children's in any given month may be 15 to 20. Based on actual experience in 1986, 4 to 5 of these patients may have a medical need for helicopter transport to the doors of the hospital.

The literature review indicated that there are no definitive predictive clinical indicators of prognosis; that is, any estimate of the number of transports to the doors of Children's would have to include an additional number of patients whose condition at time of referral was appropriate for air transport but who over time were determined not to have need of helicopter transport as essential. There also needs to be some flexibility for seasonal variation in disease.

Taking into account these factors, I would estimate six (6) critically ill pediatric patients per month as an upward bound for helicopter transports to the doors of Children's in the next decade.

I recommend that the emergency transport of patients by helicopter be a planned part of a complete EMS transportation system, with guidelines for use, rather than a hospital-by-hospital provided service. The proposed WAC guidelines for air ambulance use appear to support this approach. A consortium of hospitals providing helicopter services such as the one in Airlift Northwest is certainly a most sensible approach and will make it easier to establish a systematic approach to provision of these services. We are, however, just beginning to integrate helicopter transport into our EMS system. The proposed WAC guidelines are a first step in this direction. They condition licensure of air ambulance services on meeting standards for equipment, personnel, community need, and use, and place air ambulance services under the medical control of local medical program directors.

Based on my review of Children's case files, I conclude that the Children's helistop meets the City's land use permit requirement that it save lives. I also believe, given Children's experience to date and the prospect of State-mandated controls, that use of the helistop can be restricted to life-threatening emergencies.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

While it is beyond the scope of my expertise to comment on the City's requirement that the heliстop be located so as to minimize impacts upon surrounding residential property, I strongly recommend that the City give careful consideration to the issue of helicopter safety. From a public health standpoint, the risk of an accident must be weighed against the medical benefit of helicopter transport.

I hope that these updated observations and recommendations will assist you in your permit deliberation; please let me know if any comments need further clarification. Again, my thanks to DCLU staff, to a wide variety of health professionals involved in delivery care, to the staff and administration at Children's, to the community residents of Laurelhurst, and to a number of other interested individuals who helped me to reach a better understanding of the emergency medical services delivered to infants and children in our community and the many factors which affect those services.

Sincerely,

Bud Nicola

Seattle
Department of Construction and Land Use

Beatrice Farrar Ryan, Interim Director
Charles Royer, Mayor

August 30, 1985

RECEIVED
SEP 4 198-
OFFICE OF DIRECTOR
SEATTLE-KING COUNTY DEPARTMENT OF PUBLIC HEALTH

Bud Nicola, Director
Health Department
7th Floor, Yesler Building

Dear Mr. Nicola:

I am writing to ask your help.

As you know, this Department has received an application from the Children's Orthopedic Hospital to establish a helipad on hospital grounds. The Land Use Code classifies the hospital as a Major Institution, and Major Institutions are permitted to establish helistops as a Council Conditional Use if the Council finds that:

a. The helistop is needed to save lives;
b. The helistop is located so as to minimize impacts upon surrounding residential property; and,
c. Use of the helistop will be restricted to occurrences involving life-threatening emergencies.

We must make a recommendation to the City Council and our report must examine alternative locations for the helistop, including sites outside the institution's boundaries, which would accomplish the purpose of the helistop with a lesser impact upon residential areas as part of the analysis.

The question of medical need is beyond our area of expertise and this is where I am asking for your Department's assistance. In the past, helicopters have made emergency landings at the Graves athletic field and patients are then transported by ambulance to either Children's Orthopedic or to the University of Washington Medical Center. This request by Children's Orthopedic would mean those patients destined for Children's would instead land on hospital grounds with those destined for the University of Washington continuing to land at Graves field. The University of Washington may subsequently apply for a permit for a helistop on the grounds of the U. W. medical campus.

You have agreed to sponsor a public hearing and to give us your opinion on the question of medical need. The questions I would like your opinion on are:

1. What are existing emergency services in Seattle and how does the service fit into the existing services?
2. What emergency services does COH offer that are unique and unavailable elsewhere?
3. Is there a medical need for emergency helicopter service to serve the hospitals in this immediate area, (Children's and University of Washington primarily)? What, if any, would be the effect on the well-being of a patient transported by helicopter versus helicopter and ground transport as it is presently done? Are direct flights versus air/ground transports medically significant in terms of patient morbity and mortality?

An equal employment opportunity - affirmative action employer
Seattle Department of Construction and Land Use 400 Municipal Building Seattle Washington 98104

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

4. Is the current site at Graves athletic field adequate, or is there a medical need to locate such facilities on the hospital grounds? Or are there alternative sites? Would one such facility either at COH or U. W. be a preferred location?
5. What data are available regarding the number of emergencies that are likely to be generated by the population to be served by the helicopter services? How many landings per week will result?
6. If there is an established medical need, how would you define "occurrences involving life-threatening emergencies," as the use must be restricted to such occurrences? Are there other restrictions we should consider, based on existing medical care facilities capabilities?
7. How would you suggest we monitor the occurrences to ensure that the use is restricted to life-threatening emergencies should the use be permitted? Can we ensure that the service is used for emergency purposes only?

We have asked Children's Orthopedic Hospital for more information to support their application for the helistop (see attached). This information is necessary for your consideration of these questions. As soon as we receive it, we will send you a copy. As you know, we are happy to help with the scheduling and public notice of the hearing.

Thank you for your assistance. If you have questions, please call me at 625-2262 or Katy Chaney at 625-4274.

Sincerely,

Katy Chaney

THIS DRAFT INCLUDES CHANGES SUGGESTED AT THE [illegible] OF THE [illegible] COMMITTEE MEETING. Changes from the original draft are typed in this larger print so they can be easily identified.

WAC 248-17-020

DEFINITIONS. For the purpose of these regulations, the following words and phrases shall have the following meaning unless the context clearly indicates otherwise.

(1) "Department" means the state of Washington Department of Social and Health Services.

(2) "Emergency Medical Services Advisory Committee" means the committee appointed by the Governor, pursuant to RCW 18.73.040.

(3) "Air ambulance" means any privately or publicly owned aircraft specifically designed, constructed or modified which is intended to be used for and is equipped with the intent to be used for the transportation of individuals who are sick, injured, or otherwise incapacitated or helpless.

(4) "Air ambulance service" means a service that is currently certified under Federal Aviation Administration (FAA) rules, 14 CFR Part 135, (Air Taxi Operators and Commercial Operators of Small Aircraft) and is certified by the department as an air ambulance service and meets the minimum requirements for personnel and equipment as described elsewhere in this chapter.

(5) "Local EMS Medical Program Director" means a licensed physician authorized by the department to perform duties specified in RCW 18.71 and 18.73.

(6) "Medical control" means physician responsibility for supervision of EMT training programs, the establishment of field protocols, and the recommendation for certification and decertification of EMTs certified under this chapter.

(7) Medical control as defined above does not include first responders, except as provided in WAC __ - __ (the WAC covering First Responder defibrillation).

(8) "Basic life support" means out of hospital emergency care which includes some or all of the techniques and procedures taught in a state approved emergency medical technician basic training course.

(9) "Advanced life support" means an advanced level of out of hospital emergency care that includes basic life support functions plus some or all of the following techniques or procedures:

(a) Cardiac monitoring.

(b) Cardiac defibrillation.

(c) Telemetered electrocardiography.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(d) Administration of specific medications, drugs, and solutions.

(e) Use of adjunctive medical devices.

(f) Trauma care.

(g) Airway management techniques.

(h) Other techniques and procedures authorized by medical control.

(10) Air Ambulance Support Personnel

(a) Air Ambulance Medical Director A physician licensed by the State of Washington who is knowledgeable of potential medical complications which may arise because of aeromedical evacuations. and who is engaged by the air ambulance service to oversee and assure that the appropriate aircraft, medical personnel and equipment are provided for patients transported by the air ambulance service. The air ambulance medical director and alternates function through delegation of responsibility of the local Medical Program Director in the county where the service is licensed.

(b) Registered Nurse. A person licensed and certified by the state of Washington to perform nursing functions pursuant to RCW 18.88.

(c) Paramedic. An emergency medical technician who has completed an advanced life support training program approved by the department, who is certified by the department as a mobile intensive care paramedic. pursuant to RCW 18.71.

(d) Emergency Medical Technician. An individual who has completed a basic life support training program approved by the department, and who is certified by the department pursuant to RCW 18.73.

(e) Pilot. An individual certified by the Federal Aviation Administration and licensed with the state of Washington Department of Transportation pursuant to RCW 47.68. This individual must meet certain criteria set forth by the department.

(f) Patient. An individual who, as the result of illness or injury, needs immediate medical attention, whose physical or mental condition is such that he is in imminent danger of loss of life or significant health impairment, or who may be otherwise incapacitated or helpless as a result of a physical or mental condition.

(g) Communications System. A radio or landline network connected with a dispatch center which makes possible the alerting and coordination of personnel, equipment and facilities.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-17-135 Air ambulance services - Requirements for Licensure. The department is authorized to issue licenses to services conforming to these regulatory standards:

(1) No air ambulance service shall function as an air ambulance service in this state unless the agency holds a currently valid license to do so.

(2) An application for an original or renewal license shall be made to the department and shall contain as a minimum, but is not limited to, the following:

(a) Articles of incorporation and current business license, where applicable.

(b) The name and address of the owner of the air ambulance service or proposed ambulance service.

(c) The name under which the applicant is doing business or proposes to do business.

(d) The training and experience of the applicant in the transportation and care of patients.

(e) A description and general location of each aircraft to be used as an air ambulance, including the make, model, year of manufacture, registration number, or other distinguishing characteristics.

(f) The geographical area served.

(g) The air ambulance medical director for a geographic area who shall review treatment protocols, assess field performance and critique air ambulance runs with the local medical program director. The air ambulance medical director shall be designated in writing by the local medical program director.

(h) Agreement to abide by the review process designated by the department and/or the local medical program director as defined in WAC 248-15-020.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(j) A current roster of medical personnel which includes level of certification or licensure.

(k) Agreement to provide reports to the department for each trip made, on forms or a data format specified by the department.

(l) They shall provide evidence of coordination with the local medical program directors in communities where the service intends to operate.

(3) The department shall review each application for licensure based upon type of service to be offered, equipment, trained personnel, and whether the public convenience and necessity requires the proposed service. Before issuing a license to a new service, the department shall inspect the vehicle, the ambulance equipment and the personnel roster.

(4) An ambulance service license will be issued for a period of three years from the date of issue and will remain valid for this period unless revised, modified, revoked or suspended by the department. Inspections shall be conducted to assure compliance. The vehicle license will be for a period of one year and updated annually.

(5) Grounds for denial, suspension or revocation of air ambulance license shall include, but are not limited to proof that the applicant and/or service

(a) Has been guilty of misrepresentation in obtaining the license.

(b) Has engaged or attempted to engage in service that is not authorized by the license.

(c) Has demonstrated incompetence or has otherwise been unable to provide adequate service.

(d) Has violated or aided and abetted in the violation of any provisions contained in RCW chapters 18.73 and 18.71.

(e) Has demonstrated unprofessional conduct in the course of providing services.

(f) Has failed to meet requirements in associated statute and rule.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-17-136 Air ambulance services - Personnel Requirements.

(1) Air ambulance medical director.

(a) Each air ambulance service must have at all times an air ambulance medical director (or his/her alternate) who is a licensed physician knowledgeable of the air medical requirements of patients. It is the responsibility of the air ambulance service applicant to provide in writing to the department the name of the medical director and approved alternate(s).

(b) The air ambulance medical director (and alternate) must have training in altitude physiology and be familiar with the emergency medical services communications system.

(c) The air ambulance medical director (or alternate) will:

(i) Be knowledgeable of the capabilities and limitations of the aircraft used by his service.

(ii) Be knowledgeable of each of the medical attendants' capabilities relative to meeting the patient's medical needs.

(iii) Be knowledgeable of potential medical complications which may arise because of aeromedical evacuation of patients being transported by the air ambulance.

(iv) Match during interfacility transports appropriate aircraft, medical personnel and medical equipment necessary in the care of patients' medical needs or any anticipated inflight complications.

(v) Be knowledgeable in the application, use, maintenance, removal and hazards of any routine or special medical equipment used in the transport of patients by the air ambulance service.

(vi) Assure current certification, training requirements, and education requirements are met by all medical attendants providing services for the air ambulance service.

(vii) Ensure that all medical attendants are adequately trained to perform inflight duties prior to functioning in an inflight capacity.

(viii) Ensure that each medical attendant meets the requirements necessary to provide given levels of medical care.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(d) The air ambulance medical director is responsible to coordinate with local medical program director(s) in every county where service is provided.

(2) Air ambulance medical attendant.

(a) At least one medical attendant accompanying the patient shall be a person who:

(i) Has current Washington state certification or licensure as a Paramedic, Registered Nurse, or Physician.

(ii) Must have training and be familiar with altitude physiology, aircraft safety and Washington emergency medical systems communications, as determined by the department.

(iii) Must be knowledgeable in the application, operation, care, and removal of all medical equipment used in the care of the patient. The medical attendant(s) must have a knowledge of potential inflight complications and their treatment which may arise from the use of such devices.

(iv) Will be required to know and follow all policies and procedures of the air ambulance service's medical director.

(v) Must have available during transport a current copy of all written protocols authorized for use by the air ambulance medical director. Patient care shall be governed by these authorized written protocols.

(b) The air ambulance medical director may designate additional attendants with specialized skills to meet the specific needs of the patient.

(3) Pilot. In addition to being licensed with the state of Washington department of transportation pursuant to RCW 47.68, the pilot must:

(a) Possess commercial rotorcraft certification and a minimum of 2,000 rotorcraft flight hours as pilot in command.

(b) Be factory trained or equally prepared and have at least five (5) hours in the specific type of aircraft, before flying as pilot in command on patient missions.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

(c) Meet FAA requirements for medical certification, licensing and type of ratings for the flight(s).

(d) Have training and be familiar with altitude physiology and EMS communications

(e) The final decision to fly or not to fly will be made by the pilot.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WAC 248-17-137 Air Ambulances - Required Equipment. All air ambulances shall carry at least the following medical equipment:

(1) Cardiac monitor/defibrillator with strip-chart recorder and battery back-up power. Monitor should be tested to insure that it does not produce electromagnetic interference with aircraft navigation and communication equipment.

(2) Litter or stretcher approved by FAA for type of aircraft with straps for securing patient to litter and litter to frame.

(3) Medical oxygen source (installed or portable). The minimum amount of oxygen carried should be sifficient to supply one patient for one hour at 10 LPM. Oxygen bottles should be secured to aircraft in an approved manner.

(4) Portable suction device with battery back-up power, tested and certified to function at all altitudes.

WAC 248-17-138 Air Ambulances - Selection and utilization. The selection and utilization of an air ambulance service shall be determined by the medical program director in the county of patient origin or the air ambulance medical director and the referring physician prior to response based upon the following:

(1) Level of medical care the patient's illness or injury requires during transport, or non-availability of local transport.

(2) The urgency of transport (immediate or not immediate). In special circumstances, because of urgency of transport, an action of providing less than minimal air ambulance transport care may occur.

(3) The dispatch protocols adopted by the medical program director of the county of origin.

(4) Any agency (requesting agency and transporting service) that dispatches a service that does not meet the minimum requirements is required to prepare and submit a written justification to the local medical program director and the state Emergency Medical Services Training and Licensing Section within 14 days of the action.

(5) Other aircraft not herein defined by this chapter shall not be used for transportation of patients who may require medical attention enroute, except that such transportation may be used when a disaster creates a situation that cannot be served by licensed ambulances.

AIR AMBULANCE PROTOCOLS

INTRODUCTION

Chapter 248-17, Washington Administrative Code (WAC), establishes minimum standards for licensing air ambulance services and aircraft.

The purpose of this document is to set forth air ambulance policies adopted by the State of Washington Department of Social and Health Services to promote and protect the health and safety of the people of this state.

Field use of an air ambulance shall only occur when there is reasonable cause to believe that the patient's death or increased morbidity will result if any means other than air ambulance is utilized.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CRITERIA FOR USE OF PREHOSPITAL AIR AMBULANCES

I. To provide rapid delivery of a critical patient(s)* to an appropriate definitive care facility when ground transport times would be protracted (more than 15 - 20 minutes). For example:

Long distances
Terrain problems
Traffic congestion
Long field extraction times
Hazardous road conditions or other road obstruction

II. To provide rapid delivery of special critical care medical personnel to the scene otherwise staffed by non-critical care personnel, for example, paramedics/Rns/physicians assistants/EMTs - experts to assist in disaster or hazardous materials incidents.

III. To provide extrication from otherwise ground inaccessible sites and/or assist in search and rescue operations (mountains/islands).

IV. To provide integrated support in multiple patient incidents, e.g., most seriously injured patients - to deliver skilled personnel or needed supplies/equipment.

CRITERIA FOR NON-UTILIZATION OF AIR AMBULANCE

I. Obviously fatal injury (decapitation, rigormortis).

II. Cardiac arrest of any etiology.

III. If the ground ambulance is capable of arriving at the hospital with the Patient before the air ambulance can arrive at the scene of the accident or illness.

* CRITICAL CASES - EXAMPLES

A. Trauma

1. Physiologic Criteria

a. Trauma score 12 or less

b. Glascow Coma Scale 10 or less

2. Mechanism of Injury Criteria

a. Motor vehicle accident with:

Extrication time more than 20 minutes
Structural intrusion into victim's space by more than 1 foot

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE.
IT IS DUE TO THE QUALITY OF THE DOCUMENT.

a. Motor vehicle accident (continued):

Victim ejected from the vehicle
Associated death in the same vehicle
Pedestrian struck and thrown 15 feet or more
Child under 12 years struck by vehicle

b. Falls of 15 or more feet

c. Evidence of rapid deceleration

3. Anatomic Criteria

a. Penetrating injury anywhere from the head through the groin

b. Amputation above the ankle or the wrist with potential reimplantation

c. Critical burns or burns by inhalation injury, electrical burns, or other accompanying trauma

d. High voltage electrical injuries (more than 1,000 volts)

e. Spinal cord injuries

f. Toxic inhalation injuries

g. Three or more long bone fractures

h. Injuries of two or more body systems

4. Comorbid Factors

a. Age - 12 or less/60 or older

b. Underlying medical conditions, for example

5. Criticality Criteria

a. Deteriorating conditions which may include loss of consciousness, onset of shock and/or respiratory distress within 30 minutes of injury (define vs. remove)

B. Medical - requiring emergent (within 15 minutes) definitive care center intervention, for example

Rupturing aortic aneurysm

Severe hype or hyperthermia

Acute subarachnoid hemorrhage

c. Obstetric or neonatal - requiring emergent (within 15 minutes) definitive care center intervention

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

CRITERIA FOR INTERHOSPITAL AIR AMBULANCE UTILIZATION

GENERAL

1. Requirement for critical care enroute, not otherwise available
2. Time critical injury or illness
3. Need to minimize time out of hospital
4. Alternate travel means unavailable or undesirable

SPECIAL CONDITIONS

1. Cardiac
   a. Acute coronary occlusion
   b. Cardiogenic shock
   c. Dysrhythmias, life threatening
   d. Pericardial tamponade
   e. CHF with decompensation
2. Respiratory
   a. Respiratory failure
   b. ARDS
   c. Ventilator dependency
   d. Severe asthma
   e. Epiglottitis
   f. Aspiration
3. Other Medical
   a. Renal failure (acute fluid overload or electrolyte imbalance) requiring dialysis
   b. CNS bleeds requiring airway and/or ventilator management
   c. Shock (hemorrhagic, DKA, septic, anaphylaxis)
   d. Coma requiring airway and/or ventilator management
   e. Overdose requiring airway and/or ventilator management or accompanied by shock, dysrhythmias
4. Trauma
   a. Multisystem trauma (Champion-Sacco Criteria)
   b. Trauma score $\leq$12
   c. Glasgow Coma Score $\leq$8
   d. Severe extremity injury (amputation, crush injury, unstable long bone fracture)
5. Other Surgical
   a. Acute vascular catastrophe
   b. Acute abdomen
6. OB
   a. Premature labor
   b. Pregnancy induced hypertension
   c. Poorly controlled D.M.
   d. Premature rupture of membranes
   e. Prolapsed cord
   f. Vaginal bleeding (including abruptio placenta, placenta previa)
   g. Fetal distress

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

7. Neonatal
   a. Respiratory distress syndrome
   b. Prematurity
   c. Sepsis
   d. Congenital anomalies
   e. CHF
8. Pediatrics
   a. Respiratory distress
   b. Decreased level of consciousness
   c. Poisoning
   d. Severe infections (epiglottitis, meningitis, severe pneumonia)
   e. CHF

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Appendix B

Airlift Northwest's Consistency with AAMS and NEMSPA Rotorcraft Standards and Guidelines and FAA Guidelines for Helistop Design

This Appendix examines the consistency of Airlift Northwest with the guidelines and standards established by the Association of Air Medical Services (AAMS, which was formerly ASHBEAMS) and the National Emergency Medical Service Pilots Association (NEMSPA). An examination of the Kitchen Garden Helistop with the design guidelines of the Federal Aviation Administration (FAA) also is included.

Airlift Northwest has begun a program to work toward consistency with applicable AAMS standards.

A. AIRLIFT NORTHWEST CONSISTENCY WITH AAMS STANDARDS AND GUIDELINES FOR ROTORCRAFT

The AAMS standards have been reviewed for Critical Care Providers.

Standard or Guideline	ALNW Consistency
STANDARD I - The aircraft designated for the air medical mission must be evaluated carefully, considering the geographic area to be served, the type of missions it is to perform, and the crew and equipment it must carry.	
A. Aircraft operator must comply with FAR Part 135.	Consistent
B. Aircraft design must give medical attendants access to the patient.	Consistent
C. Aircraft should have a cargo door.	Consistent
D. Aircraft should be climate controlled.	Consistent
E. Aircraft must have interior lighting that allows patient care to be provided without interfering with pilot's vision; cockpit must be isolated to minimize distraction.	Consistent
F. Aircraft must, at minimum, be equipped with:	
1. Airway management equipment (oxygen, mechanical suction, intubation equipment, and ventilatory support equipment)	Consistent
2. A cardiac monitor/defibrillator	Consistent
3. Advanced cardiac life support drugs and therapeutic modalities; or equivalents for specific mission	Consistent
4. Pulse oximeter.	Consistent
G. Aircraft must have appropriate communication equipment to facilitate communication:	
1. Within the helicopter	Consistent
2. With medical control	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
3. With flight operations center	Consistent
4. With air traffic control	Consistent
5. With EMS and law enforcement agencies.	Consistent
H. Aircraft must be equipped with appropriate survival equipment.	Consistent
STANDARD II - The air medical crew shall be well organized, properly directed and staffed according to the nature and extent of health care needs anticipated and the scope of services offered.	
A. Service shall be available 24 hours per day, allowing for exceptions due to unsafe weather, commitment to another flight, grounding for maintenance, etc.	Consistent
B. An educational program should inform potential users of the capabilities of the services.	Consistent
C. Vendor shall accept medically necessary calls from authorized personnel and will not discriminate due to race, creed, color, age, religion, national origin, ancestry, or handicap.	Consistent
D. Medical direction shall be provided by a physician trained and experienced in emergency, trauma, and/or sub-specialty critical care medicine.	Consistent
E. Suggested educational experience of the medical director shall include:	
1. Advanced Cardiac Life Support (American Heart Association standards)	Consistent
2. Advanced Trauma Life Support (American College of Surgeons standards)	Consistent
3. Certification in appropriate specialty, through board exam	Consistent
4. In flight patient treatment modalities	Consistent
5. Knowledge of altitude physiology	Consistent
6. Infection control	Consistent
7. Stress management techniques.	Consistent
STANDARD III- Staffing the air medical unit shall be commensurate with the missions's patient care need afforded by the airborne facility. The aircraft, by virtue of medical staffing and retrofitting, becomes a patient care unit.	
A. Medical flight crew must consist of at least one designated flight nurse specially trained in emergency/critical care who is present at the hospital or with the aircraft.	Consistent
B. Additional qualified medical personnel (such as specially trained, experienced Critical Care or ALS providers, paramedics, or respiratory therapists) assigned as flight crew members may be advantageous.	Consistent
C. Protocols for the addition of air medical personnel should be developed.	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
STANDARD IV- All training and experience requirements must be commensurate with the mission profile and airborne environment and must be documented and approved by the program medical director and in the program's policy and procedure manual.	
A. A planned, structured training program shall be required for all medical personnel designated as regularly scheduled flight crew members. Training shall include:	
1. Emergency, trauma, and critical care courses covering Advanced Cardiac Life Support and trauma life support.	Consistent
2. A general review of emergency patient care including medical, pediatric, obstetrical, newborn, behavioral and psychiatric emergencies, infection control, and crisis intervention techniques.	Consistent
3. Altitude physiology, EMS communications, aircraft and flight safety, and the use of all patient care equipment on board.	Consistent
4. Knowledge of the use of extrication devices and of rescue and survival techniques appropriate to the terrain and conditions under which the program operates.	Not Consistent: ALNW does not perform extrications, or search and rescue missions
B. Written policies and procedures shall indicate what therapies can be performed under protocol.	Consistent
C. The physical well-being of flight crew members should be ensured through periodic physical examination and hearing examination.	Partially Consistent: ALNW does not require periodic physical examinations
D. All medical flight crew members must be assigned to the flight service as their primary responsibility to ensure immediate response.	Consistent
E. Competency and currency must be ensured on at least an annual basis through relevant in-service education relating to safety, infection control, stress management, and skills maintenance specific to the air medical component.	Consistent
STANDARD V - Policies and procedures addressing patient transport issues involving communicable diseases, infectious processes and health precautions for emergency personnel as well as for patients must be current with the local standard of practice. Information must be written and readily available to all members of the air medical service. Additional medical and agency resources pertinent to the area of infection control must be identified and made available in the policy manual to all members of the air medical team.	

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
A. Air medical personnel transporting patients must practice preventitive measures lessening the likelihood of transmission of pathogens.	Consistent
B. Policies and procedures must include the following: personal health; communicable disease and infection management; cleaning and disinfecting of aircraft, equipment and supplies; protocols for risk identification; communication plan for suspected/ confirmed exposure.	Consistent

STANDARD VI - A significant commitment of resources is required of the sponsoring institutions. Appropriate services shall be rendered within the hospitals, the defined capabilities of the sponsoring hospital and/or other hospitals within the service region.

A. The Emergency Department(s)/Services shall be staffed and equipped to facilitate safe and effective care of patients as recognized by the American College of Surgeons and JCAH standards of emergency services for a Level I or II facility.	Consistent
B. The Emergency Department(s)/Services must offer emergency care 24 hours a day with at least one physician experienced in emergency care on duty in the emergency care area.	Consistent
C. Specialized care and services must be provided to patients being transported through evaluation and categorization in the care of cardiac, medical, burn, neonatal, pediatric, and other emergency patients.	Consistent
D. The helipad must be located in an area that assures safe access and allows for rapid movement of the patient to the treatment facility.	Consistent
E. The landing site must be appropriately marked, lighted, and secured and wind conditions reviewed and inspected. Appropriate safety programs should be offered to those responsible for such operation.	Consistent
F. The helipad must comply with local, state or federal regulations.	Consistent
G. The landing zone must be reviewed at least yearly to ensure safe access and egress and appropriate lighting and security. Programs addressing safety and appropriate behavior around the landing zone must be offered by the air medical service.	Partially Consistent: Although safety programs are offered, annual inspections of landing zones (as opposed to helistops) are not conducted
H. A safety program must be provided to appropriate public safety/law enforcement agencies and hospital personnel to ensure that when any landing	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
site is set up, it is secure, marked, free of overhead obstruction and ground debris, and appropriate in size to the aircraft that will be landing.	
STANDARD VII - The quality and appropriateness of patient care provided by the air medical service shall be continuously reviewed, evaluated and assured through the establishment of a quality control mechanism.	
A. A periodic review of the quality and appropriateness of care delivered must be done at least monthly. This review should evaluate:	
1. Reason for transport	Consistent
2. Mechanism of injury or illness	Consistent
3. Interventions performed or maintained	Consistent
4. Outcome of patients transported.	Consistent
5. Timelines of transport.	Consistent
B. The medical director shall be responsible for ensuring this timely review, using medical record and pre-established criteria.	Paritally Consistent: The review does not currently use pre-established criteria.
C. A patient record shall be maintained documenting patient care rendered by the air medical crew and disposition of the patient at the receiving institution. A copy of this record should be provided to the receiving institution.	Consistent
D. Ongoing education and skills maintenance must be ensured. These programs shall meet the individualized needs of the program as identified in audit sessions and by current trends in air medical patient transport.	Partially Consistent: On-going education and skills maintenance is ensured, however, no audit sessions are conducted.
STANDARD VIII - An air medical service must strive for full integration into existing emergency medical systems and inter-hospital transfer networks.	
A. The air medical service:	
1. Must strive for appropriate utilization of service.	Consistent
2. Must interface with existing communication, public safety, and law enforcement agencies (as well as local medical control as appropriate within a scene response area).	Consistent
3. Must ensure continuum of care and expeditious treatment of patients by utilizing standard protocols, whenever possible.	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
4. Should facilitate integration of all emergency services and transport modalities by supporting joint continuing education programs.	Consistent
5. Should promote timely feedback as to patient outcome and treatment rendered before, during and after transport, where appropriate.	Consistent
STANDARD IX- An organized and structured plan must be developed to access the air medical service, provide flight following and communicate pertinent data between requesting agency, airborne flight crew and recipient agency.	
A. A dedicated air medical communications specialist must be assigned to receive, coordinate all requests, and record necessary flight information.	Consistent
B. Air medical service shall be available 24 hours per day to authorized callers except for: . under unsafe weather conditions . commitments to another flight . grounding due to maintenance . medical control officers triaged diversion of air medical service . other reasons that would prevent response.	Consistent
C. The coordination point must be maintained 24 hours per day and must have radio capabilities to transmit and receive with the air medical helicopter.	Consistent
D. The air medical service shall accept medically necessary calls from authorized personnel and will not discriminate due to race, creed, sex, color, age, religion, national origin, ancestry or handicap.	Consistent
E. Training must be commensurate with the scope of responsibility in the Communications Center.	Consistent
F. The dispatcher should be able to initiate a flight. The following information should be recorded:	
1. Time call received and time aircraft departed	Consistent
2. Name of party or agency requesting the flight and verification phone number	Consistent
3. Pertinent medical information	Consistent
4. Pertinent landing site information	Consistent
5. Other data pertinent to the program's specific needs.	Consistent
G. Continuous flight following must be maintained and documented, with communication of location and estimated time of arrival occurring no less than every 15 minutes.	Consistent
H. At least one incoming phone line must be dedicated to emergency air medical service.	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
I. There should be a system for recording all incoming and outgoing telephone and radio transmissions, with recordings to be kept for a minimum of thirty days.	Not consistent
J. The dispatch center must have the capability of immediate notification of the air medical crew.	Consistent
K. A backup emergency power source should be available.	Consistent
L. The coordination point should maintain a status board detailing crew names, maintenance schedule, pre-planned flights, training flights, etc. Local area maps should be readily available.	Consistent
M. A readily accessible emergency plan must be part of the flight following protocol.	Consistent

STANDARD X - A professional and community education program shall be developed that will promote proper air medical service utilization.

A. The program should include:	
1. Program accessibility through 24 hour availability as appropriate; an educational program informing potential users of the capabilities of the air medical service; and non-discrimination.	Consistent
2. A safety program covering landing site. designation and safe conduct around the aircraft that shall be offered to appropriate agencies and individuals.	Consistent
3. Stabilization of the patient for airborne transport.	Consistent
4. The capabilities of the air medical crew and the patient care modalities afforded by the airborne treatment facility.	Consistent

STANDARD XI - The air medical crew will approach the mission where hazardous material is suspected or known to exist in such a manner so as to ensure the safety of the crew and aircraft as the primary consideration. A structured program for responding to the patient(s) involved in a hazardous material incident must be in place, with policies and procedures clearly outlined and available for the pilot and medical crew prior to lift off.

A. Air medical personnel must be trained to evaluate the potential for hazardous material, safety hazards and appropriate responses; as well as to meet the patient's medical need when determined appropriate to do so.	Not Consistent
B. Policies and procedures for hazardous materials.	Not Consistent

In addition to the preceding general guidelines, AAMS has the following safety guidelines for helicopters:

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)		ALNW Consistency
SAFETY GUIDELINE I - Weather: The air medical helicopter operating VFR must establish weather minimums based on the topography of the service area and weather history known to exist in the area.		
A. All FAR must be met and the safety of the air medical crew never compromised.		Consistent
B. Ceiling and visibility minimums should not be less than:		Consistent
Day local	500' and 1 mile	
Day cross country	1000' and 1 mile	
Night local	800' and 2 miles	
Day cross country	1000' and 3 miles	
C. Operational policies dealing with climatic changes mustbe established and adhered to.		Consistent
SAFETY GUIDELINE II - Pilots: The helicoper pilot , flying air medical missions, must call upon many resources, experiences and skills. The mission frequently involves night flying and unprepared landing sites. The pilot shall be summarily prepared, certified and trained.		
A. All FAR duty time requirements shall be met.		Consistent
B. For each aircraft there must be a minimum of three permanently assigned pilots, who are supported by relief pilots.		Consistent
C. The pilot must possess commercial rotorcraft certification and a minimum of 2000 hours as pilot in command.		Consistent
D. The pilot must be trained in the specific aircraft.		Consistent
E. The pilot must be specifically trained, preferably experienced in flying the terrain and conditions unique to the flight program and oriented to the hospital's health care system.		Consistent
F. Annual training must be done.		Consistent
G. A planned, structured orientation must be provided relief pilots.		Consistent
H. Quality assurance and competency must be insured through monthly operational review. Remedial training must be implemented as deficiencies are identified.		Consistent
I. A lead pilot and designated safety officer must be appointed.		Consistent
J. The pilot has the right to decline or abort any portion of the mission for safety reasons.		Consistent
SAFETY GUIDELINE III - Maintenance: The helicopter mechanic is vital to mission readiness.		
A. The mechanic must have two years experience as a certified air frame and power plant mechanic.		Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
B. The mechanic must be properly prepared and trained in an approved program to maintain the aircraft.	Consistent
C. The mechanic's primary responsibility is to the air medical service.	Consistent
D. Back-up support to the mechanic should be provided.	Consistent
E. A procedure for alerting Air Medical Control during maintenance periods must be in place.	Consistent
F. A hangar or similar facility must be available.	Consistent

SAFETY GUIDELINE IV - Aircraft: The aircraft must have appropriate equipment in order to assure the maximum safety of the air medical crew and patient(s).

A. The aircraft must have a 180 degree, controllable searchlight.	Consistent
B. The aircraft must have appropriate communications equipment.	Consistent
C. The aircraft must be equipped with appropriate survival equipment.	Consistent
D. All medical equipment, supplies and personnel must be secured and restrained.	Consistent
E. All patients must be properly restrained.	Consistent
F. A protective barrier must isolate the pilot and controls from contact by the patient(s) and/or crew.	Consistent

SAFETY GUIDELINE V - Helipad: The helipad must be designed and located so as to facilitate the safe and effective transfer of patients.

A. The location of the helipad must be a place that assures safe access and allows for rapid movement of the patient to the treatment facility.	Consistent
B. The landing location should be appropriately marked, lighted, secured and wind direction identified.	Consistent
C. The sites should be periodically reviewed and inspected.	Consistent
D. The helipad must comply with local, state and federal requirements.	Consistent
E. The landing zone designated for occasional and episodic use must be reviewed periodically.	Not Consistent
F. Programs addressing safety and appropriate behavior around said landing zone must be offered by the air medical service.	Consistent

Note: The consistency of the Kitchen Garden Helistop site has been examined for items A-D, above; because items E and F relate to landing zones, Airlift Northwest's overall policies, rather than the Kitchen Garden Helistop site, were examined for consistency.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Standard or Guideline (continued)	ALNW Consistency
SAFETY GUIDELINE VI - Communications: A designated person must be assigned to receive and dispatch all requests for air medical services.	
A. Continuous flight following must be maintained and documented.	Consistent
B. The aircraft must communicate with ground units securing unprepared landing sites.	Consistent
C. An emergency plan must be part of the flight following protocol.	Consistent
SAFETY GUIDELINE VII - Medical Crew: All air medical crew members must be trained and capable of performing program missions.	
A. Training specific to general aircraft safety must include: - FAA rules and regulations pertaining to safety - aircraft capabilities, limitations and safety measures - emergency procedures - ground operations - safety related to patient care in aircraft environment - environmental survival - day and night flying protocols	Consistent
B. Scheduling practices should assure a well-rested, alert crew.	Consistent
C. Periodic physical and hearing examinations should be conducted.	Partially consistent; periodic physicals are not conducted.
D. Management policies must promote on-going communication regarding safety between crew members.	Consistent
SAFETY GUIDELINE VIII - Pre-Hospital and Hospital Personnel: The air medical service must offer sufficient training and education to ensure safe conduct around the helicopter by all potential users.	
A. A safety program must be offered to appropriate agencies and individuals.	Consistent
B. Aircraft-specific procedures must be developed and practiced.	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. AIRLIFT NORTHWEST CONSISTENCY WITH NEMSPA SAFETY GUIDELINES

Guideline	ALNW Consistency
GUIDELINE 1: MINIMUM EXPERIENCE AND QUALIFICATIONS FOR PILOTS (in addition to FAA requirements)	
I. Pilot in Command	
A. Flight experience	
1. 3,000 hours helicopter total time	Consistent
2. 1,000 hours turbine experience, helicopter	Consistent
3. 300 hours night, helicopter	Not consistent 100 night hours
B. Ratings	
1. Commercial Helicopter	Consistent
2. Instrument Helicopter	Consistent
OR	
II. Pilot in Command Grandfather Clause	Airlift Northwest does not apply the Pilot in Command Grandfather Clause
A. Flight experience of 2,000 hours total helicopter time, plus one of the following:	
1. One year EMS pilot experience	
2. 300 hours as an EMS pilot	
3. 200 EMS missions	
III. Co-Pilot	Not Applicable: The August 109 Mk II aircraft does not have a pilot/co-pilot seating configuration
A. Flight experience	
1. 1,500 hours helicopter total time	
2. 500 hours turbine experience	
B. Ratings	
1. Commercial Helicopter	
2. Instrument Helicopter	
C. May upgrade to P.I.C. by meeting requirements of Grandfather Clause	
GUIDELINE 2: MINIMUM INITIAL PILOT TRAINING (in addition to FAA requirements)	
I. Less than 100 hours in aircraft type	
A. Factory school or equivalent (ground and flight)	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

B. 25 hours as P.I.C. in aircraft type prior to EMS missions	Consistent
II. Over 100 hours in aircraft type	
A. Part 135 check ride	Consistent
B. 5 hours local area orientation	Consistent
III. Less than one year EMS experience	
A. 12 duty days at hospital participating in a structured training program in an EMS aviation environment	Not Consistent
IV. Over one year EMS experience	
A. 6 duty days at hospital participating in a structured training program in an EMS aviation environment	Not Consistent
GUIDELINE 3: MINIMUM RECURRENT PILOT TRAINING (in addition to FAA requirements)	
I. All programs	
A. Semi-annual training flight oriented toward realistic EMS operations including day and night operations, IMC procedures, scene work, unimproved area operations, instrument training, egress and survival training, emergency procedures and limitations	Consistent
B. Recommend instrument currency and proficiency for all pilots	Consistent
GUIDELINE 4: AIRCRAFT TYPE AND EQUIPMENT (in addition to FAA requirements)	
I. Aircraft type	
A. Recommend IFR certified helicopters for all programs flying other than day, VFR only	Consistent
II. Equipment	
A. Recommend IFR certified aircraft, and/or stability augmentation, and/or two pilot operations	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

GUIDELINE 5: MINIMUM STAFFING REQUIREMENTS (in addition to FAA requirements)

I.	Single helicopter contracts	
A.	Four crews	Consistent
B.	In addition, one relief crew available to cover holidays, sick days, vacation, training, etc.	Consistent
II.	Multi-helicopter contracts	
A.	One additional crew above the minimum for each additional helicopter	Consistent

GUIDELINE 6: DUTY TIME LIMITATIONS (in addition to FAA requirements)

I.	12 hour shift maximum (recommend no more than four shifts in a row) or average 42 duty hours in a seven day period	Not Consistent: five 12-hour shifts are followed by five days off.
II.	Limited rotation between days and nights	Consistent

GUIDELINE 7: VFR WEATHER MINIMUMS (in addition to FAA requirements)

I.	Day	
A.	Local: 500 foot cloud ceiling and 1 mile visibility	Consistent
B.	Cross country/not local: 800/2	Consistent
II.	Night	
A.	Local: 500/2	Consistent
B.	Cross country: 1,000/3	Consistent

GUIDELINE 8: MEDICAL ATTENDANTS ON AIRCRAFT (in addition to FAA requirements)

I.	All attendants	
A.	All attendants who routinely fly must receive an aircraft and operations orientation designed to introduce attendants to EMS missions. Orientation should include safety awareness training, operating standards, and communications. This shall take place for both ground and flight operation.	Consistent
II.	Other than regular attendants	
A.	These personnel must be briefed prior to each flight.	Consistent

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

GUIDELINE 9: SAFETY PROGRAM

I. Each EMS program will implement an active safety program.	Consistent
II. Each EMS program should be subject to an annual evaluation by an independent party.	Not Consistent: Airlift Northwest's safety program has been reviewed by an independent party, however, not on an annual basis.

C. KITCHEN GARDEN HELISTOP CONSISTENCY WITH FAA DESIGN GUIDELINES

Table B-1 identifies FAA design guidelines as established in Advisory Circular 150/5390-2, Heliport Design, and the consistency of the design of the proposed Kitchen Garden Helistop with those design guidelines.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Table B-1
SUMMARY OF FAA RECOMMENDED HELISTOP DESIGN GUUIDELINES
AND CONSISTENCY OF KITCHEN GARDEN SITE WITH GUIDELINES

Helistop Specifications[1]	Helicopter Design Guidelines	Compliance[3]	Comment
TAKEOFF AND LANDING AREA Diameter: 85'	2.0 x rotor diameter	Agusta (72.0'): yes Huey (96.6'): no	
HELIPAD Length: 40' Width: 40'	1.5 x undercarriage length	Agusta (17.4'): yes Huey: yes	Minimally sized touchdown pads are not encouraged, but may be used in cases of economic or aesthetic necessity.
UNOBSTRUCTED AREA Length: 12' on each side of minimum (72')	Recommended: 1/3 x rotor diameter Minimum: 10' on each side	Agusta (12.0'): yes Huey (16.1'): no	An obstacle-free area surrounding the takeoff and landing area. Keep the area clear of parked helicopters, buildings, fences, etc. The three-foot fence surrounding the take-off and landing area would be an obstruction.
HELICOPTER PRIMARY SURFACE Diameter: 85'	2.0 x rotor diameter	Agusta (72.0'): yes Huey (96.6'): no	Imaginary plane overlying the takeoff and landing area. Area to be free of all obstacles.
HELICOPTER APPROACH SURFACE Length: 4,000' Inner width: 85'	4,000 feet 2.0 x Rotor Diameter	Yes Agusta (72.0'): yes Huey (96.6'): no	Approach and departure surfaces should not be penetrated by any objects that are determined to be hazards to air navigation. Several trees and light poles, that would be obstructions within the surfaces at Children's must be removed or relocated. At least one unobstructed approach and departure surface is required.
Outer width: 500'	500'	Yes	
Slope: 8:1 (horizontal to vertical)	8:1	Yes	

Table B-1 (continued)

Helistop Specifications[1]	Helicopter Design Guidelines	Compliance[3]	Comment
HELICOPTER TRANSITIONAL SURFACE			
Length: Full length of approach and primary surfaces	Full length of approach and primary surfaces	Yes	Surface should not be penetrated by objects.
Width: 250' from approach and primary surface center line	250' from approach and primary surface center line	Yes	
Slope: 2:1	2:1	Yes	

1 Sizes given are the dimensions of the proposed Kitchen Gardens helistop
2 Guidelines as set forth in FAA's Heliport Design Advisory Circular 150/5390-2; January 4, 1988.
3 Numbers in ( ) are recommended dimensions for each helicopter

APPENDIX C

DRAFT

MEDICAL REVIEW COMMITTEE

(July 23, 1987 Draft Proposal)

Purpose of the Committee

The purpose of the Medical Review Committee is to review compliance with condition (3) of the Council Conditional Use Permit and recommend corrective action where appropriate.

Composition and Appointment

The Committee will consist of the following five members:

(1) The Director of the Seattle-King County Department of Public Health, who will serve as Committee chair.

(2) A representative of CHMC selected by the Chief Executive Officer.

(3) A physician representative of the Washington State Medical Association (WSMA), selected by the President of the Association. The representative must be a qualified neonatologist, pediatric intensivist, or pediatric emergency physician.

(4) A physician representative of the Washington State Society of Pediatrics (WSSP), selected by the President of the Society. The representative must be a board certified pediatrician.

(5) A distinguished citizen, appointed by the Mayor of Seattle and confirmed by a majority of the Seattle City Council.

The representative of CHMC will be appointed for a term set by the Chief Executive Officer of CHMC. The representatives of the WSMA, the WSSP, and the Mayor/City Council will be appointed for three

DRAFT

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

years. In the event a Committee member can no longer serve, a replacement will be appointed by the original appointing authority.

Responsibilities

The role of the Committee is advisory. The Medical Director of Airlift Northwest (ALNW) will retain ultimate authority and responsibility for all ALNW helicopter transports to the CHMC campus.

The Committee members will work cooperatively with the Chief Executive Officer of CHMC, the Chairman of the ALNW Executive Committee, and the ALNW Medical Director to assure use of the helistop will be restricted to life-threatening emergencies.

The five-member Committee will have the following responsibilities:

(1) In consultation and cooperation with the ALNW Medical Director, develop written guidelines for determining whether a helicopter transport to the CHMC campus involves a "life-threatening emergency." The ALNW Medical Director will be responsible for establishing the final guidelines.

(2) In consultation with the ALNW Medical Director and based on the final guidelines and information available at the time of transport, conduct a semi-annual (twice a year) review and evaluation of all helicopter transports to the CHMC campus to determine whether each transport involved a life-threatening emergency.

(3) Prepare and submit a semi-annual report to the Mayor of Seattle, the Director of the Seattle Department of Construction and Land Use, the Chief Executive Officer of CHMC, the Chairman of the ALNW Executive Committee, and the ALNW Medical Director discussing the Committee's

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

evaluation of all helicopter transports to the CHMC campus.

(4) Prepare and implement written policies and procedures designed to assure the Committee's proceedings and the results of the Committee's work are open to the public to the extent allowed by the laws and administrative rules governing the confidentiality of patient medical records.

(5) Adopt additional rules and procedures needed to govern the conduct of the Committee's responsibilities.

Staff Support and Funding

The City of Seattle will provide the Committee's staff support and funding as follows:

(1) The Emergency Medical Services (EMS) Division of the Seattle-King County Department of Public Health will provide the staff support needed by the Committee to carry out its responsibilities.

(2) The City of Seattle (through the EMS Division) will provide the funds needed for equipment, supplies, and other Committee expenses.

(3) The City of Seattle will reimburse Committee members for their reasonable expenses required to carry out their responsibilities. Committee members will not receive any compensation or other benefits for their service on the Committee.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUA ITY OF THE DOCUMENT.

Operations

CHMC will request the written consent of the parent or guardian of each patient transported by helicopter to the CHMC campus for Committee members to review the patient's medical records.

Each Committee member will agree in writing to abide by all laws and administrative rules governing the confidentiality of patient medical records.

Semi-annually, the EMS Division staff will conduct a preliminary review and evaluation of all helicopter transports to the CHMC campus.

The Committee will meet semi-annually to consider the EMS Division staff evaluation of all helicopter transports to the CHMC campus for the previous six months.

With the help of EMS Division staff and the ALNW Medical Director, the Committee will prepare and publish semi-annual written reports of the Committee's evaluation of all helicopter transports to the CHMC campus.

Reports and Recommendations

Based on information available at the time of transport, the Committee's semi-annual reports will identify and report all helicopter transports to the CHMC campus that did and did not involve a life-threatening emergency.

The semi-annul reports will recommend actions to be taken by the Chief Executive Officer of CHMC, the Chairman of the ALNW Executive Committee, the ALNW Medical Director, and the Committee to decrease the incidence of medically unnecessary helicopter landings on the CHMC campus, if any.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The Committee will submit the semi-annual reports to those officials listed above in subparagraph (3) of Responsibilities. The Committee's reports will be made available to interested community groups, appropriate media, and any community resident or interested citizen who requests a copy.

Evaluation/Duration of the Committee

Within three years of the date of the Conditional Use Permit, the Seattle Mayor and City Council will evaluate the Committee's operations and results to determine whether to continue the Committee. The Committee will be discontinued after three years unless the Mayor and City Council decide to continue it.

Appendix D

KEY CHARACTERISTICS OF CRITICALLY ILL AND INJURED PATIENTS
TRANSPORTED BY AIRLIFT NORTHWEST HELICOPTER DIRECTLY TO CHILDREN'S
(August 1, 1985 - March 26, 1989)

Admission Date	Time*	Referring Hospital/Scene	Age	Presenting Condition	Admitted To	Discharge/Current Status
8/3/85	1600-1800	Puget Sound Naval Hospital, Bremerton, WA	1 day	Necrotizing enterocolitis	IICU	Expired 8/4/85
8/20/85	1100-1550	Forks Community Hospital, Forks, WA	Premature newborn; 30 wk. gestation	Severe hyaline membrane disease	IICU	Transferred to Olympic Memorial Hospital 9/25/85
8/27/85	1800-2022	St. Helen's Hospital Chehalis, WA	4 weeks	Respiratory distress, Beta strep meningitis	IICU	Discharged 12/13/85
10/15/85	0830-0800	Central Wash. Hospital, Wenatchee, WA	Premature newborn; 27 wk. gestation	Congenital anomalies, diaphragmatic herrla	ER	Expired 10/15/85
11/19/85	0800-0400	Covington, WA (scene)	Premature newborn; 29 wk. gestation	Severe respiratory distress	IICU	Transferred to Valley General Hospital 2/22/86
11/27/85	1150-1225	St. Joseph's Hospital Bellingham, WA	Newborn; 37 wk. gestation	Respiratory distress	IICU	Discharged 12/5/86
11/28/85	1125-1255	St. Peter's Hospital Olympia, WA	2 months	Bilateral subdural hematomas; seizure activity, retinal hemorrhages	IICU	Transferred to St. Peter's Hospital Olympia, 12/16/85
12/4/85	0935-0945	Harrison Memorial Hospital, Bremerton, WA	Premature newborn; 32 wk. gestation	Respiratory distress; apneic episodes	IICU	Expired 12/14/85
12/13/85	2115-2245	St. Helen's Hospital Chehalis, WA	Newborn; 37 wk. gestation	Respiratory distress	IICU	Discharged home 1/5/86
12/22/85	1329-1350	Skagit Valley Hospital Mt. Vernon, WA	7 months	Meningitis; septic shock	PICU	Transferred to Skagit Valley Hospital 1/8/86
1/11/86	1510-1740 (Boeing) -1800 (CHMC)	Ketchikan General Hospital, Ketchikan, AK	Newborn; 36 wk. gestation	Group B strep sepsis and respiratory distress	IICU	Expired 1/20/86
1/20/86	0735-0805 (Boeing) -0815 (CHMC)	Yakima Valley Hospital Yakima, WA	18 months	Gross internal bleed, metabolic acidosis, respiratory distress, ongoing CPR	PICU	Expired 1/20/86

MONTHLY AIRLIFT NORTHWEST TRANSPORTS (JANUARY 1987 - MAY 1992)

AIRLIFT NORTHWEST

STANDING ORDERS FOR CHILDREN'S LANDINGS

If during the transport of a critically ill child any of the following clinical conditions occur, a Children's Landing is authorized by the Medical Director of Airlift Northwest

I. UNSTABLE AIRWAY

- A. Diagnosis or clinical presentation of epiglottitis
- B. Inability to protect the airway
- C. Inability to provide an artificial airway

II. INABILITY TO VENTILATE/OXYGENATE

- A. Inadequate PaO2 confirmed by oxygen saturation monitoring
- B. Significant hypoxia in the face of 100% oxygen administration
- C. Inability to generate adequate gas exchange, as in status asthmatics or acute pulmonary edema.

III. INABILITY TO MAINTAIN ADEQUATE CARDIAC OUTPUT

- A. Low or absent blood pressure
- B. Lethal cardiac rhythm
- C. Inability to provide IV access in hypotensive patients

IV. INABILITY TO MAINTAIN ADEQUATE CEREBRAL BLOOD FLOW

- A. Uncontrolled seizures
- B. Signs and symptoms of massive cerebral edema as in Drowning, Carbon Monoxide Poisoning, Strangulation

V. THE PERSISTENCE OF UNSTABLE VITAL SIGNS DESPITE HEROIC ATTEMPTS TO CONTROL THEM

January 1990

To Our Neighbors,

As I'm sure you are all aware, the most critically ill patients admitted to Children's Hospital and Medical Center, particularly those from outside the city, are transported via the emergency medical helicopter operated by Airlift Northwest to the Emergency Room entrance at Children's

In an effort to keep you informed about the number and types of cases landing at the hospital, we plan to send you periodic reports about medical airlift activity at the hospital. This report will indicate the date, time and origination of the airlift; the age, sex and admitting diagnosis of each child; where the child went within Children's; and his or her outcome. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

If you have any questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Truman Katz
President and Chief Executive Officer

Emergency Medical Helicopter Landings at Children's Hospital and Medical Center: Summary of Airlift Northwest Flight Activity is published quarterly by the Communications Department at Children's Hospital and Medical Center, Seattle, WA. If you have comments or questions, Please call Suzanne Petersen, Director of Government Affairs, at (206) 526-2530.

26	7:50 pm	St. Joseph Hospital, Bellingham	F	2 months	Sepsis, chronic heart disease	Infant Intensive Care Unit	Still in hospital
29	8:15 am	Harrison Memorial Hospital, Bremerton	F	14 years	Overdose	Emergency Room	Still in hospital
December							
4	9:50 am	King County Medic 4, Renton	F	3 years	Status epilepticus (seizures)	Emergency Room	Discharged
17	4:40 pm	Group Health, Olympia	M	18 months	Foreign body aspiration (peanut)	Emergency Room	Discharged
23	4:20 pm	St. Joseph Hospital, Bellingham	F	3 months	Cardiac arrest	Infant Intensive Care Unit	Still in hospital

*Outcome as of January 2000

Children's
Hospital & Medical Center

May 1990

To Our Neighbors,

In an ongoing effort to keep you informed about patients transported by emergency medical helicopter to Children's Hospital and Medical Center, we are sending you periodic reports. These reports indicate the date, time and origination of the airlift; the age range and admitting diagnosis of each child; where the child went within Children's; and his or her outcome. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

Most requests for emergency helicopter transport of patients to Children's come from physicians in the Puget Sound area or Olympic Peninsula. These reports describe the cases of children most critically ill who require immediate transport to the emergency room entrance at Children's. Other critically ill or injured children, determined able to withstand delay and movement, are helicoptered to other landing sites in Seattle and then transported by ambulance to Children's Hospital.

If you have questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Peterson, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Truman Katz

Truman Katz
President and Chief Executive Officer

* Definition of Diagnosis/Treatment

Kidney and lung hypoplasia: *A condition in which the kidneys and lungs are underdeveloped, which can result in a lack of or diminished function of the organs.*

Omphalocele: *A defect in the abdominal muscle structure causing some portion or all of the abdominal organs to herniate out of the cavity.*

Persistent fetal circulation: *A condition in which the blood circulation in newborns fails to switch over from in utero oxygenation or oxygenation by the mother, to oxygenation by the newborn's own lungs. As a result, the newborn's blood bypasses its lungs and fails to absorb enough oxygen. The infant's metabolism continues without sufficient oxygen, which produces acid in the bloodstream. This acid is toxic to body systems.*

Respiratory syncytial virus: *Also known by its acronym, RSV is a serious respiratory virus that affects the lining of the airways in the lungs, producing a large amount of mucous and swelling. Because young children cannot cough up the mucous, it remains in their airways and increases labored breathing. RSV is especially serious in premature infants, whose health is already compromised.*

ECMO: *Extracorporeal membrane oxygenation is a form of heart-lung bypass used as a treatment of last resort for newborn infants who are critically ill with reversible heart or lung disease. ECMO can take over most of an infant's heart and lung functions, giving the baby's injured organs time to rest and heal.*

In March, Children's Hospital began providing ECMO treatment for newborns in the Infant Intensive Care Unit.

A report to the community about emergency medical helicopter landings at Children's Hospital and Medical Center: A summary of flight activity is published quarterly by the Communications Department at Children's Hospital and Medical Center, Seattle, WA. If you have comments or questions, please call Suzanne Peterson, Director of Government Affairs, at (206) 526-2530.

Children's
Hospital & Medical Center

August 1990

To Our Neighbors,

We are sending you quarterly reports about patients transported by emergency medical helicopter to Children's Hospital and Medical Center in order to keep you informed about the number and types of the cases of children who require immediate transport directly to the emergency room entrance. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

Emergency helicopter transport of patients to Children's Hospital occurs when time is a critical element of saving a child's life. This service is used by emergency medical teams responding to crises in the field and by community hospital physicians who need to send patients to Children's for emergency tertiary (highly specialized) care services. For example, during the summer months, near drownings are too often examples of some of the conditions that require immediate, advanced medical intervention at Children's. The hospital's medical and surgical teams are notified of the helicopter transport and are ready to provide immediate treatment upon the child's arrival.

If you have questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Truman Katz
President and Chief Executive Officer

*** Definition of Diagnosis/Treatment**

Bacterial meningitis: *Life-threatening infection of the membranes which surround the brain and spinal cord.*

ECMO: *Extracorporeal membrane oxygenation is a form of heart-lung bypass used as a treatment of last resort for newborn infants who are critically ill with reversible heart or lung disease. ECMO can take over most of an infant's heart and lung functions, giving the baby's injured organs time to rest and heal.*

In March, Children's Hospital began providing ECMO treatment for newborns in the Infant Intensive Care Unit.

Epiglottitis: *Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.*

Grand mal status epilepticus: *Rapid succession of major epileptic seizures attended by loss of consciousness.*

Pyelonephritis: *Infection of the kidneys which, if not treated promptly, can lead to growth arrest of the kidneys, deterioration of kidney function, and obstruction. In the most severe cases, acute pyelonephritis can spread, causing the child to develop a generalized, life-threatening infection of the blood.*

Sudden Infant Death Syndrome: *Also known by its acronym, SIDS is a collection of disorders whose common feature is the sudden death of an infant who appeared to be in good health and developing normally. SIDS deaths remain unexplained after a complete case study and postmortem examination is completed. The child is usually discovered during a sleeping period with no heart rate and no respirations. Emergency medical personnel will attempt to resuscitate a child who has a detectable heart rate or whose skin color is near normal.*

A report to the community about emergency medical helicopter landings at Children's Hospit and Medical Center

A summary of flight activity, April through June 1990

A report to the community about emergency medical helicopter landings at Children's Hospital and Medical Center: A summary of flight activity is published quarterly by the Communications Department at Children's Hospital and Medical Center, Seattle, WA. Children's
Hospital & Medical Center

November 1990

To Our Neighbors,

In an ongoing effort to keep you informed about emergency medical helicopter activity at Children's Hospital, we are sending you quarterly reports about the number and types of cases of the children who require helicopter transport to Children's Emergency Room entrance. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

Emergency helicopter transport of patients to Children's Hospital occurs when time is a critical element in saving a child's life. This service is used by emergency medical teams responding to crises in the field and by community hospital physicians who need to send patients to Children's for immediate advanced medical intervention. The AirLift Northwest medical helicopters are equipped and staffed to provide specialized pediatric emergency care to the child during the flight to Children's.

If you have questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Peterson, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Truman Katz

Truman Katz
President and Chief Executive Officer

*** Definition of Diagnosis/Treatment**

Birth asphyxia: *A condition resulting in inadequate oxygen delivery to the tissues.*

Cardiac dysrhythmia: *An abnormal heart rhythm that affects the heart function.*

Diaphragmatic hernia: *A condition at birth in which the abdominal contents are displaced into the chest cavity causing respiratory distress and usually requiring immediate surgery.*

Streptococcal septicemia: *The organism called Group B Streptococcus causes a severe infection of the lungs, bloodstream and other organs such as the brain. This infection can lead to respiratory failure, cardiac failure and/or meningitis resulting in neurological complications and/or death.*

Pyelonephritis: *Infection of the kidneys which, if not treated promptly, can lead to growth arrest of the kidneys, deterioration of kidney function and obstruction. In the most severe cases, acute pyelonephritis can spread, causing the child to develop a generalized, life-threatening infection of the blood.*

Children's
Hospital & Medical Center

March 1991

To Our Neighbors,

In an ongoing effort to keep you informed about emergency medical helicopter activity at Children's Hospital, we are sending you quarterly reports about the number and types of cases of the children who require helicopter transport to Children's Emergency Room entrance. We have been careful to protect patient confidentiality in our attempt to share with you as much information as possible about these life-threatening cases.

Emergency medical teams responding to crises in the field and community hospital physicians who need to send patients to Children's for immediate advanced medical intervention make the decision to request emergency helicopter transport. Critically ill or injured children determined able to withstand delay and movement are helicoptered to other landing sites in Seattle and then transported by ground ambulance to Children's.

In response to a request from a community member, beginning with this report, we are including helicopter departure as well as landing times for each transport. Helicopter ground time at Children's depends upon the amount of time necessary to transfer essential medical equipment and information about the child between the helicopter medical team and the emergency room staff.

If you have questions about this report or about emergency medical helicopter landings at Children's, please direct them to Suzanne Peterson, Director of Government Affairs, at (206) 526-2530, or write to her at Children's Hospital and Medical Center, 4800 Sand Point Way N.E., Seattle, WA 98105.

Sincerely,

Treuman Katz

Treuman Katz
President and Chief Executive Officer

*** Definition of Diagnosis/Treatment**

Acute Epiglottitis: *Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.*

Bacterial Meningitis: *A potentially fatal bacterial infection of the covering of the brain and spinal cord which requires intensive therapy. May cause deafness, brain damage or other serious permanent neurological damage.*

Cardiac Dysrhythmia: *An abnormal heart rhythm that affects the heart function.*

Diabetic Ketoacidosis: *A condition in which the lack of insulin causes a breakdown of fats, and the accumulation of by-products in the blood may lead to pH changes and respiratory distress.*

Grand Mal Status Epilepticus: *Rapid succession of major epileptic seizures attended by loss of consciousness.*

Viral Encephalitis: *A viral infection of the brain often associated with seizures, alterations of consciousness, fever, neurological dysfunction and mental changes. May be life-threatening, requiring intensive care and treatment.*

Vocal Cord Paralysis: *A condition in which the vocal cords do not open and thus prevents breathing.*

• Definition of Diagnosis/Treatment

Adult Respiratory Distress Syndrome: A condition comparable to Infant Respiratory Distress Syndrome in which there is a clinical dysfunction of lung physiology.

Cerebral Edema: Swelling of the brain. If severe, causes coma; if very severe, can interrupt blood flow to the brain and result in death.

Croup: Inflammation of the airway which may cause difficulty breathing. If severe, can result in blockage of the airway and require insertion of a tube to allow the patient to breathe.

Epiglottitis: Swelling in the back of the throat due to bacterial infection that can rapidly block the airway. Treated by a pediatric anesthesiologist or otolaryngologist (ENT) who inserts a tube to bypass the swelling to allow the patient to breathe.

Herpetic Encephalitis: An infection of the brain with herpes virus which can cause brain damage or other serious permanent neurologic damage; may be fatal.

Intestinal Vascular Insufficiency: Insufficient blood supply to the intestine (gut) which can result in intestinal obstruction and may result in irreversible damage to the intestine; may be a surgical emergency.

Meningococcemia: A potentially fatal bacterial infection of the covering of the brain and spinal cord which requires intensive therapy. May cause deafness, brain damage or other serious permanent neurological damage.

Myocarditis: Inflammation of the heart muscle often caused by a virus. It can be associated with heart failure and may cause long term damage to the heart.

Sepsis: A bacterial infection of the blood stream which may progress rapidly to involve multiple other organs including the brain, lungs and liver. It is often associated with shock and may be fatal.

Sudden Infant Death Syndrome: Also known by its acronym, SIDS is a collection of disorders whose common feature is the sudden death of an infant who appeared to be in good health and developing normally. SIDS deaths remain unexplained after a complete case study and postmortem examination is completed. The child is usually discovered during a sleeping period with no heart rate and no respirations. Emergency medical personnel will attempt to resuscitate a child who has a detectable heart rate or whose skin color is near normal.

• Definition of Diagnosis / Treatment

Acidosis in patient with microcephalus: *Severe metabolic imbalance in a patient with an abnormally small head which may be the consequence of a birth defect or severe brain damage in early life.*

Acute liver necrosis: *A sudden, massive injury to the liver, usually from a toxin or an infection which causes severe liver damage resulting in liver failure.*

Acute respiratory syncytial virus: *Also known by its acronym, RSV is a serious respiratory virus that affects the lining of the airways in the lungs, producing a large amount of mucous and swelling. Because young children cannot cough up the mucous, it remains in their airways and increases labored breathing. RSV is especially serious in premature infants, whose health is already compromised.*

Anoxic brain damage: *Extreme deficiency of oxygen to the brain.*

Aspiration pneumonia: *Pneumonia due to inhalation of foreign material into the lungs.*

Croup: *Inflammation of the airway which may cause difficulty in breathing. If severe, can result in blockage of the airway and require insertion of a tube to allow the patient to breathe.*

Meningococcemia: *Infection of the blood stream by meningococcus bacteria. Often progresses very rapidly and can be fatal.*

Streptococcal sepsis: *The organism called Group B Streptococcus causes an overwhelming infection of the lungs, bloodstream and other organs such as the brain. This infection can lead to respiratory failure, cardiac failure and/or meningitis resulting in neurological complications and/or death.*

• Definition of Diagnosis / Treatment

Encephalopathy: *Deterioration in brain function usually accompanied by a change in level of consciousness*

Meconium aspiration syndrome: *Pneumonia-like illness of newborn due to inhalation at birth of fluids containing material from infant's bowel*

Hypoplastic left heart: *Severe underdevelopment of left side of heart which can have life threatening consequences*

Reactive airway disease: *Acute narrowing of the airways which may cause severe difficulty in breathing and require mechanical ventilation*

Pertussis: *Whooping cough—a very contagious infection of the respiratory tract that may be accompanied by seizures and encephalopathy*

Status asthmaticus: *Severe asthma attack during which the patient is not responsive to treatment*

Status epilepticus: *Continuous epileptic seizures during which the patient is unconscious*

Children's
Hospital & Medical Center

March 1992

To Our Neighbors,

In an ongoing effort to keep you informed about emergency medical helicopter activity at Children's Hospital, we are sending you quarterly reports about the number and types of cases of the children who required helicopter transport to Children's Emergency Room entrance. This report also reflects the number of cases landing at the UW Intramural Field.

In order to minimize the impacts on the community, only the most critically ill or injured patients are to land at the Children's Emergency Room entrance. Other patients determined able to withstand delay and movement are landed at the Intramural Field and are transported by ambulance to Children's. Airlift Northwest physicians and nurses make the decision about where to land based on the condition of the patient. The majority of patients continue to arrive at the Emergency Room by ambulance.

This report is mailed to all households in the 98105 zip code through a mailing service. We apologize for any errors in names or addresses.

If you have questions about this report or about emergency medical helicopter landings at Children's, please contact Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write her at Children's Hospital and Medical Center, PO Box 5371, Seattle, WA 98105-0371.

Sincerely,

Treuman Katz

Landings Location Summary

Month	Children's Hospital	UW Intramural Field
October	9	17
November	6	18
December	9	8

• Definition of Diagnosis / Treatment

Acute tracheitis: *Inflammation and swelling of the trachea (airway) that, if severe, will impair breathing.*

Hypoxia: *Lack of oxygen, in this case, because the hot dog was aspirated and was blocking the airway.*

Meconium aspiration syndrome: *Pneumonia-like illness of newborn due to inhalation at birth of fluids containing material from infant's bowel.*

Status asthmaticus: *Severe asthma attach during which the patient is not responsive to treatment.*

Streptococcal sepsis and streptococcal meningitis: *A bacterial bloodstream infection and a bacterial infection of the membranes covering the brain and spinal cord.*

Viral encephalitis: *A viral infection of the brain often associated with seizures, alterations of consciousness, fever, neurological dysfunction and mental changes. May be life-threatening, requiring intensive care and treatment.*

Children's
Hospital & Medical Center

June 1992

To Our Neighbors,

In an ongoing effort to keep you informed about emergency medical helicopter activity at Children's Hospital, we are sending you quarterly reports about the number and types of cases of the children who required helicopter transport to Children's Emergency Room entrance.

In order to minimize the impacts on the community, only the most critically ill or injured patients are to land at the Children's Emergency Room entrance. Other patients determined able to withstand delay and movement are landed at the Intramural Field and are transported by ambulance to Children's. The decision about where to land is based on the condition of the patient. The majority of patients continue to arrive at the Emergency Room by ambulance.

Most requests for emergency helicopter transport of patients to Children's come from physicians in the Puget Sound area or Olympic Peninsula. Children's Hospital and Medical Center is a regional specialty hospital. Often, there are several pediatric specialists called to the case within minutes of arrival. Community hospitals do not have the resources to provide this highly specialized pediatric treatment and diagnosis.

This report is mailed to all households in the 98105 zip code and some in the 98112 zip code through a mailing service. We apologize for any address errors.

If you have questions about this report or about emergency medical helicopter landings at Children's, please contact Suzanne Petersen, Director of Government Affairs, at (206) 526-2530, or write her at Children's Hospital and Medical Center, PO Box 5371, Seattle, WA 98105-0371.

Sincerely,

Treuman Katz

Treuman Katz
President and Chief Executive Officer

*** Definition of Diagnosis / Treatment**

Bronchiolitis: *Inflammation of the small air passages in the lung which makes breathing difficult. If severe, mechanical ventilation may be required to maintain patient's breathing.*

Grand mal seizure: *A convulsion with sudden loss of consciousness and repeated involuntary jerking movement of all limbs. These seizures can be life threatening if very prolonged.*

Meconium aspiration: *Pneumonia like illness of newborn due to inhalation at birth of fluids containing material from infant's bowel.*

Pneumococcal meningitis: *Bacterial infection of the covering of the brain and spinal cord by the bacteria streptococcus pneumoniae. It can be life threatening.*

Pneumonitis: *Inflammation of the lung due to infection or inhalation of an irritating substance. It can progress to pneumonia.*

September 9, 1985

I am John Neff, M.D., Medical Director for Children's Orthopedic Hospital and Medical Center, and Associate Dean of the U.W. School of Medicine.

Thank you very much for inviting me to participate in this hearing regarding the need for helicopter services in the state. This is a complicated issue and I would like to address my comments toward the need for a balanced emergency medical transportation system as it relates to services for children in the State of Washington and the Pacific Northwest. In order for my comments to have any meaning, I would like to put them in context of what has developed in the northwest as a very unique regional system for the care of critically ill children. In this area we are fortunate to have developed a very coordinated regional system for emergency care. Part of this system has already been described in the testimony that relates to the Emergency Medical System; additionally, excellent emergency services for children exist in Tacoma and Spokane. My comments will be directed only to the system as it relates to COHMC.

COHMC, as the only completely full service specialty care center for children in the northwest, is an essential part of the Emergency Medical System. COHMC coordinates emergency care of children principally with two other institutions, Harborview Medical Center and the University Hospital.

Harborview Medical Center receives and cares for most children with trauma and burns.

The University Hospital which has a high risk maternity service and a newborn intensive care unit, shares the emergency care of newborn prematures with COHMC as bed space is available.

COHMC receives children who require emergency care for acute medical and surgical illnesses and receives most of the newborn prematures who are not born at University Hospital and who require intensive nursery care.

The intensive care nurseries at the University Hospital and COHMC are run and coordindated from a patient care standpoint by a unified group of newborn specialists who also coordinate the newborn transport system.

Because COHMC is the only nospital in the region that has full services in pediatric surgery, radiology, anesthesia and the specialties of medicine, the majority of non-traumatic and non-burned emergency situations must come to our hospital.

In order for COHMC to be a part of this Emergency Medical System and to provide the appropriate services for the support of emergency illnesses in children, we require a balanced transportation system - a transportation system which includes three modes of transportation:

1. Ambulance
2. Fixed wing plane
3. Helicopter

In those instances where a child can be stabilized and when transportation time is not a critical factor in the outcome of the child's illness, ambulance is the preferred mode of transportation.

In those instances where children have to be transported long geographic distances, and again where their condition can be stabilized, fixed wing plane is the preferred mode of transportation. We use fixed wing for most of the transportation for children who come from our wider geographic referral area. This area includes eastern Washington, Montana, Idaho and Alaska.

The third mode of transportation, helicopter, is required when the physician is faced with an emergency situation, where it is difficult to stabilize the child, where time is a critical factor in the outcome of the illness, where it is important to limit the number of times that a child is moved from one vehicle to another, and where there are severe geographic limitations to ground transport. The helicopter transports occur within the Puget Sound area where many communities are separated by large bodies of water. Most of these transports involve acute medical and surgical problems of the young children and small infants, most of whom are attached by tubes to various mechanical support systems. Without the availability of a helicopter, no emergency system for children is complete or adequate.

To emphasize this point I will describe three recent examples of children landed by helicopter at COHMC because of an emergency request by the physician attending the child in flight. There really was no other alternative for each of these children.

The first example was a one day old child from Bremerton who developed an acute intestinal obstruction that required immediate surgery. The child was placed in the helicopter and while in the air, or just before the child was transported, the intestines perforated and the child went into shock. The helicopter made an unplanned emergency landing at COHMC, and unfortunately and despite two operations the child died. This is the type of condition where the only chance of survival was to provide as rapidly as possible the services of pediatric surgeons and pediatric anesthesiologists in a setting where all of the support services are available for the very small infant. These services are available in the northwest region only at COHMC and we provided this child with his only chance of survival.

The second example is a four week old previously healthy and normal child from Chehalis, who within 24 hours developed an inflammation of the brain, meningitis. The night before the child was noted by his mother to be fussy and have a temperature. In the morning what first seemed like an ear infection develoned

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

during the day into a frighteningly progressive meningitis. When the transport team arrived on site at six in the evening, the child was in shock and had signs of beginning brain damage as characterized by severe brain swelling. Within a half hour following an emergency landing at COHMC the child was in the Intensive Care Unit, stabilized, surviving and with evidence that the pressure in the brain was decreasing. The only chance for this child was rapid transportation and limited number of transports from one vehicle to another. If this child had not been landed just outside the door of the Emergency Room at COHMC, the child would have had to be landed in the soccer field at the University. Such a landing would have required a transfer to and out of an ambulance and increased the transportation time by 25 minutes, essentially doubling the time from the hospital of origin to COHMC and thereby decrease chances for positive outcome. Such a landing away from the hospital with the transfers involved also would have increased the chances that the child would have become disconnected from his support systems. We had no other alternative but to allow this emergency landing to occur.

The third child was born in Forks, extremely premature weighing only a little more than two pounds, with immature lungs. The physicians arrived with the helicopter and while the child was being placed in the helicopter, the child acutely collapsed his lungs and required mechanical breathing. The physician was able to reexpand the lungs by withdrawing air from the child's chest with a needle and syringe, but during the flight the child became progressively critically ill and showed signs of lack of oxygen. Permission was grantd to land this child outside the Emergency Room at COHMC. Immediately following the landing the child was in the Intensive Care Unit, on a respirator, and is, fortunately, doing very well. Time, geography and the number of transfers was certainly an important factor in this child's survival. These three examples, are very typical of the type of emergencies we face.

In each one of these situations, time and the need to place a child in the Intensive Care Unit as soon as possible, with limited number of transfers, is essential not only for the long-term survival, but also for the need to limit any progressive brain damage that the child might suffer. In each one of these situations we, as physicians, are able to tell the parents that we were able to do everything within our power to provide life for their child and to limit whatever damage their child might incur from the disease process. We feel as advocates for children, and for us to fulfill our responsibilities for this region for the care of children, we can do no less.

COHMC is the only full service children's hospital for the area and we must be advocates for the children we serve. It is critical for us to be able to land the helicopter on our campus so that we can utilize all aspects of what are essential parts of an emergency transportation system.

There is another economic factor that often is not considered in health care planning for emergency and intensive care services for children. We would acknowledge that these services are expensive. When one considers, however, the Northwest area as a whole, there are only a relatively small number of children who require emergency and intensive care services and only a small percentage of them need helicopter services. The use of helicopter services improve the life of a child and minimize the chance that illness or injury will create life-long body and/or brain damage. Such damaged children become an incredible cost, both individually and collectively, to our society as a whole. If the cost of emergency and intensive care services provided these children is averaged out over a life span and measured against potential death, loss of life-long productivity, or worse yet, dependency on a family or an institution, then these emergency cost measures become almost insignificant.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

[redacted]

I would like to continue my statements with remarks that explain the importance of the regional system for emergency care for children in this area. As I mentione.., there are only a small number of emergency bed needs for children in this area. Fortunately, even though accidents, trauma and prematurity are the major causes of deaths in children, the actual number of specialty bed needs to care for such afflicted children is relatively small when compared to the population as a whole. Therefore, in order for emergency care for children to be as cost-effective as possible, there should be only a few hospitals designated where emergency trans portations should take place. This transportation should optimally be coordinated by the Emergency Medical System. We are fortunate to be living in an area where this regionalization has occurred. This regional emergency system is known nationally as one of the outstanding examples of cooperation among health care facilities, and state agencies. This regional emergency system also provides provides vehicles which are shared among several hospitals, rather than individual hospitals owning their own vehicles and competing among each other, as occurs elsewhere in this country. Therefore, we at COHMC feel very fortunate to be in an area and to be part of the process which has allowed such regionalization to occur. Our plea is that there be general recognition that this cooperation exists and that our hospital be allowed to provide those services which are absolutely essential to assure the best possible outcome of a tragic emergency condition that could possibly affect any one of our children from this region.

THE CHILDREN'S ORTHOPEDIC HOSPITAL AND MEDICAL CENTER

September 13, 1985

Joanne Brekke
House of Representatives
State of Washington
Olympia, Washington 98504

Dear Ms. Brekke:

I would like to thank you for giving me the opportunity at the House Committee on Social and Health Services to present the views of The Children's Orthopedic Hospital and Medical Center concerning the helicopter. It was an exhausting evening and the committee certainly can be congratulated for their patience and for bringing out all aspects of this complicated and emotional issue.

There are a few things that I would like to comment on while the meeting is still fresh in my mind.

First, when I was asked about the number of transports that we might expect by helicopter to COHMC, I indicated that our recent experience has been about five a month. It is awfully hard to predict this number, since there is great variability in the number of transports and in the type of emergency. Our projections, however, may be closer to fifteen transports a month.

Second, I know there were several comments about the Mast helicopter. Perhaps it was not pointed out adequately that even though it has been very valuable to have the Mast helicopter services, these helicopters do not have physician staffing for child care and are not designed and cannot adequately take care of the very small child who requires monitoring. The vibrations within the helicopter are intense making critical monitoring impossible. It also is quite easy for the child to become disconnected from the support mechanisms and the environment is not at all conducive for stabilizing the child. It may be fine for adult military transport but is just not adequate for children. These helicopters have been designed for combat use, not critical care pediatrics. In addition, it would be impossible to land the Mast helicopters at COHMC and once again we would have to go through the process of moving the child from the soccer field to COHMC. This is not three minutes, but is closer to 20 or 25 minutes because of the amount of time required in transferring the child from one vehicle to another with all of the various support systems that are attached to the child.

Third, I certainly support a review process of the flights. I hope that our internal review system will be credible, but I would have no trouble in expanding our review process to a broader audience, since our institution is very public and there are many aspects of our services that already are exposed to outside scrutiny, and we believe that what we are doing i[illegible]

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Fourth, we are extremely concerned about the safety issues for the neighborhood. It is certainly not our intention to save lives and in the process endanger others. The FAA has assured us, however, that the helicopter route along Sand Point Way, and coming down directly on the hospital grounds does not put in jeopardy the local residential areas and certainly is quite a distance from the playing fields and schools that were mentioned in the testimony. The possibility of a crash also is extremely small. Additionally, airlift Northwest chose this particular helicopter because of the extremely low probability of mechanical problems which might lead to a crash.

Fifth, I believe Dr. Michael Copass has information which demonstrates that in some situations the cost of helicopter transport is less than the cost of ground transport. You can obtain that information directly from him.

From a personal standpoint I wish to respond again to your question about the hard choices that we all face. I have been in the discipline of pediatrics for twenty five years and have seen enormous progress in the care of children during that time. Although the cost of health care has increased dramatically over those twenty five years, I would hope that your committee would look at children separately, as compared to adults. During this twenty five years the number of hospital beds for children has decreased remarkably and hospital services for children likewise have been limited to only a few institutions. The number of institutions for dependent (mentally and physically retarded) children has decreased remarkably, demonstrating the tremendous advances that have been made in pediatrics in developing out-of-hospital and out-of-institution services for the multiply handicapped. The number of what one would call intensive care services for children is very small and well regionalized. The enormous savings that have occurred from the reduction of hospital beds throughout the area has more than offset the increased costs of our few intensive care units. Most of these gains have been made because pediatrics as a discipline has directed a great deal of its attention to preventive measures and the greatest cost savings that we enjoy in pediatrics come from limiting hospital and institutional stays and admissions. It is very difficult for me to respond to your question about making difficult choices when I feel that in this country we have been extraordinarily responsive in providing superb care for children and at the same time have limited that cost. I am disturbed with the trend that I see. As our health care dollars shrink, there is an enhanced shifting of the health care dollar from children to adults, particularly to adults at the end-stages of their lives, rather than at the beginning. Finally, I have never been asked to determine which child should or should not live unless I am faced with a terminal condition where treatment is futile or only prolongs the agony of dying. I hope the state never askes me to make that type of decision.

To me, the use of the helicopter in the state, although a highly emotionally charged issue, is only a very small but essential part in our continued ability to provide a better life for our children, and in the ideal world these emergency transportation services should be paid for on a grant from the state rather than leaving the hospital with the fee for service mechanisms which unfairly penalizes the few unfortunate individuals who are inflicted with a catastrophic illness. I worked in Maryland for years and at that time the state supported the emergency transport system and controlled it.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

You asked me if I would support you personally in your letters to the Governor to maintain funds for prenatal programs. I will do so absolutely. Everything that we can do to prevent problems, in the expectant mother and in the child, will reduce our need for intensive care services and provide considerable savings for the populace as a whole. If we do not continue to put efforts toward preventing illnesses, then the need for intensive care services will certainly increase.

Children are not voters and so therefore those of us who care for them must stand up and be heard. You and your committee can count on my assistance in any efforts you take to improve the health care for children, be it in Spokane, Tacoma, Seattle or any part of the State of Washington. I extend to your committee an invitation to visit COHMC to meet with our staff so that we can share with you our deep concerns about the limited number of resources that are available to take care of women and children in our society. I also will be glad to meet with your committee at any time. I sincerely hope that these larger issues are not lost in these emotional issues of whether or not a helicopter should or should not be allowed to land at COHMC.

Thank you very much.

Sincerely,

John M. Neff, M.D.
Medical Director

THE CHILDREN'S ORTHOPEDIC HOSPITAL AND MEDICAL CENTER

October 29, 1985

Dr. Bud Nicola
Health Officer, City of Seattle
7th Floor, Yesler Building
Seattle, Washington 98104

Dear Dr. Nicola:

I want to thank you for the excellent job you did in holding the hearing last week concerning the medical justification for the helipad at The Children's Orthopedic Hospital and Medical Center. You gave all sides a chance to aire their opinions and feelings, and you were absolutely impartial in the process. Personally, I don't enjoy this adversarial role with the community. I am sure that they also feel equally uncomfortable in being viewed as opposing good health care for children and will be glad when this process is over.

After I went home and reflected on the hearing, I felt there were some things I would liked to have said, not so much to you but in answer to some of the community concerns and to the lawyer that represented Laurelhurst. While these thoughts are still fresh in my mind, I would like to share them with you.

The first concerns our abilty to provide objective data concerning the need for the helipad. During the hearing it was stated that the City in the past has been able to study helicopters for police use. I hope that the community understands that a study of helicopters for health related use would be difficult to do. I imagine that the police use of helicopters was studied by choosing two similar neighborhoods and providing for one patrol cars, and for the other helicopters. At the end of a given time period the City probably looked at crime incidence figures. The only way I would know to perform a similar study involving helicopters for medical use would be to take two similar communities such as Port Angeles and Bremerton and provide direct transport to COHMC by helicopter for one and another combination of transportaion for the other, or to do a study using alternate forms of transportation for comparable cases. In a very short time the community that did not have the direct helicopter service would ask very soon why their patients could not be transported directly by helicopter to COHMC and minimize as much as possible the risks to that child. Not only would it be difficult to control such a study but there would be real ethical and legal problems involving the first death or complication of a child for whom we denied direct helicopter transportation to COHMC. A case by case control study would be even more difficult. That is why it is nearly impossible to perform any type of prospective study.

Scientific retrospective studies also are equally difficult. In a situation where we do not have a helicopter, you cannot compare the different modes of transportation in a retrospective fashion and can only conjecture on a case by case basis whether or not a helicopter would or would not have made a difference.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

During this past year, for your review, we have identified three children who died and were transported either by ambulance or a combination of fixed wing and ambulance.

I can go back in subsequent years and probably find three approximately similar cases each year. Although I feel that each of these children would have benefited by direct helicopter transport to COHMC, I can't prove this but only can use my clinical judgment and conjecture that we should have given each child an optimal chance for survival. This type of review is further complicated because medical-legal questions will come up whenever we have alternative forms of transportation, and the death of a child is associated with a less direct mode of transportation.

During this past year we also have transported four children directly to COHMC because of the emergency condition of that child. Two of these children died. One will have some degree of undetermined persistent brain damage, and one child is perfectly healthy. The mortality of 50 percent for the helicopter is not a measurement of success or failure of that form of transportation, but reflects only the fact that we are selecting out the most critically ill children for helicopter transportation.

Finally, a retrospective case review, even if we had alternate modes of transportation, is extraordinarily difficulty because of the incredible variety of illnesses which we confront and the variability of each individual child. That is why I emphasized in my testimony the fact that of our 18 helicopter transports since May, the children transported represented 12 different diagnoses. The two repeating diagnoses, meningitis and head trauma were sufficiently different in age and the type of pathology involved that these cases can't be compared within those diagnostic groups. Thus, we are left with the problem of not having enough cases in any one category to allow us to provide a scientific evaluation. Again, I am left with having to make a clinical judgment in each individual case, and according to the individual cases I would say that the children were young enough and had illnesses of sufficient acuity that transportation by helicopter was justified.

I don't believe that we are unique in having difficulty in coming up with hard scientific data that would justify our proposal for a helipad, and we must use clinical judgments on a case by case basis. It is hard to refute that a critically ill child or infant requires rapid transportation and quick transport to the nearest and best intensive care unit in order to have the optimal outcome for that individual child. That is what our patients and our referring physicians demand of us, and we expect it of ourselves. Unless we have the ability to land safely a helicopter at COHMC, we will never be able to prove to you its benefit. We could only present to you on a year by year basis the number of children who died while in transport, or died shortly after arrival at COHMC, and conjecture that the outcome would have been better if there had been a helipad at COHMC. There is no question in my mind that the risk of helicopter transport for emergency situations is far less than the risk of ground transport through the congested and slippery streets of King County. I am glad we did not have an emergency from the east side last week when I-90 was completely blocked because of a multi-car accident. That sort of event is far more frequent than the rare, but very newsworthy, helicopter accident.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

The concern from the neighborhood that was most difficult to respond to last week was the elderly lady whose husband has a heart condition and who lives in the apartments immediately adjoining COHMC. I wish I could remove or alleviate the fear and anxiety factor that goes along with the use of helicopters. I personally don't believe that the noise from the few helicopter landings is a significant factor when one already considers the noise that exists in the neighborhood from traffic and overhead planes. Most of our flights would be in the daytime and very few at night. Although I can't prove it, it seems to me that the noise from an ambulance at code red along Sand Point Way is just as disruptive as a helicopter. The only difference is that we as a society have become accustomed to the ambulance and accept that as a part of our background noise. From a health standpoint, although again I can't prove it, I would imagine the danger of a local resident being hit by a speeding ambulance is as great or greater than the danger of a crash of a helicopter or a heart attack because of alarm from a helicopter noise. Unfortunately, our society has become more accustomed to car accidents and almost accepts those as given risks, yet there seems to be a greater fear of the more dramatic but extraordinarily infrequent helicopter crash. The one argument that I cannot abide by is that because of these factors the helicopter should go to Harborview rather than to COHMC. I believe that there are many apartments in which the elderly live around the Harborview campus, and the Harborview campus seems to be more congested than the COHMC campus. The only differences between the two communities are the socio-economic factors, and I don't think that those should bear a role in the decision as to where a helicopter should or should not land.

Let me end by indicating to you once again my commitment to review with you the use of helicopters at COHMC on an ongoing basis and to assure you and the community that we have no intention of utilizing this service unnecessarily. I do make a plea, however, to let us build a safe and protected area at COHMC where we can land children by helicopter and have direct access to the Emergency Room and Intensive Care Units. Liz Anderson in her testimony indicated that she is not against landing critically ill children at COHMC and I sincerely believe she speaks for the majority of the community.

I hope we can come to a resolution on this issue relatively soon. There are too many critical issues involving the health care of children that we must work together to solve. I look forward to a long and rich association with you and I thank you again for your patience and understanding.

Sincerely yours,

John M. Neff, M.D.
Medical Director

Children's
Hospital & Medical Center

[illegible]

September 28, 1987

Fred Bruner
Shapiro and Associates
The Smith Tower, Suite 1812
506 Second Avenue
Seattle, Washington 98104

Dear Mr. Bruner:

I hope that I can give you adequate answers to Liz Anderson's questions on this short notice.

First, Ms. Anderson suggests that, "one is really 'splitting hairs' in discussing whether or not there is more patient manipulation due to an additional transfer at the [University of Washington's] east campus" as opposed to flying directly to Children's. Ms. Anderson's statement is probably correct when it is applied to older children who are in relatively stable condition. The only children, however, whom we are landing at Children's Hospital are those children whose condition is such that death or bodily damage is imminent because of very unstable cardiovascular, respiratory and/or neurological systems. Most of these children are very small. In these situations, even the most minor change in the respiratory or cardiovascular status can mean the difference between life and death or brain injury. We feel, therefore, it is inappropriate to take even the slightest risk with such unstable children.

Second, Ms. Anderson asks for data to support the claim that "time-saving can decrease suffering, decrease hospital stay time and in most severe cases, can mean the difference between life and death." I am sure that there is no such controlled data. One instead, has to use medical sense and clinical experience. There is no question that a small child whose blood pressure is dropping, who has a fulminant infection or obstruction in the respiratory tract, should be given every chance at optimal survival as soon as possible, and should be in an appropriate intensive care unit as quickly as possible. We can relate the cases that have landed at Children's Hospital from August 3, 1985 to December 31, 1986. There were 47 transports directly to Children's Hospital and Medical Center. These all were admitted directly to the Intensive Care Units. These children were so critically ill that 22 of them died as part of their presenting condition, and 25 survived. I have listed the illnesses and the outcome according to life and death by diagnostic categories. All of these children were critically ill and required immediate transport to an intensive care unit. Almost in every category some children died and some did not. The numbers are very small but in each situation every possible effort was made for survival. All were critically ill and had life-threatening conditions that required their immediate landing at Children's

Children's Hospital. The physicians involved did everything they could to work toward a good outcome for that child, and in each situations it was the physicians' feelings that the child should be in the intensive care unit quickly. To have done otherwise would have the potential result of a worse outcome. Certainly any landing other than at Children's only would have the potential to worsen the outcome and increase cost, and could not have possibly helped the child.

Finally, Ms. Anderson asks that data be provided to support the statement that "delays in treatment of other patients, while perhaps not a life or death situation, could result in suffering", and she includes in that statment patients with impaired breathing, diaphragmatic hernia, aspiration of a foreign body, cardiac irregularities, near-drowning and vascular collapse from general infection. There is not good data in the literature of the kind that Ms. Anderson is requesting. It would be unethical to perform a controlled experiment in children to provide that kind of scientific data. One would have to provide for one group of children a rapid transport to an intensive care unit, and to the other group of children with exactly similar critical conditions, a delayed transport. No parent or health care professional would accept for their child the potential of an impaired outcome that could come about as a result of a delayed transport time with no expectation of any potential good for the child coming out of such a delay. Such a proposed study would never be accepted by institutional boards, and no physician of any repute would propose or take part in such a study. Therefore, we must depend on review of individual cases, and decide on these individual cases whether or not the physician was justified in providing rapid transport.

In reviewing the cases that have landed at Children's Hospital during the past two years, I feel that the requests for emergency landing were justified based on the condition of the individual patient.

Thank you very much.

Sincerely,

John M. Neff, M.D.
Medical Director

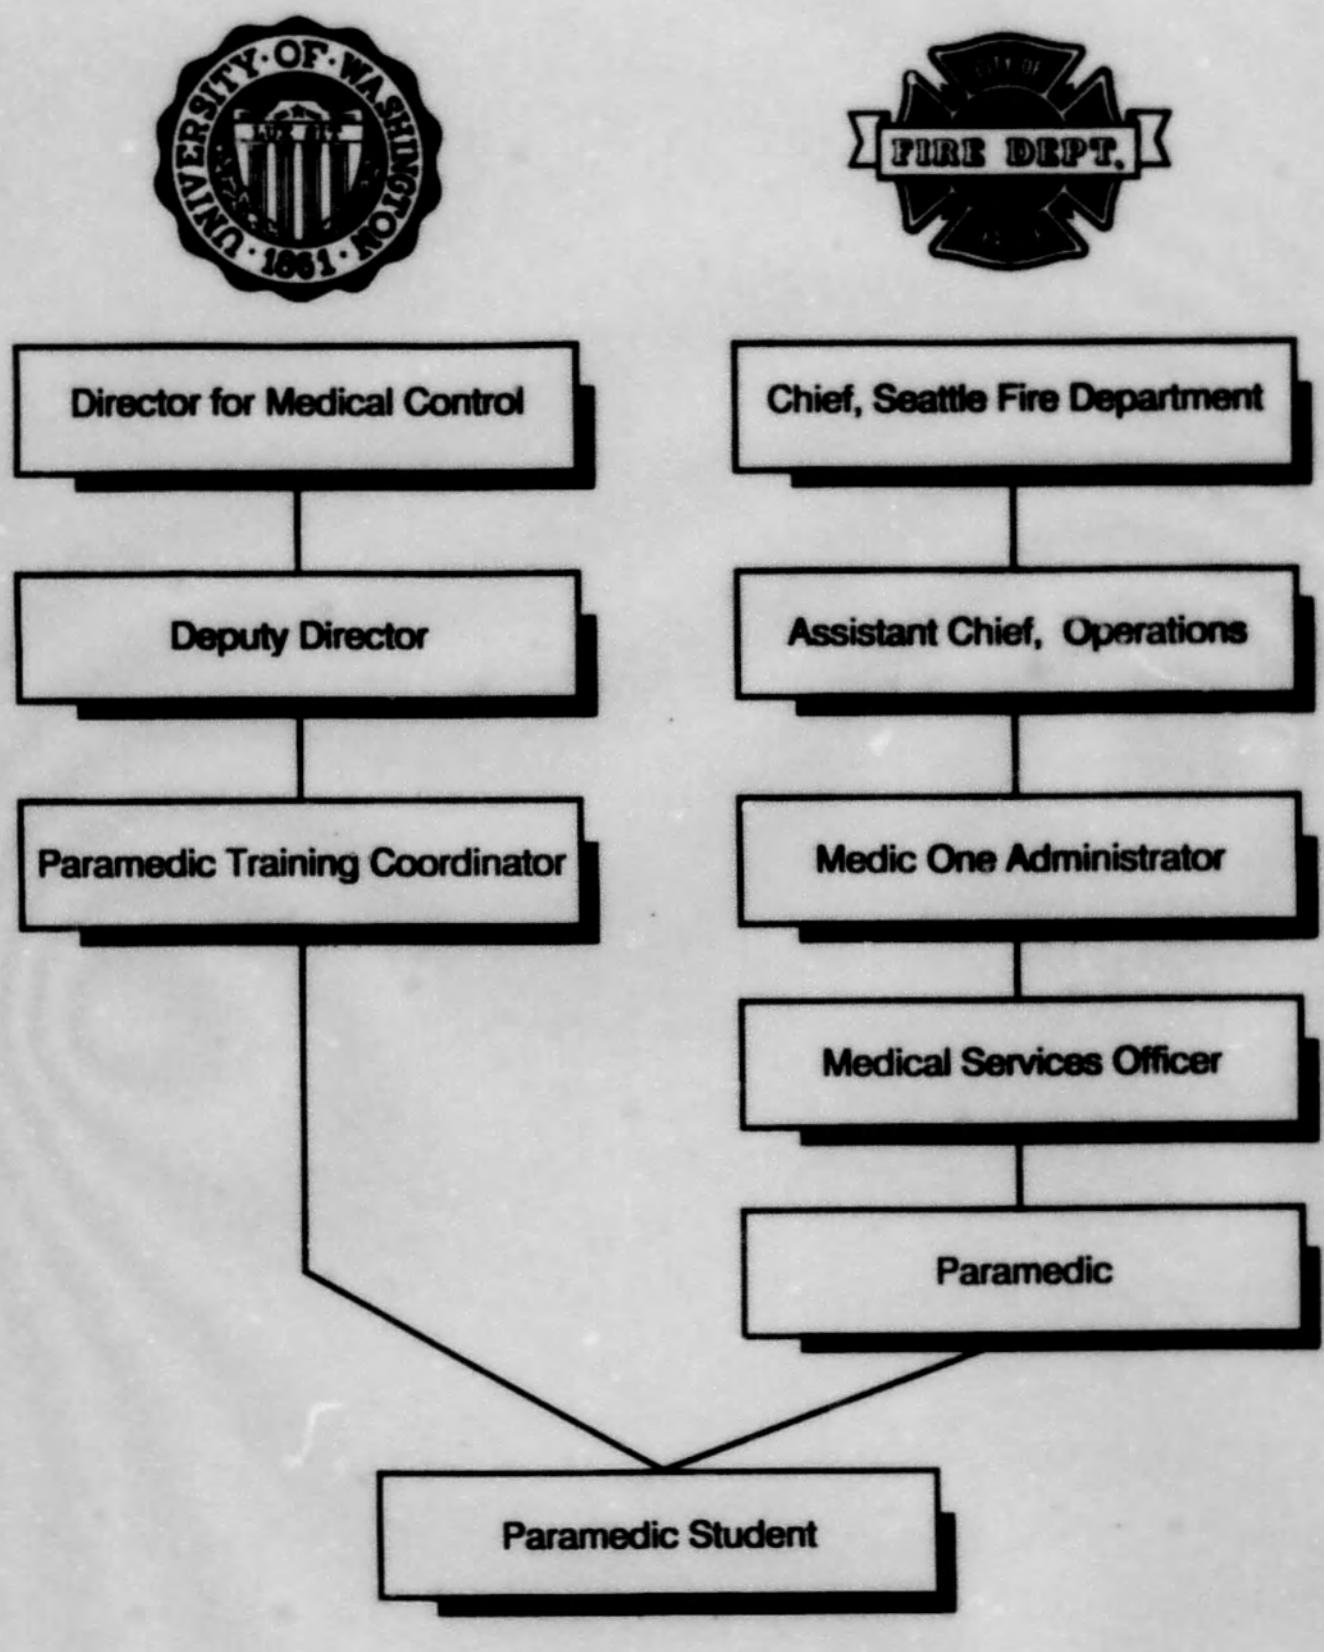
The Seattle Paramedic Training Program

The University of Washington/Harborview Medical Center Paramedic Training Program was established in 1969 to train paramedics for the Seattle Fire Department Medic-1 Program. Original classes were composed of Seattle Firefighter/EMTs only. After a few years, the program began training paramedics for other regional emergency care provider groups. With the certification of the most recent class in 1988, 251 paramedics have received training through the UW/HMC program. On completion of the course, paramedic students are certified as Mobile Intensive Coronary Care Unit Paramedics by the University of Washington School of Medicine, which is equivalent to Washington State certification.

The Program Director, Coordinator and office staff are located at Harborview Medical Center, which is the sponsoring institution. Harborview Medical Center, a 330- bed acute care hospital, is a University of Washington affiliated teaching hospital. Harborview houses an impressive variety of medical facilities and services; including the region's only twenty-four-hour Level 1 Trauma Center, the twenty-two-bed Northwest Regional Burn Center, an eighteen bed medical/surgical intensive care unit and a nine-bed Coronary Care Unit. Two of the Seattle Fire Department's Mobile Intensive/Coronary Care Units are based at Harborview Medical Center.



The majority of paramedic training takes place at Harborview. This includes lectures, medical labs, medical/surgical rounds, emergency room and CCU training. Some aspects require that students be rotated through other University of Washington School of Medicine affiliated teaching hospitals in Seattle. They are assigned to the University of Washington Medical Center Labor and Delivery Suite for obstetrical experience and to Children's Hospital and Medical Center for performing pediatric I.V.'s, intubations and evaluating emergent pediatric patients.

The Paramedic Training Program remains closely tied to the Seattle Fire Department Medic-1 Program, whose headquarters are at Harborview. Paramedic students accrue field experience by accompanying certified paramedics on Seattle Fire Department medic units. Seattle medic units respond to over 9,400 Advanced Life Support responses annually. Seattle Fire Department facilities are also used for specified training sessions such as drills, practical experience in triage, hazardous materials, vehicular and building extrication.

The Curriculum

LECTURES

Students attend 252 hours of formal lectures. The lecture series is divided into four sections of study:

- **Introduction**
- **Block 1**
  - cardiology
  - respiratory system
  - pharmacology
- **Block 2**
  - general acute medicine
  - trauma
  - burns
  - orthopedic
  - neurology
- **Block 3**
  - obstetrics
  - pediatrics
  - triage and extrication
  - death and dying
  - legal considerations
- **Continuing Education Lectures**

A comprehensive written examination follows each of the three Blocks.

Children's Hospital Helistop
Glossary

Accident
The National Transportation Safety Board characterizes an "accident" as an occurrence associated with the operation of a rotorcraft between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death or serious injury, or in which the aircraft receives substantial damage.

Advanced Life Support (ALS)
The provision of definitive medical treatment to a patient while en route to a hospital. This treatment can include but is not limited to establishing intravenous lines, administering drugs, inserting an endotracheal tube, or using a cardiac defibrillator. This care is normally provided by registered nurses or physicians.

Association of Air Medical Services (AAMS)
Formerly the American Society of Hospital Based Emergency Air Medical Services (ASHBEAMS), AAMS is a voluntary organization dedicated to the improvement of the aeromedical industry.

Critically ill or injured Patients
Those patients who might die or become seriously damaged unless appropriate medical treatment is received immediately.

Decibels (dB)
A sound level measurement unit.

Decibels, A-weighted (dBA)
A sound level measurement unit that takes into account the sensitivity of the human ear at various sound frequencies.

Emergency Medical Service (EMS) System
The extension of medical services to critically ill or injured patients and, if necessary, the transport of these patients to appropriate medical facilities.

Emergency Medical Technician (EMT)
An individual with a minimum of 81 hours of training in the treatment of medical emergencies.

Flight segment
The portion or leg of a mission that involves a take-off, travel to a destination, and landing at that destination. Flight segments for the proposal include travel from the Harborview or Boeing Field base to the patient, travel with the patient to Children's and return of the aircraft to base (or to the next mission). Flight segments may include picking up a specialty medical transport crew at Harborview or at the IMA Field.

Helipad
A surface used for parking helicopters.

Helistop

An area used or intended to be used for the landing and takeoff of helicopters engaged in dropping-off or picking-up passengers or cargo.

Heliport

An identifiable area on land, water, or structure, including any building or facilities thereon, used or intended to be used for the landing and takeoff of helicopters. The term heliport applies to all sites, including helistops, used or intended to be used for the landing and takeoff of helicopters.

IICU

Infant Intensive Care Unit. Children's 19-bed IICU treats newborns with critical illnesses including respiratory distress, asphyxiations, congenital anomalies, newborns requiring major surgeries, and infants with severe infections. See also NICU, below.

Incident

Those occurrences other than an accident, associated with the operation of a helicopter, which affects or could affect the safety of operations.

Instrument Rated

A certification given to a pilot who demonstrates that he/she can operate an aircraft only under instrument orientation, without the ground being visible.

Instrument Flight Rules (IER)

Under Federal Aviation Regulation (FAR) Part 135, the rules that govern the procedures for conducting instrument flight, which corresponds to the situations in which visibility is less than one-half mile because of fog or clouds.

Interhospital Transport

The transport of a patient from one medical facility to another.

Intramural Field (IMA) Helistop

The existing helicopter takeoff and landing area located on the University of Washington's East Campus. The helistop is sometimes referred to as Graves Field, which is located several hundred feet to the east.

Intubation

Insertion of a tube into any hollow organ, such as a larynx or trachea, in order to provide air flow.

IV

Intravenous Treatment. The provision of a medicinal solution for medical treatment through a patient's vein. Either a syringe or a bottle connected to the needle by a plastic or rubber tubing is used to store and convey the solution.

Isolette

An enclosed unit used for the transport of babies. The 160-pound isolette contains a self-contained battery pack, which can be used when the isolette is not powered by aircraft or other electric system, as well as medical support equipment that can be configured to the specific needs of the transported patient.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

Military Assistance to Safety and Traffic (MAST)
The U.S. Army's helicopter service designed to provide services such as support in search and rescue operations, as well as the transport of patients to medical facilities.

Mission
One or more flight segments designed to accomplish a particular objective, including such objectives as patient transport, fueling, and training.

National Emergency Medical Services Pilots Association (NEMSPA)
A voluntary association whose primary concern is safety in the EMS industry.

Neonate
A child younger than one month.

Neonatology
A specialized branch of medicine that deals with children younger than one month old.

NICU
Neonatal Intensive Care Unit. The NICU is a medical unit similar to the IICU, however, the NICU is associated with an obstetric unit, while the IICU is not. The University of Washington Medical Center has a 32-bed NICU. Additional NICUs are located at Tacoma General Hospital, Madigan Army Medical Center and in Spokane.

Paramedic
An individual with a minimum of 1500 hours of training in the treatment of medical emergencies.

Pediatrics
Medical science related to the care of children and the treatment of their diseases.

PICU
Pediatric Intensive Care Unit. Children's 17-bed PICU treats critical pediatric medical emergencies. Other PICUs are located at Mary Bridge in Tacoma, and Tacoma.

Pre-hospital Transport
The transport of a patient from non-hospital settings (home, work, play or accident scene) to a hospital or medical center.

Primary care
Medical care that is offered by a physician who is the first contact with the patient and who provides entry for the patient into the health care system.

Secondary care
Medical care by a physician(s) who acts as a consultant at the request of the primary physician. More sophisticated care is referred to as tertiary care (see below).

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT

Sound Measurement

L_{eq}: The level of a steady sound that contains the same acoustical energy as the fluctuating noise over a given period of time.

L_{dn}: The L_{eq} over a 24-hour period, with a 10 dBA penalty included when averaging the L_{eq} for the hours between 10 p.m. and 7 a.m.

L_{max}: The highest instantaneous sound level occurring during a given period of time.

SEL: The Sound Exposure Level of a steady one-second sound that contains the same amount of sound energy as the entire event.

Standard of Care

The average degree of skill, care, and diligence exercised by members of the same profession, practicing in the same or similar locality in light of the present state of medical and surgical science.

Tertiary care

Advanced medical care involving those services necessary to deal with illnesses characterized by complex patho-physiological processes. Children's is a pediatric tertiary care center.

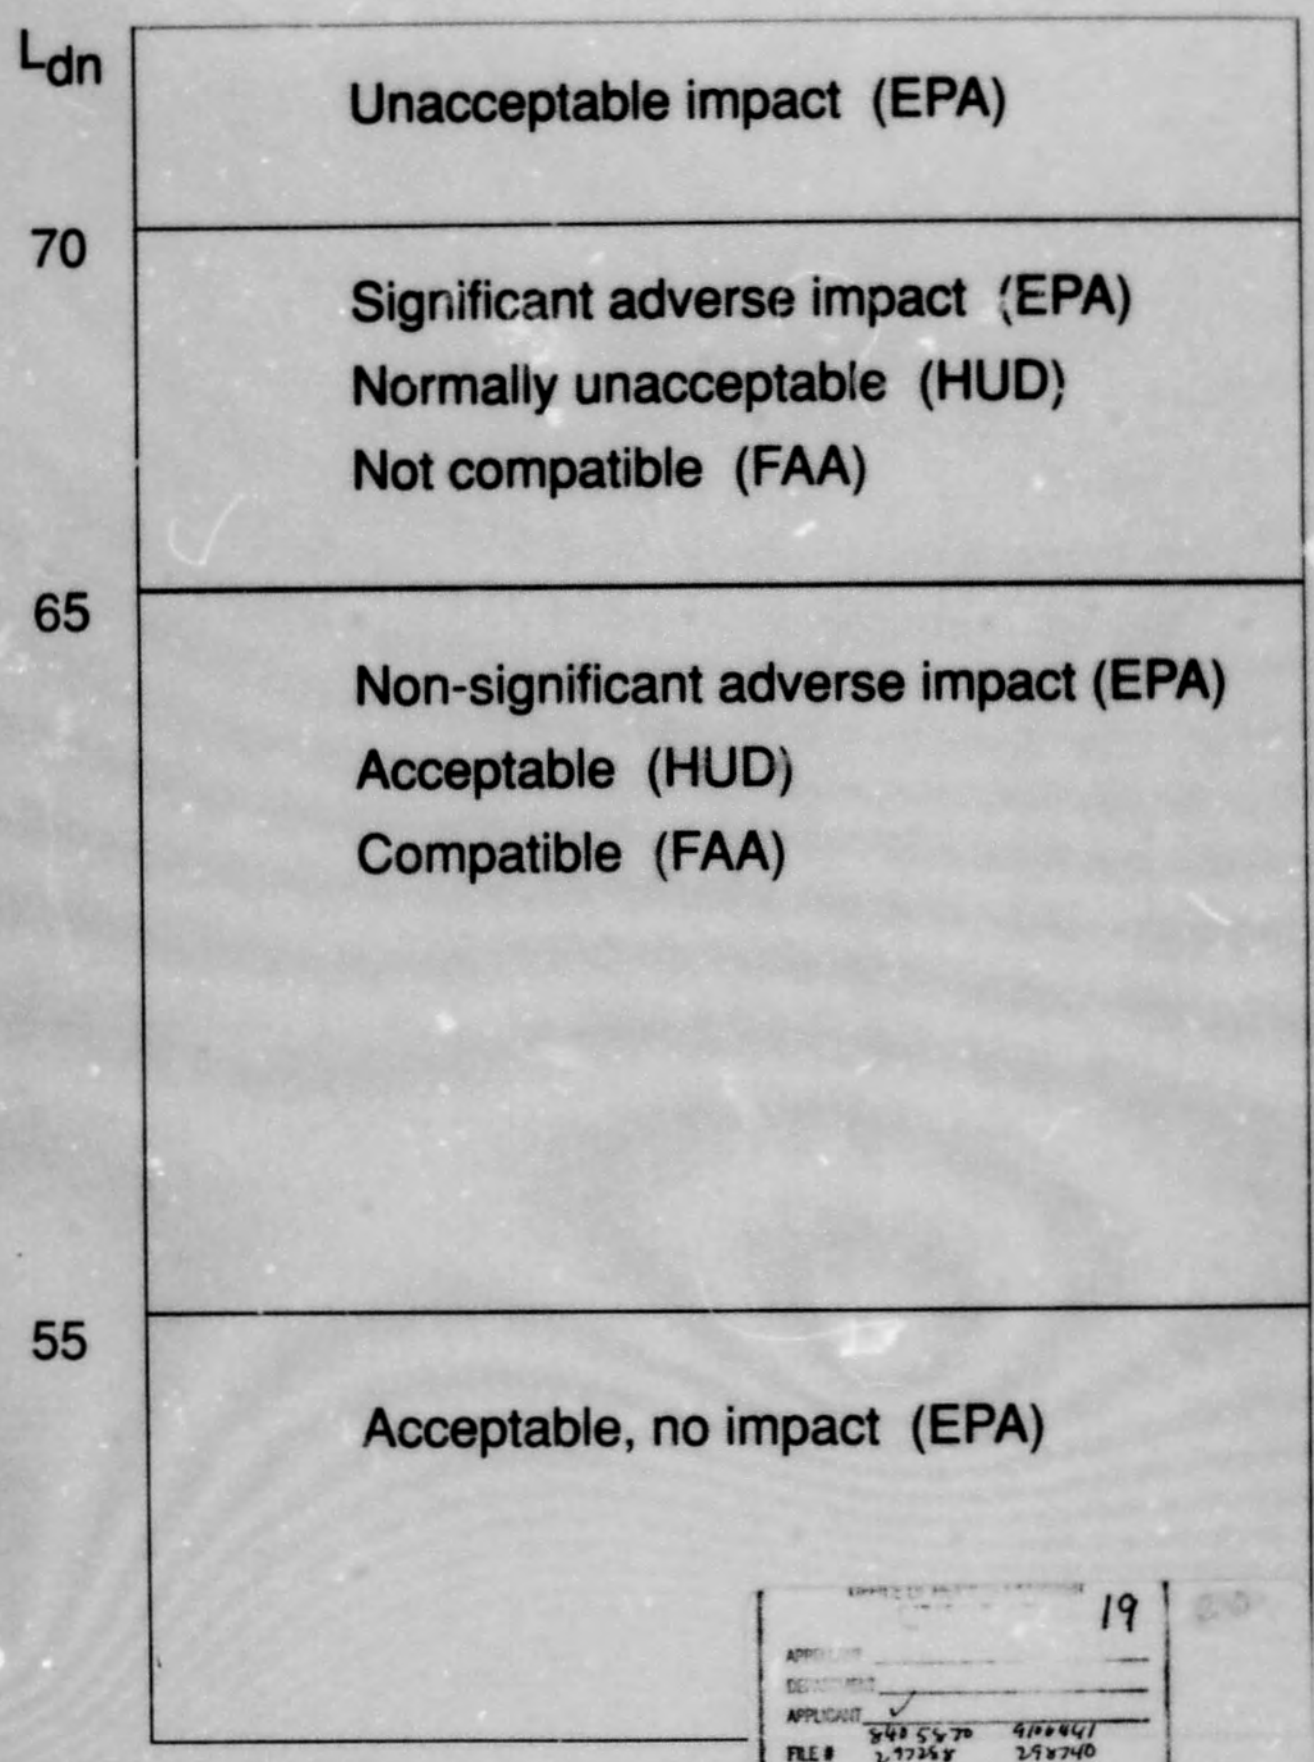
Transport or Transport Mission

One or more flight segments whose purpose is to transport a critically ill or injured patient from the point of origin to his/her destination and return the helicopter to its base or start of its next mission, See Flight segment, above. Flight segments may include picking up specialty medical transport crew.

Trauma

An injury caused by a mechanical or physical agent.

Visual Flight Rules (VFR)



Under Federal Aviation Regulation (FAR) Part 135, the rules under which the helicopter typically is operated when visibility is more than one-half mile. See Instrument Flight Rules, above.

Weather Minimums

Weather conditions that determine whether the aircraft will fly under Instrument Flight Rules, Visual Flight Rules, or not fly at all.

MASTER USE PERMIT

NOTICE OF DIRECTOR'S RECOMMENDATION ON COUNCIL CONDITIONAL USE, ENVIRONMENTAL DETERMINATION AND PUBLIC HEARING

Children's Hospital and Medical Center has applied for a permit to allow an emergency helistop on the CHMC campus and a second, primary helistop on the University of Washington campus near the intramural fields.

Project numbers: 8405870 and 9106441
Addresses: 4800 Sand Point Way N.E. and 2501 N.E. 45th Street
CF numbers: 297288 and 298740

The Director's recommendation is that the Council Conditional Use be conditionally approved. Recommended conditions relate to limiting noise, improving safety and monitoring of landings (types of equipment used and flight paths).

ENVIRONMENTAL DETERMINATION

DCLU has determined that the Final Environmental Impact Statement (FEIS) adequately describes and assesses the adverse impacts of the proposal. The proposal has been conditioned to mitigate impacts. Although significant noise impacts occur, the benefits of the proposal have been found to outweigh the adverse impacts.

INFORMATION AVAILABLE

Copies of the Director's Report and Recommendation and the application materials are available at the DCLU Master Use Permit Information and Notification Center, 710 Second Avenue, Suite 200, Dexter Horton Building. Questions may be directed to Faith Lumsden, Senior Land Use Specialist, 684-8875, at DCLU.

PUBLIC HEARING

A public hearing to take public comment on the Director's recommendation and to establish the record for this application will be held on **June 23, 1992**, beginning at 9:00 a.m. in Room 1310 Alaska Building, 618 Second Avenue. The first two hours of the hearing have been scheduled for presentations by DCLU and CHMC. (This location is accessible.) Citizens may call the Office of Hearing Examiner in June to confirm timing for public testimony or to request accommodations for disability.

NOTICE: IF THE DOCUMENT IN THIS FRAME IS LESS CLEAR THAN THIS NOTICE, IT IS DUE TO THE QUALITY OF THE DOCUMENT.

WRITTEN COMMENTS

Written comments may be submitted through **June 23, 1992**. Comments may be sent to:

Office of Hearing Examiner
1320 Alaska Building
618 Second Avenue
Seattle, Washington 98104

Those persons who want to receive a notice of the Hearing Examiner's recommendation should specify that request in their comment letter.

HOW TO APPEAL THE ENVIRONMENTAL DETERMINATION

Appeals of the decision finding the EIS to be adequate may be submitted to the Hearing Examiner through **May 29, 1992**. Appeals should be addressed to the Hearing Examiner at the address above.

Any appeal of the SEPA determination will be heard at the conclusion of the public hearing. A second day, June 24, 1992, is available for the appeal, if necessary.
